- KANSAS CITY, MO.—Plans are being pre-pared by Chief Engineer Knight for an engine house for the Eighteenth Street Cable Railway Co. It will be of brick, stone, and iron, and will cost \$150,000. Address him for details.
- CHICAGO, ILL.—846-54 Walnut, br dws; cost, \$15,000; o. Foskett & Brown; a, G Gressing; b, owner

La Salle and N Watersts, at the river, 4-story br warehouse: cost, \$35,000; o, West-ern Refrigerating Co; a, W W Boyington;

Same place, 4-story warehouse; cost, \$45,-000; o, Western Warehousing Co; a, and b, same as above

854-58 Milwaukee av, br stores, offices, and flats; cost, \$30,000: o, Le Grand Perce; a, Seely; b, A Lanquist

Dearborn st, below 24th, br flats; cost, \$60,000; o, Henry W Martin; a, C A Weary

Dearborn and 23d sts, br flats; cost, \$50,-000; o and a, same as above

Wood, nr Harrison, br and stone apartment block; cost, \$50,000; o, A W Hatfield; a, D Seymour

Hermitage av, br and stone apartment block; cost; \$40,000; o, same as above; a,

York st, bet Hermitage and Wood, br and stone apartment block; cost, \$60,000; o and a, same as above

W 21st and Robey, br store and dw; cost, \$11,000; o, Wilhelm Heinrich; a, Aug

Ashland av, just north of Twelfth, lime-stone church, with 180-foot tower; cost, \$50,000; o. Emanuel Lutheran Church; a, Fred Ahlschlager

35 buildings costing less than \$7,000

PHILADELPHIA, PA.—Walnut st, west of Broad, 5-story stone club house; o, Manu-facturers' Club; b, Allen B Rorke

Prospect and Gleason, 5 2-story dws and 1 stable; o, Ernest Ragnor

- 1.ITTLE ROCK, ARK.—Ash and 25th, 2-story br residence, slate roof; cost, \$7,000; o, C W Clark; a, B J Bartlett
- HARRISBURG, PA .- Walnut st, offices of the Sunday Telegram; cost. \$15,000; o, Telegram Newspaper Co; a, Smith & Waruer; b, A Hughe

BUILDING INTELLIGENCE.

- TALLAPOOSA, GA.—For details of \$10,-000 hotel, address the Tallapoosa Land, Mining, and Manufacturing Co., of this city, or Col. Geo. W Adair
- SEVEN MILE BEACH, PA-A large hotel is to be erected here from plans made by Architect W E Jackson, 506 Walnut street, Philadelphia, Pa
- DENVER, COL—According to reports a steel car plant is to be established in this city J W Nesmith, and others, are interested
- GRAND RAPIDS, MICH.—Terrace av, fr dwell; cost \$7,000; o, and a, S J Osgood; b, J F Macery

Washington st, fr dwell; under construction; cost, \$8,000; o, S B Jencks; a, S J Osgood; b, Richens & Stearnes

Lagrave st, br church, under construction; cost, \$12,000; o, Fourth Christian Roformed; a, S J Osgood; b, J Rosema

MUSKEGON, MICH.—Foundation in br blk; cost. \$50,000; o, L J Mason; a, S J Osgood; b, contract not let.

Cherry st, Hard heads and pressed br bld; cost, \$25,000; o, E C Fox; a, N G Robinson; b, Contractor not known at

- WHITESTONE, L. I.-Fifty dwellings are to be erected here in the spring. Address the President of the Improvement Society for details.
- CANTON, O.—Three new school-house are to be erected here. Address President Barlet, of the Board of Education, for de-
- PUEBLO. COL.—Architect Stovens, of this city, has plans for a \$50,000 city hall, to be erected here. Address him for details.
- YANKTON, DAK.—Two wings are to be added to the insane hospital here at a cost of \$90,000.
- LOWELL, MASS.—Nothing over \$7,000 to report.

DETROIT, MICH.—Baltimore, br dwelling: cost, \$7,000; o, G. A. Whitney; a, Hess & Raseman; b, P. Cook.

McElliott, br dwell; cost, \$7,000: o, Munz; a, Hess & Raseman; b, L Reh-

berg.
Dequindre, br shop; cost, \$9.000; o, M J Murphy & Co; a, Scott & Co; b, H

210 Campan, br dwell; cost, \$9,000; o, H. Carew; a, Scott & Co; b, H Carew.

DUBUQUE, IOWA—Eighth & Pine st, Dubuque Water Co will build a pumping station; cost, \$20,000; o, Dubuque Water

PASADENA, CAL.—Raymond av, fr hotel: cost, \$75,000; o, Pasadena Improvement Co; a, Eisen, Cutlett & Co.

Fair Oaks av, br block; cost, \$45,000; o, Mr Doty; a, Fred Rochrig; b, George Webster.

Fair Oaks av, br block; cost, \$40,000; o, Y M C A; a, as above.

Colorado, br block; cost, \$20,000; o, Steven's Hardware Co; a, as above.

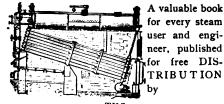

The above buildings are partly planned and partly built. The excavation for other large brick blocks are commenced.

ROBERT EVANS,

92 Fleet Street, -LONDON, ENG. Is in a position to command the most advantageous terms for the purchasing and forwarding of goods of every description.

Reference permitted to the office of this journal.

WE desire to draw the attention of Engineers, Municipal Authorities, etc., to the advantages of the Shone Hydro-Pneumatic Sewerage System. By the introduction of Pneumatic Ejectors any required gradient can be given to the small pipe sewers necessary. The velocity of flow r nders the sewers self-cleansing. The sewage is carried away while fresh, and there is, consequently, no generation of sewage-gas. The Ejectors are absolutely automatic, and any number may be worked from one compressed-air station, situated at any distance therefrom. We invite application for the fullest particulars.

INTERNATIONAL CONGRESS FOR THE IMPROVEMENT OF INLAND NAVIGATION.

THE announcement on another page of the meeting of the Third International Congress for the Improvement of Inland Navigation to be held next August at Frankfort-on-the-Main will be of much interest to all our engineering readers, and especially to those who have had to do with similar work in this country. It is earnestly to be hoped that this interest will soon take some practical shape that may result in sending suitable and sufficient representatives to the approaching congress. There is no country more largely interested than our own in the improvement of inland navigation, and perhaps none in which more extensive works have been accomplished, if the South Pass, the Erie Canal, and Hell Gate may be taken as fair examples.

If proof were needed of the former assertion, some, at least, is given in the letter of Captain Bixby in another column, showing the great benefits derived from comparatively small sums expended to improve the inland waterways of two of our South Atlantic States, and on the latter point a European estimate of the value of our experience in such matters may be found in the unexampled fee paid to Mr. Eads for his advice in regard to the Mersey Canal mentioned by our correspondent.

A due regard, therefore, for our national interests, as well as an international esprit du corps, will prompt our various engineering societies to seasonably arrange to acquire as well as to contribute all the information possible on this important occasion, and our National Legislature should be early memorialized to take suitable measures for adequate representation and the display by maps and models of our most characteristic and important works.

MUNICIPAL ENGINEERING PICNIC EXCURSIONS.

In a recent number of the *Builder*, under the title "A Sanitary Hitch," the large expenditure for sanitary purposes in England, amounting, in cost of plant and works, to over four hundred millions of dollars, and in present annual outlay to about seventy-five millions, is declared to be steadily increasing, while the results obtained are inadequate. The main cause of this undue and unnecessary cost of municipal engineering works for sanitary purposes is ignorance on the part of municipal authorities. When public part of municipal authorities. When public opinion as to the sanitary condition of a town, the impurity of its water-supply, or the need for a system of sewers, becomes so far aroused that the authorities feel called on to do something, one of the first steps taken, according to the Builder, is that "a deputation is appointed, consisting, for the most part, of wholly inexperienced persons, to go round the country and see what other people are doing. Time, no doubt, in one sense of the word, is thus gained; in another sense it is lost, and money too. In one instance the results of such expeditions, and of the subsequent deliberations on them, has been the expenditure of £90,000 on outfall works for 11,000 persons, with the effect of producing an intolerable nuisance."

Like causes under like circumstances produce like effects, and the spectacle of a special committee of some board of aldermen or town council traveling about the country to investigate the merits of sewage systems or waterworks, or patent pavements, is by no means a novelty on this side of the Atlantic. The result, when there is any, is usually that the committee advises the authorities to do what they ought to have done in the first place-viz., to appoint an expert engineer, or a commission of experts, to advise as to what should be done.

These picnic excursions of municipal committees do not, as a rule, lead to the construction of improper works, as in the case referred to by the Builder; in fact, as a rule, they lead to nothing, except delay and unnecessary expense. It is true, however, that they have some educational value, and when they result in convincing a board of aldermen that expert advice should be obtained, it may be that the result is worth the cost. It seems a pity that the work has to be done over again so many times, but there is probably no help for it. When a city has legal business, or has to provide for its sick, the authorities do not consider it advisable to investigate for themselves the merits of law vs. equity, or to send out a traveling committee to compare homœopathic with other hospitals and dispensaries; but the education of most City Fathers has not got so far as this in relation to doubtful points of municipal engineering. The "chorus of interested advice," as the Builder terms it, is loud and incessant, and if the choice is to lie between the picnic excursion and the rushing through a job contract, it must often happen that the first is the lesser evil.

SHIP-RAILWAYS—ANCIENT AND MODERN.

UNDER this title Harper's Monthly for February contains a very interesting article by F. L. Hagadorn, giving a brief historical sketch of what men in all ages have, for purposes of war and commerce, done in the way of overland transport of ships, and a glance at what is now being done and proposed in the same line, the whole illustrated with several maps. We only give a few of the leading points of what will well repay careful reading.

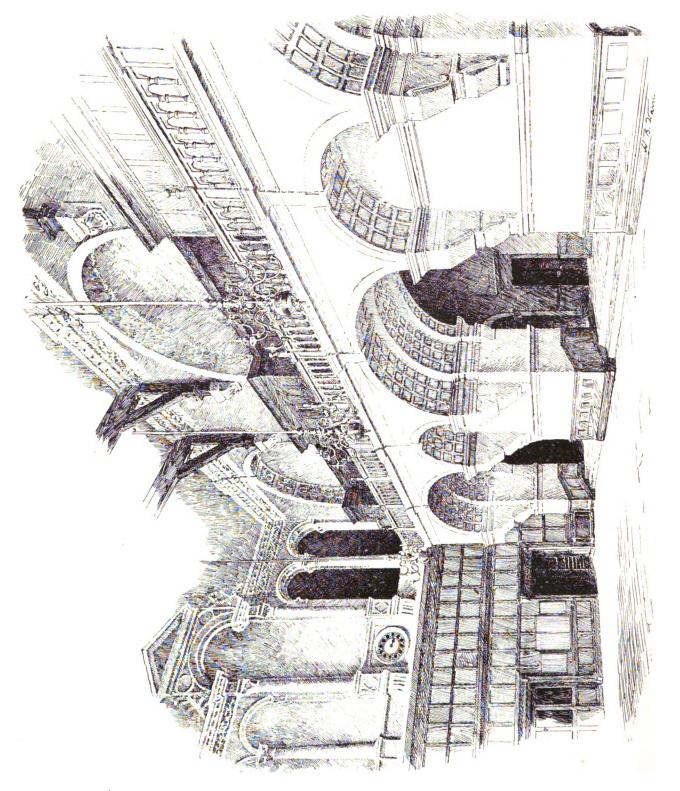

To go back to the "cradle of civilization," it seems that even from prehistoric times the natives of Corinth were skilled in dragging vessels of all kinds across the narrow isthmus, where, subsequently, 550 B. C., the Athenians built the "Dioclus," or haul-over, a veritable ship-railway of polished granite provided with suitable cradles and rollers, which they operated for three hundred years, often carrying war vessels of an average length of 150 feet and a displacement of at least 450 tons.

In the fifteenth century the Venetians, under the direction of an engineer named Sorbolo, in barely six weeks carried a fleet of thirty vessels fifty miles overland from the River Adige to Lake Garda, crossing Mount Peneda on the way, in order to relieve the city of Brescia, then besieged by the Milanese.

The road had to be prepared as they went, and at least six of the vessels were nearly as large as those handled two thousand years be-fore by the Athenians on the "Dioclus," requiring 600 oxen each to haul them out of the water and half that number to move them on the land, as they were fully loaded with cannon and munitions of war and with supplies for the beleagured Digitized by GOGIE

ENDOWMENT ASSOCIATION BUILDING, WASHINGTON, D. C.—GLENN BROWN, ARCHITECT.

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES.

INTERIOR, EXAMINATION SCHOOLS, OXFORD, ENGLAND.

T. G. JACKSON, 'ARCHITECT.

At the present time a ship-railway is about to be constructed across the isthmus of Chignecto, at the head of the Bay of Fundy, by Sir John Fowler.

The Canadians have also under consideration a project for a ship-railway from Toronto on Lake Ontario to Georgian Bay, an arm of Lake Huron.

In our own country Major Jones, of the U. S. Engineers, has designed a ship-railway to avoid the dangers of the Dalles on the Columbia River, in Washington Territory, and his plans are now under consideration by the War Department.

Another ship-railway has been projected across the peninsula of Michigan, from Michigan City to Toledo, and still another across the Florida peninsula.

As regards the feasibility of these ship-rail-way projects, if it be said that but little can be argued from previous successes in that line on account of the small size of the vessels handled, it should be answered that the difficulty of handling such a large body lies not so much in its size or weight as in its relative weakness, which renders it proportionately more liable to injury, and if it can be shown, as there should be no difficulty in doing, that modern metal ships are stronger in proportion to their size than those handled by Sorbolo and the Athenians, the difficulty vanishes.

When one considers the superior strength and durability of metal, and how much more firmly it is possible to unite plates and bars of iron than planks and ribs of wood; what hard treatment the vast "Great Eastern" sustained uninjured during her launch when she rested for some time practically on two points only; how seldom, if ever, an iron vessel succumbs to the fury of the waves alone, as wooden vessels have not unfrequently done, it does seem as if there should be little question of the ability of modern engineers, with all the mechanical resources of the present day, to handle the largest vessels, which are always metal, with perfect safety on the dry land, where they were built and whence they were launched into their miscalled "native element," with much less care than will be taken on any well-managed ship railway.

It was such considerations as these that inspired the lamented Eads to undertake his gigantic project of an inter-oceanic ship-railway at Tehuantepec, now in the hands of his able associate, E. L. Corthell, as chief engineer, of which we cannot say more than to indorse the following comment of the London Times: "This scheme is a bold one, but it is not more remarkable for its boldness and originality than for its engineering soundness and for the perfection with which every detail has been worked out and every possible contingency provided against."

OUR ARCHITECTURAL ILLUSTRATIONS.

INTERIOR OF EXAMINATION SCHOOL, OXFORD, ENG.—

T. E. JACKSON, ARCHITECT.

A BUILDING AT WASHINGTON, D. C.

THE subject of our vignette illustration this week is the building of the Beneficial Endowment Association at Washington, D. C. It is built of brick, stone, and terracotta. First story in cherry, the others in white pine, all polished. The architect was Mr. Glenn Brown, of Washington, D. C.

A FRENCH VIEW OF THE PANAMA CANAL.

In connection with the impartial account drawn from official sources by Lieutenant C. C. Rogers, U. S. N., so fully presented in our issue of January 28, the editorial statements and data in the *Genie Civii* of January 21 are of timely interest. The different divisions and the nature of the work are described much the same as by Lieutenant Rogers, but the estimate of remaining excavation is 135 million metres, instead of De Lesseps' 105 million and Rogers' 125 million.

In view of the great difficulties, time, and expense that are mevitable in carrying out the original scheme of a sealevel route it has been determined to construct a provisional route with five or six different levels, to be used,

however, only until the completion of the original deep cut.

The line of the canal will not be much changed; sealevel will be maintained from Colon to kilo 22.7 and from kilo 59.1 to the Pacific, the backbone of the Cordilleras being surmounted at the formidable Culebra division by a summit level of 38m., reached by flights of four locks at each end, of 8m. and 11m. rise.

The arrangement is not yet fixed in detail and further investigation and conditions of water supply may cause modifications; some consideration is given to the plan of fixing the summit level at 49m. by adding a fifth lock of 11m. rise to each flight. This will make the natural water supply, which is assured for the 38m. level, unavailable during several months at least in the year, when it will have to be pumped from the 40m. to the 50m. plane at an expenditure of about 3,600 H. P. The available supply is from the basins of the Chagres, Obispo, and upper Rio Grande Rivers, with a total drainage area of about 200,000 hectares.

The section between the locks will be the same as in the sea-level portion. The locks will have an available length of 180m., with gates 18m. wide, and are to be built of metal, by M. Eiffel, engineer of the 300m. tower.

The speed of a ship in transit is estimated at 10 kilos per hour through long and 3 kilos through short levels, and about one hour is required for each lock; a single ship then can pass from ocean to ocean in 17½ hours and one of a fleet in 28½ hours. Ten ships a day are estimated, which at 2,000 tons burden each gives 9,125,000 per year, against the required capacity of 7,500,000.

The estimated water required for lockage, and losses by evaporation, filtration, etc., is 10 cubic metres per second.

THE ARCHITECTURAL LEAGUE.

THE PLANS OF A ROMAN PALACE.

THE Architectural League held its regular monthly dinner and meeting at Morelli's, 4 West Twenty-ninth Street, on the evening of the 6th inst., with the President in the chair.

A committee was appointed to enter protest, in the name of the league, against the conduct of the municipal building competition upon its present lines; also a committee to report upon the advisability of the league's taking permanent quarters, and the ways and means to the same.

Mr. E. R. Tilton read a most interesting paper on "Life in a Roman Palace." Mr. Tilton was born in the Barberini Palace, and lived there most of his life, and his description of its plan, with the numberless secret stairways, rooms, passages, and closets, and the queer discoveries made in them, was very entertaining. His paper was illustrated by a plan of the part of the palace occupied by his family, which plan showed so little thought in planning that, although the lease covered twenty rooms, twelve of these had to be used to reach the other eight.

UTILIZING THE SEWAGE OF PARIS.

THE French Chamber of Deputies has just adopted a bill authorizing the utilization of the sewage of Paris for ferti'izing purposes, with a view to purifying the Seine. There was also a proposition before the Chamber for the construction of a covered sewage canal from Paris to the sea, with reservoirs, for the benefit of farmers requiring the sewage for fertilizing.

POISONED BY SEWAGE.

A DISPATCH to the New York Times states that the whole ship's company of a vessel lying at Philadelphia are seriously ill from drinking polluted water. The man who had contracted to fill their tank from the city mains took the water from the river instead, near the outlet of a large sewer. Analysis shows the dangerous character of the water, and the probabilities are that had the ship gone to sea all hands would have perished. Detention by the ice alone prevented it. It would be gratifying to hear of the severe punishment of this contractor.

VALUABLE MAPS OF LAND UNDER WATER.

DUPLICATE maps, made by Civil Engineer Burrus in the office of the Secretary of State, of the entire shore line of Kings County, bound in atlas form, are now finished and on file, and a map of Richmon I County is well under way. As the maps are compiled from the records of the State Department, and when necessary from actual surveys, they are of untold value, and will in the future become valuable records in themselves.

REPORT OF SECRETARY OF WAR FOR 1887 ON ENGINEERING PROJECTS.

In the report of the Secretary of War for 1887, we find a few items which are of interest to engineers.

The appropriation bill for rivers and harbors having failed, the department finds itself in the anomalous condition of having no funds with which to pay for the surveys and examinations required at the South Pass of the Mississippi before they can certify as required by law to the maintenance of the channel. The amount paid Eads or his representatives up to September 30 was \$5,450,000, leaving an amount yet to be paid under certain conditions of \$2,550,000.

The masonry dam across the Potomac for the new watersupply of Washington was completed in August, 1886. It is 2,877 feet long and 4 to 20 feet high. The tunnel excavation has been completed, and the masonry lining finished for 8,767 feet, leaving 11,929 feet, nearly all of which must be lined. This increase in the quantity of lining requires an increase of \$320,000 in the estimates for completing the work.

There have been 5,314,000 cubic yards of material excavated and deposited upon the Potomac Flats, thus raising 461 acres of marsh to a height of 4 to 10 feet above mean low tide. The cost thus far was \$985,341, and the cost of completing the improvement is estimated at \$1,441,365.

A 12-inch breech-loading rifled cast-iron mortar, hooped with steel has been completed and tested. With a charge of 65 pounds of hexagonal powder and a shell of 625 pounds, and an elevation of 45 degrees, a range of 9,385 yards was obtained, and still better results are obtained with brown prismatic powder of American manufacture.

The test of the 8-inch breech-loading steel rifled gun has progressed; 102 rounds have been fired with charges up to 113 pounds of brown pewder and shot as high as 302 pounds weight. The highest pressure reached in the chamber exceeded 40,000 pounds per square inch, and after the one-hundreth round no appreciable enlargement and no erosion were perceptible. The ballistic result exceeds that of any published result from guns of like calibre.

At 3,000 yards, the centres of all shot-holes were contained in a circle 61/2 feet in diameter.

The forgings for one 8-inch and one ro-inch B. L. steel rifle have been received and accepted. Those for the 8-inch were from the Midvale Steel-Works, the jacket and tube forgings being the largest steel forgings yet made in this country. This result was reached by them only after repeated failures, owing to inadequacy of plant, but there will be less difficulty in the future.

The forged hoops for the 10-inch gun were made by the Cambria Iron-Works, and the high standard of excellence demanded by the specifications were fully complied with.

The jacket, tube, and trunnion-hoop for this were procured from Joseph Whitworth & Co., of Manchester, England.

The need of enlarged appropriations for heavy ordnance is dwelt upon, also of a more thorough drill of the men in this branch of the service.

The gauging of the lower Mississippi is likely to be intermitted unless the appropriations for it be regularly made.

The dynamite torpedo-gun is favorably mentioned, also an electric fuse by which the shell may be ignited through contact with salt water.

The Signal Service is mentioned favorably, and attention called to the fact that it has become so far a scientific institution, that it is better to continue it as such and omit all military instruction. The Army has ceased to rely upon it, and now provides its own instruction in military signaling. It has been hampered in its proper work through insufficient appropriations.

A HUGE HYDRAULIC LIFT.

THE existing water communication between the Bristol Channel and Worcester by means of the Gloucester and Berkeley Ship Canal and the canalized River Severn between Gloucester and Worcester is navigable for vessels carrying two hundred tons, so that the necessary improvements to enable vessels of that class to navigate to Birmingham are upon the Worcester Canal about twenty nine miles in length only. The total lift from the River Severn at Worcester to the summit level at Birmingham is about 425 feet; and this, the London Engineer says, is proposed to be accomplished by twelve locks of 14 feet lift each, and by a hydraulic machine with a lift of 257 feet.

THE PERLIN METROPOLITAN RAILWAY. No. II.

(Continued from page 150.)

The Foundations.—Good sharp sand was encountered within a few metres of the surface, excepting in a few exceptional locations which were originally old water-courses and where the sharp sand was encountered at greater and very variable and irregular depth with overlying strata of peat. The depth of foundation was fixed at a level of about 10 metres below the level of the rails, and of the total length of 7,964 metres of viaduct structure 4,593 metres are founded on masonry direct, 773 are founded on masonry between sheet-piling, 6,33 metres are sunk to a lower level and founded on masonry direct, and 559 metres are founded on piles.

The Piers.—The piers were divided into abutments, intermediate piers, and cluster piers. The abutments vary extremely, as almost every street crossing showed a different ground plan, and the different styles of superstructure required different treatment in the development of the masonry of those piers. The intermediate piers were very uniform in their construction and generally of a trapezoidical form and normal to the line of the road. The cluster piers were arranged at every fourth or sixth arch.

Arches.—The arches were generally of 12 metres span, 2½ metres rise, 55 centimetres thickness, and curved to a radius of 8¾ metres. Their ground plan was almost invariably rectangular. Oblique arches were re-

ings of 18 metres, measured at right angles; the arches are each built of 11 concentric rings of masonry, eight of which carry the four tracks. The separate rings of masonry are carefully and substantially anchored to each other with heavy iron anchors built in the masonry.

The bridge, inclusive of the two three-cornered land piers, covers a surface of 1,300 square metres, contains 7,040 cubic metres of masonry, inclusive of concrete foundations, and cost complete 250,000M. (493M. a square metre). The other stone bridge crosses the canal at right angles and has one opening of 24 metres. It is a flat, circular-arched bridge, covers a ground surface of 500 square metres, contains 2.850 cubic metres of masonry, inclusive of the concrete foundations, and cost 110,000M. complete, or 222M. per square metre. Of the four iron bridges, one is an iron arched bridge crossing the Spree. It has a clear opening of 48.15 metres and two adjoining street crossings of 15.05 and 10 metres respectively, clear width with a row of columns upon each of the curb lines. The arched bridge trusses are arranged in pairs, two for each track. It covers 1,560 square metres surface, contains 890,300 kilograms of iron, and cost complete 410,000 M., or 264 M. per square metre. The next is the bridge over the canal-basin; it is the largest bridge on the line. It has five openings of approximately 29 metres clear span. The piers were limited in size by the authorities on account of the valuable water-space, and were founded on piles, each pile being loaded with 20 tons and the masonry of the foundations loaded with 30,800 kilograms per square metre.

iron floor-beams. The weight of the superstructure is 275,700 kilos; the total cost of the bridge 199, 200 marks, or 187 marks per square metre.

THE ROAD; SIGNALS.

The roadway is built on the Haarmann system, which is so generally used upon German railroads. The rail is of steel of the Vignole type, 16½ feet long, and weighing 60 pounds to the yard. It rests on a stringer stamped from a metallic plate, which is one foot wide at the base, and 2½ inches high. This stringer is completely imbedded in the ballast. The rails are fastened to the stringers by bolts and fastened together by cross-ties.

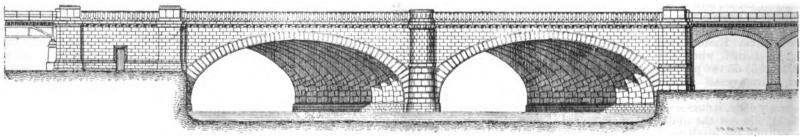

Moving trains are protected by the block system in general use upon the German railways. The signals consist of semaphores with movable arms, and are of the Siemens system.

TRACTION, ROLLING STOCK, MOVEMENT OF TRAINS.

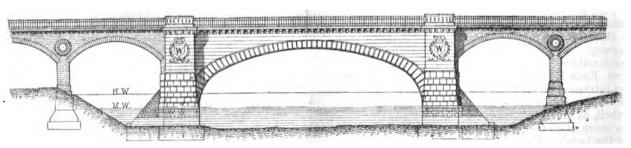

The locomotives in use upon the local service of the Metropolitan Railway are provided with a tender and have four wheels coupled. Two types differing very little from each other are used.

The oldest have a weight of forty tons, equally distributed upon three axles. They are provided with a condenser, and with an arrangement of the fire-box, and an exhaust which avoids the production of smoke or escape of steam.

The engines more recently put into service weighthirtysix tons. They have no condenser, experience having proven that no inconvenience arises from allowing the steam to escape while traversing the city.

BRIDGE OVER THE SPREE.

BRIDGE OVER A CANAL.

sorted to in a few isolated cases only. On top the arches had a course of hollow brick-work carefully arranged for drainage and air circulation. The drainage was carried off through the centre of the piers. All arched masonry was covered with a water-proof layer, generally a preparation of felt and asphaltum specially manufactured for this purpose.

On top of the arched masonry the viaduct was finished with low retaining-walls on either side, which served to confine the materials of the road-bed and to support the coping on which a railing is erected. The latter varies greatly in style according to the section of the city through which the viaduct passes. The road-bed consisted originally of sand at the bottom and gravel on top, with iron ties bedded into it. The layer of sand at the bottom has not worked well on account of retaining too much moisture.

Materials.—The masonry of the foundations and of the piers and arches was of brick laid in hydraulic cement. The masonry was carried up plain, with little attempt at ornamentation, and only at street crossings of where the viaduct ran parallel to a street for some distance the architectural appearance of the structure was improved by stone trimmings, cornices, and recessing of the masonry.

Bridees.—The River Spree is crossed three times, the canal twice, and a canal-basin once. Of these six bridges, two are entirely built of stone; the others are built of stone piers and iron superstructure.

The first Spree crossing, which is on a curve of 300 metres radius, is built entirely of stone; it has two open-

are built of brick-work, dressed with basalt lava, which reaches down to low water. The iron superstructure consists of two main trusses for each track, with parallel cords, single triangular web system, and riveted joints, with transverse girders at each panel point. The longitudinal stringers resting on the transverse girder are trough-shaped and filled with gravel, in which the rail-carriers are bedded. The weight of the entire superstructure amounted to 851,850 kilos. The surface covered by the bridge is 2,800 square metres; the total cost of the bridge, including foundations and masonry, 498,000 marks, or 168 marks per square metre.

The Spree crossing at Bellevue crosses the river at an angle of 45 degrees; it has three openings of about 17 metres in the clear. The superstructure consists of four main girders, one under the centre of each of the four tracks. They are single intersection lattice girders of 2.8 metres depth and 3.7 metres panel distance. They carry the transverse girders upon the upper chord at the panel points, so arranged and braced as to divide the superstructure longitudinally into two parallel bridges, carrying two tracks each. The piers are built of masonry, with foundations carried to considerable depth and founded on concrete. The total weight of the superstructure is 384,200 kilos. The bridge covers a surface of 1,202 square metres. The total cost of the bridge is 225,950 marks, or 176 marks per square metre.

The bridge over the Kupfergraben has two spans of 26½ metres each. The iron superstructure consists of two hinged arched girders for each track, 2½ metres deep and spaced 2.03 metres apart, carrying the tracks on

The tuel used consists of briquettes, which produce very little smoke.

The trains consist only of second and third class carriages. There are no vans; and a guarantee against accident is granted only for one reserved compartment at the head of the train.

All of the trains are provided with a continuous compressed-air brake of the Carpenter system.

For the local traffic the trains are run during the week at ten minutes intervals in each direction from five o'clock in the morning to midnight. On Sundays and holidays they are run under five minutes headway. The minimum number of cars in a train is 8, the average weight II ½ tons.

The cars are compartment cars, and mounted on two axles 4.6 metres apart. The second class cars have four compartments; the third-class cars have five, each for ten persons. The running time of express trains making three stoppages only is from 34 to 37 minutes; at the terminals trains stop six minutes; the running time of locals between end stations is 45 minutes.

The stops at the stations average thirty seconds each; and the average speed of the local traffic is about fourteen miles per hour, including stops and slow running. A parcel post has not been established yet but is in contemplation. The trains are accompanied by a conductor only, who gives the signal for the departure of the train with a conductor's whistle. Only passengers provided with tickets are allowed to enter upon the platforms, where the tickets are punched by a guard. They must then be preserved by the passenger during the ride, and handed to

Digitized by GOOGIC

a ticket-taker at the station at which the passenger leaves the train.

EXPANSES: RECEIPTS.

As we have already had occasion to state, it is the Prussian Government that constructed the Metropolitan Railway.

The figures given as the total first cost of construction are divided as follows:

Right of way, \$8,377,362; construction, \$9,482,868. Total expenses, \$17,870,230.

The actual annual expenses amount to about \$868,200. The receipts, deducting the traffic derived from the trunk lines, amount to \$772,000. It is therefore from the receipts of the trunk lines, all of which belong to the State, that the deficit of \$96,200, as well as the interest on the the capital sunk in the construction, must be made up.

Although the financial condition of the Metropolitan was crippled at the outset it is nevertheless improving. More could not be expected of a line which, at the time of its construction, and while the necessities of Berlin traffic required no such exploitation, presented only a strategic interest.

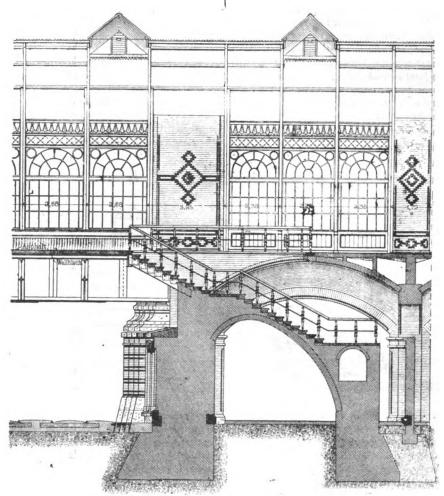

The construction of the railroad began in the fall of 1875, with the construction of some portions of the viaduct. Work, however, progressed slowly and had to stop entirely at intervals, on account of delays in acquiring the right of way, and because of the determination of the alignment, which in many essentials could not be concluded until the following year. At the close of 1877 only 917 metres of viaduct and the embankments and retaining walls at each end were completed and 950 additional yards of viaduct were in progress of construction. During this period of 21/4 years less than 47,000 cubic metres of masonry were completed. Construction was pushed, however, in 1878, when 2,800 lineal metres of viaduct were finished, and 1,200 additional metres were in progress of construction. Also the two masonry bridges were nearly completed, and the foundations for two depots were commenced. The amount of masonry put up in that year amounted to more than 102,000 cubic metres. In 1879, 1,100 metres of viaduct, with two stone bridges, the piers of the bridge over the canal and the basin, and of one of the Spree bridges were finished; also the superstructure of one of the stations. In 1880 the remaining portions of the viaduct and the foundations of nearly all of the remaining stations were commenced and nearly finished; and some of the iron-work was put up. The rest of the work, the finishing of the stations, the erection of the depots, the iron-work of the bridges and street crossings, the ballasting of the road-beds, and the finishing of all

superstructures were so nearly finished at the close of the year 1881, that the road could be opened for local traffic on February, 1882. During 1882 all work was finished; the road was opened for through traffic May 15, 1882. The cost of the whole road of a length of 12,145 metres, inclusive of the embankment approaches at each end, was 75,085,000 marks. Of this amount the cost of construction was 39,086,000 marks, and the cost of the right of way, 35,199,000 marks, leaving property on hand and not wanted, valued at 8,000,000 marks. Most of the construction work was done by contract.

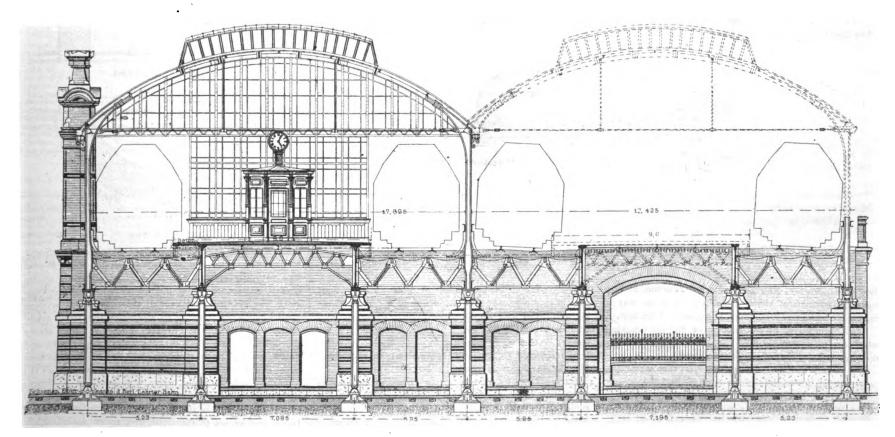

(To be continued.)

THE EIFFEL TOWER.

THE 1,000-foot tower in connection with the French Exhibition of 1889, and known by the name of the designer and constructor as Eisfel's tower, has now reached the height of 179 feet. The four arches of the base are now joined, and the great platform for the rooms of the first stage is about to be constructed, so that the work has passed the most laborious stage. Most of the construction will now proceed from the interior.— Engineer.

SOME DETAILS OF WATER-WORKS CONSTRUCTION.

No. VII.

(Continued from page 88.)

BY WILLIAM R. BILLINGS, C. E., Superintendent of Water-Works, Taunton, Mass.

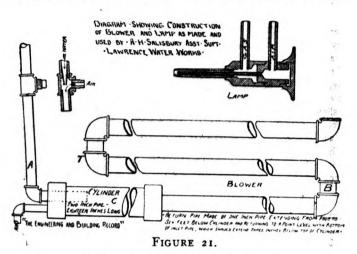

TAPPING.

The regulation wiped-joint is one of the awful mysteries of the plumber's craft, and a description of its making would avail but little. It is the plumber's shibboleth, and if one of the trade can be found who will admit that any other joint is its equal he may be counted as one out of many. It is not to be denied that in many instances nothing can equal in appearance and fitness a well-wiped joint, and a thorough workman certainly knows how to make one; but a well-made cup-joint is equally strong—perhaps stronger—does not require a tenth part of the solder, and is made more quickly and with less practice.

A cup-joint is shown in Fig. 20, and is made by expanding the end of the lead pipe with a properly shaped plug, scraping the inside of the cup with a jack-knife to give a

For heating Mr Brackett uses, or did use, a sweatingiron, and so did the writer until Mr. Ilenry W. Rogers, formerly Superintendent of the Lawrence Water-Works, introduced a blow pipe and air-pump apparatus which is a great improvement in speed and convenience over a pair of hot irons

The air-pump and the blow-pipe or lamp are shown in Fig. 21. A jet of water, whose size may vary with the pressure under which it is to be used and the work to be done, from 1/6-inch to 1/4-inch, induces a current of air to enter the tee, and water and air together enter the separating chamber C made of 2-inch brass or iron pipe. The water flows off through the trap or bent pipe to waste and the air through the smaller pipe to the lamp or blow-pipe. When the apparatus is in operation the outlet for the air is so small that air accumulates in the separating chamber and forces the water down below the top of the trap a distance depending on the special conditions which exist in any given case; and the pressure under which the air accumulates is measured by the difference between the heights of the two water-columns in C B and T B. The lamp is a Bunsen burner and the quantity of air from the pump, and of common gas from

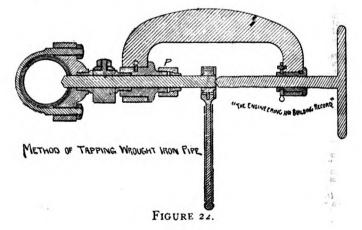

surface of clean metal, dropping a soldering nut or tailpiece, properly tinned, into the cup, heating the whole joint by some appropriate method, and finally by filling the thin annular space between the cup and the tinned brass casting with melted solder. If these details are properly executed a perfect joint is the result. The writer has had several of these joints sawn in two and the bond is then seen to be perfect.

This joint was brought to the writer's attention by Mr. Dexter Brackett, Assistant Engineer of the Boston Water-Works, and a study of the method and its results will show that this is not a "tinker's joint," for it is used in

a convenient jet, may be so regulated as to produce a flame hot enough to make a bit of chalk glow like a calcium light. In fact there is an excess of heat for joint-making, purposes and a little experience will be required to prevent one from getting the metals so hot as to cause the solder to run through.

A very convenient form to use the solder is that given by drawing the common sticks into wire, about ½-inch in diameter. Wire solder has been for sale at a high price, and a large consumer would find it cheaper to build a small mill and draw the wire for himself than to pay 25 cents per pound.

Boston, Lawrence, New Bedford, and Taunton by the water departments of those cities, who have no sort of reason for using any methods or materials but the best.

The only portions of the process of cup-joint making which call for special mention are the method of heating the joint and the kind of solder to be used.

We should note in passing, however, that while the plug is being driven to form the cup, the end of the lead pipe should be firmly held in a vise between two castiron half-round clamps that are cut out to correspond with the outside shape of the cup. When under these circumstances the plug is driven home, the lead forming the walls of the cup is compressed, and anything like a blister or defect has a chance of being closed.

There seem to be no standard weights for the various sizes of lead pipe, and an examination of a "Table showing weights of lead service-pipes used in various cities," which was compiled by Mr. William B. Sherman, of Providence, R. I., as an appendix to Mr. Richards' paper before referred to, will show more clearly than anything else the absence of uniformity.

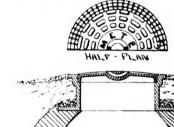

For any but excessive pressures, exceeding 150 pounds per square inch, the following weights will be found sufficient:

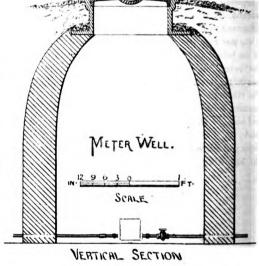

S'zeInches Weight per foot Pounds	1½ 3	5% 3%	34	1 4%	1½ 5½	11/2	
		<u>'</u>	!	<u>' </u>	1		

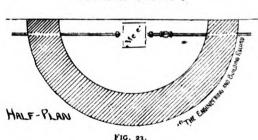

TAPPING WROUGHT-IRON MAINS.

There are more different methods of tapping cement-lined or coated wrought-iron pipe of any sort than of tapping cast-iron mains. Cast iron is seldom less than half an inch in thickness, but with wrought-iron the actual thickness of metal is one quarter of an inch or less, and it is evident that such different conditions call for different treatment. Figure 22 shows in section the apparatus used for tapping wrought-iron kalamein pipe, used by Mr. Frank E. Hall, Superintendent of the Quincy, Mass, Water Co., and to whom I am indebted for a drawing of the machine. A packing of sheet-lead is put between the clamp and the pipe at the point to be drilled, and if tightness is not secured by screwing the nuts down hard, the lead can be calked up.

With cement-lined pipe a similar clamp may be used. and such a clamp is a regular article of trade. A corporation cock may, however, be soldered or wiped directly on to the wrought-iron pipe without any clamp, and this is now the practice in many places. A small portion of the outside coating of cement is carefully broken away, the pipe is thoroughly cleaned and tinned, the cock is then attached to the main by soldering with an ordinary iron, or by wiping, and then with an arrangement similar to that shown in Fig. 22 a hole is drilled, passing the drill through the opened cock. After perforation the drill is withdrawn just far enough to allow the tapper to close the cock, and then the tapping apparatus is removed, the stuffing-box at P having kept the water back during the operation. Any convenient form of drill may be used, but Fig. 20 shows the form used at Plymouth, Mass.

SERVICE-BOXES.

Considerable ingenuity has been expended in efforts to devise a cheap and satisfactory service-box. Wood was, naturally enough, one of the first materials to be chosen, and scored at first an apparent success when the stock was kyanized, but even if the preserving process proved to be in some cases successful, the frost made stumbling-biocks of the boxes by throwing them above the sidewalk level. Combinations of drain pipe, light and heavy castings, and wrought-iron pipe with cast-iron bases might be described, but none of them, so far as the writer can judge, are any better, if as good as a simple cast-iron box in two principal parts sliding, telescope fashion, one insi le of the other. The extension shut off boxes, well known to the trade, give entire satisfaction, and at the price at which they are now offered it will hardly pay for any one to design a new pattern for any but special cases.

Digitized by GOOGLE

METERS.

Of making many meters there has been no end, and much experience with with some of them is a weariness to the flesh. Of the six hundred or more that have been patented, six or less have come to any extensive use in this country, but in the value of that half dozen the writer has an abiding faith.

The important points in setting a meter are perfect protection against freezing, a firm support, accessibility, and in some cases protection against meddlesome fingers. Too much care cannot be exercised in the first of these points, for a frozen meter is worth its weight in junk only, as a rule, and meters have been known to freeze in cellars in which the potatoes (so the owner said) never froze. If a house is to be metered, and the cellar is without a furnace, the safest place for the meter is just below the cellar bottom, and if the ground is too wet to allow this, and draining the cellar is out of the question, then a tight double box, with a 2-inch air-space, affords the next best protection.

Even if a house is not to be metered, it often is wise to enter the service-pipe from the street below the cellar bottom, as this affords protection to the pipe and secures cooler water in summer. In some cases the only place for a meter is in a driveway, a sidewalk, or a lawn, and in such cases a brick wall with a cast-iron cover, the whole costing nearly \$25, offers the best arrangement, as shown in Fig. 23.

Meters should be well supported, either by a hanging shelf or a brick pier if one wishes to avoid all chance of springing the joints or the shell of a meter.

With lead pipe there is, of course, not the chance to hang the meter by the pipe that there is when iron or brass is used. It is quite important that a meter be so constructed as to have the inlet and outlet in the same line, for the best have to come out once in a while for repairs or cleaning, and then, with proper construction, a piece of pipe may take the place of the meter, with no inconvenience to the consumer.

ELECTRICITY FOR STREET-RAILWAYS.*

W. H. PREECE, F. R. S.

THERE are few people who know that the number of horses required to work a tramway is 12 per car. My figures are taken from Manchester, where there is one of the best-worked systems of tramways that we have in this country. There every car requires 12 horses to work it; the life of a car horse on those tramways is only four years. Working tramways in the north, wherever there are heavy gradients, is really cruelty to animals. We know that a horse can only do a horse's work; there are some men who can do a good deal more than an ordinary man's work, but we rarely should expect any man to do more than five or six men's work. But these tramway horses are absolutely frequently called upon to do-eight or ten times more than nature has constructed them to do, and it is no wonder that their life is so very short. This remarkable fact comes out in dealing with horses from a pure matter-of-fact point of view. If we work a tram-car by electricity by means of batteries placed in the car, taking the price of horseflesh and the price of batteries per ton, the cost is exactly the same—it requires a ton-and-a-half of horseflesh, it requires a ton and-a-half of batteries to work a car. The life, as I stated, of a car horse is four years; the life of a battery is four years. A horse will hardly do more than thirty miles a day; a battery will carry a car for sixty miles a day, and, in fact, when we remember that for the price of two horses, for the life of two horses, we can work tramcars by means of electricity, then when you think that it takes twelve horses, the mere question of £ s. d. will carry the day. There is not the slightest doubt that, when the matter is properly and thoroughly worked out in a practical manner, batteries can and will work tramways, and the day is not far distant when all our tramways in and about London will be worked by means of batteries, and the poor horses relegated to duties for which they are

THE FLOW OF AIR IN PIPE-SEWERS AND ITS EFFCT ON TRAPS AT THE FOOT OF SOIL-PIPES.

WE have received a copy of the printed evidence submitted in the case of the Drainage Construction Company vs. the city of Chelsea, Mass., in the Circuit Court of the United States in Equity. The Drainage Construction Company is practically Colonel George E. Waring, and the suit is to prevent the city from using automatic flushtanks in connection with a system of pipe-sewers. The city purchased some Field flush-tanks, and the question at issue is its liability for royalty in using them in connection with a system of sewers alleged to infringe a patent of Colonel Waring's. The suit is not yet concluded, but the following testimony of William E. McClintock, the Engineer of the city, in which he gives an account of the observations made by him on the system of sewers, is of interest, aside from the merits of the suit. He found that there was an almost constant current of air through the sewers varying from one to four feet per second. Generally, the air-current is opposed in direction to that of the watercurrent, though there is a constant but very slight flow of the air just at the surface of the water in the same direction with the water. The discharge of a flush-tank causes the air to flow down the sewer with a velocity of from two to four feet per second for from 35 to 100 seconds. The effect of the flush on the air is lost in about 300 feet of

Mr. McClintock savs:

"I have made a series of experiments dated December 6, 1886, as follows, to show the action on the water in a trap attached to a 4-inch pipe branching into a 6-inch pipe, with a current of air through the larger pipe.

"The apparatus consisted of a length of 6-inch tin pipe about 28 inches long; from this led a 4-inch pipe, with an offset in it, making a water-seal one and a half inches deep. A slot cut through the side of the trap, covered with glass, having a scale measuring sixteenth of an inch marked on its surface, enabled observations to be made on the surface of the water in the trap.

"The observations were made at the Magee Furnace Company's foundry, using the furnace-blast for getting a movement of the air.

"The apparatus used consisted of two pipes and a trap, as above described; this was connected with the air-blast by means of a 4-inch pipe tapped into a cap on the main blast-pipe, enlarging to a 6-inch pipe; in the supply was a slide to regulate the amount of air furnished to the 6-inch pipe.

"First—The trap was filled with water; a full blast was then turned on equal to 33½ feet per second. The effect of this blast was only felt in the tremor of pipes and slight spilling of the water.

"There was a lowering of the surface of trap water of about one-sixteenth inch on the side away from the large pipe.

pipe.
"The velocity of the air through the pipe was varied to

Digitized by Google

with a velocity about one-third to one-half as fast as the air in the 6-inch pipe.

"These experiments were not made upon the sewer itself, but upon an apparatus constructed for the purpose.

"Int. 99. Did you make any experiments with the same apparatus to show the effect of the pressure of a current of air moving through the pipe representing the sewer, in forcing the water out of the trap? If so, will you produce the record of such experiments as a part of this answer?

"Ans. I made experiments, of which the following is

"DECEMBER 11, 1886.

"Experiments at Magee's Foundry, Chelsea, to determine the action of the pressure of air moving at different velocities on a body of water in a 4-inch trap, such as is used in the Prattville sewers:

"The apparatus used for the trial consists of a piece of 6-inch pipe; leading out of this is a 4-inch pipe with a trap having a water-seal of 13/4 inches. This is placed in such a position as to receive the air from the blast-pipe of fan, the same being regulated by a slide so as to give different velocities through the pipe.

"The end of the 6-inch pipe was placed 14 inches from the end of the blast-pipe, making a break in the pipe of 14 inches, which is three inches in diameter, enlarging to six inches.

"A slot in the side of the trap, in which was set a piece of glass, enabled the surface of the trap-water to be observed.

"The air was first allowed to pass through the 6-inch pipe, the velocity being measured by meter; the cap was then placed over the end of the 6-inch pipe, the air being pressed back on the surface of the trap water by its own velocity alone; the height of the trap water was then observed, the difference between the reading before and after the cap was put on being caused by the action of the air and varying with the velocity of the air.

"The following table gives the results of the above trials.

"The results are an approximate of the true results, and are close enough to judge what the effect of a current of air flowing through a sewer will have on the water in a trap. The trap is full when the reading on the side gauge is 20; the divisions on gauge are sixteenths of an inch.

Table showing the effect of pressure of air at different velocities on the water in a trap:

/elocity	pipe.		inen Column	Column of water supported oy air.					
2.55 fe	et per	secon	db sis	teenths	of inch.				
3.30	**	**	r	**	**				
3.58	**	••	I	**					
4.58	**	••	2	••	**				
8 17	••	••	5	"	••				
10.50	**	**	6	**	••				
10.92	••	••	6	**	**				
11.25	**	**		**	. **				
12.33	••	••	2	•• .	••				
15.00	••	••	4	**	••				
28.33	••	••	18	"	••				
29.17	**	44	20	**	+1				
33.17	**	• •	22	••	**				
Full bla	ast		28	**	**				

"In the above observations there is a chance for a slight discrepancy, owing to a variation in the velocity of the air between the time of placing the cap over the 6-inch pipe and the reading of gauge on trap.

"This would account for the small readings opposite the 8th, 9th, and 10th readings. A series of readings would give a mean value that would eliminate the apparent error."

BENEFIT CONFERRED BY RIVER AND HARBOR WORK

THE advantages following the improvement of waterways in the State of North Carolina are set forth by Capt. W. H. Bixby, Corps of Engineers, U. S. Army, in a recent letter to the Wilmington *Messenger*, from which we quote:

"Few people realize the advantageous commercial, agricultural, and colonizing effects produced by the Governmental improvement of rivers and harbors of the United States, and especially of the South Atlantic and Gulf States

"The rivers and creeks of the South Atlantic and Gulf States are, as a rule, streams of gentle slope, considerable

length, and moderate depth, obstructed mainly by sunken logs, snags, and fallen or overhanging trees. Were these latter obstructions thoroughly removed (usually readily done at a comparatively small cost) these rivers and creeks would at once appear in their new role of natural and economical navigable waterways, similar to and rivaling the artificial and more expensive canals of the Northen and Middle States. As soon as one of these streams is opened to commerce, the reduction in freight charges is so considerable as to encourage the rapid development of such towns as are already in existence along its length: and the certainty and cheapness of its freighting and traveling facilities authorize the establishment of continuous and extended settlements all along its banks over large areas of good land, until then so deprived of transportation facilities that the sale of farm products would not even pay the expenses of their transport to the nearest market. More than this, the removal of obstructions from the bed and banks of the stream facilitates the free movement of water in the stream and aids so greatly the natural drainage of the river bottoms and other adjacent lands, that land until then malarious and sickly becomes fit for habitation and culture.

"In this way we readily see that the Governmental improvement of such rivers and harbors not only increases the existing commerce of such waterways, but improves the drainage, culture, value, and health of the adjacent lands, builds up the existing towns, and encourages the settlement of previously unoccupied territories. In no other way can so small an expenditure of public money produce such valuable results in the development of the country at large.

"As an example of this good work let us look at the results obtained in the States of North and South Carolina during the last few years preceding the 1st of July, 1887.

"On the Trent River, N. C, since 1879, about \$42,000 has been spent in opening up about forty miles of river, reducing freights by from 25 to 75 per cent., rendering marine insurance unnecessary, and increasing the commerce by \$250,000 per year, thus showing a development of \$6 of annual commerce for each dollar once spent by the Government.

"Oh the Contentnea Creek, North Carolina, since 1881, about \$34,000 has been spent in opening up about thirty miles of river, reducing freights by from 12 to 50 per cent. and building up a commerce of \$600,000 per year, thus showing a development of \$17 of annual commerce for each dollar once spent by the Government. Besides this, two towns on the creek bank have nearly doubled in population and property, and the whole river basin shows marked gains in settlement and prosperity.

"On the Pamlico and Tar Rivers, North Carolina, since 1876, about \$56,000 has been spent in opening up about sixty miles of river, reducing freights by from 12 to 25 per cent. and increasing the commerce by \$1,800,000 per year, thus showing a development of \$32 of annual commerce for each dollar once spent by the Government. Besides this, the town of Washington, N. C., has increased 25 per cent. in population and property, and the town of Greenville has increased from 912 population and \$266,000 real estate in 1880 up to 2,505 population and \$600,000 real estate in 1886, the development of both these places since 1876 being almost entirely due to the river improvements.

"On the Neuse River, N. C., since 1878, about \$220,000 has been spent in opening up about 70 miles of river, reducing freights by from 25 to 75 per cent. (the freight on cotton being 75 cents per bale, where it was formerly \$2.75 per bale by wagon and rail), rendering marine insurance unnecessary, and increasing the commerce by \$1,800,000 per year, thus showing a development of \$8 of annual commerce for each dollar once spent by the Government. Besides this, the whole river basin is rapidly gaining in population and prosperity.

"On the inland waterway from Newbern to Beaufort, N. C., at Beaufort Harbor, N. C., on the inland waterway from Beaufort Harbor, N. C., to New River, N. C., at New River, N. C., and on Black River, N. C., the present unfinished improvements will give returns at least equal to (if not exceeding) those of the preceding waterways.

"On the Cape Fear River, N. C., at and below Wilmington, since 1829 about \$1,800,000 has been spent upon the improvement of 26 miles of river, increasing the available draft 7½ feet in 1829 up to 16 feet in 1886, reducing greatly marine freights and insurance, and increasing the foreign commerce by \$4,500,000 per year since 1871, thus

showing a development of \$2.40 of annual foreign exports for each dollar once spent by the Government during the same period; although the last increase of two feet in draught in the river channel is too recent to produce its natural effect on such development. The present development of the lower Cape Fear River means the future development of all the State of North Carolina and of many Western States which will before long be forced to send their commerce by new and shorter routes via North Carolina railroads and the Cape Fear River to the ocean and foreign markets.

"On the Cape Fear River, N. C., above Wilmington, since 1881, about \$66,000 has been spent in opening up 112 miles of river, abolishing former tolls, reducing freights by about 33 per cent., rendering marine insurance unnecessary, and increasing the commerce by \$1,200,000 per year, thus showing a development of \$18 of annual commerce for each dollar once spent by the Government.

"On the Waccamaw River, S. C., since 1880, about \$45,000 has been spent in opening up about 70 miles of river, reducing freight, rendering marine insurance unneccessary, and increasing the commerce by \$1,200,000 per year, thus showing a development of \$26 of annual commerce for each dollar once spent by the Government.

"On the Great Pee Dee River, S. C., since 1880, about \$37,000 has been spent in opening up about 200 miles of river, reducing freights by from 25 to 60 per cent. (the freight on cotton being now by river 75 cents, where it was formerly \$1.75 by wagon and rail), and increasing the commerce by \$1,6 ×0,000 per year, thus showing a development of \$43 of annual commerce for each dollar once spent by the Government. Besides this, the neighborhood of the river is steadily developing under the influence of better transportation facilities.

"At Lockwood's Folly Inlet, N. C., on Lumber River, N. C., Little Pee Dee River, S. C., Clark's Creek, S. C., Black Mingo River, S. C., Alligator Creek, S. C., streams already recommended for improvement by the Government; and at Georgetown Harbor, Winyah Bay, Santee River outlet to Winyah Bay through Mosquito Creek, waterways already under improvement by the Government, the present indications are that the completion of the present recommended improvements will give returns at least equal (if not superior) to those of the preceding named waterways. The speedy improvement of Winyah Bay means a rapid increase in the development of the Santee and Pee Dee River basins comprising two-thirds of the entire State of South Carolina; and a single immediate outlay of \$800,000 properly spent here would undoubtedly quickly develop an additional South Carolina commerce of \$8,000,000 per

"On the Wateree River, S. C., since 1882, about \$33,000 has been spent in opening up 64 miles of river. Nothing but the obstructions offered by the S. C. R. R. and the W. C. & A. R. B. bridges (mainly the S. C. R. bridge) now deprive the adjacent fertile lands of Kershaw and Richland Counties from the free transportation facilities to which they are justly entitled; and nothing but the obstruction offered by these bridges now prevents a development of river commerce (similar to that of the similarly situated Great Pee Dee River), which will probably amount at once to from \$500,000 to \$1,000,000 per year.

*On the Congaree River, S. C., since 1861, about \$5,000 has been spent in fairly opening up 47 miles of river. Nothing but the obstructions offered by the S. C. R. R. bridge now deprives the city of Columbia, S. C., and adjacent river valley of a free water communication with the ocean ports of Georgetown and Charleston; and nothing but the obstructions offered by this bridge now prevents a development of river commerce (similar to that of the similarly situated Great Pee Dee River); which will amount at once to from \$1,000,000 to \$2,000,000.

"Although the above improvements have already produced such good results in the development of the country, these improvements are to-day not more than half completed; and there is every indication that further improvements will be accompanied by equally good results until the cost of such improvement shall amount to fully double what has been already spent by the general Government."

A CONCESSION has been granted by the Honduras Government for a railroad from Puerto Cortez, on the Atlantic coast, to Amapala on the Pacific coast. The distance is three hundred miles. A line had been surveyed several years ago, but was abandoned. The route was found quite practicable.

MISSISSIPPI RIVER WATER.

THE report of Dr. Charles Smart, U. S. A., giving the results of a series of analyses made for the State Board of Health of Minnesota of waters from the Mississippi River and some of its tributaries, has been published by the board. The following extracts from it will be found of

In examining the waters of the upper Mississippi, singular and unlooked-for results were obtained by the process for determining the amount of oxygen required to oxidize the dissolved organic matter. These will be of much interest to those engaged in the study of natural surfacewater, showing, as they do, in waters that are free from sewage, factory refuse, or other matters usually considered to be of dangerous quality, an amount of oxidizable organic matter such as would warrant an unhesitating condemnation of the water for domestic use. The rule condemnation of the water for domestic use. The rule which experience has hitherto educed may be expressed as follows: Well-waters which require .2 parts of oxygen per 100,000 of the water are usually dangerously charged with the products of animal waste; but a surface-water which has no manifest sewage inflow may decolorize the equivalent of .4 parts of oxygen without being considered as of doubtful quality. The organic matter of surfacewaters is of a carbonaceous or vegetable nature, and is derived from decaying vegetation found on the water-shed. This is generally regarded as harmless; but when the amount of oxygen required exceeds 4, the water yielding this result approximates in character to that of swamps and marshes, and must be viewed with proportionate sus-picion, or it is connected with some source of contaminapicion, or it is connected with some source of contamina-tion which should be discovered and shown to be of a harmless nature before t e water is warranted as whole-some in this respect. The water of the Mississippi River at Aitkin, Brainerd, and St. Cloud contained an amount of vegetable organic matter largely in excess of that regarded as coming within the limits of wholesomeness in a surface-water; Aitkin waters required 1.204 of oxygen; Brainerd, 1.082 St. Cloud, 1.122. The water from a

Brainerd, 1.083; St. Cloud, 1.132. The water from a Louisiana swamp required 1.254.

The vegetable character of the organic matter in question was indicated by the relatively small amount of nitrogen evolved from it as ammonia; a dilution of sewage nitrogen evolved from it as ammonia; a dilution of sewage or other foul liquids of animal derivation that required this quantity of oxygen would have been rankly ammoniacal or putrefactive in its odor. The vegetable matter in a swamp-water is decomposed more readily, and yields a proportionately larger quantity of albuminoi ammonia than was obtained from the water of the upper Mississippi. Moreover, this vegetable matter was of a stable or nonputrescible nature as shown by the slow manner in which the albuminoid ammonia was evolved from it during

the Wanklyn process.

Previous laboratory work had obtained results of this kind from such substances as Irish peat, and pine shavings or sawdust. It is not unlikely, therefore, that the large quantity of permanganate required for the oxidation of the organic matter in these waters indicates no unwholesome constituent, but a carbonaceous and probably resinous contribution from the timbered lands of the watershed. The St. Croix River contains a similar vegetable product which, although in smaller proportion than in the Mississippi, is nevertheless sufficient to raise doubts concerning the quality of the water, unless the harmlessness of its nature be demonstrated. The Minnesota River contains considerably less vegetable matter than the St. Croix, although more than is commonly found in Eastern rivers having a naturally clean water-shed. Evidently the Minnesota drains a country that is comparatively barren of the vegetation which so strongly charges the waters of the Mississippi and St. Croix.

Running water is generally credited with the ability to purity itself, and, indeed, it is certain that much of the dissolved matter of sewage is readily destroyed by the agencies operating on it during its flow. Urea, for instance, is speedily decomposed into ammonia, which, with the ammoniacal products of putrefaction, is as speedily decomposed and ammonia products of putrefaction, is as speedily decomposed and ammonia products of putrefaction, is as speedily decomposed and ammonia products of putrefaction, is as speedily decomposed and ammonia products of putrefaction, is as speedily decomposed and ammonia products of putrefaction and products of putrefaction. with the ammoniacal products of putrefaction, is as speedily converted into nitric acid. But it seems probable that dilution has as much, if not more, to do with the disappearance of the sewage of Minneapolis and St. Paul in the Mississippi River than the chemico-vital processes. The nitric acid in fifteen samples of river-water, collected at various points above the inflow of sewage at Minneapolis, averaged .0113 per 100,000 of the water; in eight samples collected below Minneapolis, and at and immediately below St. Paul, the average quantity was .020; in nine samples from Red Wing and Winona, the average was .0110. Nitric acid is a stable compound and does not disappear from its solution as do ammonia and organic nitrogen. The reduction in its quantity at Red Wing and Winona to the average contained in the waters above Minneapolis, notwithstanding the polluted inflow at that city and St. Paul, must therefore be attributed wholly to the immensity of the dilution. the immensity of the dilution.

The same thing is shown by the chlorine estimations. Sixteen samples taken from above the inflow of the Minneapolis sewers gave an average of .168 per 100,000 of the water; nine samples from Minneapolis and St. Paul water; nine samples from Minneapolis and St. Paul yielded an average of .425, and ten samples from the river at Red Wing and Winona gave .246. The decrease by dilution is at first sight less in this case than in that of the nitrates; but when it is remembered that the Minnesota River contributes to the Mississippi, between Minneapolis and St. Paul, a large quantity of chlorine without a relatively corresponding quantity of nitrates, the persistence

ANALYTICAL RECORD OF CERTAIN WATERS

Examined in the Laboratory of the State Board of Health of Minnesota during November and December, 1886. (Results are expressed in parts per 100,000 of the water.)

of a larger proportionate amount of the former at Winona

may be easily understood.

This dilution is also indicated by the decrease in the I his dilution is also indicated by the decrease in the quantity of the carbonaceous vegetable matter as the stream is followed down from Aitkin. The amount of oxygen required for the destruction of organic matter is decidedly less at Winona and Red Wing than at the upper settlements, notwithstanding the output of oxidizable substances by the two large intervening cities.

Three specimens of ice from the river at St. Paul were found unfit for use, two of them being, in fact, solidified

sewage, showing but few signs of having undergone the certain amount of purification which usually results from a gradual congealation. The specimen of Lake Como ice was decidedly inferior to that from Lake Phalen, although the latter appeared to have met with some accidental contamination, as it was less pure than the waters of the lake. Ice from Cedar Lake was less satisfactory in its character than that cut from the Mississippi at Minneapolis. The host specimen of river-ice examined was taken from near than that cut from the stage of the Red Wing Water-Works. The chemical characters of ice are related to those of the water from

Digitized by GOGI

which it is formed. The worst specimen of a series of Syracuse ice samples recently examined by Dr. Willis J. Tucker yielded only .005 of free ammonia, and .001 of albuminoid ammonia in 100,000 parts of the water, and required only .04 of oxygen for the destruction of its organic matter. But the Red Wing sample may be accepted as a fair specimen of Mississippi River ice, the slow evolution of its albuminoid ammonia being held in remembrance.

The well-water from Aitkin does not give good results; it contains an excess of chlorine, and the free ammonia and nitrates indicate the proximity of the well to the source whence the chlorine was derived.

ANNUAL REPORT OF THE POUGHKEEPSIE WATER COMMISSIONERS.

WE give below an abstract of the nineteenth annual report of the Poughkeepsie Water Commissioners to the Common Council for the year ending December 31, 1887:

"The consumption for the whole year was somewhat in excess of last year, though the increase was in a less ratio than the increase of services. The volume pumped is, however, far too great for the need of the city, taking as a basis of estimate the quantity used by the metered services, which now comprises nearly one-third of all the services in use.

"In the early part of the year an amendment to the rates was adopted, requiring all new services to be metered. Accordingly all the services added this year are metered services. This change has seemed to meet with general approval, and more services have been added than in the year previous.

"In the report of last year reference was made to the desirability of placing meters upon the services of all the city buildings, in order to locate and check the waste therein, and it is hoped that your honorable body will give its early attention to this matter. In view of the fact that more than 640,000,000 gallons of water have been pumped during the year, and that nearly one-third of the consumers—those under the meter system—have used less than 69,000,000 gallons, this board is of the opinion that it would be a wise expenditure to apply a portion of the surplus of the receipts to the purchase of meters, to be placed on the old services, in order that as soon as possible the entire city may be brought under that system and all classes of consumers placed on the same basis.

"The meter rates have been reduced from time to time during the past eight years, and it is the purpose to continue such reduction as rapidly as the increasing revenue will permit.

"The sewer system has been in good working condition. At the request of the Board of Health, the outlet of the Fallkill main sewers has been trapped to prevent the escape of the odor into the atmosphere.

SUPERINTENDENT'S REPORT.

"Referring to the filter-beds, the Superintendent says:
"During the months of August, September, October, and part of November there was an unprecedented development of low plant life of the order of filamentous algæ, family oscilla toriaceæ. This development would begin in minute patches on the surface of the sand as soon as the beds were cleaned, and in a few days would cover the surface like a blanket, and a few days later no water would pass through the beds unless this blanket was removed. It was necessary to clean the beds twice in each of the months mentioned, and during the year they have been cleaned sixteen times."

"The cost of removing ice, cleaning beds, and washing sand during the year has been \$795.42; gallons of water filtered, 644.858,352; cost of filtration per million gallons. \$1.23.

"One hundred and eight new meters were bought during the year at a cost of \$1,608.75, and \$101.90 was paid for repairs.

"The volume of water pumped during the year was 644.858,352 gallons.

"It is a singular fact that while the total volume is about ten millions in excess of that in 1886, and while the winter was of unusual severity, the volume pumped in the three coldest months January, February, and March, was about ten millions less than in the corresponding months of 1886. Also that the excess of consumption this year has occurred in months, July. August, September, and November, in which, by reason of abundant rainfall and absence of frost, the least consumption was to be expected.

pected.
"The volume that passed through the 530 metered services was 68,800,000 gallons, and of this quantity 33,290,000 passed through 40 meters. Applying this ratio to the

whole number of services would give less than 230 million gallons for the annual necessary consumption. This volume constituted the paying volume from which revenue is derived. The whole volume pumped cost per 1,000 gallons about three cents.

"The water delivered to the city throughout the year has been of excellent quality, except for a period of ten days in April and about two weeks in December, when a clayey sediment was present, producing a discoloration that sand filtration alone will not remove.

"Notwitstanding the unusual development of algæ at the filter-beds referred to, there has been no unpleasant odor or taste in filtered water. There has been but slight indication of the presence of sea-water.

indication of the presence of sea-water.

"The water-pipe system comprises 18 miles of cast-iron pipe, from 4 to 24 inches diameter. The cost of maintaining the water-works for the year was \$18,011.44, and for the sewers, \$2,289.80. Cost of pumping 644,858.352 gallons 280 feet high, \$10,287.32; cost of pumping 1,000,000 gallons one foot high, 5.7 cents, and for filtration per 1,000,000 gallons, 0.44 cent. Cost of water per million gallons at tap, \$27.90."

PRESSURE DOES NOT ASSIST HOT WATER CIRCULATION.

NEW YORK, December 10, 1887.

SIR: In looking over a catalogue of hot-water heating apparatus I find that the maker of the apparatus considers that pressure will increase the circulation of the water within the pipes. He seems to class apparatus under two heads—namely, gravity hot-water apparatus, or ones that are open to atmosphere, and pressure apparatus, or ones that are closed similar to a car-heating apparatus. Will you kindly explain through the columns of your journal what the difference is, if any, and help a novice out?

Yours truly, B.

[It is wrong to suppose that any pressure in excess of the water column in the apparatus will increase the velocity of flow of water through the pipes, all other things being the same. There seems to be an idea that a car-heating apparatus has a closed tank for this purpose, but this is erroneous. The use of a closed tank is twofold in a car: It prevents loss by evaporation or slopping, and it permits of getting a greater pressure in the pipes, and consequently allows of warming the water above 212°, which cannot be done with an open apparatus without making steam. Below 212°, however, the apparatus, whether open or closed, will give the same result in velocity of flow. Above 212° there may be a greater velocity of flow, due to a greater difference of temperature and consequent density of the water in the up and down legs of the apparatus. If the maker of the apparatus explained that by closing an apparatus he could get a greater temperature (with its attendant and unavoidable greater pressure) and thereby increase the velocity of flow by a greater difference in temperature between the up pipes and the down pipes, then he would not have misled you and many others.

A great many in the trade, however, really think a closed apparatus circulates better than an open one. Under similar temperatures, however, there is no difference, and to increase the temperatures above 212° Fah., it matters nothing whether you do so by lifting your tank high up or by compressing air above the water in a low tank. In cars the former is not practicable, however, and if it was there would be no bursting of hot-water apparatus in railroad cars.]

"A CONSTANT READER," Grand Rapids, is informed that anonymous communications are not answered. A name is always required, though not necessarily for publication.

ON MAKING LEAD BENDS.

On making lead bends in plumbers' shops, a practical plumber from Boston writes us that the description of "L. D. H." in our issue of January 28, and his views regarding the making of lead bends, "covers the case entirely, being the way that plumbers generally make their bends in Boston."

STOP-COCK ON CIRCULATION-PIPE RESULT-ING IN AN EXPLODED BOILER.

LONDON, December 30, 1887.

SIR: In the articles on "Hot-Water Circulation" mention was made, page 491, Vol. XVI., of THE ENGINEERING AND BUILDING RECORD, of the improper practice of fixing stop-cocks in circulation-pipes. This evil has just been emphasized at a gentleman's country mansion. A new kitchen range had been fixed, the hotwater circulation-pipes had all been attached to the boiler,

and the work tested. A defect was found rendering it necessary to partly empty the boiler. Stop-cocks had been fixed in the circulating-pipes, and these were shut off during the time the repairs were being made, after which the fire was relighted, but the men forgot to open the stop-cocks. As the boiler was only partly filled with water, space was left for steam to generate. A short time after the fire had been lighted the boiler burst with great violence. The boiler was driven through a brick wall, and a portion of one of the plates buried four inches deep in another wall. A trussed iron roof, 23x20 feet, was lifted, and on falling back on the walls was found to have twisted six inches from its original position.

Seven men were seriously injured. One of them lies in the hospital, and his recovery is doubtful.

Culpable negligence was the cause of all this trouble, but the fact remains that it is a highly dangerous practice, which cannot be too strongly condemned, to fix stopcocks in circulating-pipes. If they are fixed, a safety-valve should be attached to the boiler; but it is best to avoid their use and so save the risk of an explosion.

Yours truly,

THE AUTHOR OF "ENGLISH PLUMBING PRACTICE."

ON MAKING LEAD BENDS IN PLUMBERS' SHOPS.

BOSTON, February 6, 1888.

SIR: Having noticed the article on making lead bends by Mr. Nicholson, of Milwaukee, in your issue of January 7, and the criticism of the method by L. D. H., of New York, I would say, that from experience in making bends of various sizes, both from lead and brass pipe, I believe that the blocks as shown by Mr. Nicholson have very decided advantages over the method used by L. D. H., inasmuch as they keep the pipe firmer, and give the workmen greater control over the pipe while in the act of forming a bend. We have used the blocks in our shop for years, and have them attached to our portable benches that we take on our jobs. As we use a great deal of brass pipe for supplies to water-closets and waste to bowls, and seldom anything but brass pipe for hot water, we find them of great utility in forming bends, curves, and offsets. Mr. Nicholson has done a service to a great many plumbers who have not had experience in making bends, by the very plain diagrams and descriptions. The giving of employment to workmen in winter by making bends of various degrees and sizes may do for some parts of the country, but I do not believe it would be profitable in this part, as nearly every individual fixture requires different treatment as regards bends, curves, and offsets.

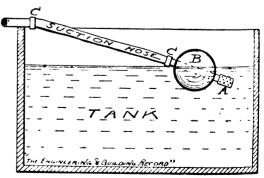

Respectfully yours, ISAAC RILEY.

PUMPING WATER FROM WATER-LINE IN CISTERN.

SIR: I have a contract to do some plumbing in which the specification requires that the suction-pipe of the pump should take the water from the cistern at or near the water-line wherever that water-line may be. It has been our custom to have the suction-pipe extend to near the bottom of the cistern. Can you suggest how this specification may be carried out?

C.

[We understand that in the vicinity of Boston water is taken from cisterns in this way. A suction-hose is arranged

with a suitably sized float, properly weighted, and attached to its immersed end. The hose is wired inside to prevent collapsing or kinking and of sufficient length to take advantage of its flexibility. One end is clamped or wired to the pipe, the other end to the float. The preferable method would be to pass the tube through the float, extending the end as indicated in sketch, so as to dip as much below water-line as desired. This end should have a brass strainer on it as shown.]

CAR-HEATING IN GREAT BRITAIN AND IRE-LAND.

A CORRESPONDENT of the New York Sun thus describes his experience:

his experience:

"The solemnity with which an ancient institution is accepted in Great Britain is astounding to the average New Yorker. Not long since I traveled from Cork to Dublin with four rare old Irish gentlemen. They did not know one another, but their affability was none the less cordial and sincere. The weather was bitterly cold. The railroad company had 'warmed' the section after the only plan known throughout the United Kingdom—viz., by filling a small can with lukewarm water at the beginning of the route, placing the can on the floor of the car, and washthe route, placing the can on the floor of the car, and washing its hands of the whole affair thereafter. By the time the car got to Cork the can was about as warm as the heart of a Manitoba blizzard. It lay in chilly isolation in the middle of the compartment floor until the Irish gentlemen straggled in spasmodically. They bowed to me and to each other after disposing of their parcels, and seated themselves comfortably. They all had hat-boxes, shawls. rugs, umbrellas, canes, and valises. No man thinks of taking a three hours' journey here without encumbering himself with more luggage than an American would carry on a week's trip. The oldest man of the quartet pushed the can affectionately into place in the middle of the floor, and, setting two large and substantial Hibernian feet upon it, smiled pleasantly on the others and said: the car got to Cork the can was about as warm as the heart

it, smiled pleasantly on the others and said:

"'There's room fur all, gintlemin.'

"They moved up and placed their feet side by side upon the chilly surface of the can until it was completely hid

from view.
"'It's a grand invintion, this,' muttered one of the of the quartet complacently. Then turning to me he said politely, 'Shall we make room for you, sir?'
"'Thanks, no; I'm not cold.'
"My teeth chattered so that I could hardly speak, but I

saw that the other passengers shivered too, much to my satisfaction.

satisfaction.

"'It's apt t' give wan chilblains, this intinse hate,'
remarked the oldest man sedately. He leaned over and
touched his finger to the can to see just how intense the
heat was. The finger nearly froze fast, but the old Irish
gentleman didn't turn a hair. He beamed paternally upon

gentleman didn't turn a hair. He beamed paternally upon the others,
"'Isit dangerously warrum?' asked his neighbor softly, leaning over, too. 'No,' he added, answering himself, 'it's phat I call extramely coomfurtable.'
"The others felt of it in turn, and then they all leaned back as imposing a group of beautiful liars as it has ever been my good fortune to see. Every man tried to bluff his neighbor into the belief that his feet were warm, and the curious point is that not only did they succeed in conthe curious point is that not only did they succeed in convincing each other, but in the course of an hour I grew so blindly envious of their apparently blissful condition that I moved up and begged for a corner for my own frozen extremities. After that I felt warmer in spite of myself.

"Travel in England at this season of the year is

far more barbarous than in the remote precincts of America. There is no heat, the trains wait four minutes at the small and seven minutes at the larger stations, and the only food is that found at the old-time Iuncheon counters along the route. I listened to a young Bestonian not long since while traveling from London to Liverpool. He was explaining the system of American Liverpool. He was explaining the system of American railroads to a square-jawed member of Parliament who was traveling in the same carriage. The Boston man had explained the great vestibule trains that run between Chicago and New York in glowing terms, commenting upon the 'dining-room cars, bath cars, smoking-cars, observation cars, and all lighted by electricity, and heated by steam,' with frenzied enthusiasm.

""Well I hope' said the M. P. when the American

by steam, with frenzied enthus asm.
""Well, I hope,' said the M. P., when the American had finished, 'that such amazing innovations will neval gain foothold heah.
""Why not? You are shaking like a leaf in a gale now.
Hadn't you rather travel in comfort?"
""No cir"

· · · Why?

"Because no man who travels in that manner can truly appreciate his home when he—ah—gets there."

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

HOW TO RAISE SEWAGE.

MADISON, WIS., February 2, 1888.

SIR: I wish to know the means usually employed in a system of sewerage to raise the same a few feet—from one to three—in order to get sufficient fall. If you have described any method in your journal during the last few years, will you kindly refer me to the same, or if there are any patented apparatus, will you give me the addresses of the manufacturers, and oblige,

Mc. C. Dodge.

[Presuming that it is the sewage, and not the system of sewerage which discharges it, that our correspondent wishes to raise from one to three feet, we would say that the means usually employed to that end are either direct pumping or the use of compressed air in an apparatus

called an "ejector," such as is used with the Shone System, which has been fully described in our columns. Where the lift is so small, perhaps a paddle wheel, working in an inclined trough, would be sufficient to throw it up and out. This, if water-power was available, could be conveniently driven by a water wheel on the same shaft. The address of the American representative of the Shone system is: The Shone Hydro-Pneumatic Sewerage and Water-Supply Company, 72 Commerce Building, Chicago, 1

TITLES OF PUBLICATIONS ON ABATTOIRS OR PACKING-HOUSES WANTED.

[We gave an answer to a similar question as above on page 742, issue November 26, 1887, Vol. XVI.]

INTERNATIONAL CONGRESS FOR THE IM-PROVEMENT OF INLAND NAVIGATION.

(From an Occasional Correspondent.)

WARSAW, January 20.

THE Third International Congress for the Improvement of Inland Navigation will be held at Frankfort-onthe-Main from the 20th to the 23d of August next, under the patronage of the Crown Prince of Germany. The Ministers of State, Von Boetticher, Maybach and Lucius, have each honored the congress by accepting the office of Honorary President.

The object of the Congress is to promote the interests of inland navigation by bringing together men of science, engineers, representatives of governments and of commerce-in short, all those interested in the matter-to read and discuss papers on various points of special interest to the general subject.

This question has latterly attained great importance in Europe. Steps are everywhere being taken to improve the navigation of rivers and to open artificial canals where natural water-courses are either wanting or insufficient. Thus Manchester is being connected with the sea by the great ship canal, on which work has just commenced; in Brussels and Paris designs for similar projects have been discussed for several years, and influential persons are doing their utmost to connect both those cities with the sea, so that ships can sail directly from all ports to these important capitals. St. Petersburg is enjoying the benefits of its ship canal, and the great ocean steamers can run up into the Neva without previous lighterage, and Bremen is deepening the estuary of the Weser to keep abreast of Hamburg, Rotterdam and Antwerp. great rivers of Germany-the Rhine, Elbe, Oder and Vistula—have been much improved by works of rectification. and latterly the German engineers have been following the example of their French colleagues, who have been the pioneers in this matter, and have begun to improve the navigation of the smaller rivers by "canalization" by means of movable dams. The river Main has thus been canalized, and the Rhine boats are able to run up to Frankfort with a draught of six and one-half feet. At Frankfort a port has been built with quays, warehouses, and granaries. These works on the Main were opened in October, 1886, and have already produced great results. Frankfort was, therefore, well chosen as the seat of the third congress.

These works and the new harbors of Mannheim and Mayence will be visited by the congress, as also the works on the Rhine. The labors of the congress will be confined chiefly to the four days set apart for the sessions. The following papers have already been selected for discussion: "The Improvement of the Navigation of Rivers by Rectification and by Canalization; "The Best Forms of Boats for Inland Navigation and the Best Means for Their Propulsion; "Inland Canals for Seagoing Vessels"; "Improvement of Estuaries and Deepening and Maintaining Channels in the Same"; "Improvements to be Made in Statistics of Inland Navigation"; "Advantages Derived by Agriculture from the Improvement of Rivers and Construction of Canals."

It is intended to have an exhibition of plans, drawings, and models in the building in which the congress will hold its session.

The Central Organizing Committee has been formed at Frankfort with the Mayor of that city, Dr. Miguel, Member of the Reichstag and of the Herrenhaus, as its

President, and active preparations have commenced. The congress will be visited by a large number of members from all countries.

It is sincerely to be hoped that American engineers will not be backward in showing their colleagues on this side of the water what they have accomplished in this direction. Much has been done by them, and on a scale that will interest and surprise their European brethren.

TESTS OF ELECTRICAL WELDING.

WE referred to Professor Dolbear the inquiry contained in our issue of January 21, and give below his reply.

COLLEGE HILL, MASS., February 5, 1888.

SIR: I have had made nearly a hundred tests of the tensile strength of electrically-welded bars of iron, steel, and other metals. The results were of such a character that I can state positively that with Thomson's welding process it is possible to weld both wrought iron and steel so that the weld is as strong as the same cross-section in another part of the bar; that the appearance of the fracture is fibrous for iron and generally granular for steel. the strength of this granular steel being on some samples as high as 125,000 pounds per square inch; that the process is such that the welding is homogeneous from necessity. I had a number of bars welded by an expert blacksmith, and a number of similar ones by the electrical process for comparison, with the result that the electrically-welded bars were much stronger than those welded by the ordinary process. The bars were of various sizes, up to an inch and a half for iron and three-fourths of an inch octagon steel. A. E. DOLBEAR.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

AN EXPLOSIVE SAFETY-PLUG,

MESSRS. LAYMAN, DEMPSEY AND COPPINGER, of Bolivar, N. Y., have jointly and severally invented a safety-plug for boilers on the homœopathic principle of preventing a big explosion by utilizing a small one.

Their plug contains a charge of powder or other explosive, which when exposed to excessive heat, by reason of low water in the boiler or formation of scale, etc., bursts the plug and relieves the pressure.

BRAZING AND WELDING BY OXYGEN GAS. WARRINGTON, January 7, 1888.

SIR: The cheapening of oxygen by Brin's process of manufacture has put into the hands of metal-workers a new power. I have recently made a few experiments with the compressed oxygen and coal gas, and found that with a 1/2-inch gas-supply a joint could be brazed in a 2-inch wrought iron pipe in about one minute, the heat being very short, the redness not extending over one inch on each side of the joint.

The appearance of the surface after brazing led me to experiment further with welding, a process which is not possible with ordinary coal-gas and air, owing to the formation of magnetic oxide on the surfaces. Contrary to my expectation, a good weld was obtained on an iron wire one-eighth of an inch diameter with a very small blowpipe, having an air-jet about one thirty-second of an inch diameter. This matter requires to be taken up and tried on a large scale, for such work as welding boiler-plates, which, it appears to be, can be done perfectly with far less trouble than would be required to braze an ordinary joint. The great advantage of this would be that the boilers would require no handling, but could be welded with an ordinary large blow-pipe in position, and with about onetenth the labor at present necessary.

The cost of the oxygen is trifling, and it is evident, from the results obtained in brazing, that the consumption of gas would be considerably less than one-fourth that necessary with an air-blast, irrespective of the fact that welding is possible with an oxygen blast, whereas it is not possible if air is used.

The surface of iron, heated to welding heat, by this means comes out singularly clean and tree from scale, and

Digitized by GOGIC

a small bottle of compressed oxygen, with a blow-pipe and a moderate gas-supply, would make the repairs of machinery, boilers, brewing-coppers, and other unwieldy apparatus a very simple matter. The trouble and difficulty of making good boiler-crowns, which so frequently "come down," would be very small indeed when the workman has an unlimited source of heat at command under perfect and instant control.

THOMAS FLETCHER.

Those of our readers who may wish to try this process can doubtless readily obtain all the oxygen they may need from those who manufacture it for calcium lights. The following is from the London *Engineering*, to which it appears Mr. Fletcher had addressed a similar letter:

LEEDS FORGE, LEEDS, January 24, 1888.

"SIR: With reference to Mr. Fletcher's letter published in your current issue, it may interest him and your readers to know that for years past we have, in the manufacture of Fox's patent corrugated boiler furnaces, been welding Siemens mild steel plates from ¼ inch to ¾ inch in thickness with ordinary gas and air, using a form of blow-pipe jet. The aggregate of our welding during the past year would be represented by some 20,000 lineal feet, the tubes being from two feet to five feet in diameter, to work at pressures as high as 200 pounds per square inch.

"The amount of oxide formed is dependent upon the relative amounts of gas and air employed, an oxidizing flame producing more and a reducing flame less. The surfaces of our tubes are perfectly clean of scale, showing absence of oxide.

"W. L. WILDY, Engineer,"

THE POTOMAC RIVER DAM FOR THE WASH-INGTON WATER-WORKS.*

THE water-supply of Washington, D. C., is taken from the Potomac River at a point about fifteen miles above the city. An island in the Potomac divides it into the Maryland and Virginia channels at the point where the upper end of the conduit is received, and the water was supplied from the Maryland side, which was dammed for the purpose. The extension of the masonry dam across the island and the Virginia shore and the raising the original portion to the same height by adding a 15-inch coping is the subject of this paper. The dam as finished is 2877 feet long and from 4 to 20 feet in height.

The lower side of the dam was rock-faced coursed work, the centre and lower part of up-stream wall was concrete, and the upper part of wall coursed ashlar. The river bottom was rock, with vertical ledges of blue gneiss of varying hardness. There was usually a long period of low water in summer, but sudden floods were at all time possible. The current at site was pretty strong, and carried large quantities of heavy drift wood. A rip-rap dam was built above the site of the masonry structures which it was intended to protect from floods.

A box coffer-dam was placed just below the rip-rap and the masonry built inside; when it was finished, the rip-rap was filled in next the masonry and furn shed the permanent backing. A track was laid on top of rip-rap dam and the larger stones brought on it to the end and dumped; smaller stone was floated down in scows.

The pumping was done by three 8-inch centrifugal pumps, estimated to discharge 10,000 gallons per minute, driven by portable agricultural engines, which proved very efficient and convenient, as in time of sudden floods they could be quickly run off to a place of safety.

When the ends of the dam were completed, leaving only a gap 150 feet long in the channel, cribs were built, 8x20x9 feet high, made of poles notched and bolted together and filled with stone. I hese were sunk above the line of the dam, stringers and a planking of 1-inch boards put on the up stream side, and bruch, sedge, grass, etc., filled in, making a barrier which deflected the water over the finished portion of the structure and reduced the depth at the gap to about one foot. Then short sections were enclosed with little dams of sand bags and clay, the water thrown out and the foundations laid.

The so-called Cumberland cements, "Round Top" and "Shepardstown," were chiefly used, except in the channel section, where "New York" and "Rosendale" were used.

NEW DRY DOCKS AT MARSEILLES.

ACCORDING to the *Genie Civil* the equipment of the port of Marseilles is just completed by the finishing of two improved dry docks of most recent and approved construction, which, added to the four previously in use and the old floating dock, afford ample accommodation for all requirements of vessels.

One of the old docks has a length of 180m. and 7m. depth of water on keel blocks; another measures 110m. two others 90m. each, and the two new ones are not less than 130m., with 6m. depth of water on keel blocks. Special machinery has been provided for the service of these new docks. Three engines and three pumps, capable of emptying one of the docks in an hour and a half, form part of the plant. The docks were constructed upon the plans and under the superintendence of M. Guérard, Chief Engineer of Ponts and Chaussées, and the plant was furnished by the Mediterranean Forge and Shop Company.

A BRIDGE SUPPOSED TO DESTROYED BY FROST.

A SHORT time ago a suspension bridge which spanned the River Oise at Merv fell bodily into the river during the night. Fortunately, nobody was on it at the time. The bridge was built in 1827, destroyed by the French in 1870 before the advancing Germans, and reconstructed in 1872. The London Ingineer says that the cause of the accident is supposed to have been the contraction of the iron by the sudden severe frost.

THE PROPOSED SUPPLY OF WATER BY METER IN THE CITY OF LONDON.

By the report of a recent meeting of the Court of Common Council of the city of London, given in the Journal of Gas Lighting, it appears that three years ago the corporation had introduced a bill in Parliament providing among other things for the supply of water in London by meter. It was defeated by only a small majority and it is proposed to reintroduce it an early day. The opinion was expressed that the citizens should be supplied with water by meter and that the water companies should be compelled to thus supply it.

A NEW OIL-PIPE LINE.

The Standard Oil Company proposes to build an immense pipe line from Lima, O., to Chicago to transport oil for fuel purposes. The right of way is being secured, and preparations made for construction. This is the beginning of the proposed 1,000 miles pipe line between New York and Chicago. There has been in use for some years a pipe line from the cil fields of Western Pennsylvania to New York, which will form the eastern connection.

THE WORLD'S ELECTRIC INDUSTRY.

UNDER this title the London *Electrician* gives some very suggestive figures. It says that in the United Kingdom there are 229,000 miles, or thereabouts, of public telegraph wires employing 23,868 persons, and on the world's telegraph lines, approximately amounting to 1,800,000 miles not including submarine cables, a total number of 179,708 persons find their occupation exclusively in telegraphic signalling operations. This, of course, does not include railway and post-office officials whose telegraphic duties occupy but a part of their time and by whose addition the aggregate would be greatly increased.

Taking the same basis of exclusive occupation, there are about 6,000 persons, almost all British, engaged on submarine cables and some 30,000 on telephones, a total of 216,000 operators.

The electric-lighting industry employs about 100,000 persons, of whom about 5,000 are in Great Britain, and adding to this some 5,000 persons employed in the manufacture of electric cables and insulated wires, gives with the 216,000 operators a grand total of 320,000 people. About 100,000 more are engaged in Great Britain in industries which but for the practical utilization of electricity would have no existence. Reckoning three to a family, these industries provide support for 300,000 people, and multiplying this by the proportion which the electrical industries of that country bear to the rest of the world, it is concluded that at least 5,000,000 people would have to look to other means of subsistence if electricity and its commercial applications had not been made known to men.

FOG AND GAS.

A RECENT foggy day in Marchester, England, caused a consumption of 19,974,000 cubic feet of gas in that city, against 14,378,000 cubic feet consumed on the same day of the previous year, the latter being about a fair average for the season.

LIGHTING AND HEATING RAILWAY CARS IN EUROPE.

THE Chronique Industriel'e reports that at a recent conference in Milan questions relative to this subject were discussed. It was stated that flat-wicked lamps burning vegetable oil gave some satisfaction, those burning mineral oil are preferred, and gas is entirely satisfactory but found inconvenient to supply. Results of experiments with electricity forbid its use until lamps and generators are much further perfected.

"Warming is considered a more delicate question on account of the diversified tastes of the traveler." Portable foot-warmers are much used, the Radelet footwarmer, whose heat is supplied by metal bars of high temperature, and the acetate-of-soda foot-warmer satisfactorily retaining their efficiency. Many trials have been made with fixed and semi-fixed foot-warmers. The methods of heating by hot water, or steam furnished by the locomotive, or a special boiler carried on the train, are also employed, but present considerable difficulty in arrangement, connections, etc. Both warming and lighting were eventually pronounced open questions.

WESTERN PENNSYLVANIA ASSOCIATION OF ARCHITECTS

At the last annual meeting of the Western Pennsylvania Association of Architects, held in Pittsburg last month, the following officers were elected: President, Andrew Peebles; Vice-President, George S. Orth; Secretary, L. O. Danse, C. E.; Treasurer, Joseph Anglen; Directors, Thomas M. Boyd, C. E., Joseph Stillburg, I. V. Evans.

MINNEAPOLIS SOCIETY OF CIVIL ENGINEERS.

THE Minneapolis Society of Civil Engineers has just elected the following officers: President, W. A. Pilce; First Vice-President, E. B. Abbott; Secretary, Walter S. Pardee; Assistant Secretary and Treasurer, B. O. Huntress; Librarian, W. W. Redfield; Member of the Board of Managers of the Association of Engineering Societies, Andrew Rinker; Standing Committee on Membership, Andrew Rinker, M. D. Rhame, R. A. Sanford; Committee on Entertainment, George W. Sturtevant, F. W. Chappelon; House Committee, W. W. Redfield, S. C. Deverly.

COMPRESSED AIR FOR POWER PURPOSES.

THE works for the public supply of compressed air to the town of Birmingham, England, have been pushed forward vigorously during the year 1887. The present contracts for engine power are for three triple expansion engines each of 1,000-horse power. The buildings for this installation and for a further 1,000-horse power are completed, and the engines are in course of erection. The steam-boilers on the "Lane" system are erected for six engines, as are also the gas producers by which the steam is generated. The mains for distributing the compressed air from the central station are being laid through the town, the largest size being twenty-four inches in diameter, which is now being laid, together with others of twenty inches and eighteen inches diameter. They are wrought iron, and are jointed by what is known as the "Kimberly" joint. They are laid in either concrete or brick trenches. By the time that the mains are laid the engines will be ready to deliver air to the large number of consumers on the company's list. The commencement of the public supply of compressed air motive power in Birmingham is expected to be about April, so that the works will be in full operation by the middle of the year. MM. Petit and Boudenoot have had engines of about 300 horse power at work for some time supplying compressed air to motors in the St. Avoye quarter in Paris. The results have been so satisfactory that the system is being rapidly extended, and during the past year Messrs Davey, Paxman & Co., of Colchester, have supplied an immense plant of engines, boilers-these latter of the marine type-and air-compressors to a French Company.

METHODIST BOOK CONCERN BUILD-

MR. E. H. KENDALL, of New York, has been selected as the architect of the new office building of the Methodist Book Concern. It is to be on south west corner Twentieth Street and Fifth Avenue; 100x175 feet and ten stories high

For works for which proposals are requested see also the "Proposal Column," pages v-vi-vii-175.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

NEW YORK CITY.—See our Proposal Column for important advertisement of proposals wanted for furnishing and delivering cast-iron pipe and special castings, laying the same, etc., by the Aqueduct Commission.

EUSTIS, KAN.—John Boyd, City Clerk, writes as follows: "Our city has voted waterworks bonds and are negotiating for the works, same to be completed as soon as possible."

CUBA, N. Y.—The President of the Common Council of this place writes us concerning the water-works question as follows: "The taxpayers are at present agitating the question of a thorough system of gravity water works which would afford ample fire protection for the village. A vote will probaby be taken soon. I judge the sentiment at present to be about equally divided for and against the project with the favorable side gaining ground by agitation."

COUNCIL BLUFFS, IA.—The Council Bluffs Water-Works Company has increased its capital stock from \$750,000 to \$1,000,000. Extensive improvements are contemplated in the near future.

SALT LAKE CITY, UTAH.—The Special Committee on Sewerage has presented its report to the Common Council and the matter is now in the hands of that body. The report recommends an improved form of the pipe system, and estimates the cost at from \$112,500 to \$185,500. Early developments may be expected.

WILLIMANTIC, CONN.—George W. Melony, of this town, under date of February 8, writes us as follows: "It may be of interest to readers of your Contracting Intelligence columns to learn that this borough voted last fall to construct 6,600 feet of main sewer early in the coming season, this section to be part brick and part vitrified tile and to cost nearly \$25,000. A special committee, of which I am a member, has been appointed to make contracts, etc., and we are now looking for a construction engineer to prepare detail plans immediately and supervise the work."

Washington, Mo.—The taxpayers of this place have presented a petition to the trustees asking for a special election to submit the question to voters as to whether water-works shall be established. Messrs. Jones, Hagebusch and Beinke were appointed a special committee to make necessary arrangements for such election.

LOUISVILLE, KY.—The Louisville Water Co. advertises for proposals for building en-

gine-house, furnishing pumping-engine, and building river and inlet work. See our Proposal Column.

ALLEGHENY, PA.—At a meeting of the Water Committee, held February 6, the question of submitting to councils a printed report relative to securing a better supply of water was presented.

The report includes three plans of obtaining water from Nine-Mile Island, which are described as follows: "The first plan embodies a system by which the water is pumped into a steel delivery main at such a pressure as to distribute it at the highest points in Allegheny City at an estimated cost of \$1,500,000. The second plan is essentially the same, with less powerful engines and without a rising main, by which the water is sent to Allegheny City and then elevated by the present water-works engines, and will cost \$1,261,408.90. The third plan includes the first plan, with the addition of reservoirs or settling-basins, and would cost \$2.581,936."

MAYNARD, MASS.—The water-works question is being agitated.

WOLFBORO, N. H.—This place has voted in favor of water-works

CHEYENNE, W. T.—The question of improving the water-works system here is being discussed by the city officials and it is probable that steps toward that end will soon be taken. A system of storage reservoirs is regarded as the most teasible and the estimated outlay for the proposed improvements is \$20,000. Donald Miller, the City Clerk, can give details.

GORDONSVILLE, VA.—Reports state that a system of water-works will soon be established here.

LAKE, ILL.—On January 31 the Board of Trustees adopted the plans and specifications submitted by Mr. Horn, the Town Engineer, for a sewage pumping station upon the Shone hydro-pneumatic system. The pneumatic ejectors will be placed underneath the surface of the street at the intersection of Sixty ninth and Halsted Streets. They are to be capable of lifting twelve hundred gallons of sewage per minute against a head of thirty feet. The air-compressors will be placed about 700 feet from the ejectors.

MYERSDALE, PA.—Concerning water-works matters here our correspondent writes us, under date of February 7, as follows: "A company has been formed, named Myersdale Sand Spring Co., and a charter obtained. Last night the Council granted right of way to lay pipes, etc., in the town and the Executive Committee is pushing the matter as fast as possible, but the work will not begin before spring and is not under contract yet."

WINNEPEG, MAN.—Concerning the report that the sewerage system here was to be extended our correspondent writes as follows: "Plans and estimates have been submitted covering about three miles of extensions at an estimated cost of \$38,000, but have not yet been decided upon."

LYNN, Mass.—Concerning the report that the water-works here were to be extended our correspondent writes as follows: "No steps have been taken as yet to extend these works beyond a petition to the Legislature for liberty to increase the bonded debt. Probably the pumping capacity and more storage will have to be provided in the near future."

Toledo, O.—The Superintendent of the Water-Works has been ordered to advertise for bids for a new pumping engine of 10,000,000 gallons capacity, and for the sale of the two old Worthington engines of the capacity of 5,000,000 gallons each. Also to advertise for bids for laying a submarine line, 16-inch main, across the river. See the Proposal Column.

BUFFALO, N. Y.—The Board of Water Commissioners has submitted a communication to the Common Council favoring improvements to the water-works plant, which will necessitate the addition of new storage and distributing reservoir, a 20,000,000 gallon pumping-engine, and two lines of mains, one 36 inches and the other 42 inches. The Common Council will consider the matter at once.

STERLING, Col.—A water works system to cost \$40,000 is to be established here this spring. The water will be furnished by some springs lying six miles north of Sterling, the head of the water-supply being 125 feet above the town, which alone gives a good water pressure.

MILTON, MASS.—It is reported that there are two schemes on foot here for furnishing a water-supply. The Water Committee can give details.

PHILADELPHIA, PA.—The Water Committee has ordered that plans and specifications for the fitting up of filters be drawn by one of those tendering for the supply of the same. The plans will be for a plant with a purifying capacity of one million gallons per day, including all the water used in the building.

MEMPHIS, TENN.—The Artesian Water Company, which began operations here six months ago, with a capital stock of \$100,000, has purchased the plant of the old water company, which supplied the city from Wolf Creek, for the sum of \$55,000. The new company will issue \$750,000 in stock and \$500,000 in bonds. Seven hundred thousand dollars will be expended in improvements at once. There are now 35 miles of pipe, and 15 miles are to be added. A stand-pipe 225 feet high will be built, and two pumps of a capacity of 10,000,000 gallons a day erected. The water will be drawn from 20 wells, which will be linked together. The average depth will be 500 feet, and the flow adequate for a city of twice this size.

NEBRASKA, CITY, NEB., has just accepted completed plans of grade and sewer-system and proposes to go ahead with the construction at once. Messrs. Rosewater & Christie, Omaha, Neb. who designed the plans, will have charge of the construction.

OTTAWA, KAN.—Messrs. Rosewater & Christie, of Omaha, Neb., have just completed plans and specifications of a system of sewerage for this city. The plans have been accepted and arrangements are being made to proceed with construction of a part of the system early in the spring.

MILTON, MASS.—Concerning the proposed water-works project here the Chairman of the Water-Works Committee writes us as follows: "The Milton Committee on Water-Supply have reported to the town that on account of the great cost and small income that it would be inexpedient for the town to build a system of water-works at the present time. The estimated cost of the proposed works was \$275,000. Operating expenses. \$5,000. The fixed charges and operating expenses amounted to \$21,000, and the income from hydrants and water takers to but \$12,000, and on account of the prospective large annual deficit we made the report I stated."

LAKE, ILL.—The trustees of this place will readvertise for bids for the proposed watermain. It has been declared by the Town Attorney that the bonds lurnished by the lowest bidder on the previous award were excessive, hence the new move.

BELLVILLE, ILL.—The City Water Company has purchased thirty acres of land near their present reservoir, in which, with the opening of spring, they will construct a new reservoir twenty feet in depth, and having five times the capacity of their prsent large reservoir, so as to provide for an ample supply of water at all times.

SUNDANCE, Wv.—It is reported that waterworks will be established here.

FRENCHTOWN, N. J.—The water-works system of this place is to be improved. Address S. D. Hagerman, Town Clerk.

IRON MOUNTAIN, MICH.—City Clerk F. Crocker, it is said, can give details of a proposed water-works system for this place.

WICHITA, KAN.—Plans and specifications for a system of sewerage for this city have been adopted and work will be begun in the spring. The plans were prepared by Messrs. Rosewater & Christie, of Omaha. The estimates show that the system will embrace 85 miles of sewers to cost \$365,000.

CHAUTAUQUA, N. Y.—The water-works at this place are to undergo improvements.

OWATONNA, MINN.—City Clerk E. M. Trice can furnish details of proposed waterworks system.

BRIDGES.

BAY CITY, MICH.—There is to be considerable bridge building here.

WHEELING, W. VA.—The election by the voters of Wheeling and Ohio Counties on the question of voting the sum of \$300,000 toward building a Union bridge across the OhioRiver at this point resulted in favor of the measure, and work on the new enterprise will begin at once. The City Engineer of this place will furnish details.

PORTLAND, ME.—At a recent meeting of the Maine Central Railroad directors it was voted to replace some eight of the short wooden bridges between Portland and Vanceboro with iron structures. The cost will be about \$50,000. The directors have also decided to construct 400 flat and box cars at the Waterville shops next summer, the cost of which is estimated at \$400,000.

SMITH'S FAILS, CAN.—Reports say that a large bridge is to be erected here.

BRIGHTON, N. Y.—It is reported that a large bridge is to be erected here.

BUFFALO, N. Y.—It is reported that the Erie Railroad will erect a \$100,000 bridge here. Chief Engineer Buchholtz, of the Erie, can give details.

ST. PAUL.—The Board of Public Works recommend an appropriation of \$10,000 for the construction of approaches to the Dale Street bridge.

MISCELLANEOUS.

NATIONAL, CAL.—It is proposed to petition the City Council to order a special election for the purpose of issuing city bonds to the amount of \$100,000. The money is needed for the purpose of making public improvements—a fire department, city hall, fire-plugs, etc., being contemplated.

CHATTANOGA, TENN.—The Committee on Commerce has reported favorably the joint resolution to appropriate \$75,000 for continuing the improvement of the Cumberland River above Nashville, with a view to securing a depth of four feet in the channel. Part of the money is authorized to be used in the purchase of sites for necessary lock and dams.

NEW CORPORATIONS.

THE Morden Brake Beam Company, of Chicago, Ill., capital stock, \$400,000, to deal in appliances relating to car brakes; incorporators, Franklin H. Watriss, George C. Wilson, and other

The Bowers Dredging Company, of Chicago, Ill., capital, \$200,000, to do a contracting business; incorporators, A. L. Amberg, L. W. Bates, and others.

THE Spring Valley Elevator Company, of Spring Valley, Ill.; capital, \$20,000; incorporators, I.ouis Ackerman and others.

THE Smith Feed Water-Heater and Purifier Company, capital stock, \$50,000; incorporators, C. E. Bleyer, T. A. Walsh, and others.

THE Chicago and South Side Rapid Transit Railroad Company, Chicago, Ill.; Will H. Clark, and others, incorporators.

THE San Diego and Elsinore Railway Company, San Diego, Cal.; capital stock, \$2,000,000; C. C. Stevenson, and others, incorporators.

THE Cedar Rapids Belt and Southwestern Railway Company, Cedar Rapids, lowa; capital stock, \$500,000; J. May, and others, incorporators.

THE Santa Ana, Fairview, and Pacific Railroad Company, Santa Ana, Cal.; capital stock, \$60,000; A. L. Clarke, and others, incorporators.

THE Electrical Manufacturing Company, Newark, N. J. Capital stock, \$5,000. Paul W. Roder and others, incorporators.

The San Francisco Steam Company, San Francisco, Cal. Capital stock, \$5,000,000. P. T. Dickenson, and others, incorporators.

SCRANTON, PA.-Address W. J. Lewis, of the Suburban Electric-Light Co., for details of some new electric-light work.

LAKE, ILL.-C. S. Armstrong has applied to the Trustees for a franchise for an incan-descent electric light and power plant for the purpose of supplying electric light and power to private residences.

BUFFALO, N. Y. — Our correspondent rites: "In your issue of last Saturday I see a denial from a city official of the report that the Thomson-Houston Electric-Light Company would spend \$40,000 for a plant and building here. I did not furnish you with the report, but if it was not true then, it is now. I am at a loss to understand why it should be denied by a city official. If that official would like a little information on the subject, just tell him that the company has purchased a lot on Court Street near Pearl, and has also started a building which will ultimately be carried up six or seven stories, but only two stories at present. The architect of the building is H. H. Little. I do not know what the plant and building have cost the company, but certainly not less than \$40,000, as it is in the central part of the city.

DAVENPORT, IOWA.—The People's Light Co. has been incorporated in this city, with James Thompson as President. The capital stock of the company is \$10,000. The company has applied to the City Council for a charter and right of way. It is proposed to make use of the Moline water power in the securing of electricity for purposes of illumination.

HEMPSTEAD, L I .- The Town Board of Commissioners of this place has given permission to the Hempstead Gas Light Company to extend its system of electric lighting one mile in all directions beyond the village limits.

RAVENNA, O.—An electric light plant to cost \$12,000 is to be established here.

PORT HURON, MICH.—Electricity is to take the place of gas as an illuminator here.

KENOSHA, WIS.—The city officials have decided to establish an electric light plant.

STOUGHTON, MASS.—This place is to be lighted with electricity.

CHICAGO, ILL.—A project to supply this city with unlimited quantities of natural gas for fuel and illuminating purposes is developed by a combination of capitalists, some of whom live in Chicago and others in Philadelphia, W. W. Gibbs, of Philadelphia, Pa., is at its head.

Spencer, Mass.—Electric lights are to be

BIDS OPENED.

FOND DU LAC, WIS .- The following bids for lighting the public streets were opened February I by the Committee on Public Light-

ing:
Fond du Lac Gas Light Co., two proposals, as follows: First-To furnish any number of as follows: refs:—10 turns any number of electric lights, at the rate of \$72 per year for 2,000 candle power, or \$50 a year for 1,200 candle power, at the option of the city. Location of lamps to be fixed by the city. Schedule of lighting same as now used. Contract to run five or ten years. Second—If gas and electricity are used in combination, to furnish the electricity at the rate of \$50 per year, and the gas lights at \$25 per year, the number and location of lamps to be fixed by the city. Schedule of lighting as at present. Contract to run five or ten years. If a liberal number of gas lamps are used, the price of gas to private consumers will be reduced.

L. O. Hill & Co., Fond Du Lac, proposed to furnish ten more arc lights than are now used by the city, at a cost of \$4,350, the contract to run two, three, or five years.

The first proposal would distribute in the city 83 lamps of 2,000 candle power, or 120 lainps of 1,200 candle power. The old contract called for 20 lights.

Under the second proposal the city could have 60 electric lights of 2,000 candle power and 120 gas lights for \$6,000.

No award has as yet been made

No award has as yet been made.

CEDAR FALLS, IOWA.—Synopsis of bids for constructing a system of water works under plans prepared by Loweth & Curtis, civil engineers, of St. Paul, Minn, opened anuary 31 by Council Committee on Water-

R. D. Wood & Co., Philadelphia, Pa., hyc. D. wood & Co., Philadelphia, Pa., hydrants, \$30.50, \$31.25, \$33.00; 8 inch valves, \$23.00; 6-inch valves, \$16.00; 4-inch valves; \$10.00

Gordon & Maxwell, Hamilton, Ohio, pump, 10x10¼x12, \$2,680; pump, 18x10¼x-18, \$3,060; boiler, \$1,010. Shickle, Harrison & Howard Iron Co., St.

Louis, Mo., pipe, \$30.40; special castings, 3 cents.

Detroit Pipe and Foundry Co., Detroit.

Mich., pipe, \$30.80; special castings, \$46.50.
Dennis Long & Co., Louisville, Ky., pipe, 4-inch, \$32.75; 6 and 8-inch, \$31.75; special castings, 3½ cents.
American Water & Gas Works Construc-

tion Co., Chicago, Ill., entire work, \$16,800.

THE OSBORNE SYSTEM OF STEAM HEATING is based upon scientific prin ciples carefully worked out and reduced to practice, having been in use for the last seven years; in short, it is an ideal system of steam-heating, adapted for use in all large buildings requiring steam heat. It is from 15 to 20 per cent. more efficient than the Gravity System, and from 30 to 40 per cent. more efficient than any of the Expansion or High-Pressure Systems using traps and open tanks.

THE GRANT MONUMENT COMPETI-TION.

THE Executive Committee of the Grant Monment Association issued a note some ten months ago inviting designers to send for a circular embodying the conditions and provisions under which the above competition would take place. Upon application it was stated that "the terms of the circular were not quite decided upon, the committee being desirous to issue a circular whose conditions should be of the best and most satisfactory character," that "expert advice was being taken as to the best method to be adopted,"

Under date January 26, 1888, this circular, which has been nearly a year in preparation, is issued, with the time for receiving designs extended from March 1 to November 1, 1888.

It would be supposed that the terms of a competition upon which this much thought-as measured by time-had been employed, upon which expert advice had been taken, with the excellent and successful precedent of the Indiana State monument competition—just decided and for a work of such importance, would be above reproach. Such, unfortunately, is not the case.

The competition is an open one, and as such is perfectly fair and right, the usual methods for preserving the incognito of the designers being adopted, but the provisions covering the methods by which the design is to be shown are to be criticised.

Section 6 of the circular says:

"All the drawings are to be made in lines with India ink and the drawing pen, or simply shaded in India ink."

While from section 8:

"To aid in illustrating any figure or bas-relief shown in a design, models of such, made with plain, untinted plaster of Paris, may accompany any design. These to be to a scale of one inch to one foot. Competitors may also, at their option, submit similar plaster models of the entire structure at a scale of one-quarter of an inch.

Here are three separate styles in which designs may be shown, and to one who is familiar with the great difference in appearance between an outline pen-and-ink drawing and a plaster model of the same design, it is apparent that this is a most mistaken and faulty provision.

The circular further states that five designs considered the best and most meritorious will be selected, and to these premiums will be paid, ranging from \$1,500 to the first to \$200 to the fifth, "whereupon the said designs shall become the absolute property of the association.' premiums are probably as liberal as could be expected, but the provision taking away the property right in all the premiated designs is quite indefensible. The committee wish to erect one monument, not five, and the premium for any design not adopted should be a bonus and not a price.

Again, the committee do not bind themselves to employ the author of the first prize design to carry out the work, but, as the design is their property, they are quite at liberty to amend it, to add to it, to combine it with the other four and turn the completed masterpiece over to some granite company to execute.

The last and the condition which merits the most severe criticism is Sec. 17:

"Each competitor shall state in the letter accompanying Proposals his design what further remuneration he would expect for

furnishing all details and superintending the work should his design be adopted and the committee choose to em

One can conceive the scramble that this will cause, the cutting of rates, the patriotic one-percent. offers, and the consequent suffering among contractors when the one-per-cent. man builds his one-per-cent, design.

. This committee have been somewhat criticised in the public press for some time, and this last . would seem to show that they deserve it. Let their object be not, How much can we get for the least money? but, How can we get the

IMPROVEMENT OF THE CANALS OF NEW YORK.

STATE SENATOR CANTOR has introduced a bill "To facilitate State commerce by increasing the lockage capacity of the Erie and Oswego canals, and to improve the Erie, Oswego, Black River, Champlain, and Cayuga and Seneca Canals," which provides for the appropriation of \$1,000,000 to be expended in doubling the length of at least fourteen locks on the Erie Canal and of two locks on the Oswego Canal; in deepening the Erie Canal by dredging one foot from the bottom, where it can be done without interfering with permanent structures, and by raising the banks one foot, which will increase the present standard depth from seven feet to nine; in deepening or bottoming out the other canals men-tioned, and in furnishing machinery for the locks. The total expense of these improvements are

said to be estimated at \$5,000,000, and as boats are now towed in pairs, tandem, the lengthening of the locks will greatly expedite their passage, while increasing the depth will allow fuller loads with less tractive power.

From the completion of the enlargement of the Erie Canal, commenced in 1836, until last year, when the lengthening of the locks was commenced tentatively, nothing has been done by the State to cheapen transportation by enlarging the Erie Canal. Although the impetus given to New York City by the canal before the fall in railroad freight charges commenced has kept her, as it made her, the principal commercial emporium of our country, her commercial growth has undoubtedly been much slower than if the capacity of the canal and the boats employed on it had kept pace with the improvements in the railroads and their equipments.

From 1862, the date of the completion of the enlargement, the average canal-boat load has not been increased; at times, from obstructions in the canal, it has decreased. But by doubling and quadrupling tracks, by building new roads, and by improvements in engines, cars and roadbed, the carrying capacity of our railroads has been immensely increased, while their freight charges have been reduced to about one-fourth of what they were twenty years ago. During this time the quantity of grain exported from Montreal, Boston, Philadelphia and Baltimore has increased in much greater ratio than the grain exports from New York City.

These considerations would seen convincing in favor of enlarging the canals, the only question being: Is the proposed enlargement sufficient? Mr. Sweet, while State Engineer, read a paper before the American Society of Civil Engineers proposing a radical enlargement of the Erie Canal, so that lake vesradical

Digitized by GOOSI

sels could continue their voyage from Duluth or Chicago to this city. The elevator interests in Buffalo have, with the railroads, so far prevented any direct action by the State on this suggestion, so that not even a survey showing the probable cost of such an enlargement has been made. But the proposition has undoubtedly been influential in leading to the bill introduced by Senator Cantor, and interests which would have been glad to have the canal remain in its present state may possibly urge this bill forward to prevent an enlargement which would still further cheapen freights.

While any real improvement of the canal is to be welcomed, it would seem unwise to spend any large amount of money on work that may be superseded by, if, indeed, it be not in the way of, more radical improvements later on. It would certainly be the part of wisdom, before any further steps are taken, to formulate a comprehensive plan that shall provide for the final enlarge-

and lakes, and thus to provide pure water for our crowded and increasing cities.

"This matter is now being brought more prominently into public notice from the agitation of the question of a supply of pure and wholesome water for the cities of Newark and Jersey City, and my attention has been officially called to the avowed intention and effort of parties to control, so far as it may be possible, by purchase of water rights, the water-shed which may in the future become necessary, not only for the comfort, but for the health and prosperity of the people of this State. The claim is already made, by different parties, that they have secured water rights by purchase, to which the interests of the State are subservient, and which render the use, by our rapidly increasing populous cities, of the natural supply of pure water, which a beneficent Providence has freely given to one section of our State, impossible except by purchase from them. If this claim be well founded, it is high time that the people took steps to secure whatever interest they may now need, and whatever rights they may hereafter require.

missing a passing horse car filled with passengers.

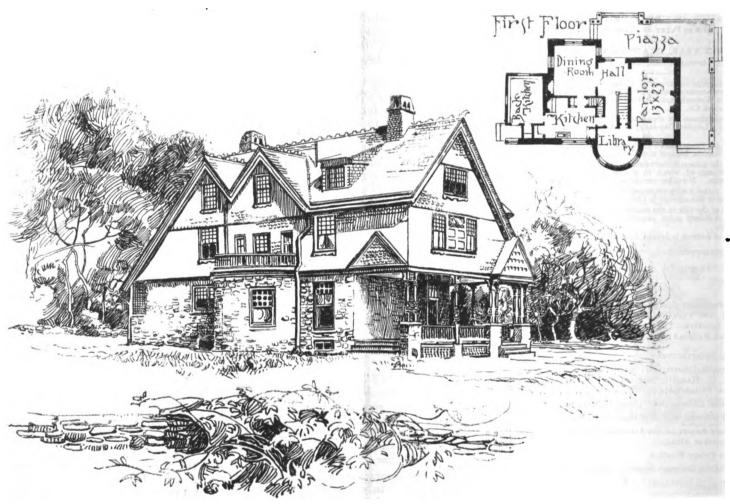

This week another contractor for the same company has had a similar accident on Broadway, but this time it did not miss the car, and four dead and many wounded are the consequence.

The accident is described on another page, but one of its lessons we would like to enforce here.

It is briefly this:

Such operations in crowded streets should not be left to the sole care of mere riggers, however careful or skillful. Both these accidents, apparently, occurred from ignorance on the part of the men in charge as to what strains half-finished structures could safely bear, and not from any deficiency in the materials or methods employed to handle the weights they had to lift

The obvious remedy is to have a competent engineer in immediate charge of such work, or

A HOUSE NEAR PHILADELPHIA. --- AMOS J. BOYDEN, ARCHITECT.

ment of the canal to its utmost useful capacity, so that all work done hereafter may be in harmony with that purpose and subordinate to its ultimate and systematic accomplishment.

SELLING RAMAPO WATER TO NEW YORK AND BROOKLYN.

In view of the proposal of certain parties to sell water to New York and Brooklyn, to be conveyed thither from the Ramapo region through the State of New Jersey, and thence by pipes through a tunnel under the Hudson River, the following reference to the matter by Governor Green, of New Jersey, in his recent message to the Legislature, is of interest, as indicating that the State of New Jersey expects to be consulted before such a proposal could be carried out:

"Much attention has been given by the State Board of Health, during the past year, to the water-supply of the State. It is time that some efficient legislation was had to secure to our citizens the benefits of mountain streams "In 1882 a State Board of Water-Supply was created. It entered upon its work. The next year its field of operations was extended. The reports are able and instructive and are the result of careful examination and investigation. Among other duties they are required to keep the Attorney-General advised of any attempts to interfere with the rights of the State, and their work in this direction has been faithfully done and attended, it is believed, with good results. An appropriation to defray the expenses of the board was made in 1883, but it was limited to two years and has expired by its own limitation. I would recommend that an appropriation be made to meet the necessary expenses of the board as provided for in former acts."

THE FALL OF A HOISTING-ENGINE ON AN ELEVATED RAILROAD IN BROOKLYN.

IT will be remembered that last fall a traveling derrick used in erecting the structure of the Union Elevated Railroad, on Flatbush Avenue, Brooklyn, fell to the ground, barely

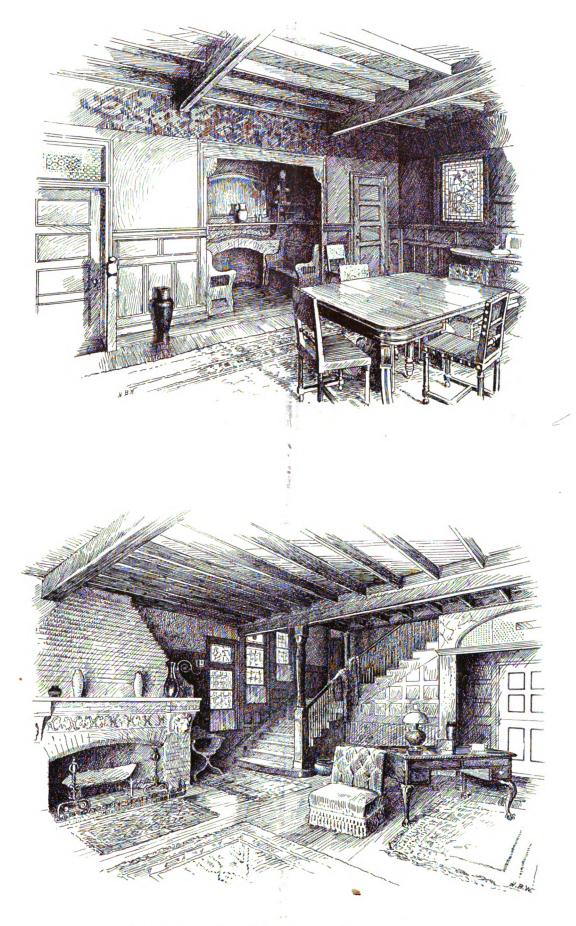

at least he should have such oversight as to see that the unbraced structure is not subjected to dangerous strains. In both cases the delay in bracing the longitudinal girders seems to have largely contributed to the accident, and such a source of danger should not be longer tolerated merely for the convenience of the contractor.

Whether the engineering superintendence of such work should be provided by the contractor, the company, or the city we shall not now discuss. It is the duty of the city to protect the lives and property of its citizens, and it should either exercise such oversight itself or compel those to do so to whom, for their own advantage, it has granted the use of its streets.

COTTAGE HOSPITAL CONSTRUCTION. BY HENRY C. BURDETT,

Chairman of the Executive Committee of the Hospital Association.

Author of "Cottage Hospitals," "Pay Hospitals of the World," etc.

Some two years ago I drew attention in the Lancet to several new cottage hospitals designed upon the pavilion principle on the lines laid down in the second edition of my book on "Cottage Hospitals," where the plan of a model hospital for fifty beds constructed upon this plan is given. I unfortunately omitted to caution the inexperienced that the pavilion system is too costly to be extended to hospitals having less than fifty beds, and as a matter of fact, several of the more recent cottage hospitals demonstrate this fact beyond all question. The importance of economy in cottage hospital construction is generally admitted, and at the request of correspondents in England and America, of architects and hospital authorities, I am induced to ask you to allow me to suggest some alternative plans based upon an exceptional experience combined with a careful consideration of the faults apparent in several of the more ambitious cottage hospitals which have been erected during recent years. The ends to be kept in view in building a cottage hospital are: (1) Economy in administration; (2) convenience of intercommunication between every portion of the building, so that the nurses, matron, and her assistants may be saved as much labor as possible; and (3) in cases where the population is increasing, facilities for extension, should occasion arise for increasing the hospital accommodation. All these points have been considered, and I am of opinion that the plan which seems preferable to the pavilion for small cottage hospitals is one designed upon the straight model. Such a plan enables the architect to arrange all the wards upon the ground floor and to provide perfect ventilation. The matron's and nurses' rooms and the bath and operating rooms can also be placed on the same floor, whilst the kitchen, with sleeping accommodation for the staff, can be located upstairs. A lift communicating with the kitchen and ground floor should be provided. The complete isolation of the kitchen when necessary, and the avoidance of many evils which might otherwise arise, may be secured by the erection of a special staircase connecting the outside and back portion of the premises with the kitchen, by which access could always be obtained to the latter without entering the hospital. Such a plan affords the widest scope for future extension, should they be necessary at any time. Some people have a strong prejudice in favor of keeping the sexes apart by placing the female wards on the first floor. They also prefer a two-story building, on the ground that it is less pretentious and more homelike and comfortable than any other which can be devised. I have endeavored to meet the views of such persons in plan No. 3, and I have been induced to give such a plan with the object of showing that, although the building occupies less ground, and would, therefore, at first sight be thought to entail a less expenditure, in practice it will be found that this form of building is as costly as the other.

The plans have been prepared for me by my architects, Messrs. Young & Hall, who have made hospital and asylum construction a special study. I find that whoever desires to secure a cottage hospital for a particular locality is in.pressed with the feeling, and I think rightly so pressed, that the elevation of the building, however plain, should at least be attractive and stirking. I therefore commence my series of plans by giving the elevation of ground plan No. 2, in order to show that the straight model is not unsightly, but the contrary, as will be seen from the following sketch:

The chief feature in the first design is the entire separation of the administrative portion of the building from ward block, the two being connected by a covered y. The advantage of this plan is that the ward or ds, and the administrative block can be placed in any ition on the site, and in relation to each other. It most effectually separates the quarters of the rest of taff from the ward atmosphere. For these reasons the lan is commended to the consideration of local sanitary authorities and others who have to maintain infection hospitals where the population is comparatively sm I There is no reason why the new blocks on this should not be indefinitely extended to meet the requirements of special localities, and at a comparatively

sma 11

cost.

ADMINISTRATION BLOCK.

Here will be found the day-room and kitchen directly communicating, with a covered way, and adjacent to it a scullery, larder, coals, etc. On the left of the entrance is the matron's sitting-room, the staircase, with the operation-room beyond, and opposite it the rooms for linen and stores. Upstairs are provided five bedrooms for the matron and staff.

WARD BLOCK.

This is self-contained and is arranged to provide accommodations for five male and five female patients. Each ward has a disconnected lavatory, sink, and water-closet, with a separate linen closet and other conveniences. There is also a nurses' room and a bath-room, both of which are placed in the centre, so as to be easily available for both wards. An abundance of cubic and floor space

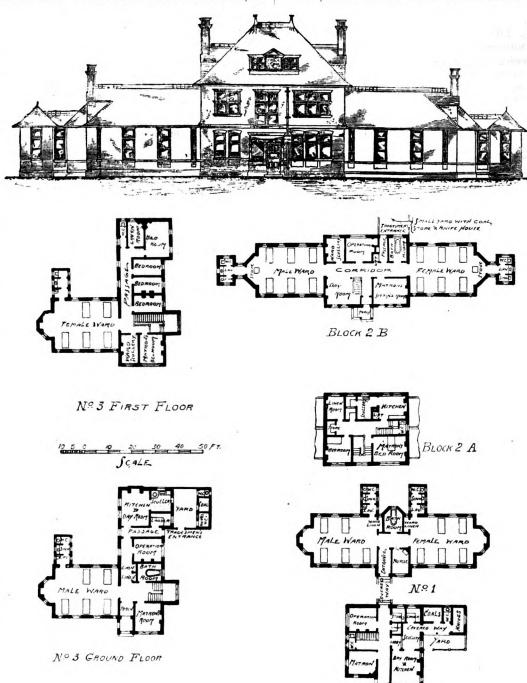

secure complete separation between the tradesmen's lobby and the communication with the wards. A speaking-tube on the ward side of the lift would insure ready communication between the kitchen and ground floor.

ADMINISTRATION.

This is placed in the centre of the building and consists, on the first floor, with the exception of the matron's sitting-room, of a kitchen, with scullery, stores, and laundry, the former of which is connected with the wards and tradesmen's entrance by a lift, as before described. A linen-room, with the nurses' and matron's bedrooms, and store-closets are provided, while sleeping accommodations for the servants and two nurses, if necessary, will be found on the third story.

WARD BLOCK.

This provides accommodation for twelve beds in two

is provided, and each ward would present an unusually cheerful and airy appearance.

PROBABLE COST OF PLAN NO. I, EXCLUSIVE OF SITE.

The building, as shown in the plan, cubes up at 6d. to
£2,010, but in country districts it ought to be possible
to erect such a building for about £1,500, exclusive of
the cost of furniture.

NO. 2, THE STRAIGHT MODEL PLAN.

In this plan the kitchen is placed on the top floor, and, in order to obviate the necessity for tradesmen's boys and men entering the hospital, a lift is placed in a central position which serves equally well for carrying up stores to the kitchen and for sending down meals to the wards. This lift is accessible on the ground floor both to the ward corridors and to the tradesmen's entrance. It will be observed, however, that the plan is so designed as to

wards of six beds each. These wards provide ample accommodation and are entirely disconnected from the offices by a cross-ventilated lobby. In cases where it is probable that an extension of the building may be found necessary, the lavatories, etc., might be placed at the side, behind and at one end of the wards, as shown in Plan 3. This might entail the sacrifice of one bed, but would enable the beds to be doubled at the smallest possible outlay. In those places where more accommodation is not likely to be wanted we should strongly advise the adoption of the arrangement shown on the plan. A spacious dayroom is placed at the left of the entrance, which is thrown open to the corridor on the model of the Halstead Cottage Hospital, where this arrangement has proved in practice a success. A ward scullery, an operating-room, and a bath-room are also provided. Glass doors are placed on

the right of the entrance lobby, shutting off the corridor communicating with the female ward from the day-room and mess corridor. This plan, cubed out at 6d., would cost £1,778, or less than £150 a bed, although it is replete with every modern appliance and would in practice be found to leave little, if anything, to be desired.

No. 3 -THE VILLA HOSPITAL PLAN.

In this plan the kitchen offices are on the ground floor, a point of some importance being a passage which separates them from the rest of the hospital. This passage is ventilated at each end and would certainly tend to prevent any smell of cooking from penetrating to the front part of the building.

GROUND FLOOR.

This provides accommodation for five beds in the male ward situated on the left of the entrance, the scullery and offices being disconnected from the wards and placed outside the building. The matron's room is situated on the right of the entrance, next to it being the staircase; then the bath-room, having the linen-closet in front, and an operating-room with large window at the back. Beyond, again, but disconnected from the patients' portion by the passage already referred to, are the kitchen or day-room, with the usual offices.

FIRST-FLOOR PLAN.

This contains a female ward for five beds, similar to the male ward, with matron's bedroom, ward scullery, four other bedrooms, one of which might be used for isolating a special case, a linen-room, etc. I do not like this plan half so well as No. 2, and I have only given it for reasons already stated. It cubes up at 6d. to £1,988, but in some parts of the country such a building might be carried out at 41/2d. to 5d., which would bring the cost down to £1,500, exclusive of furniture.

GENERAL REMARKS.

Such are the three plans upon which a cottage hospital, complete in all particulars, may be erected and maintained at the smallest cost. No. I plan is specially adapted for infectious cases. No. 2 is undoubtedly the best for small cottage hospitals, because the original cost, as well as the cost of administration, would here be reduced to a minimum. I am often asked how to estimate the cost per head of erecting buildings of this character. Heretofore the pavilion principle has been so generally adopted that the original outlay on cottage hospitals has proved enormous, and the working expenses afterwards are often in consequence so great as to dishearten the supporters of these institutions. The hospitals at Stratford-on-Avon, at Darlington, and at Spalding are especially notable instances of this, and the plans are worthy of study for this reason. It will be observed that the smallest of the three hospitals for which plans are here given contains ten beds. I am disposed to think that accommodation for any smaller number may best be provided in an ordinary cottage. Mr. Charles Ayres, architect for the Watford District Cottage Hospital, containing nine beds, has produced a plan so compact and complete as to make it worthy of study. The building is of one story, and the beds are placed in two wards of four beds each, with an isolation ward for one bed. The lavatories are disconnected from the wards, and operation and bath-rooms are added. The kitchen is cut off from the main building by a disconnecting passage, and the whole plan leaves little to be desired. I have ascertained that the total cost of the buildings was, however, quite £1,800, making the cost per bed over £200, whilst the furniture (£221) and instruments (£31) cost £250 and the site £550.

THE PROPOSED NATIONAL BUREAU OF HARBORS AND WATERWAYS.

In publishing the following letters we desire to state that we shall be glad to give a reasonable space for a discussion of the proposed bill which was printed in our issue of January 28 and the general questions with which it seeks to deal.

KEY WEST, FLA, February 2, 1888.

SIR: The bill recently introduced by Senator Cullom for establishing a corps of United States Civil Engineers, to be charged with the construction and management of the river and harbor works of the United States, a copy of which you have sent me with a request for my opinion upon it, appears to me to be an exceedingly wise measure.

It provides, briefly, for the establishment of a Corps of

Engineers, the membership of which is thrown open to the competition of all the engineers of the United States, while at the same time retaining the skilled services of a part of the corps of engineers in whose exclusive charge these works have been for more than half a century; and it provides also for a system of appointment, promotion, and retirement which, if enacted, must, by relieving the mempressure of political influences, secure to the country the best results of independent engineering skill and judgment.

Since 1826 the management of the river and harbor

improvements of the country has been in the hands of the improvements of the country has been in the hands of the Corps of Engineers of the Army, aided by as many civil engineers employed for the purpose, as occasion demanded. At first the improvements ordered by Congress were not many, nor very extensive, but within the last quarter of a century these have grown enormously, and what is commonly known as the River and Harbor Bill, which has became one of the regular appropriation bills, now provides annually for hundreds, if not thousands, of improvements, involving the expenditure of many milimprovements, involving the expenditure of many millions of dollars. And all these works are managed by a part of the Corps of Engineers, numbering 109 officers, whose services are supplemented by those of 200 or 300 civil engineers, the number depending upon the amount of the annual appropriations.

The faults of this system are apparent. Each and every officer of the Corps of Engineers has too many duties to attend to, and the civil engineers employed, who are as capable and efficient as any in the land, have little or no capable and efficient as any in the land, have little or no prospect of advancement, and though they may remain in the service until they attain to old age, they can never feel sure of retaining their positions however, valuable their services may be, but are liable to lose them at any time through the failure of the appropriations or the change of an officer in charge of the work. With all this the service has been excellent, and no body of trained engineers in the world, can show as the result of their labors greater. the world can show as the result of their labors greater successes or fewer failures than the Corps of Engineers of the army and the civil engineers who have served with

The work is increasing, however, so rapidly, that some different provision for its management must soon be made. Very few of our own citizens, probably, realize how very large our land is compared with the historic countries of the world. When we reflect that the single State of Texas is greater in area than either of the empires of Germany or Austria, or the Republic of France, and that her waterways exceed in length the waterways of either of those countries, it is manifest that we ought to have for the improvement of the waterways of the United States at least as many engineers as either of those countries employs; and, if my memory does not mislead me, France alone has five or six hundred engineers in charge of her internal improvements, whose lives are devoted to her service, and whose services, encouraged and fostered by the State, have made her engineers famous throughout the

The time has come when a broader and better organization of the engineering forces which manage our public works should be attempted, and it is my belief that the system proposed in Senator Cullom's bill is one which in its results would be invaluable to the country, and which engineers of every rank and class throughout the land can unite in supporting. Very truly yours,
WALTER MCFARLAND,

Lieut, Col. of Engineers, U. S. Army.

CHICAGO, January 31, 1888. SIR: I am glad that you have published in your paper the bill lately introduced in the House of Representatives for the reorganization of the river and harbor works of the Government. This bill, as you must have seen by your examination of it, is not hastily or crudely drawn. It is the result of several years' study, deliberation, and con-ference on this subject with Members of Congress who are interested in the subject with Members of Congress who are interested in the subject and among the engineers who constitute the council of the engineering society on national public works, particularly among the members of the executive board of that council, who have had several meetings within the last two years and have, within the last few months, given special attention to this subject. In fact, in order that a proper bill might be formulated, we meet in Weshington and thore had large accounted, we met in Washington and there had a long conference, lasting two days, with Hon. C. R. Breckenridge, who introduced the bill in the House, and by appointment we called upon the President and had a long conference with him. The bill was then drawn up by Mr. Breckenridge and was The bill was then drawn up by Mr. Breckenridge and was sent to us here for examination and revision. We spent several days upon it making some necessary changes in it, and the bill as now printed by you is the result of this work we have given to it. We have endeavored to present a measure to Congress that will tend to purify the river and harbor legislation and to improve greatly the administration of national public works, so far as they relate to rivers and harbors. None of us connected with this subject have any personal aims in view nor any personal benefits to secure. We have been led by a patriotic desire, and not merely by professional purpose, to bring this matter forward to its present status. We have given a great deal of time and considerable money in the way of expenses and work to it, and we now, through your journal and other engineering papers, call upon the engineering and other engineering papers, call upon the engineering profession to come to our assistance and to take hold of this matter in earnest, not only in disseminating the correct views on the subject, but also to bring what influence you can (and it is large) upon Congress so that this bill, perhaps considerably modified, if discussion in Congress shows any changes to be necessary, will pass this session and become a law so that next year the whole subject may be taken up on a broader basis and a better system.

We believe, and have some evidence on which to found this belief, that the U. S. Engineer Corps will not oppose it after they fully understand it. We believe it will be for their benefit as well as for the civil engineering professi have a law enacted under which a better system and a ril one can be employed.

Yours truly civil one can be employed.

E. L. CORTHELL.

THE PRELIMINARY REPORT ON THE ASSEMBLY CHAMBER CEILING IN THE CAPITOL AT ALBANY.

ALBANY, February 3, 1888.

To the Honorable the Speaker of the Assembly:

SIR: The undersigned, having received notice upon February 1, 1888, of their appointment as a commission to examine "the Assembly chamber in the new Capitol, and particularly the ceiling and foundations and supports thereof, for the purpose of ascertaining its present condition and stability, and the danger, if any, to be apprehended therefrom," immediately began work by examining the drawings of the Assembly chamber furnished us We began an examination of the ceiling of the chamber

which has revealed such a dangerous condit on of thing that we are compelled at once to report to the Legislature upon the pressing and immediate question of danger. We went up to the top of the ceiling of the chamber and found that there had been many serious movements of the stones of the groin-vaults, owing to the vaults and ribs not acting together. This caused cracks at the points in some cases of considerable length. In one place, at the apex of the ceiling, the Assembly floor can be seen through the crack. We found that the main vault, certainly in two places, had settled away about (3) three inches below its original level.

All the main ribs which support the central vault were found to be crushed and shattered near the circular keystone. In one of the ribs we found a stone three feet long which was split from end to end in strips. By the side of a stone of another rib was found a spall split from the ribs by excessive pressure; this spall was ten and a half inches long and seven inches wide and three and a half inches thick; it was a perfectly strong and sound piece of stone, and its being split off was due to no defect in the material. On the other side of the same rib another stone had spalled off, leaving the width of the rib at the upper surface reduced from this ten inches to another stone had spalled off, leaving the width of the rib at the upper surface reduced from thirteen inches to six inches in width. Evidences of this fracture extend further up the rib. Here was clear evidence of a piece of sound sandstone split by a pressure of probably many times what it had been calculated to sustain.

We have mentioned these two or three strong instances.

We have mentioned these two or three strong instances but we may say that the whole ceiling is in the same dangerous condition—all more or less cracked—and showing signs of unexpected pressure. As the original size of the ribs was none too large to resist the pressure, it will be clear, in their constantly reducing condition, they are less and love able to do their work. and less able to do their work.

A time must come, and that, we believe, very soon and without warning, when one or more of these overtaxed rib-stones must give way. When that happens the whole ceiling will fall.

We recommend that the Assembly chamber and the rooms in the story beneath be immediately vacate

That steps be at once taken to put up strong and properly supported centres.

That the whole ceiling be taken down as soon as pos

sible, and such steps taken as will relieve the pressure on the walls and supports. There are many other questions connected with the inquiry which we have had no time to examine and will

report upon hereafter.

The imperative necessity of reporting at once upon a question of danger has caused us to postpone everything

BRICK-LAYING IN FROSTY WEATHER.

OUR London correspondent writes: "Builders, and others whose building operations are interfered with by frosty weather, may find it worth while to study a report just issued by the Foreign Office, on the question of bricklaying during frosty weather in Norway. The advent of frost in that country, whatever its intensity, does not interfere with building. The secret is in the addition to the mortar used of various proportions of unslaked lime. The mortar is made in small quantities immediately before using. The lime developing warmth, it is necessary to use the mortar quickly, to enable it to set before it cools: the proportion of lime must, therefore, be increased as the temperature falls. The bricks used must not have been exposed to frost or rain, but kept under cover."

Lime is sometimes mixed with cement-mortar for a similar purpose in this country, but is believed to some what reduce the strength of the mortar, and we should prefer to use salt as described in our issue of November 19. r887. We should be glad to hear from any of our readers that have had experience with either method, especially if they have had tensile tests made of the mortar.—ED.]

HENLEY-ON-THAMES SEWERAGE SYSTEM.

(From our London Correspondent.)

THE authorities of this town having received an intimation some time since that they would have to provide some other arrangement of sewerage in place of that existing, whereby the town drained into the Thames, decided to adopt the Shone hydro-pneumatic sewerage system. The works were completed early last year, and after some months' trial were formally opened in October.

The area of the district dealt with is about 175 acres, and the total population at present is about 4,000. The works are, however, calculated for 6,000, allowing 30 gallons per head, or 180,000 gallons per diem. It is estimated by the engineer that one-half of this quantity of the sewage will come to the ejector stations in 400 minutes, or that the maximum flow is 225 gallons per minute. There are no manufactories to take into account, except a few breweries, but in this connection it may be added that a great quantity of large bungs come through without interrupting the working of the valves of the ejectors. The old system of sewers, gravitating to the Thames, is used for the surface water, which is not passed into the Shone system.

The plan shows the division of the town into four districts, each district having an ejector station at its lowest point (marked I. to IV. on plan). The sewage runs to these several ejectors by gravitating sewers of stoneware pipe, seven inches in diameter. Being expelled from the ejectors by compressed air, the sewage passes into a castiron sealed main of five inches diameter. This main, running along along Reading Road and Bell Street, between the ejector stations marked I. and IV., and receiving in its course the tributaries from stations II. and III., is gradually increased to eight inches diameter at Station IV. It is continued thence of the same diameter to the intermediate Station V. (containing three ejectors), whence the sewage is lifted through a pipe of the same diameter to the settling tanks in Lambridge Woods. House connections are 5-inch diameter. Stations I. to IV. contain each two ejectors, and Station V., as previously stated, contains three, all arranged to work independently. The capacity of each ejector is 150 gallons. They are designed to discharge the volume of their contents once a minute. The settling tanks, of which there are two, working independently, each of a capacity of 24,600 gallons, are situated in the woods about a mile and a half from the town ejectors (I. to IV.). The total lift from the town ejectors to the intermediate station (V.) is 52 feet, thence to the settling tank 77 feet. No chemicals are used in precipitating the sewage. A system of "locks" is provided whereby the effluent from the tanks can be run over any desired portion of a large piece of adjacent ground specially prepared for that purpose. The solid matter is readily purchased by farmers in the neighborhood. The total cost of the installation, including legal and preliminary professional charges, purchase and preparation of the land at the outfall for irrigation purposes, etc., etc., was £18,000 (\$86,400). Mr. Isaac Shone, of Wrexham and Victoria Street, London, was the engineer; Messrs. Hughes & Lancaster, of Chester, the contractors for the ejectors, and Messrs. Pratchitt, of Carlisle, the contractors for the general work and the compressing engineers.

AIR COMPRESSORS FOR HENLEY-ON-THAMES.

The compressed air required for raising the sewage of the town of Henley-on-Thames is supplied by two sets of air-compressing engines, each of which is able to supply the whole quantity required while the other is in reserve. The general arrangement of these engines will be readily understood by a reference to the drawings, of which Fig. 1 is a plan and Fig. 2 is a sectional elevation. Figure 3 is a transverse section.

The maximum work per minute consists in lifting 225 gallons to a total height of 180 feet, including friction, or, as this is done in two lifts, it is equal to lifting 450 gallons per minute to a height of 90 feet.

The compressors can deliver per minute a quantity of 290 cubic feet of free air compressed to 39 pounds, the compressing cylinders being 14 inches in diameter, with 21-inch stroke.

The compressor has two single-acting cylinders arranged vertically, so that one delivery-valve is at the top and one at the bottom. The delivery-valve forms at the same time the cylinder-head, and as it lifts when the piston approaches it, no clearance space is required and the whole quantity of air taken into the cylinder can be expelled at each stroke. The inlet-valves are carried in the piston and

HENLEY ON THAMES SEWERAGE PLAN. SECTION HENLEY SEWERAGE SHONE HYDRO-PNEUMATIC SYSTEM SHONE & AULTS PATENT AIR COMPRESSOR. Bullowa Mecono Fig 1.

the two valves are connected together by a rod, so that the one is closed when the other opens. This action is assisted by a friction-clutch gripping the valve-rod.

Each set of compressors is driven by a horizontal compound condensing steam-engine. The high-pressure steam cylinder is 11 inches in diameter. The low-pressure steam cylinder is 19 inches in diameter, each having 18-inch stroke. Both cylinders are steam jacketed and fitted with variable expansion gear.

The engine and air-compressors are mounted on a substantial bed-plate. The plummer-blocks that carry the crank-shaft have bearings that can be adjusted in a horizontal as well as in a vertical direction. The air-pump is 10 inches in diameter, with 6-inch stroke, and is driven from the crank-shaft by manne of a balt.

The engine is provided with a governor to prevent the speed getting above 90 revolutions per minute, and it has also an air-pressure regulator by means of which the steam-

supply is throttled when the air-pressure is above the standard pressure of 30 pounds per square inch.

This regulator is shown in detail in Figs. 4 and 5. The air-pressure acts on a piston and compresses a spiral spring. The motion of this piston is transmitted through multiplying levers to an equilibrium bell-valve by which the steam is shut off when the pressure is too high.

The efficiency of the air-compressor has been tested by counting the number of revolutions and noting the increase of pressure when filling the empty receiver and airmain, and then comparing their capacity with the theoretical volume found by multiplying the piston displacement per stroke by the number of revolutions. The difference has been found in a number of trials to be five per cent.

The engines work with a steam-pressure of 60 pounds per square inch, with a cut-off in both cylinders $= \frac{1}{10}$ of the stroke. They use about $2\frac{1}{2}$ pounds of coal per I. H. P. per hour when developing 35 I. H. P.

STEAM-HEATING IN WASHINGTON VERSITY.* UNI-

PREVIOUS to 1879 the buildings of Washington University were heated by the old style of cast-iron furnace, but during the summer of that year the university erected a boiler-house and put in a steam-plant to supersede the old

and unsatisfactory furnaces.

On October 20 of that year, now eight years ago, the writer hereof took charge of this steam apparatus. The boilers, three in number, have been described to this club before, in a paper by Mr. Charles F. White, in May, 1880. But as some of you may not have been present on that occasion, I will state that they are 16 feet long, 5 feet in diameter, containing 36 4 inch tubes, and have each 750 square feet of heating surface, and are rated 75 horse-power. The tubes are arranged so as to leave a space of 12 inches width in the centre, so that a man entering the manhole on the lower side of the front head, can pass up between them, thus affording excellent opportunity for cleaning and inspection. This arrangement of the tubes, to the best of my knowledge, was an original idea of the late Professor Charles A. Smith, and it has proved a most excellent one, as it is this central water-space, in my opinion, that has protected the boilers from injury during these eight years of the extremely heavy duty to which they these eight years of the extremely heavy duty to which they have been subjected, and to the free and rapid circulation this space has afforded is probably due the remarkable work they have been found capable of. Two of these boilers, when designed, were expected to be amply large for the work of heating the buildings and running the engine in the manual training-school shops, leaving one in reserve, for cleaning or repairs if necessary, but buildings since added and rooms in the old buildings not then occupied and not thought worth using, as they were difficult of access, but since brought into use to meet the cult of access, but since brought into use to meet the growing demand for more room, necessitating the putting in of additional radiators, these have long putting in or advanced as since used to since used up our reserve and compelled us to crowd all three of the boilers to double their rated capacity. It was also found upon careful measurement that the buildings are nearly 30 per cent. larger than they were considered to be in the original estimate. The buildings since added are the school building, at the manual training-school (the shops now occupying all of the original building), the gymnasium and the observatory. These additions required an increase of about 21 per cent. in the heating pipes. An additional reason is also found in the higher temperature demanded by the occupants of many of the rooms. Formerly they were satisfied if the temperature reached 68 or 69° Fah.; now they demand 73 to 75° Fah., and we have had complaints that this was not warm enough. This has always occurred in rooms heated indirectly, and, I think, must be owing to the fact that the occupants are in a gentle current of dry air; for we all how much cooler it seems in summer on a day when the air is dry, than when it is charged with moisture, although the thermometer may read higher in the former

As we have both systems of heating at the university, direct and indirect, a brief consideration of the merits of the two systems may not be out of place here.

Experience has shown the indirect to be the most satisfactory where there are a number of persons congregated, and who remain in the room for a considerable time, which is owing to the perfect ventilation obtained by this means; and it is the unanimous testimony of the teachers engaged and it is the unanimous testimony of the teachers engaged in rooms heated in this manner that when the rooms were heated by the old furnaces a short time in them would frequently bring on headache. Now they can spend an unlimited time in the rooms with perfect comfort. Pure air is not always found where the direct system prevails. As an instance of this, I well remember being called at one time to attend to a trifling leak around a valve-stem in a room heated directly. There were about sixty boys in the room. On first entering from the pure, fresh air of outdoors I was surprised to find a disagreeable odor, which was also noticed by the janitor, who accompanied me. On inquiry I found that it was not perceptible to those who were in the room, they having been there some hours. The indirect system, however, is the most expensive in fuel, probably to the extent of twenty-five to thirty per cent., but the perfect purity of the atmosphere of the rooms justifies the additional expense. Another strong point in its favor lies in the fact of its being situated in the basement, which admits of any trifling derangement being attended to without disturbing the occupants of the rooms. On the other hand, buildings heated by the direct system can be more quickly warmed; hence, it is seldom found necessary to heat these buildings over night, which must always be done, except in very mild weather, in those buildings heated indirectly, which accounts for part of the greater cost of heating indirectly, the remainder being found in the larger heating surface required; but the greater cost is far outweighed by the benefits accruing to health and comfort.

The buildings comprising the university

The buildings comprising the university group, and which have to be heated by the three boilers mentioned, are eight in number, as follows: The university building, comprising the college and polytechnic schools, the chemical laboratory, gymnasium, observatory, manual trainingschool (two buildings, school and shops), Smith academy, and museum of fine arts.

To these must be added the Second Presbyterian church,

which is heated on Sundays, and also for two evenings

during the week and at irregular times when needed for weddings or funerals.

The university is heated principally by the indirect system, but is supplemented by direct radiators in some of the rooms which have been found difficult to warm. The arrangement consists of small vertical tubular-boilers set in brick chambers, which are connected by suitable coldair flues with the outer air, which is conducted under these boilers, passes up through the tubes and around the shell, to the flues leading to the rooms. These boilers are each 8 feet in height by 3 feet in diameter, containing thirty-four 4-inch tubes, making 344 square feet of heating sur-face in each. The Smith Academy and Art Museum are heated by direct radiation, as is also the gymnasium and the observatory. At the manual training-school we have both systems combined, which are so arranged that we can heat either with the exhaust from the engine or with steam direct from the boilers. Here we do altogether the best work; the exhaust from the engine is found sufficient, until the thermometer falls to within 10 degrees of zero, for both buildings, when it will serve for one, the other being heated with live steam. The engine is 12x12 and is developing about 25 to 30 horse-power, running 203 revolu-tions per minute. The exhaust from this engine does this tions per minute. The exhaust from this engine does this heating with little or no increase in the back-pressure; in fact, in very cold weather the back-pressure is somewhat less, owing to the rapid condensation, the pipes in the hot-air chamber forming a condenser, which proves, that with a properly designed system of piping, there need be no loss of power in the engine from excessive back-press-ure; and I am of the opinion that many establishments now heating with live steam could, with very little expense for alterations, heat with their exhaust that is now wasted,

which would make the heating clear gain.

In order to show what our boilers have been found capable of. I introduce a statement of their work during the season of 1884 and 1885. I have selected this season be-cause it was an extremely cold and long one, extending from October 1, 1884, to June 10, 1885. The first ten days of June required us to heat some, the temperature being very low for this month, on the 9th falling as low as 52° Fah. The average temperature for the time stated being very low for this month, on the 6th falling as low as 52° Fah. The average temperature for the time stated was 5° Fah below the normal. The months of January and February were exceptionally cold, the temperature being on many days below zero, compelling us for thirty-seven days in these two months to keep the steam in all of the buildings the entire twenty-four hours.

The several buildings comprising the university group were warmed during the season under consideration the following number of hours each:

*This building has the larger heating-surface, in order to utilize the exhaust of the engine for heating.

Making a total of 3,241,899 cubic feet of space which

Making a total of 3,241,809 cubic feet of space which was heated in the case spoken of by 39,014 bushels of bituminous coal for 216 days, which is 1,038 cubic feet heated by one pound of coal for the entire season.

To do the work required we frequently burn as high as 2,400 pounds of coal per hour, on 72 square feet of grate-surface, 33½ pounds per square foot, which, at 6 pounds of water per pound of coal, gives 14,400 pounds of water per pound of coal, gives 14,400 pounds the evaporated at an average pressure of 45 pounds, the evaporation reaching 6.4 pounds of water per square foot of heating-surface. This is heavy duty, I know, but numerous trials have proved that these boilers regularly

perform this duty when required. It was expected, when these beilers were first erected, that we would be able to show, at the end of each day's run, just how much water had been evaporated without the trouble of regular trials. For this purpose the returnthe trouble of regular trials. For this purpose the return-pipe from each building was fitted with a meter, but they had to be taken out, as it was found that the return of the water was intermittent, not flowing until there was suffi-cient hydraulic head to move the meters; in the mean-time, the water in the boilers would get lower than was desirable, so the meters were taken away, and the tank upon which they had been placed was fitted up as a feedwater heater, and glass gauges placed upon it, so that the height of water in it could be seen. This tank has been filled a number of times, and the water drawn off and weighed, thus establishing lines between which is a known weight of water. By this means we can at any time run a trial to ascertain the evaporation.

During the eight years that these boilers have been running several attempts have been made to introduce a smokeless furnace. The first of these was a furnace by smokeless furnace. The first of these was a jurnace by B. F. Smith, of Chicago, which was built in March and April. 1880. The arrangement consisted of a sort of basket built out of 2-inch pipes, placed vertically in front of and connected to the boiler, being enclosed in brickwork. The fire was to be forced by a fan-blower, the products of combustion passing under the boiler through the opening of the fire doors (the doors being removed), the entire furnace space under the boilers being filled with fire-brick, built up pigeon-hole fashion. After a number of trials and the construction of three different furnaces, this attempt was abandoned, it being a complete failure, as it would not maintain sufficient steam to run to remove the smoke nuisance cost over \$2,100, which was bonne by Messrs. Huse, Loomis & Co., of St. Louis.

The secand attempt to introduce a smokeless furnace was made in the spring of 1884, which was a furnace designed by Mr. J. S. Williams, of St. Louis. This furnace was quite an elaborate and complicated affair, contemplation was dutte an elaborate and complicated anali, contemplating the admission of air by forced draft, both above and below the grate. The air admitted above the grate was expected to be a known measured quantity, gauged to suit the theoretical amount demanded for the coal fired, which was to be carefully weighed, and fired in small quantities, about 16 to 20 pounds at a time. The delivery of air was to be in sufficiently large quantity to secure perfect combustion when the coal was first fired, gradually decreasing as the coal burned, until it reached the incandescent state, when the supply of air would be cut of entirely. This air was also to be admitted in time streams, just above the fire, at a high velocity, conditions which seemed to meet the requirements for perfect combustion.

The furnaces (two) were built in the ordinary furnace space, after removing the fire front with its fixtures, the grates being placed 4 feet 4 inches from the lowest part of the shell of the boiler. A central brick pier pierced with small, round holes on both sides, communicating with an air-chamber in its centre, was built, the air-chamber being connected with the blower. This pier also served to support one end of the fire-brick arches which interposed between the fire and shelf of the boiler. These arches, or perhaps more properly, series of arches, were fire-brick, in single rows, spaced two inches apart, running back from the front about 5 feet. The side walls were also pierced with the small, round holes for the admission of air, the idea being that the air entering from both sides of the furnace, at high velocity and in fine streams, would thoroughly mix with the gases passing off from the coal, and perfect combustion would be the result. This furnace did give very good results as to being smokeless, but its capacity was so small, and it gave such evidences of being difficult and expensive to operate and maintain, that was taken out during the following summer. Cost to the university, \$536.28.

The third smokeless furnace tried was the patent of the Backus Furnace Company, of Detroit, Mich. This furnace consisted simply of two fire-brick arches, built in the common furnace, one inside each door, extending inwards 2½ feet, where they had a drop wall 9 inches thick descending to within 9 inches of the grate-bars.

This also failed to do the amount of work required of our boilers, by about 40 per cent.

This gentleman action

our boilers, by about 40 per cent. This gentleman accepted his defeat in a most graceful manner, paying all the expenses of building and removing his furnace. I may add that we have also tried other devices suggested may and that we have also tried other devices suggested to us by our own experience and that of others with the same unvarying result—viz., whenever we have admitted air above the grates it has resulted in a loss of capacity, which, in our present condition, we cannot spare.

The cost of the entire steam-heating apparatus to the University is as follows:

University is as follows:

Land					\$500.00
					2,873.00
					2,990.≎0
					. 627.00
					233.91

Heaters in	mauual	training	-schoo	l shops	1,404.00
**	**	٠.	••	rooms,	1,200.00
Total					\$17,048.07

The cost of the heating apparatus in the museum of fine arts I have been unable to ascertain, as this building was deeded to the university complete in every respect by the

SOME EXPERIENCE WITH UNDERGROUND PIPES.

As the several buildings heated from our boilers are some distance away from each other and from the boiler-house, the pipe system underground, connecting them with the boilers, forms no inconsiderable part of the whole plant, requiring, as it does, nearly 1,000 feet each of steam and return pipes. From this it wil readily be seen that in the eight years these pipes have been laid we have had considerable experience with underground pipes.

The main line to the university is 400 feet long, and

had considerable experience with underground pipes.

The main line to the university is 450 feet long, and has, leading out of it at right angles, three branches 51 feet, 15 feet, and 12 feet long, respectively. The line 10 the manual training-school is 314 feet long.

The line to Smith Academy is 90 feet long. The one to the museum of fine arts is 63 feet lorg. All of these pipes, with the exception of the line to the museum of fine arts, were originally laid in pine boxes made of 2-inch arts, were originally laid in pine boxes made of 2-inch lumber, which were well tarred, both in ide and outside.

^{*} Read before the Engineers' Club of St. Louis by Charles E. Jones, and published in the Journal of the Association of Engineering Societies.

The pipes were wrapped, 1st, with a sheet of asbestos paper; 2d, with three-quarters of an inch of hair felt; 3d, with a heavy, strong wrapping paper, the whole securely bound around with strong twine. The intervening space in the box was filled with coke breeze.

The pipes to the art museum were laid in what is called "gutter pipe," which is one-half of the cylinder of sewerpipe. In this case the intervening space was filled with ground charcoal, made into a paste with cement, the whole covered with another half-cylinder or "gutter pipe," forming a complete circle, inside of which the pipe was inclosed. There were some short lengths under the floor of the boiler-house that were simply plastered over with of the boiler-house that were simply plastered over with cement and the brick floor above them carefully grouted with cement, which, it was hoped, would keep the water from them. These pipes lasted just two years, and when taken up it was found that the expansion had cracked the cement off them, which allowed water filtered through the bricks of the floor to reach them, which the heat of the

pipes evaporated, thereby destroying them very rapidly.

These pipes were renewed at the time of the burst, but the following summer the arrangement was changed, so that these pipes were run overhead, where they should have been in the first place; but as this work was done during vacation, when every one connected with the university who knew how such work ought to be done was away, the intelligent (?) pipe-fitter ran things to suit him-

This was the beginning of our troubles, for during the succeeding winter we had to replace the pipes supplying the gymnasium, where it was found that a defective drain had freely supplied the covering of the pipes with water, this covering (as described previously), acting as a sort of sponge, absorbed large quantities of water, thus keeping the pipes wet, which insured their rapid destruction.

During the same winter the heavy oaken boxes built around the expansion bands had to be rebuilt (this time of

around the expansion bends had to be rebuilt (this time of brick). The heat from the pipes inside of these boxes, with the moist earth outside, rotted them so badly that in the short time of two years they were in danger of caving in. While rebuilding these expansion chambers, it was thought advisable to connect them with the sewer, to drain them, as on one occasion, during a heavy rain-storm, drain them, as on one occasion, during a heavy rain-storm, the street gutter becoming obstructed, the water ran into the chamber and flooded the pipe boxes. The winter following (1883) the pipes supplying what is known as the physical laboratory wing of the university gave out; here again it was found that the non-conducting covering had hastened the decay of the pipes. The yard through which these pipes are laid not being paved, whenever it rained the water readily found its way through the ground and was soaked up by the covering, which kept them wet much longer than if they had been without covering.

In the winter of 1884 the pipes to the museum of fine arts gave out. From these pipes I had expected long service, thinking that there was no possible chance for water to reach them, but it was found that owing to their being packed tight in the "gutter piping" with the charcoal filling, the expansion and contraction had broken the joint between the two halves of the gutter pipe, thereby allowing

ing, the expansion and contraction had broken the joint between the two halves of the gutter pipe, thereby allowing the charcoal filling to absorb the moisture from the earth, with the usual result—viz., rapid destruction of the pipes. In the next winter (1885) the pipes supplying the manual training-school failed. Here it was found that the pipe-fi.ter, with his usual forethought, had run the pipes immediately under some water-closets, so that any overflow from the closets dripped down upon them, and although they were covered with a coating of cement the expansion had cracked it so that the water readily found its way to them. Thus burst succeeded burst every winter, until in April, 1887, a burst in the main return-pipe (from the university) created considerable anxiety regarding the April, 1887, a burst in the main return-pipe (from the university) created considerable anxiety regarding the condition of the whole main line, which up to this time had given no trouble. About 535 feet of the main line is laid in St. Charles Street, which is macadamized, and has good drainage, and it was hoped that these conditions had secured to the pipes underlying the street immunity from our enemy, water. This afterwards proved to be the case, as far as we took it up (335 feet), with the exception of about 25 feet immediately underlying a point in the street where the surface had become broken. As the need for a separate pipe to run the various small engines need for a separate pipe to run the various small engines in the physical and mechanical laboratories and elevatorn the physical and mechanical laboratories and elevator-pumps had become pressing, it was finally decided to open the street to a point opposite the manual training-school, where an attachment could be made to the pipe supplying steam to the engine in that building, which would give these machines steam of the proper pressure, and separate them from the heating system, which was desirable, owing to the fact that we were compelled to maintain such pressure as would run these machines in the heating apparatus, which often resulted in largely overheating the buildings.

buildings.

It was also decided to renew those pipes that passed through the yard, and as our experience had been adverse to the use of covering around the pipes, owing to its acting as an absorbent, and also to an objectionable smell from it, when wet, finding its way into the buildings. It was now determined to protect it in a different manner. As I am of the opinion that there is no better non-conducting medium than confined air, that was the plan adopted. First, a floor of hard hydraulic pressed brick was laid down in cement, and well grouted in; a single course of brick was then laid along edges of the floor, forming a "stringer." Upon this stringer 21-inch "gutter pipe" was laid, forming an arch over the pipes. All joints and connections were well cemented. I his, it is believed, will keep the pipes dry, but if water should get

in it has a chance to run away to the sewer connections in

in it has a chance to run away to the sewer connections in the expansion chambers without wetting the pipes, as they are carried on rollers 1½ inches in diameter, and the floor is slightly hollowed out in the centre under the rollers.

The cost of protecting these pipes in this manner has been \$1.25 per running foot. The value of the pipes is about \$3 per foot.

As stated heretofore, the pipes in the street were found to be in fairly good condition; the boxing was badly rotted in those parts where it was only a short distance below the surface (about three feet at the shallowest part:) below the surface (about three feet at the shallowest part;) the top, which had been put on without cross-bars under it, was split its entire length, and was crushed in, so that the middle of the boards rested upon the pipes, the edges remaining on the sides of the box. The covering that was remaining on the sides of the box. The covering that was around the pipes had also rotted away to a large extent, leaving the upper sides of the pipes uncovered; some portions of it was found in the lower part of the box among the coke breeze which appeared to have been ground down by the contraction and expansion of the pipes until the box was only about half full or slightly less, it being less than half its former bulk, as the boxes when laid were followed to their warest consents: filled to their utmost capacity.

PLUMBING IN THE RESIDENCE OF MAX NATHAN, ESQ.

No. II. (Continued from page 152.)

THE arrangement of pipes in the kitchen and a portion of laundry is shown in Fig. 4. Two boilers are represented: A' for the low (street) pressure supply and B' for high (or tank) pressure Only one water-back is required for heating the water for the two systems of supply. A heater is provided as shown between the boilers at C', which is explained in detail in Fig. 4, to which the reader is referred to clearly understand the following description. The general course and use of each pipe is as follows: The low-pressure supply flows |

When the high-pressure system is in use, the stop-cock projecting above marble slab is opened, which permits water to flow into fixtures, but prevented from flowing into low-pressure system by a check-valve.

The hot water in pipe D passes up through check-valve to supply toilet-basin through D'. A pipe branches from D in hall, indicated by D', passing into and through laundry, drying-room, and into storeroom, and up partition wall to second floor, thence along floor to cut-off in dressing-room. The cold water flows direct from pipe A in cellar up through elevator shaft at M to cut-off in bathroom, shown in Fig. 5, passing to toilet-basin through pipe M". The cold supply for toilet-basins in dressingroom runs vertically from cellar through storeroom to cutoff in dressing-room. The pipe E branches from B below heater, and is carried up back of it into hall and up to cut-off in bath-room, connected with D, as shown in Fig. 5, being utilized as a circulating pipe. The branch E' in hall runs parallel with D' to dressing room and there joins the cut-off in a similar manner, utilized for the same pur-

The high-pressure supply from tank is marked H in Fig. 4. The cold supply passes down elevator shaft, entering boiler B' at top, thence down as shown by dotted line and out at I, thence through J to water-back, passing out that through K to heater, where it heats the lower pressure supply which surrounds it; thence returning to boiler through L, and up through G' into elevator shaft, terminating over tank to relieve pressure in boiler. A pipe branches from G on second floor for cut-off, as shown in Fig. 5. Pipes branch also from this pipe on third and fourth floors to supply fixtures in bath-rooms.

The pipe C' branches from G in hall, thence parallel with D' to cut-off in dressing-room, connecting as shown in

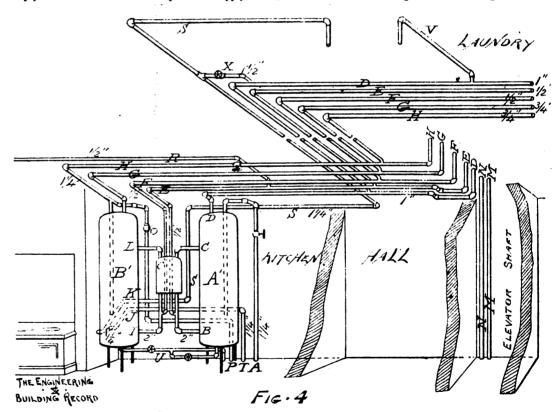

DIAGRAM SHOWING PIPE SYSTEM IN KITCHEN AND PART OF LAUNDRY RESIDENCE OF MAX NATHAN ESQ. N.Y.

from grease-trap up through pipe A, entering the boiler A' at top, thence down as indicated by dotted lines, passing out at B and up into heater C'. The water returns hot into boiler A' at C' and out into pipe D, passing through hall and up elevator shaft, supplying hot water for all fixtures in bath-room on second floor.

A cut off is illustrated in Fig. 5 that is secured to toiletbasin in bath-room, which is utilized to facilitate the control of the two systems of water-supply.

A duplicate cut-off is attached to toilet-basin in dressingroom on second floor, and the description now to be given applies to both. Four pipes are shown in Fig. 5, two for hot and two for cold water, M and D being the low-pressure, and H and G high-pressure supply. Stop-cocks are set between each pair of pipes as shown.

Projecting above marble slabs stop-cocks are set in pipes M and D for use when the check-valve fails to work

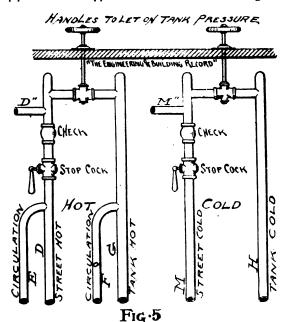

Fig. 5. The pipe F is a circulating pipe for high-pressure system, and branches from I below heater, thence up parallel with E to cut-off in bath-room, as shown in Fig. 5. A branch, F', leaves F in hall and runs parallel with E' to cut-off in dressing-room.

The cold supply for high-pressure system flows through branches from H on each floor running to fixtures in the bath-rooms. The cold supply from high pressure for dressing-room branches from H in hall, passing through H' up to cut-off. The pipe R branches from E and runs to opposite end of kitchen to furnish hot water for sink, extending also to butler's pantry. The cold supply for the sinks in butler's pantry and kitchen come direct from cellar. The waste-pipe from boilers is shown at U. The pipe P runs from cellar back of boilers and connects with high-pressure pipe H for an intermediate supply through check-valve O, between the high and low pressure systems. The boilers A' and B' contain 100 gallons each.

Digitized by GOOGLE

The connection between the kitchen and laundry range will now be described. The supply to water-back in laundry range is indicated in Figs. 4 and 6 by I. This pipe branches from pipe B under heater, passing back of boiler A' and down to cellar, there suspended to ceiling, and up to laundry-range, as shown in Fig. 6 at T. The pipe S branches from B above T, thence passing into hall and crossing over the pipes shown in Fig. 4, passing into laundry and down to range, as shown in Fig. 6.

The pipe V, in Fig. 6, branches from D' and passes over range and down, connecting with a stationary copper clothes-boiler in opposite end of range. A branch from this pipe extends down into cellar. A waste-pipe from clothes-boiler runs to cellar also, and is shown at W. A pipe connects copper boiler with flue above range to

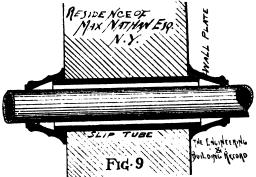

Detail of cut-off between high and low pressure supply.

Residence of Max Nardan Esq. N.Y.

remove excess of steam. If the hot water in flowing through pipe S from kitchen to laundry should meet water circulating from laundry range towards the kitchen with the same velocity, there would be danger of the flow becoming air-bound, and to avoid such a contingency a connecting pipe is inserted between S and D', in which a valve is set, as shown at X in Figs. 4 and 6. This valve is intended to be left open sufficiently to permit passage of air into D', but not open enough to affect the direction of flow in pipe S and D'.

The illustration in Fig. 6 is a view of clothes-drying rack, one of which is drawn out into laundry. The drying-room, as previously stated, is situated between toilet-room

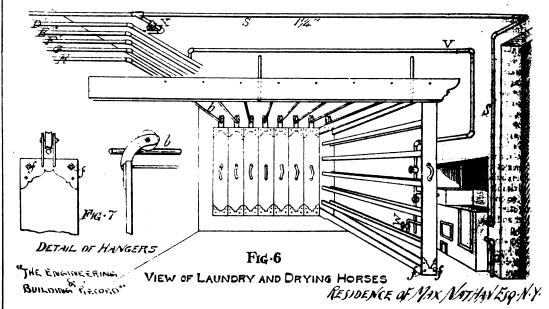

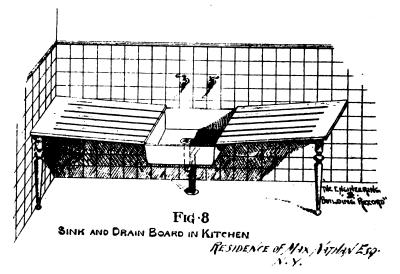

METHOD OF SECURING PIPES THROUGH —

and hall, the dimensions being about 8x10 feet. The device for drying clothes consists of eight horses, each being six feet high, eight feet long, and one foot in width. They are suspended on tubes with iron rollers, as shown in detail at b and f in Fig. 7. These hangers consist of iron plates screwed to front and rear ends of horses. The iron braces carrying the rollers are a continuation of the plate, all being one solid piece. The frame of the horses consists of boards, front and rear, fastened together by four strips set in pairs, two at top and two at bottom, which form the frame. These strips are 1x5 inches at top and 1x6 inches at bot-

tom; but the latter has one inch of width cut out nearly the whole length of lower edge, as shown in Figure 6. A plate corresponding to top, minus the braces carrying roller, is secured to front and back at bottom. To supply additional strength to these horses rods are inserted, each one-half inch in diameter, running in pairs the entire length at top and bottom, their position being indicated in Figs. 6 and 7 at F by heavy black circles. The tubes on which the rollers travel are suspended in laundry as shown by a horizontal girder 2x8 inches. This girder is supported by two hangers made of galvanized pipe secured to ceiling, and also by one end resting on partition wall. The tubes on which the rollers travel are suspended from ceiling in drying-room by means of hangers also made of pipe. Each horse is provided with wooden bars that form the racks on which the clothing to be dried is suspended. The bars are in pairs as shown, and are 1x2 inches, mortised into front and back of frame. A handle

JOHN SEALY HOSPITAL AT GALVESTON. THE Committee on Building the John Sealy Hospital, to be erected at Galveston, Tex., through its Secretary, Dr. W. H. Baldinger, officially notified Architect N. | Clayton that his plans for the structure have been adopted. Mr. Clayton has embodied in his plans all the latest improvements in hospital construction and sanitary arrangements, particularly concerning ventilation, heating, the comfort of the patients, and the convenience of the management of the institution. The plans adopted embrace all the important features to be found in all the leading hospitals of the country. The system of buildings consists of four separate structures, conveniently grouped and connected together, yet entirely isolated from each other by scientific means and for sanitary reasons. The administration building is a square structure, forty six feet on each side and ninety feet high. It consists of three stories above an eight-foot basement, and is terminated by

is secured to front for use in throwing them out. Coils of steam-pipe run on floor in drying-room under the horses, supplying the heat necessary for drying purposes.

The kitchen sink is located on opposite side from hall, and is shown in Figure 8. Draining boards are provided on each side made of ash with grooves, as shown, that are about three eighths of an inch in depth, and two inches apart. These draining boards are secured to the wainscot and outer edge, supported on turned legs of ash. A rim of wood is secured to entire edge exposed to prevent dishes from slipping off. A wainscot of tiles extends from floor up above this sink.

Figure 9 shows the method of supporting pipes at all points where they pass through partitions. The device consists of a short tube passing through the partitions with a thread cut on each end, which permits a wall-plate to be screwed on. These tubes are large enough to allow the collars of each pipe to slip through. When the pipes are inserted and wall-plate screwed in position the pipes are suspended in the centre of the tube.

(To be continued.)

a curved pavilion roof, and fronted with a covered portico On each side of this pavilion is situated one of the ward buildings, thirty-three feet by seventy-six, and sixty feet high, thus making, with their connections to the adminis. tration building, and this building itself, a continuous length of 218 teet. The wards will consist of two stories over the eight-foot basement, the first story being devoted to the medical ward and the second story to the surgical ward. As there will be two such wards of two stories each; one will be devoted to the accommodation of male and the other to that of female patients. An elevator, located in the interior of the administration building, and of such dimensions as to admit a bed or stretcher, will facilitate access from this central point to either of the wards, and carriages will be enabled to drive through a porte cochere existing behind the front steps, right up to the very starting point of that elevator in the basement. The domestic service of the institution will be accommodated in another separate building.

THE FALL OF THE ELEVATED RAILROAD HOISTING-ENGINE IN BROOKLYN.

On Broadway, in Brooklyn, J. B. & J. M. Cornell have for some months been erecting a structure for the use of the Union Elevated Railroad Company. The columns are of 15-inch channels, latticed in the usual way, and at the point where the accident occurred were spaced sixty feet apart longitudinally and forty-five feet apart transversely. They were connected by single transverse plate-girders about four feet deep, with reinforced chords. On the top chords of these rest the four lines, two for each track, of longitudinal drop-end plate-girders, which are four feet deep, with \(\frac{1}{2} \)-inch webs, and unreinforced chords of $6 \times 6 \times \frac{1}{2} \times 1$ -inch angles, weighing about six tons each.

The columns and transverse girders having been erected by portable derricks, the longitudinals are hoisted into place by trussed arms secured between the pairs of longitudinal girders already erected and extending half-way over the next span. The hoisting-engine and boiler for this work are carried on a platform traveling on the longitudinal girders, and which, when in use, is nearly over the transverse girder between the two last-erected spans. About 10 A. M. on the 14th inst. a set of longitudinals had just been erected, the trussed arms had been placed in position, and the traveler, weighing ten or fifteen tons, was being hauled ahead for a fresh lift, and had a little passed the centre of the next to the last erected span, when, without w arning, it fell to the street below with the four girders on which it rested.

A horse car passing underneath was crushed, the driver and two of the erecting gang were instantly killed, another man has since died, and about a dozen others were more or less seriously injured.

It is not possible to fix the immediate cause of the accident with absolute certainty, but the following facts may be noted as suggesting a possible explanation:

The longitudinal girders, attached by only two bolts at each end, are not braced in any way whatever until after the traveler has passed. This is done partly to avoid the inconvenience of having a gang of riveters between the traveler and its work, and partly to avoid having the traveler run over the heads of the rivets used to attach the bracing.

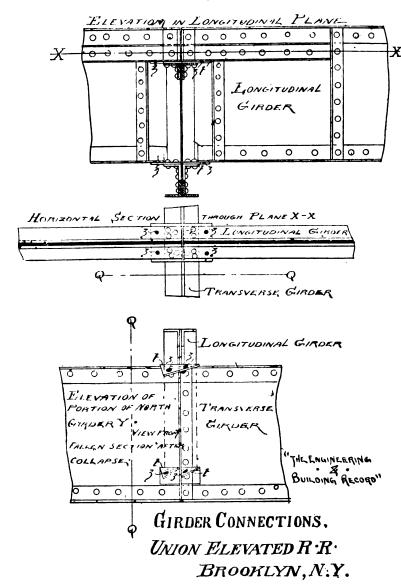

The girders that fell all laid with their top chords in the same direction.

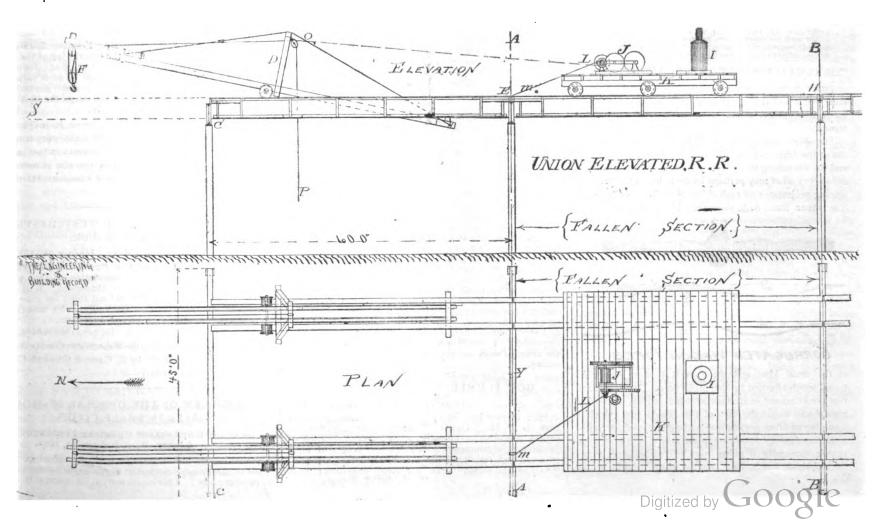

They bore evidence of all having been bent in the same direction before striking the ground, which they did upon their convex sides, and were more or less straightened again by the fall. The cracks, bends, and buckles in both top and bottom chord angles plainly showed this.

Of the sixteen unbraced girders left standing all but one or two that were practically straight were curved more or less, some of them apparently as much as two inches, in the direction in which the others fell. This curvature was probably due to rough handling on trucks or lighters, or in transfer from one to the other, but that

it should have always been in the same direction seems at least a singular coincidence.

Lastly, the men engaged in hauling the traveler ahead stated that the rope, instead of being fastened directly ahead, was led off very much to one side, so as to pull the traveler strongly in the direction in which most of the

other girders were already sprung, and in which the ill-fated ones actually fell.

DESCRIPTION OF ILLUSTRATIONS.

In the details of girder connections, t t show the plates by which the longitudinal were connected to the transverse girders, and z z are the holes for the connecting bolts, which had been put in the upper plates only. The elevation of a portion of the transverse girder Y shows the plates t t as they appeared after the accident, bent down on the side toward which the tops of the longitudinal girders lay after they fell. Only one lower plate was so bent.

On the general plan and elevation, D shows the trussed arms secured in place ready to lift the next set of longitudinals by tackle F with hoist-rope O running back to hoisting-engine J, which, with boiler I, was carried on traveling platform K.

It was originally intended to have had the hoisting-engine on the ground, in which case the hoist-rope would have led downward as at P, but this was not permitted.

The rope L, by which the traveler was being hauled ahead, is said to have been made fast at the point m on girder Y. While this may have afforded a reasonably fair lead when the traveler started from the previous span, it was obviously exciting a strong lateral pull when in the position shown, which, as near as can be ascertained, is about where it was when the accident occurred-

Everything between points A and B fell to the ground. The tops of the fallen girders lay toward what would be the west if the arrow on the plan pointed due north, as shown. It really points about north-west.

As already mentioned, almost all the unbraced girders left in place were more or less sprung in that same direction. The columns were just inside of the curb lines.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

CORRUGATED ROLLED STEEL WAGON-TIRES

THE illustrations show Fox's patent corrugated rolled steel tire, a recent English invention, designed especially for use in towns where tram-lines are laid through the streets.

The object of the invention is to assist the wheel to get out of the tram-line and thus avoid skidding of wheels and the wrenching of vehicles and horses. The invention consists of what may perhaps be described as a series of sloping projections on each side of the felloes of the wheel. The inner lines, A A, show the width of a plain tire-bar

of the usual kind, and the lines B B show the additional width afforded ty the projections. It is claimed that the increased width thus afforded enables a wheel to engage and mount the sides of the groove into which a tram-line so often degenerates without a wrench or jerk—a matter of great importance in the case of a heavily laden vehicle, especially if going down hill. The Leeds Forge Co., Limited, Leeds, Eng., are the manufacturers of the tire.

INDICATOR-DIAL FOR STEAM-GAUGES, ETC.

DANIEL L. MITCHELL, of Taunton, Mass., has patented the right to paint one-half of his steam-gauge dial black or red, it he chooses, and leave the remainder white. His object is to provide a danger-field on the face of a gauge, the better to warn the attendant of the limit of safe pressure. His first claim is: "A sight-signal or indicator having a field or dial the face of which is painted or otherwise made in two strongly contrasting colors, with a clearly-defined dividing-line at any desired point, in combination with an index-finger or pointer arranged to move over said field or dial, and having its outer face painted or otherwise made in the same two strongly contrasting colors."

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

ON THE POLICY OF MAKING LEAD BENIS IN PLUMBING SHOPS.

NEW YORK, February 1, 1888.

SIR: In reference to its being profitable, I cannot agree with the writer of the article "Regarding the Making of Lead Bends," in your issue of January 7. 1888. His method of forming the bend is ingenious and new to me as applied to this particular industry, but not new to the old-time plumbers who were often called upon to make water-backs out of iron pipe. Just about such an arrangement of blocks was used by them, only the faces of the blocks were neatly lined with band-iron to preserve them against the red-hot iron pipe. In those days our bends and traps were all made up in the dull months of winter and midsummer, by hand, but sheet-lead was the invariable material. Those were the halcyon days of plumbing in this country for the journeyman. In our shop a 4-inch S-trap was a day's work, and I have often wondered if the boss—who, by the way, was a long, lank, good-natured New York plumber, with a down-east twang—ever laid awake nights trying to learn why it was that twelve men could work six days and produce each a 4-inch S-trap at the close of the day and still have only twelve to twenty traps on the shelves at the end of the week.

Some of the old timers can explain it. My present foreman is of that ilk, and he says it don't pay to make traps and bends in the shop—and he knows; that is, looking at it from the well-worn bench in a good-natured way. Now, how does the man in the office view it? He says two feet of 2-inch pipe weighs ten pounds, at a cost of six cents per pound. Correct, Mr. Stool; but if the boss can buy a 2-inch machine-drawn bend, perfect in shape, uniform in calibre, and equal in thickness and strength throughout for "from forty to fifty cents," will you tell me how it can be profitably made on the bench if the pipe alone costs 20 to 50 per cent. more than the complete machine-made bend, to say nothing of the cost of the other items that go with the hand-made article—as time, fuel, solder, etc.? Mr. Stool says, "That's my question, and I will go on hunting for that little mistake in my trial balance while you work it out."

BUFFALO.

SIR: In reference to the matter of lead bends referred to in THE ENGINEERING AND BUILDING RECORD of January 7, and to the policy of keeping men employed in making same when work is dull, it might be well to have a few on hand in any shop, as they might suit in some instances. But in regard to keeping men employed for any length of time on such work, it would not pay any employer. Take any good plumber and put him on work where such bends are required and he will prefer to make his bends to suit the different positions. Besides, a good workman would make as many of these bends in one week as the average plumbing establishment would use in a year—that is, of 1½-inch and 2-inch; those are the sizes referred to; the larger sizes can be purchased cheaper than they could be made up. I think the plumbing trade of the country are at a loss to k..ow at present what they could keep some good men employed on in dull times in their workshops that would pay. I made up some lead service-boxes two years ago and have had them on the shelf until within a few weeks; however, they came in good for old lead for calking, etc. I have a few good men that I may in a short time not have work for, but I wish to keep them employed. I would really like to know what I could put them to work on that would remunerate me for the outlay.

HOW PLUMBERS MAKE LEAD BENDS.

MILWAUKFE, Wis., February 6, 1888.

SIR: In your issue of January 28 is a communication from L. D. H., giving very workmanlike instructions in regard to making lead bends, and as I wrote the article of January 7, recommending the use of bench-blocks, I wish to thank your correspondent for the article above referred to, and would like to hear from him further.

W. G. NICHOLSON.

TON, D. C. STAUNTON, VA., January 30, 1888.

EXAMINATION OF PLUMBERS IN WASHING.

SIR: You will please let me know through your valuable paper what examination a plumber has to stand in Washington, what questions are asked, and what answers given. If they have been published in your paper please forward me copy of same. What license does a plumber have to pay in Washington? By answering the above you will greatly oblige C. B.

[At present no examination is required, nor any license fee, the regulations adopted by the District Commissioners last spring having been declared illegal by the court. The regulations in question (under which nearly all the master plumbers of Washington were examined last summer), were printed in our issue of April 30, 1887. The nature of the questions asked is there stated, and a report on the examinations was given in the issue of October 1, 1887.]

NOISE ABOUT BOILER PROBABLY DUE TO IMPROPER CONNECTIONS.

ARLINGTON HEIGHTS, MASS., February 2, 1888.

SIR In our house we have a No. t Gorton steam-heating boiler supplying about 150 square feet of heating surface. Occasionally, when there is no steam on, the water in the boiler falls three or four inches with a very disagreeable sound (which I cannot explain). You will, therefore, conter a great favor on a constant reader of your paper if you will explain the cause and state remedy for same. Also, when the boiler is filled with coal for the night there is a cracking sound, unlike that heard in the pipes, and at regular intervals. Any information on the cause and cure for this will also be gratefully received by

J. L. B'xby, Jr.

[You do not send sufficient data for an intelligent reply. In cases of this kind a diagram should be sent, showing the manner and arrangement of all the pipe connections and their diameters.

Symptoms such as you describe are usually the result of improperly connecting boilers, and do not show any inherent defect in the boilers themselves. Indeed, they will occur with any boiler improperly connected. If the pipe from the upper end of the combination-gauge cylinder is a branch of the main steam-pipe, it will account for the subsidence of the water after steam is down. Tap it into the head of boiler direct.

Without knowing more about the particular boiler von have we cannot speak as to the cause of the cracking at night. Why it should go on at night any more than in the daytime we cannot understand. The coal slipping through the magazine will make a little noise any time it moves.]

HOT. WATER HEATING IN MR. WYLD'S HOUSE, TORONTO.

GARDINER, ME., February 8, 1888.

SIR: Am much interested in the description of the hotwater heating in the residence of F. Wyld. Esq., Toronto, Can., but would suggest that it would be more valuable were the scale of the plans given, or some method by which we could form some idea of the size of the building.

Yours truly.

C. E.

[The main part of Mr. Wyld's house is 50x56 feet and the extension 34x24 feet. The main story front is 14 feet in the clear and the second floor is 12 feet in the clear. Our custom is either to mark the size of rooms or give a scale. In this case, however, it was omitted through an oversight.]

HOT-WATER HEATING OF WESTCHESTER COUNTY ALMSHOUSE.

MINNEAPOLIS, MINN., January 28, 1888.

SIR: THE ENGINEERING AND BUILDING RECORD of December 3, 1887. contained description of hot water heating apparatus in Westchester Almshouse. Will you please inform me where I can find out about the pipe-coil boiler that was used in that institution, who makes it, etc., and much oblige. Yours very truly,

SUBSCRIBER.

[The pipe boilers used in the Westchester County Almshouse heating were made by C. Garth & Co., 536 Craig Street, Montreal, Canada.]

THE PROBLEM OF THE DISPOSAL OF HOUSE WASTES IN SMALL CITIES.

BELOIT COLLEGE CHEMICAL LABORATORY, BELOIT, Wis., January 31, 1888.

SIR: Can you inform me, through your columns, what is the most advisable method of disposing of house wastes in smaller cities? This whole section of country is upon

a deep layer of drift made up of calcareous gravel for the most part. Our city has an excellent system of waterworks, but no system of sewerage, and we must therefore on our own lots dispose of this waste. How can this be done most effectually, and what is the construction of the best practical cesspool which may not injure either our own health and comfort or that of our neighbors?

I remain yours respectfully, E. G. SMITH.

[The best thing to be done when a town or city has become large enough to have a general system of watersupply is to provide a corresponding general system of sewage disposal, which will provide for this water after it has become fouled by household use.

It is not possible to lay down general rules as to how this can best be done in particular cases, but it is certain that the best thing to be done is to employ an engineer (an expert in sewerage works) to examine the locality and advise as to methods and cost. It would perhaps be possible to devise methods of disposal of excreta and foul water for a single house, which would, at all events, involve no injury to the health and comfort of the inmates of that particular house, but we do not know of any form of cesspool system which can be recommended for a town having a general water-supply.]

CONTROLLING THE DAMPERS AUTOMATIC-ALLY IN A HOT-WATER APPARATUS

SIR: Will you please inform me if there is any practicable way of controlling the dampers automatically in a hot-water apparatus? I have been using a hot-water system this winter and have felt the need of some such device to prevent boiling over through the expansion tank. Any information you can give will be appreciated.
Yours truly, W. P. POWERS.

[E. H. Cook & Co., of Rochester, N. Y., we believe have an apparatus that they claim will control the heat of the water and also open and close air-ducts similar to the ordinary regulating bowl. We believe there are some other contrivances for the same purpose, but we are not conversant with them. Presumably some of our readers can furnish further information on this subject.]

AMERICAN SOCIETY OF CIVIL ENGINEERS.

A REGULAR meeting of the American Society of Civil Engineers was held on February 15. Vice-President J. J. R. Croes presided, and about thirty members were present. Mr. H. P. Bell being absent, his promised paper on the "Estimation of Quantities by Diagrams" was not presented. An interesting paper, by Mr. Gratz Mordecai, Assoc. M. Am. Soc. C. E., was read on "The Classification of Railroad Accounts and the Analysis of Railroad Rates." Mr. I. T. B. Ives, F. G. S., exhibited and explained a "Strata Map," illustrating the geological formation of a portion of the United States by superimposed layers of variously-colored cardboard representing the different strata.

Mr. T. C. Clark, by request, told what was found by the committee appointed to investigate the Albany Capitol ceiling, and described the construction of the groined arches, their loading and subsequent settling and present cracked condition, showing that ultimate failure was inevitable, and outlined the proposed remedies. The irregular and excessive loading of the masonry (in some cases about twenty tons per square foot) was noted and the fact that the foundations sustained it with only a trifling settlement. Messrs. Cooper, Brush, Emery, Bogart, and Lucius joined in the discussion.

CLOSING SALOONS REDUCES REVENUE FROM WATER RATES.

WE saw a statement that the anti-saloon movement at Fargo, Dakota, had resulted in reducing the revenues of the water company.

In response to an inquiry, we learn that this is to a certain extent true, since the breweries and saloons were large consumers and paid proportionate water rates. What this reduction will amount to we presume the official report will ultimately show.

THE MARINE RAILWAY AT HONOLULU.

It was built in 1881, the first ship being hauled up in 1882. The cradle is capable of taking a vessel of 1,500 tons displacement, and 180 feet in length. The charges are 50 cents per ton for steamers and 40 cents for sailing vessels (builders' measurement). The average number of ships hauled up is about seventy-five per annum.

NEW ENGLAND WATER-WORKS ASSO-CIATION.

(Special Correspondence)

THE February meeting of this society was held in Boston, at Young's Hotel, on Wednesday, the 15th inst., and was attended by 65 members and guests, with President Darling in the chair, and a more sociable and thoroughly enjoyable gathering has rarely been known in the history of the association.

Dinner was served at 1:30 o'clock, and when cigars had been lighted President Darling called the company to order, and called upon the secretary to read the names of the applicants for membership who had been approved by the Executive Committee, and the secretary was instructed by vote to cast the vote of the association for the following gentlemen:

Active-Geo. A. Alexander, President Water Company, Bath, Maine; J. W. Ringrose, Secretary, New Britain, Conn.; Geo. E. Evans, C. E., Lowell, Mass.; R. A. Hale, Hydraulic Engineer, Lawrence, Mass.

Associate-Frank B. Durfey, Contractor, Norwich, Conn.; J. Henry Wells, Boston, Mass.

On motion of Mr. Baldwin, Mr. E. R. Jones, the veteran superintendent of the Eastern Division of the Boston Water Works, was elected an honorary member, and the gentleman returned his thanks in a few well-chosen words.

President Darling then introduced the topic assigned for discussion, namely, "The Waste of Water during the Winter Months," and called upon Dexter Brackett, Engineer in charge of the Mystic and Eastern Division of the Boston Water Works, to open the discussion.

Mr. Brackett stated that the cold weather had increased the daily consumption from 35,000,000 to 70,000,000 gal-

In a certain district the night rate of consumption rose from nine to eighty-nine gallons per head, and in another the consumption rose from 5.000 gallons per hour at 8 P. M., to 7,500 gallons per hour at 10 P. M.

Poor plumbing is, in Mr. Brackett's opinion, the greatest cause of this waste. Even if the supply is ample, the loss of head resulting from the excessive draught reduces the head on the distribution so that consumers on high levels cannot be supplied.

Mr. Kent, of Woonsocket, R. I., admitted that the cold weather has caused such trouble by freezing mains and services that he had asked the consumers to waste water to save more serious damage and loss, although it has raised the pumping time from six to sixteen hours per diem.

Mr. R. C. P. Coggeshall, of New Bedford, said that the cold weather had caused an increase of 400 gallons per tap per day. Mr. Nevons, of Cambridge, stated that the consumption had increased 100 per cent., but in spite of this some smaller mains have frozen, and no serious effort is made to prevent the wasting.

President Darling, of Pawtucket, described the results of a broken hydrant, from which the water worked its way for a considerable distance under the frozen surface of the ground and appeared in house cellars where the soft ground allowed it to come to the surface.

Mr. E. R. Jones, of Boston, spoke of the attempts in that city to stop waste by night inspection and by an imposition of fines, both of which have practically failed, and expressed an opinion that at present there is not any practicable method for stopping cold-weather waste. He referred to his experience in 1875, when over 2,000 services had to be allowed to go untouched until Nature undid its own work, and described the method followed in Boston for thawing with hot water and a small block-tin pipe.

Mr. Parker, of Burlington, Vt., has decided that the only way for them to prevent frozen services is to put them below frost, and now covers all pipes with six feet of earth, and if a pipe is found to be frozen it is let alone until spring and is then relaid to a proper depth. The discussion was participated in also by Messrs. Thomas, Hyde, Lockwood, Billings, Hawes, Walker, and Stacey. The following gentlemen were present:

C. F. Allen, Treasurer, Hyde Park, Mass.; J. Henry Brown, Supt., Charlestown, Mass.; Dexter Brackett, Asst. City Eng., Boston, Mass.; E. R. Jones, Supt., Boston, Mass.; W. C. Boyce, C. E., Worcester, Mass.; C. H. Baldwin, Boston, Mass.; Phineas Ball, C. E., Worcester, Mass.: W. R. Billings, Supt., Taunton, Mass.: R. C. P. Coggeshall, Supt., New Bedford, Mass.; Edwin Darling, Supt., Pawtucket, R. I.; A. B. Drake, New

Bedford, Mass.; F. F. Forbes, Supt., Brookline, Mass.; F. L. Fuller, C. E., Boston, Mass.; A. S. Glover, Registrar, West Newton, Mass.; Benj. Grush. Supt., Salem. Mass.; John Harris, Waltham, Mass.; E. A. W. Hammett, C. E., Boston, Mass.; H. N. Hyde, Jr., Supt.. Newton, Mass.; H. G. Holden, Supt., Nashau, Mass.; W. M. Harver, Fall River, Mass.; J. L. Harrington, Cambridge, Mass.; H. H. Knapp, Clerk, Lowell, Mass.; F. E. Hall, Supt., Quincy, Mass.; E. R. Jones, Supt., Boston, Mass.; Jos. A. Lockwood, Supt., Yonkers. Mass.; A. F. Noyes, City Eng., West Newton, Mass.; Hiram Nevons, Supt., Cambridge, Mass.; J. H. Perkins. Supt., Watertown, Mass.; A. G. Pease, Supt., Spencer. Mass.; F. H. Parker, Supt., Burlington, Vt.; Geo. J. Ries, Supt., E. Weymouth, Mass.; A. H. Salisbury, Supt.; Lawrence, Mass.; F. P. Stearns, Chief Eng. State Board Health, Boston, Mass.; Geo. A. Stacey, Supt., Marlboro, Mass.; Solon M. Smith, Supt., Grafton, Mass.; C. H. Truesdale, Supt., Quincy, Mass.; D. N. Tower, Supt., Cohassett, Mass.; M. M. Tidd, C. E., Boston, Mass.; L. A. Taylor, C. E., Boston, Mass.; W. C. Wilcox, Waltham, Mass; S. J. Winslow, Supt., Pittsfield, N. H.; Geo. E. Winslow, Supt., Waltham, Mass.; C. K. Walker, Supt., Manchester, N. H.; H. B. Winship, Norwich, Conn.

Associete-II. A. Gorham, Boston, Mass.; E. M. Bixby, Boston, Mass.; H. F. Jenks, Pawtucket, R. I. J. C. K. Otis, Worcester, Mass.; B. Frank Polsey, Boston, Mass.; F. E. Stevens, Boston, Mass.; C. W. Talcott, Woonsocket, R. I.; George Woodman, Boston,

Guests-Mr Welch; E. T. Ursville, Newton, Mass.; H. A. Goodnough, Boston, Mass.; Mr. Gardiner, Salem, Mass.; Mr. Brown, Salem, Mass.; Mr. Watts, Lawrence. Mass.; Mr. Johnson, Boston, Mass.; Mr. E. D. Holden, Lowell, Mass.; R. J. Thomas, Superintendent, Lowell, Mass.; Mr. E. D. Conant.

ENGINEERS' CLUB OF ST. LOUIS.

THE club met February 1, 1888 President Holman in the chair, thirty-five members and two visitors present.

The committee appointed at last meeting to report to the club suitable action on Mr. Waddell's efforts to reform the present practice in the building of highway bridges reported as follows:

Resolved, That this club express their approval of the pamphlet entitled "General Specifications for Highway Bridges of Iron and Steel," by J. A. L. Waddell, and deem it a well-considered effort to bring about a muchneeded reform.

That we recommend these specifications to the consideration of county and town boards as calculated to give structures both safe and economical when faithfully ried out, but that to insure these results competent engineering supervision is absolutely necessary.

That in the letting of highway bridge contracts, and in the acceptance of the finished structures, such boards shoul!, in all cases, call to their aid a competent civil engineer, and thus insure at once the public safety and the wise expenditure of the public funds. J. B. Johnson, Robt. Moore, N. W. Eayrs, committee.

The report was laid on the table to be called up in two weeks.

The following resolution was moved by R. E. Mc-Math:

Resolved, That the Engineers' Club of St. Louis fully endorse the suggestion recently made by the Chief of the Signal Service that self-registering rain-gauges be provided at all observation stations; also, Resolved, That we request the committees of the two Houses of Congress to insert in the next appropriation bill an item to cover the cost of such instruments.

This resolution was unanimously adopted. Mr. Carl Gayler then read a paper on highway bridge floors, giving several standard designs, with their weights and cost.

Mr. B. F. Crow read a paper on "Constructive Accounts," showing how the cost of the material and labor required to produce each integral part of a street car is found, by means of labor and material accounts with all the orders. One man does all the work due to this system of accounts for 150 workmen. Blank forms were shown and the method described in detail.

After a general discussion of this paper club adjourned.

THE old marine railway at Hunter's Point, near New York, could handle a vessel of 2,000 tons, and it was many years ago proposed to build three of like capacity at the Brooklyn Navy Yard, where now the large timber dry-dock is in course of construction.

WESTERN NEW YORK ASSOCIATION OF ARCHITECTS.

THE winter meeting of the Western New York State Association of Architects was held in Syracuse, February 7. The attendance was large, and the discussion on the matters considered was spirited and interesting. The morning hours were devoted to the examination of the exhibits of building materials, and at half past two o'clock the meeting was called to order by James G. Cutler, the president of the association, who delivered his annual address. He said that he hoped to see the day when all the architectural societies of the country would be consolidated into one great body, and he hoped that that body would include every reputable architect that could be found. He spoke at length of the rise of architecture, and said, "no good art work in architecture is possible without the highest technical skill on the part of those into whose hands the architect must entrust his design." The address closed with some complimentary allusions to the many schools of architecture.

The reports of the executive committee and of the treasurer were submitted and committees appointed.

Papers were read on "Architectural Education," by Professor C. Francis Osborn, of Cornell University, and on "Sewerage as Connected with Civil Architecture," by Emil Kuichling, C. E., of Rochester. Professor George F. Comfort, Dean of the College of Fine Arts, Syracuse University, made an interesting address on "The Facade of the Cathedral at Florence."

In the evening a banquet was tendered the visiting architects by the Syracuse Association.

At the conclusion of the banquet many toasts were made and the festivities ended with an address by President Cutler, who reviewed briefly the history of the association.

The association comprises these members, and nearly all were at the banquet, with several invited guests: George U. Baxter, Syracuse: Louisa Bethune, Buffalo: Robert A. Bethune, Buffalo; Otto Block, Rochester; Thomas Brit, Utica: E. M. Buell, Syracuse: A. C. Burdett, Buffalo; H. L. Campbell, Buffalo; John Hose, Watertown; I. O. Graham, Elmira; J. P. Johnson, Ogdensburg; W. Foster Kelly, Rochester; Edward A. Kent, Buffalo; D. D. Kieff, Watertown; J. H. Kirby, Syracuse; T. I. Lacy, Binghamton; W. W. Carlin, Buffalo; Charles E. Colton, Syracuse; G. Edwin Cooper, Utica; Charles T. Crandall, Rochester; J. R. Church, Rochester; E. A. Curtis, Fredonia; James G. Cutler, Rochester; Otis Dockstacder, Elmira; Asa L. Merrick, Syracuse; George J. Metzger, Buffalo; J. H. Murling, Buffalo; Thomas Nolan, Rochester; C. Francis Osborne, Ithaca; Charles R. Percival, Buffalo; J. H. Pierce, Elmira; A. A. Porter, Buffalo; O. W. Dryer, Jay Fay, Rochester; John Faulkner, Buffalo; Orlando K. Fort, Rochester; Fred H. Gouge, Utica; J.W. Griffin, Watertown; Ellis G. Hall, Syracuse; J. R. Porter, Buffalo: James A. Randall, Syracuse: W. H. Richardson, Rochester; Lewis P. Rodgers, Rochester; William H. Walker, Rochester; W. S. Wicks, Buffalo.

BOSTON SOCIETY OF CIVIL ENGINEERS.

The regular monthly meeting of the Boston Society Civil Engineers was held at its rooms on February 15, President L. Frederick Rice in the chair. A paper on the "Sewage Disposal at Medfield, Mass.," was read by Mr. Fred. Brooks. A paper by Mr. Wilbur F. Learned on the "Chemical Treatment of the Mystic Sewage" was read by him, after which there were remarks by Mr. F. P. Stearns and Mr. Ch. H. Swan. Meeting adjourned at 10 P. M. Thirty-eight members and seven visitors present.

STREET-CAR RAILS IN NEW YORK.

THE conference held at the Mayor's office between the Committee of the New York Chamber of Commerce, the Truckmen's Association, and the presidents of the various street roads resulted in little more than making apparent the fact that the street railroad companies were not disposed to make any changes in the present form of rails at their own cost. In other words, they will do no more than they are compelled to do towards securing better pavements in this city.

J. Reese, of Pittsburg, has patented a set of rolls, arranged to reroll old T-rails directly into small I-beams.

ENGINEERS' SOCIETY OF WESTERN PENN-SYLVANIA.

THE eighth annual meeting was held at Pittsburg, January 17, 1888. President Dempster, Directors Taylor, Hunt, Scaife and Phillips, and 47 members were present and 3 visitors.

Treasurer A. E. Frost reported: Balance on hand, January 7, 1887, \$425.97; amount received in 1887, \$1,469.50: total, \$1,895.47. Expenditures in 1887, \$1,733.78. Balance on hand, \$161.69.

Secretary S. M. Wickersham reported: Number of members January 7, 1887, 304; admitted in 1887, 39; total, 343. Resignations, etc., 13. Members on roll January 7, 1888, 330.

Ten regular meetings were held during the year, which were attended by 322 members and 18 visitors.

F. C. Phillips reported for the Library Committee, and the retiring President read an address, of which the following is an abstract:

To the Members of the Engineers' Society of Western Pennsylvania.

GENTLEMEN: Another year's experience has been added to the history of our society, and although it may not be classified as a "red-letter" year, the attendance, which is a good indicator of the health and vigor of the society, has shown a marked improvement over that of '86. This is, however, not yet what it should be, nor what it could be, if a little effort was put forth by the members.

The zeal of the older members is inspiring to new ones, and promotes life and activity in the whole. Let it, therefore, be the aim and ambition of every member to stir up the latent fires of enthusiasm, shake off the apparent lassitude, and determine that the coming year shall show such a change for the better that will form a cause of pleasure at the next annual meeting.

We note with pleasure the change that the committee in charge made at the first of April in our "meeting place," where arrangements have been made to remain until April, 1890. In these comfortable and easily accessible rooms, it should not require very much solicitation to attract the members to visit them frequently.

The library, under the care of the committee and the untiring labor of its chairman, has been placed on such a basis that there is no difficulty in procuring the information that its pages contain.

The financial status of the society is "normal"—we have not been in debt and do not intend to be. The report of the treasurer exhibits a satisfactory condition.

The number of papers presented and read during the year has shown a betterment over last year. We hope a further improvement may be realized in the coming year.

further improvement may be realized in the coming year.

The cultivation of "social intercourse" among the members has not been attended to as fully as it should be. Becoming "personally acquainted" is a great aid to the development of the aims of the society.

Our "standing committees" seemed to have been impressed with the idea that the word "standing" expressed the whole duty of the committee, and as a result they have not moved officially during the whole year. The true meaning of the word is to let all else remain standing but the work of the committee, and it should be so understood.

In conclusion, let each member feel that this is his society, in the prosperity of which he is individually interested, and show his zeal by his works in promoting its success.

According to your ability, let your light shine through the papers and discussions of the coming year, reflecting credit on yourselves, honor on the society, conferring a blessing on the community, and thus affording cause of real pleasure to your retiring President,

ALEX. DEMPSTER.

The following-named persons were elected unanimously to serve until January 15, 1889: as President, Alexander Dempster; as Vice-President (two years), W. L. Scaife as Directors (two years), T. P. Roberts, Chas. Davis; as Secretary, S. M. Wickersham; as Treasurer, A. E. Frost.

After the election, a paper, by Thos. J. Bray, was read on "Welded Steel Tubes," of which an abstract was given in our issue of February 4.

THE third annual meeting of the Association of Provincial Land Surveyors of Ontario will be held in Shaftesbury Hall, Toronto, Ontario, on February 28, 29, and March 1. The routine business of the association will be transacted and numerous papers on interesting subjects will be read and discussed.

THE UNIVERSAL EXPOSITION AT BAR. CELONA.

THE exposition of agriculture, industries, and fine arts, open to all countries, will be inaugurated at Barcelona, April 8, 1888, to continue for from six to ten months. This exposition has long been delayed by lack o' Government support, but the organization committee has now been at work two years, and last January the Spanish Government, pressed by public opinion, appropriated 2,000,000 francs for the purpose, and all the States of Europe and America were invited to participate. The plan of the grounds, containing 300,000 square metres of building and 350,000 square metres of open ground, embracing the park and gardens of the ancient citadel, is very irregular. The principal buildings are built to remain per-The most important is the Palace of Industry. manently. composed of 12 rectangular sections 21m. wide by 100m. long, which, alternating with 10 triangular ones having a base of 24m., form with an enlarged rectangular section or central pavilion a semi-circular structure whose inner radius is 84m, and the outer one 174m. Around its inner circumference runs a semi-circular hall 34m, wide, whose galleries communicate with every part of the structure, which covers 50,000 square metres. The Palace of Fine Arts, built of brick and iron, is a rectangle, soxioom, with a grand concert hall in the centre having double galleries 10m. wide. Machinery Hall is almost entirely of iron, 60x150m.; 4,000 square metres of its space is reserved for steam-engines and special machines. The charge for space for exhibits is 50 francs per square metre, except in the central galleries where it is 25 per cent. more and for machinery 4 per cent. less. Exhibitors requiring motive-power must apply three months before the opening of the exposition. The official participation of most of the European States has been assured.-Le Genie Civil.

WILLIAM C. KELLEY.

WILLIAM C. KELLEY, the reputed inventor of the Bessemer process of making steel, died at Louisville, Ky., February 12. The deceased was born in Pittsburg, Pa., in 1810, but when quite a young man married and moved to Lyon county, Ky., where he resided a number of years. He engaged in the iron trade and built one of the largest furnaces in the West.

PERSONAL.

FRANCIS LANDEY PATON, D.D., LL.D., has been elected President of the College of New Jersey, at Princton, N. J., to succeed Dr. James McCosh.

CHARLES H. CALDWELL, late of Albany, N. Y., has moved to Boston, Mass., and may be addressed care Messrs. Shipley, Rutan & Coolidge, 13 Exchange Street.

HEALTH COMMISSIONER GRIFFIN, of Brooklyn, has appointed Dr. R. C. Baker Secretary, in place of Dr. J. S. Young, who was lately promoted to be Deputy Commissioner.

DANA C. BARBER, C. E., has resigned his position in the office of the Engineer Commissioner of the District of Columbia, and has resumed the practice of his profession as a Civil and Sanitary Engineer in Washington, D. C.

SHIPLEY, RUTAN & COOLIDGE, architects, have removed their office (formerly office of H. H. Richardson) from Brookline, Mass., to 13 Exchange Street, Boston. Mass. The St. Louis office still remains at the old address. 417 Olive Street.

MR. THOMAS F. ROWLAND is very much improved in health, a stay at Lakewood, N. J., having proved most beneficial. He anticipates spending the remainder of the winter and early spring in the South and expects soon to resume active work.

MR. J. M. JOHNSON has been made Chief Engineer of the Louisville Bridge and Iron Company at Louisville, Ky., filling the vacancy created by the death of Mr. Gilman Trafton, which occurred about a year ago. Mr. Johnson had served as assistant to Mr. Trafton.

MR. B. MONTFORD has been made Chief Engineer of the Louisville and Nashville Railroad Company. The company has not had a chief engineer since Mr. De Funiah resigned five years ago, since which time Mr. Montford has been resident engineer and the late Mr. F. W. Naughn consulting engineer.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

RCHITECTURAL COMPETITIONS.

TARBORO, N. C.—Plans are wanted here or a new jail. Address the County Clerk.

SUMMERVILLE, MASS.—Plans are wanted ere for a Masonic Temple. Address the ecretary of the local lodge.

THE UNITED STATES TRUST BUILDING.

Architect R. W. Gibson, of Albany, has accived the commission for the new United tates Trust Company building, at 45 and 47 vall Street, New York. As yet few of the etails of the new structure have been decided pon.

A \$250,000 OFFICE BUILDING.

Austin Corbin is to erect an eight-story office uilding on the northeast corner of Broadway and John Street, New York, the cost of which ill be \$250,000. Architect Stephen D. Hatch as prepared the plans.

PLANS FOR AN APARTMENT HOUSE.

A new apartment house, to cover a plot 10x116 feet, seven stories high, is to be rected on the site of Holbrook Hall, corner f Sixty-second Street and Park Avenue. 4cKim, Mead & White, architects, are prearing the plans for the new structure.

FORT WORTH, TEX.—Plans are wanted or a large building for the Fort Worth Board f Trade. Dimensions, 75x100; six stories. The cost is not to exceed \$86,500. Address shape

for works for which proposals are requested see also the "Proposal Column," pages i-v-vi-vii-192.

Persons who make any use of the information they ind in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Jurraders will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

FRENCHTOWN, N. J.—L. D. Hagerman, he Town Clerk of this place, writes us under late of February 11, as follows: "At the last nunicipal election held in April, 1887, the juestion of 'better fire protection' was left to copular vote and was carried affirmatively by an overwhelming majority. The Council have juring the summer and fall employed a competent civil engineer, Professor H. C. Landon, who has been prospecting for the most available and economical method of water-supply. Several methods have been advanced, but none have been adopted as yet."

AUSTIN, TEX.—Concerning the reported ewerage project here, our correspondent writes as follows: "There is no proposition of the kind you name now pending in this ity."

AUTAUGAVILLE, ALA.—Our correspondent rites as follows: "Messrs. Smith & Muir, of his place, are putting in water-works to supply the town from a bold spring one mile disant from the town. The work is in operation and will be completed in twenty days."

ROCKDALE, TEX.—The City Clerk writes as follows concerning the water-works procet here: "The City Council as yet has done acthing toward establishing water-works. We have a Business Men's Association in our city hat speak of taking this matter in hand, but so far there is no matured plan."

RANDOLPH, MASS.—Concerning a circulated report that water-works were to be established here, we have received the following from the town clerk: "We have a system of water-works just completed."

PONTIAC, MICH.—The City Clerk of this place writes as follows: "The contract for water-works construction in our city has been

let to Shanley, Kelly & Parker, New York City. Work will be commenced as soon as ground opens."

READING, PA.—The question of improving the water-works system of this city is being considered by the officials. At the request of the Common Council, E. F. Smith, C. E., has made a complete investigation of the matter and has presented a report, together with plans, specifications, and estimates of the cost of the work. Mr. Smith, in his report, favors procuring a supply of water from Maiden Creek and maintains that it is the only feasible source for a sufficient supply for the growing demands of the city. He estimates the entire cost at \$165,944, which includes a first-class pumping engine, of a capacity of 3.000,000 gallons daily, and mains capable of delivering 8,000,000 gallons daily to the northern section of the city, to the connection of the Bernhart and other mains, thus allowing for future increase of pumpage. An analysis of the Tulpehocken, Schuylkill, and Maiden Creek waters, together with his opinions and conclusions upon each, and his recommendation as to the best supply to adopt, was prepared by Albert R. Leeds. Professor of Chemistry in the Stevens Institute of Technology, at Hoboken, N. J., some time ago. Both reports were referred to the Board of Health, with a request that that body should also prepare a report embodying its recommendation as to the best of the various proposed sources of supply from a sanitary standpoint.

MARBLEHEAD, MASS.—Our correspondent writes: "The matter of extending the waterworks of this town was laid over to the annual meeting of the town, which takes place next month."

MARINE CITY, MICH.—The proposition to bond the city in the sum of \$8,000 to extend the water-works system has been carried. The Common Council have instructed the Mayor and Clerk to negotiate a loan for said bonds, and the work of extending the watermains will be commenced as soon as the weather permits in the spring.

Newburyport, Mass.—The question of establishing a proper sewerage system for this city is being energetically discussed by officials, taxpayers and others, and it is probable that it will be solved at an early day. Numerous schemes to meet the end desired have been presented, but with no apparent success. The press of the city has taken up the matter and has procured opinions on the subject from experts and others. Among others who have made propositions to sewer the city is George H. Norman, the builder of the city's present water-works system.

SOUTH FRAMINGHAM, MASS.—The Framingham I'own Sewerage Committee, which was chosen in November, 1886, reported the estimated cost of the sewerage plan at \$140,000. The matter will be considered further at a town meeting, February 20. Our correspondent writes concerning the project as follows "I have no doubt it will be approved, and that the money will be appropriated to built the works. If it is built it will be after the plan described in the report."

Wheeling, West Va.—The Board of Water Commissioners is considering plans for improving the water-works system, and it is proposed to expend about \$50,000 in the work. Plans for two new reservoirs have already been made, one to contain 1,000,000 gallons, the other 2,000,000 gallons. They are to be heavily lined with brick and cement on clay. The other details of the undertaking are also prov ded for. The President of the Board can give details.

RALEIGH, N. C., has adopted sewerage plans prepared by J. L. Ludlow, C. E., of Winston, N. C., and will invite proposals for constructing the same. Extent, between fifteen and twenty miles. Particulars may be obtained from C. G. Latta, Chairman Sewerage Committee, Raleigh, N. C., or from J. L. Ludlow, C. E., Winston, N. C., engineer in charge.

PADUCAH, KY.—Our correspondent writes: "We have a first-class water-works, stand-pipe system; twenty years' contract from September, 1886."

OSHKOSH, WIS—A movement has been inaugurated by the Common Council towards the purchase of the water-works system by the city. It is probable that this question will be submitted to the people at the spring election.

GORDONSVILLE, VA.—Our correspondent writes, under date February 15, as follows: "A bill is now before the Legislature authorizing the town to issue \$10,000 in bonds for the purpose of constructing water-works; will pass this week. The water will be brought in 6-inch pipe between 1½ and two miles from a spring."

IRONDALE, ALA.—It is reported that a reservoir is to be erected here.

CAMBRIDGE, IND.—Water-works are contemplated.

LANSINGBURG, N. Y.—It is reported that a new \$25,000 reservoir is to be added to the water-works plant.

WAVERLY, IND.—A water company has been organized here.

MARBLEHEAD, MASS.—An election will be held March 15 to settle the question of bonding the place in the sum of \$20,000 to increase the water-works system.

FARMINGTON, ME.—An old water-works project has revived here, and public meetings are being held to further efforts toward the establishing of a system of water-works. The Town Assessors have the matter in hand.

BRAINTREE, MASS.—The Water Commissioners will soon contract for a full set of water-works machinery. Col. A. C. Drinkwater is at the head of the commission and has full charge of the details.

COLUMBIA, S. C.—The question of building an additional reservoir and making other improvements to the water-works system here is occupying the attention of the Common Council. The estimated cost of the improvements under consideration is about \$12,00. The matter has been laid over for future action. City Engineer D. B. Miller can give particulars

TROY, ALA.—The water-works question is being agitated here. J. M. Henry can give details.

BRIDGES.

PORTLAND, ME.—The Maine Central Railroad will, it is reported, erect eight iron bridges to cost \$50,000.

WEST TROY, N. Y.—"The bridge is to be built by the State officials. The village officers have no control over it, as it spans the Erie Ganal, owned by the State."

OTTAWA. ONT.—Engineers have made surveys for the proposed inter-provincial bridge which is to span the Ottawa. The distance from shore to shore is 700 feet, whilst the whole work of bridge and approaches will be 2,000 It is thought that the three governments, Dominion, Ontario and Quebec, will all grant bonuses, and that the municipalities benefited should also do the like. The estimated cost is \$125,000.

BAY CITY, MICH. — Our correspondent writes: "The bridge question will be submitted to the people at the special election to be held Monday, February 20."

Washington, D. C.—President John A. Shank and others, of the Ohio River Commission, have appeared before the River and Harbor Committee of the House and made an argument in favor of the improvement of the Ohio. The ultimate plan favored by the commission calls for twelve dams, similar to that at Davis Island, between Pittsburg and Wheeling, five of which they want commenced immediately with an appropriation of \$1,000,000, with additional appropriations from year to year, so that the five dams may be finished about the same time. They have also filed a strong protest against the construction of the new passenger bridge at Cincinnati and against unnecessary bridges generally, declaring that 35 per cent. of all the coal lost in transportation is by accidents at bridges.

CADDON, COL.—Address the Bent County Commissioners for details of an iron bridge to be erected over the Arkansas River. ST. PAUL. MINN.—City Engineer Rundlett has called the attention of the City Council to the dangerous condition of the long span of the Wabash Street bridge over the Mississippi. He maintains that it is to be only a matter of time when the bridge will fall. Bids for rebuilding the long span of the bridge will be received.

STEET-WORK AND PAVING.

COLUMBUS, OHIO.—There is to be considerable paving and other street work done here at once. For details address City Clerk Bryan.

GAS AND ELECTRIC-LIGHTING.

Webster City, Iowa.—Gas works are to be established here.

FORT PLAIN, N. Y.—An electric light plant is to be established here.

THOUSAND ISLANDS, N. Y.—An electric light plant is to be established here. For particulars, address F. A. Kenny, Syracuse, N. Y.

BROOKLYN, N. Y.—At a recent meeting of the Common Council, a report was adopted fixing the cost of lighting the city during 1888 the same as existed during the past year, which is, for electricity \$182.50 per lamp and for gas from \$19.80 to \$22 per lamp.

BAY STATE, MASS.—The officials of tais place are considering the question of establishing an electric-light plant. The town clerk can give particulars.

BONDSWELL, MASS.—Boston parties will establish an electric-light plant here.

MUNSON, MASS.—An electric-light plant is to be established here.

THORNDIKE, MASS. — The electric-light question is being agitated here.

GARDNER, MASS.—An electric-light company is to be organized at once.

PALMER. MASS.—This place is to be lighted with electricity by a Boston company.

FORT WORTH, TEX.—Address W. H. Little for details of \$50,000 electric-light plant to be erected here.

BUILDING INTELLIGENCE.

MATAWAN, N. J.-An insane asylum, to cost \$185,000, is to be erected here. Address, for details, Dr. McDonald.

PHILADELPHIA. — Our correspondent writes: "The prospects for the building business for the season of 1888 from present indications are exceedingly favorable. ent indications are exceedingly lavorable. Already a number of large operations are being arranged for, and the builders and contractors think the coming will be a season in advance of last year. Among the large structures is an eight-story building of the Girard Life Insurance, Annuity and Trust Co. of Philadelphia, corner of Broad and Chestnut Streets, having a front on Broad Street of or feet and on Chestnut on Broad Street of 95 feet and on Chestnut Street of 100 feet. The fronts will be of Indiana lime stone, the rest being of brick. The building will be heated with steam, lighted by electricity, and rapid elevators will communicate with each floor. The architect is Mr. Addison Hutton of this city. The contract has been awarded for its construction to J. E. & A. L. Pennock, for, it is said, \$340,000, but it is estimated the cost complete will be \$375,000.

"Another building to be erected is a

\$300,000 structure, to be built on the ground formerly occupied by the Temple Theatre, on Chestnut Street, between 7th and 8th Streets. The building will be 101

by 220 feet.
"A number of other large private structures are talked of."

DELEVAN, WIS.—A \$50,000 hotel will be built here by Chicago parties.

Racine County will build a \$40,000 insane asylum.

Vernon County will build a \$35,000 insane asylum.

MARINETTE, WIS.—A \$150,000 saw-mill will be built on Tweedle Island.

PRAIRIE DU CHIEN, WIS.-A \$300,000 addition will be built to the Catholic Col-

TOMAHAWK, WIS.—A \$350,000 lumber mill and dam will be built here by the Tomahawk Land and Boom Co.

MILWAUKEE, WIS.—Chambers st, fr bldg; cost, \$10,000; o, Milwaukee Base-ball Club; a, Ed V Koch & Co; b, open.

Grand av, br entrance to \$200,000 opera house; cost, \$50,000; o, Davidson Bros. Eight buildings less than \$7,000.

CHICAGO, ILL.—At Chicago City Hall, addn for building department and detective quarters; o, City; a, Commissioner of Bldgs Edbrooke.

Wabash av, nr Peck Court, re-erection of Libby Prison, which is to be removed from Richmond, Va; o, stock company; a, Burnham & Root.

487-89 N Clark, alterations in business bldg; cost, \$10,000; o, Elbridge Hanecy; a, Flanders & Zimmerman.

PROPOSALS.

(Continued from page viii.)

PROPOSALS FOR

Pumping Machinery.

OFFICE OF THE
DEPARTMENT OF PUBLIC WORKS,
CHICAGO, Feb. 13, 1888.

SEALED PROPOSALS will be received by the city
of Chicago until 11 A M. Saturday, March 31,
1888, for the construction, delivery, and erection upon
and within the foundations, pump wells, etc., to be
provided in the city of Chicago of five engines, together with suitable pumps and the necessary boilers,
all to be fully equipped and complete for constant
daily use in connection with the city water supply,
according to specifications on file in the office of the
Commissioner of Ruildings.
Proposals must be made out upon blanks furnished
at said office, and be addressed to said department, indorsed "Proposals for Pumping Machinery." and be
accompanied with \$2,000 in money or a certified check
for the same amount on some responsible bank doing
business in the city of Chicago and made payable to
the order of the Commissioner of Public Works.
The Commissioner of Public Works reserves the
right to reject all bids.
No proposal will be considered unless the party

the order of the Commissioner of Public Works reserves the right to reject at y or all bids.

No proposal will be considered unless the party offering it shall furnish evidence satisfactory to the Commissioner of Public Works of his ability and that he has the necessary facilities, together with sufficient pecuniary resources, to fulfill the conditions of the contract and specifications provided such contract should be awarded to him.

Companies or firms bidding will give the individual names, as well as the name of the firm with their address.

GEO. B. SWIFF.

Commissioner of Public Works.

IRON BRIDGE.—Proposals are wanted at Boston, Mass., until February 24 for building and erecting an iron bridge over the railroad at Wood Island Park. Address the City Engineer.

, BROKEN STONE, ETC.—Proposals are wanted at Washington, D. C., until February 23, for piles, lumber, sand, pebbles and broken stone for reservoir outlet, Potomac River improvement. Address Peter C. Hains, Lieutenant-Colonel of Engineers.

BRIDGE.—Proposals are wanted at Bloomfield, Fla., for building an iron draw bridge across the Ocklawaha River. No date specified. Address the County Commissioners.

I.UMBER.—Proposals are wanted at Galveston, Tex., until February 25, for about 500 M, feet of best quality yellow pine lumber, according to specifications. Address B. Adove.

JAIL.—Proposals are wanted at Lawrenceville, Ga., .til March 21, for building a stone jail. Address J.

FI.AGSTONES, ETC.—Proposals are wanted at Baltimore, Md., until February 27, for furnishing flag-stones, Belgian blocks, cooblestones, iron gutter plates, and sand, to be consumed in repairs to streets, etc., during the year 1888. Address A. E. Smyrk, City Commissioner.

JAIL.—Proposals are wanted at Knoxville, Ga., until March 6, for building a brick jail. Address B Le Sueur.

ELECTRIC TIGHTS.—Proposals are wanted at South Boston, Va., for the building of an electric-light plant. No date specified. Address Joseph Stebbins.

ELECTRIC LIGHTING.—Proposals are wanted at Milwaukee, Wis., for lighting the court-house, county jail and House of Correction by electricity. No date specified. Address the County Committee on Public Buildings.

BUILDING.—Proposals are wanted at Yankton, Dakota, until March 27, for building additional wings to the insane hospital. Address the Building Com-mittee, Yankton Savings Bank, that city.

PLUMBING.--Proposals are wanted at Washington, D. C., unt I March 2, for the labor and materials required in the erection of the plumbing and gas-fitting required for the post-office, etc., at Terre Haute, Ind. Address Will. A. Freret, Supervising Architect.

SEWERS.—Proposals are wanted at Washington, D. C., until February 23, for constructing t2 to 20 inch terra-cotta pipe sewers in certain streets. Address Charles W. Raymond, Major of Engineers, Commissioners, D. C.

PROPOSALS.

PROPOSALS.

Louisville Water-Works.

TO CONTRACTORS.—Sealed proposals, addressed to the President and Directors of the Louisville Water Co., and endorsed "Proposal for Fulloring Inlet and River Work," will be received at the office of said company, 540 Third Street, Louisville, Ky., until 12 o'clock M., of Monday, the second day of April, 1888, and at that time will be opened and read in the presence of the bidders or their representatives. Bidders are required to state in their proposals, under oath, the names and residences of all the parties interested therein, whether as indiv duals or business firms and companies. Bidders are required, with each proposal submitted, to enclose a certified check in the sum of one thousand (\$1,000) dollars as a forfeit to the Water Company in case of a refusal for any reason to promptly enter into a contract and bond on the part of any bidder to whom the work may be awarded. Bids must be made upon the accompanying Slank form, in the filling up of which the price must be stated both in written words and figures. Any bid submitted otherwise will be declared informal and rejected. The person or persons to whom the contract may be awarded will be required to appear at the Water Company's office, with acceptable bondsmen as sustets, and execute the contract within six days from the date of lotification that the work has been awarded to him or them, and in case of failure or neglect so to do he or they will be considered as having abandoned it, and as being in default to the Louisville Water Company to the amount of the check deposited with the proposal as liquidated damages. General plans and detailed grawings, with the specifications, can be examined at the Water Company folice, from 9 A. M. to 5 P. M., until the day the bids are opened. Not less than two bondsmen will be required from the party to whom the contract may be awarded, and the amount of the bond shall be \$5,000, for which sum the bondsmen shall be jointly and severally liabe, as a guarantee that the party entring int

to the water Company. The Water Company reserves the right to reject any or all proposals submitted. LOUISVII.LE WATER COMPANY, by Charles R. Long, President.

TO CONTRACTORS.—S aled proposals, addressed to the President and Directors of the Louisville Water Company, and endorsed "Proposal for building Engine-House and Engines Foundations, will be received at the office of said company, 540 Phrid Street, Louisville, Kv., until 12 o'clock M., of Monday, the second day of April, 1888, and at that time will be opened and read in the presence of the bidders, or their representatives. B'dders are required to state in their proposals, under oath, the names and residences of all the parties interested therein, whether as individuals or business firms and companies. Bidders are required, with each proposal submitted, to enclose a cert-fied check in the sum of five thousand (\$5,000) dollars, as a forfeit to the Wat r Company in case of a refusal for any reason to promptly enter into a contract and bond, on the part of any bidder to whom the work may be awarded. Bids must be made upon the accompanying blank form, in the filting up of which the price must be stated, both in written words and figures. Any bid submitted otherwise will be declared informal and rejected. The person or persons to whom the contract may be awarded will be required to appear at the Water Company's office, with acceptable bondsmen as sureties, and execute the contract within ix days from the date of notification that the work has been awarded to him or them; and in case of failure or neglect so to do, he or they will be considered as having abandoned it, and as being in default to the Lousville Water Company to the amount of the check deposited with the proposal, as liquidated damages. General Plans and detailed drawings, with the specifications, can be examined at the Water Company's office, from 9 A. M. to 5 P. M., until the day the buds are op ned Not less than four bondsmen will be required from the party to whom the contract runs be finence,

De accept ible to tine water Company reserves the right to reject any or all proposals submitted. LOUISVILLE WATER COM-PANY, by Charles R. Long, Pres. dent.

TO BUILDERS OF PUMPING ENGINES.
—Sealed pri posals, addressed to the President and Directors of the Louisville Water Company, and indorsed Proposal for Pumping Engine, will be received at the office of the Louisville Water Company. No. 549 Third Street, Louisville, Ky., until 12 o'clock M. of Monday, the second day of April, 1888, and at that time will be opened and read in the presence of the bidders, or their representatives. Bidders are required to state in their proposals, under oath, the names and res dences of all the parties interested therein, whether as individuals or business firms and companies. Bidders are required, with each proposal submitted, to enclose a certified check in the sum of ten thousand (\$10,000) dollars, as a forfet to the Water Company in case of a refusal for any reason to promptly enter into a contract and bond, on the part of any bidder to whom the work may be awarded. Bids must be made upon the accompanying blank form, in the filling up of whice the price must be stated, both in written words and figures. Any bid submitted otherwise will be declared informal and rejected. Tree persons to whom the co. tract may be awarded will be required to appear at the Water Company's office, with acceptable bondsmen as sureties, and execute the contract within six days from date of notification that the work has been awarded to him or them; and in case of faiure or neglect so to do, he or they will be considered as having abandoned it, and as being in default to the Louisville Water Company's office, with acceptable to the Louisville water Company to the amount of the bond same opened. Not less than five bondsmen will be required from the party to whom the contract may be awarded; and the amount of the bond shall be \$100,000, for which sum the bondsmen shall be jointly and severally liable, as a puarantee that the party entering into a co serves the right to reject any or all proposals submitted. LOUISVILLE WATER COMPANY, by Charles R. Long, President.

STEAM-HEATING PROBLEMS

Questions, Answers, and Descriptions RELATING TO

STEAM-HEATING AND STEAM-FITTING,

FROM

THE SANITARY ENGINEER.

With One Hundred and Nine Illustrations.

PREFACE.

THE SANITARY ENGINEER, while devoted to Engineering, Architecture, Construction, in Sanitation, has always made a special feature of its departments of Steam and Hot-Water Haing, in which a great variety of questions has been answered and descriptions of the sativations buildings have been given. The favor with which a recent publication from this centitled "Plumbing and House-Drainage Problems," has been received suggested the petition of "Steam-Heating Problems," which, though dealing with another branch of indeen is similar in character. It consists of a selection from the pages of The Sanitary Engineering Construction and answers, besides comments on various problems met with in the designing an construction of steam-heating apparatus, and descriptions of steam-heating work in oxize buildings.

buildings.
It is hoped that this book will prove useful to those who design, construct, and have

CONTENTS:

BOILERS.

BOILERS.

On blowing off and filling boilers.
Where a test-guage should be applied to a boiler.
Domes on boilers: whether they are necessary or not.
Expansion of water in boilers.
Cast vs. wrought iron for nozzles and magazines of house-heating boilers.
Pipe-connections to boilers.
Passing boiler-pipes through walls: how to prevent breakage by settlement.
Suffocation of workmen in boilers.
Heating-boilers. (A problem.)
A detachable boiler-lug.
Isolating-valve for steam-main of boilers.
On the effect of oil in boilers.
Iron rivets and steel boiler plates.
Proportions for rivets for boiler-plates.
Is there any danger in using water continuously in boilers?
Accident with connected boilers.
A supposed case of charring wood by steam-pipes.
Domestic boilers warmed by steam.

VALUE OF HEATING-SURFACES.

Computing the amount of radiator-surface for warming buildings by hot water.

Calculating the radiating-surface for heating buildings .— the saving of double-glazed windows.

Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.

Calculating the amount of radiating-surface for a given room.

room.

How much heating-surface will a steam-pipe of given size supply?

Coils vs. radiators and size of boiler to heat a given building.

Calculating the amount of heating-surface.

Computing the cost of steam for warming.

RADIATORS AND HEATERS. A woman's method of regulating a radiator (covering it

A woman's method of regulating a radiator (covering it with a cosey).

CITIZENS OF COLORADO ASK NATIONAL AID FOR IRRIGATION.

THE Board of Trade of Greeley, Colorado, have presented a memorial to Congress setting forth that there is much arid land in Colorado belong. ing to the Government which could be rendered fertile by irrigation; that all the summer flow of the mountain streams in many portions of the State has been already appropriated for purposes of irrigation; that frequent fires and domestic and mining requirements are rapidly denuding the mountains of the forests which protect the winter's snow from rapid thaw, thereby adding to the disastrous floods in the Missouri and Mississippi Valleys and diminishing the supply of water when needed for irrigation; that there are many valleys and lakes that can be converted into vast storage reservoirs; that the water used for irrigation percolates back to the natural water-courses, furnishing a new supply to the streams below, or is evaporated and gives rise to many a refreshing rain. They therefore think that, with an extensive system of storage and irrigation, Colorado will greatly add to the watersupply of Kansas and Nebraska, as well as render valuable a vast area of arid Government land in her own borders, and ask Congress to make suitable appropriation to construct a system of reservoirs in Colorado for irrigation purposes, and to reserve for that purpose suitable reservoir sites on the Government land before they are otherwise appropriated, and to provide for the utilization of the water thus stored.

Some citizens of a State that has neglected to protect her forests are now petitioning the general Government to protect them from the consequences of such neglect.

The memorial to Congress of the Board of Trade of Greeley, Col., which we have condensed above, asking for national aid in the matter of irrigation, and setting forth as a prime reason for such aid the rapid destruction of the mountain forests, certainly strongly suggests that it is not only the right, but the duty, of Congress to protect our forests by wise national legislation.

The petitioners plainly state, and, in fact, it is the main ground of their appeal for national aid, that the evils resulting from the destruction of their forests are not confined to their own borders, but extend to neighboring States. This clearly shows that forest preservation should not be left, as in this case, to the caprice or negligence of individual States. It should be made the subject of well-considered and far-reaching Congressional enactment, and that without de-lay, or we shall have no forests left to protect. If there is any doubt about the jurisdiction of Congress in such a case, it can at least repeal the duties on lumber, and to that extent remove the incentive to wield the axe. Paradoxical as it may sound, protection to our lumber is destruction to our forests.

THE TRANSPORTATION OF STRUCTURAL IRON-WORK.

IT will be remembered that the circumstances of the fall of the girders of the Union Elevated Road indicated that they probably failed by simultaneously buckling to one side, which the lack of bracing permitted them to do.

This theory receives incidental confirmation from the testimony at the coroner's inquest of the man who was standing by the hoisting-engine taking in the slack of the rope by which the traveler was being hauled ahead. He said: "I was suddenly swung against the engine and then the whole affair dropped into the street.'

Reference to the illustrations accompanying our description of the accident will show just where he must have been standing, and if the girders failed by buckling, the first movement of the platform would have been nearly horizontal, and in such a direction as to throw the man against the engine, or rather to bring the engine up against him, which would seem to him the same thing.

Another corroborating statement, though not brought out at the inquest, is that of a workman who was looking for a job, and who was an eyewitness of the accident. He was of the opinion that something "caused the girders to buckle."

If, then, we accept the theory of buckling as the probable immediate cause of the disaster, the curvature already described as observable in almost all the unbraced girders will easily explain why they buckled so readily and under such a comparatively light load.

How did these girders come to be so bent? The answer to this question brings us to the point we wish to enforce-namely, the importance of greater care in handling the finished members of metallic structures while in transit. In the bridge-shops they are carefully put to-gether and judiciously handled, and, presumably, properly stowed on cars or lighters when shipped; but whenever, as is almost always the case, transshipment is necessary from cars to lighters, or vice versa, or to the trucks on which they are to be hauled to the place of erection, they are at the mercy of stevedores or riggers, who think no injury short of actual fracture of any consequence.

Long plate-girders, so very strong one way and so very weak the other, are specially liable to suffer at their hands. They do not scruple to lift them on the flat by a sling in the middle, and if the chord angles fortunately escape a crack through the rivet-holes for the sway bracing no amount of permanent set disturbs their consciences. The plate-girder's troubles are not over, however, when it escapes from the hands of the stevedore. The truck on which it is laid or under which it is slung is never long enough to support its whole length. About a third of it usually projects unsupported behind, and the jolts and jars of ill-paved streets frequently put another more or less noticeable kink in it before its journey is completed. Some of the girders on this very work of which we have been speaking were so badly bent that they had to be forcibly straightened before erection.

Now engineers know, as riggers do not, that whenever a bar or a member receives a permanent set it must somewhere have been strained beyond its elastic limit—that is to say, the metal has been subjected to a strain at least double, perhaps much more than double that due to the maximum working load for which it was designed.

This would be bad enough had the strain been uniform in one direction, and sufficient to excite grave doubt as to the safety of using a member that had been so treated. Who, for instance, would accept an eye-bar that, having accidentally been made half an inch too short, had been forcibly stretched to the required length, still less one that had been stretched too long and then upset enough to make it right? Yet in an eye-bar that has been bent and straightened cold the metal at the point affected is in even worse condition. On one side it has been first compressed and than stretched; on the other side the reverse of this, not with a uniform strain, but with all degrees of intensity from the neutral axis out. What chance is there that this metal will all pull together with anything like the efficiency of an uninjured bar?

In a plate-girder that has been similarly treated the injury, owing to its greater complexity of structure, is likely to be even greater, and yet, if it can by any means be forced into its place and held there, the erecter thinks it is all right, and no inspector can thereafter guess what its internal strains may be by any process with which we are acquainted.

It is to cover contingencies like these that engineers are obliged to use such expensively large factors of safety. Factors of ignorance at present advisable or permissible we shall not at present discuss, but that the precautions should be taken, we think, admits of no discussion. Had it been done, perhaps some lives might have been saved the other day in Brooklyn.

A WAGON-TIRE FOR STREET-CAR TRACKS.

WE gave last week under this heading in our Novelty column an English invention designed to enable vehicles to get out of the car tracks with less difficulty and danger than is ordinarily experienced in so doing.

That such a device as this should be considered necessary is a forcible commentary on the evils and injury to wagon traffic resulting from the use of certain street rails, and while this invention may serve to lessen the dangers to certain vehicles, the obvious and only right remedy is to remove the cause. As Mayor Hewitt says in his recent message, the centre-bearing rail should go.

In this connection it is of interest to note that a resolu-

In this connection it is of interest to note that a resolution is pending before the Board of Aldermen to compel the removal of the centre-bearing rail from Broadway. blocks diagonally. It strikes us that this would drive many people out of their homes and compel them to live farther away from their occupations, a result doubtless profitable to the street cars, but not to the inhabitants. After all, perhaps, both as regards the time saved in riding, and the energy saved in not walking, everything depends on what you do with the savings."

A SOLDIERS' MONUMENT PROPOSED FOR NEW YORK CITY.

An Aldermanic Committee has recommended the creation of a public fund of \$250,000 in \$100 shares to be called "The Soldiers' Monument Stock of the City of New York," the proceeds to be used as indicated by its name. The Board of Aldermen have decided to adopt the recommendation and have appointed Mayor Hewitt, Controller Myers, Gen. John Newton, General Martin T. McMahon, Jordan L. Mott, Henry Hilton, and President Forster, of the Common Council, a com-

A COUNTRY STORE AT OAK PARK, ILL. -GEORGE H. EDBROOK, CHICAGO, ARCHITECT.

they have well been called, but it is not so much ignorance of the properties of the material as it is ignorance of the amount of misuse and abuse that the material is likely to receive.

The remedy is simple and obvious. The inspection in the interest of the purchaser, which should begin, at least, at the rolling-mill and cease only when the material has been finally erected, should have no such dangerous gap left in it as this period of transit is now permitted to make. Some one should be with the material at all times, at least on all occasions of transshipment, that knows how such material should be handled and has the authority to make his knowledge effective.

We are inclined to believe that if this and similar precautions were always carefully attended to, enough could be safely saved on the weight of the material to amply cover their expense.

Whether such reduction of weight would be

THE ECONOMIC WASTE OF WALKING.

In a lecture recently delivered before the Franklin Institute Prof. Haupt has been astonishing the world by his calculations on the saving to be effected by rapid transit. He calls the results "intensely practical," and insists that the prosperity of a community is fostered by recognizing the facts he discloses. The Electrician says: "We do not feel quite so sure about it ourselves, but our readers can judge. By doubling the velocity of the street cars in Philadelphia half an hour might be saved for each passenger, and a saving of 23,148 years would annually be effected on the aggregate passengers using the cars. At first we were inclined to suggest that the passenger would save his time altogether by not taking the ride. But the curious professor assumes that everybody must ride or walk, and he evidently is dead against walking, a method of locomotion which involves continuous loss of energy, in New York computed at 8,333,333 horse power. To effect a large economy in this item he proposes to erect fresh thoroughfares, cutting through the existing mittee to select a site. It is to be hoped that they will be guided by greater wisdom than was displayed by those who recently selected sites for the new municipal buildings in the same city.

buildings in the same city.

The city furnished 140,000 men to the late war, of which over 12,000 died in the service, and it would certainly seem as if their valor and patriotism deserved some fitting recognition from their mother city.

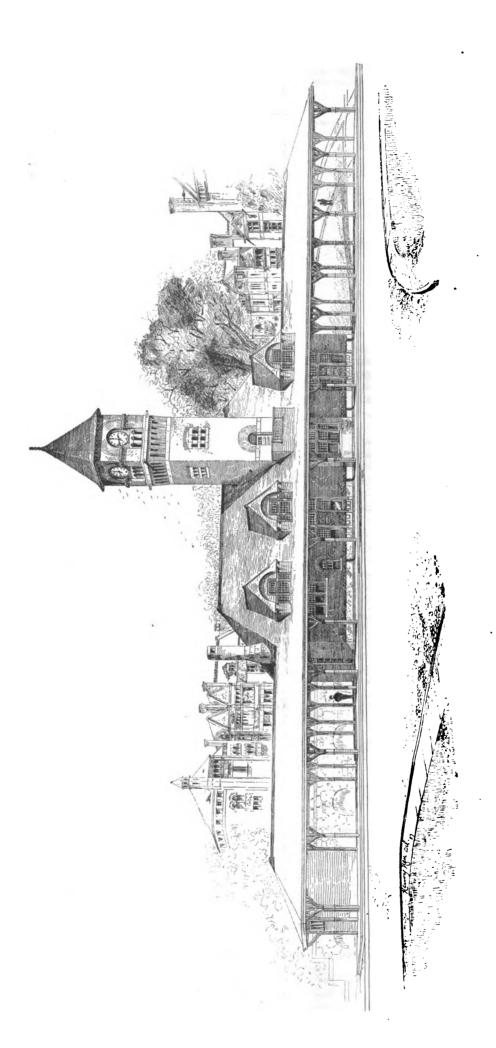

THE HIGH BRIDGE PARK.

THE Park Commissioners of New York City have adopted the plans for this park prepared by Park Super-intendent Parsons and Landscape Architect Vaux. The public will be allowed to inspect and object on March 6.

THE ARCHITECTS' OBJECT TO THE PRO-POSED COMPETITION FOR THE NEW MUNICIPAL BUILDINGS IN NEW YORK CITY.

THE New York Chapter of the American Institute of Architects object to the site selected for the proposed municipal buildings in that city, but, if that is irrevocably fixed, ask that the following changes be made in the mode of competition:

First.—That the manner of grouping the buildings and the planning and distribution of the rooms be left to the competitors, limited only by the specified requirements of space for the various departments, etc., to be accommodated.

modated.

Second.—That disinterested professional experts, who should be architects of acknowledged ability, experience and standing, should be appointed, to whom all the plans would be referred for analysis and classification, and who would make a detailed report to the commission for their consideration with recommendations as to the award of premiums and choice of plans.

Third.—That the successful competitor should be appointed architect of the building, provided that in case he should not be, in the judgment of said experts and commission, a person of sufficient artistic, or constructive or administrative capacity, then there shall be appointed an associate or consulting architect, so qualified, whose compensation shall be deducted in equitable proportion from that of the architect.

The protest of the Architectural League, presented to the Mayor by a committee of the league, consisting of J. Beverly Robinson, Frank A. Wright, A. II. Thorp, William B. Tuthill and Frank Waller, is made in a general way against the terms of the competition, and says: "In our judgment a competition of such magnitude demands careful preliminary consideration at the hands of professional advisers of known ability, and we respectfully urge that the terms be modified through such agency even at this late day. It is only by such action that men of acknowledged reputation commensurate with the dignity and importance of the municipality can be secured as competitors."

Neither of the architectural bodies nor its individual members believe that Mayor Hewitt's plans will be carried out, and they almost unanimously believe that the Legislature will step in to interfere.

The New York Times in commenting on the matter says:

"The remonstrance of the architects against the procedure adopted by the Commissioners of the Sinking Fund in relation to new municipal buildings is unnecessary, except for the future admonition of that body. The project is already dead. It was evicently an attempt to evade the law, and was thus of questionable legality, while it was of unquestionable absurdity. Any architect could have told the commissioners that their plan was impracticable and ridiculous, and thus saved them from the mortification of baving their blunders so exposed in the public prints that they have not attempted to defend them, while the Mayor has made some ineffectual attempts te disown them. Next time they will doubtless show more deference to the statute empowering them to build than they did this time, and they will also be likely to take the opinion of some reputable architect before, instead of after, adopting and promulgating a plan 'out of their own heads.'"

THE Congressional House Committee on Commerce has decided to report favorably the bill to charter the Nicaragua Canal Company. The bill, as amended, will require a majority of the directors of the company to be American citizens, and the president of the company to be a civizen and resident of the United States.

PAVEMENTS AND STREET RAILROADS.

No. XXVIII.

(Continued from page 150.)

ASPHALT AND OTHER PAVEMENTS IN THE CITY OF LONDON.

A SEPARATE report was made this year on asphalt pavements. The tests of thickness by pieces cut out, weighed for compressed asphalt from about 16½ to 22 pounds per square foot; the original thickness being about 2 to $2\frac{1}{2}$ inches and reduced thickness $\frac{1}{16}$ to $\frac{3}{2}$ of an inch less. It would seem to indicate less care in compression in some cases than in others.

In 1874 a patent "asphalt" pavement, consisting of tar, cement, sand, and sawdust, laid 2½ inches thick while hot under a pressure of 112 pounds per square inch on concrete foundation, was tried, and taken up in two months.

Another, called a metallic asphalt, consisting of blocks 2x2 feet and 4 inches thick, made up of manufactured "asphalt" and burnt ballast, also failed in the same time.

This year the "Court of Common Council" resolved, "That in their opinion tramways in the City' of London will occasion greater inconvenience to the general public and to the traffic within the city than they will conduce to the convenience of the public."

A special report made this year on asphalt and wood pavements gives conclusions as follows: Asphalt is less noisy than granite and wood less than asphalt. Asphalt needs close attention to repairs or is speedily knocked to pieces. Wood is in time unequally worn, and causes more jolting and noise than when new; disturbing those inside of carriages, however, the most. Large blocks with wide joints wear more unequally than small blocks with close joints. Asphalt is smoother, cleaner, and drier. Water remains longer on wood and dirt remains in the joints. The smell mentioned in connection with wood has caused no complaints, and, on the contrary, people living on line of streets paved with it are anxious to have it continued. Asphalt is most pleasing to the eye, and, on the whole, most pleasant to travel upon. Both should be kept perfectly clean, but this is most difficult with wood. Washing is the best method for all pavements. This makes asphalt slippery, but does not affect wood. One can be laid about as fast as the other. In good weather 125 to 120 yards laid per day. Asphalt is easily repaired and wood less so, and not so permanently.

As to slipperiness, it was found in Paris that I horse in I,308 slipped on granite, and I in I,409 on asphalt. An extended series of observations for fifty days in London, with weather mostly dry and cold, the asphalt sanded, when wet, gave one fall for each horse traveling 191 miles on asphalt and 330 on wood. On wet days this became respectively 192 and 432 miles. The complete falls were in the ratio of about I wood to 4 asphalt. The wood gives more chance to the horse to save himself, while a small quantity of mud makes asphalt very slippery. It is more difficult for the same reason for a horse to get up from the latter.

Wood, on the contrary, seems to be more slippery when frost and snow prevail. It is not so safe at ordinary times to drive fast on asphalt as on wood; and a horse can be stopped quicker on the latter, except in frost.

Compressed asphalt in all cases proved more durable than other asphalts. The opinion is expressed that no asphalt will last more than four to six years without much repairs, and that their entire surface must be renewed in from six to ten years. The cost reported on eight compressed asphalts at the date of the report for whole cost and maintenance for the seventeen-year term was, per year, from 1s. 4½d. to 2s. 4½d., the average being 1s. 8d.

At the same date wood pavements were reported, under a heavy traffic, as lasting 9 to 11½ years, the total surface having been relaid at least once, and additional blocks inserted from time to time, the mean total cost per annum being 2s. $7\frac{1}{2}d$. for those under heaviest traffic and 2s. $4\frac{1}{2}d$. for lighter traffic.

In 1875 Ludgate Circus was completed, giving a diameter of 160 feet, and greatly relieving the consequent traffic at that point.

A large number of patent wood pavements laid down for experiment, replacing granite blocks.

Cleansing of the footways begun by the Commission in 1872 was continued, and a method of sprinkling streets by means of perforated pipes laid along the curbs put in operation as an experiment.

The slipperiness of asphalt had become a subject of complaint, and sand recommended as a remedy, sparingly used

In 1876 the granite sets with "asphalt" joints, laid three years before, were found to be in very bad condition, as it was impracticable to remove blocks for repairs without considerable expense, the smallest repair requiring a boiler and special heating apparatus. The pavement was a noisy one also.

The apparatus for removing snow by melting was used, and the cost of melting a cubic yard found to be $11\frac{1}{2}d$, 192 feet or gas melting one yard. Salt was then used, and then forced towards the gullies by hand labor.

This year another patent apparatus for washing streets from pipes along the centre was put in place for trial.

A number of new "resting-places," or refuges for pedestrians in crossing public streets, were constructed. This very desirable improvement is worthy of imitation in many of our crowded cities.

In 1877 another of the patent pavements, called "Barnett's iron asphalt," proved a failure, and the company threw up its contracts for maintenance.

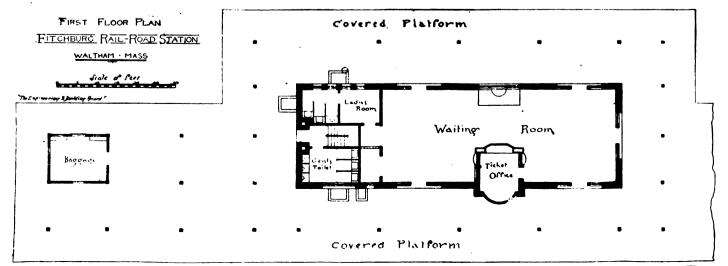

The compressed asphalt seemed steadily growing in

This year a pavement of blocks composed of clay highly compressed and hard-burned was laid. The blocks were 3½x8 inches and 6 inches deep, weighing 12 pounds. These were laid on "ordinary ballast," with ¼-inch joints filled with ballast. The removal of granite block pavements continued.

The use of salt on the streets for removing snow ("coupled with quick and careful sweeping so soon as the salt has done its work") was continued as the most effective means.

In 1879 Davison's patent iron and asphalt pavement was laid, consisting of iron frames with projecting iron studs, set in mastic asphalt on a concrete foundation. A similar one with lead disks proved a failure in three months. Up to this date thirteen kinds of asphalt pavements and eleven of wood had been laid, so that nearly every portion of the great arterial thoroughfares were paved with one of these.

In 1880 the iron and asphalt pavement and one of the mastic asphalts proved failures, also a "noiseless granite" pavement laid on felt, etc.

Digitized by Google

This year was laid a sidewalk pavement consisting of slabs made of pulverized granite sifted to the fineness of sand, mixed with Portland cement and water, and, after setting, dipped in a silicate of soda. A nuisance of steam disharged into sewers, and escaping into streets, etc., was abated by the Commission forcing the construction of a special sewer by the offenders.

In 1880 another subway for pipes, etc., was constructed by parties owning property on each side of a newly-opened street. A specimen of the so-called granolithic pavement, made of crushed granite and lime or cement, was laid. Wood and asphalt had now almost entirely replaced granite in the main thoroughfares and many of the minor streets, asphalt predominating. Three more "resting-places" were introduced.

The construction of subways was again forcibly urged as the only means by which to prevent tearing up of the streets.

In 1882 the washing of streets by a hose and jets having been in use two years was reported upon favorably. In the same year a special report gives the annual cost of maintenance only of various pavements as follows:

The average for 16 of Val de Travers compressed asphalt was 1s. per yard; of 7 Limmer compressed asphalt, $9\frac{1}{2}d$.; of 5 Sociéte Francais des Asphalte's compressed asphalt, 11d.; of 9 improved wood, $12\frac{1}{2}d$.; of 18 of all kinds of wood, $13\frac{1}{3}d$.; and of 5 granite block, $5\frac{1}{2}d$.

In 1883, the report states that "the most favorable period for using water (for cleansing streets) is when the surfaces of the wood and asphalt are in a moist and greasy condition," the mud being then most easily removed. Street washing was done on 187 nights.

In 1884 the so-called International pavement, consisting of large blocks of asphaltum and crushed limestone, highly compressed, and laid on a concrete foundation, of which a specimen was laid three years before, proved a failure. The Asphaltic Wood Pavement Company also failed. The large amount of sand required on the asphalt pavements and the removal of the mud formed is reported as requiring 50 per cent. more laborers to care for the streets.

In 1885 complaints were made of smell arising from a wood pavement. The street was one on which the sun rarely shines, and not being well adapted for wood, it was replaced by asphalt. The Henson Wood Paving Company failed.

In 1886 the engineer reports all the wood pavement companies as either bankrupts or as having failed to fulfill their contracts but three.

This ends the list of reports received to the present time. There are many other matters treated in them; and being the summary of the experience of such a dense population, the results are especially valuable to city engineers everywhere.

REINFORCED WATER-PIPE BELLS.

THE first pipe of the duplicate main which is to supply water from Lintrathen Loch to Dundee has just been laid. The jointing of the old pipes was on the turnedand-bored principle; but Mr. J. Watson, the engineer, is of opinion that this system tends to make the line of pipe too rigid, and does not leave it free to yield to fluctuations in the temperature of the water. In the new pipes the sockets are to be dovetailed inside, and the spigots placed freely in and calked with lead. Over each socket a steel hoop is then shrunk. In order to ascertain the value of the respective methods of jointing, Mr. Watson had a series of experiments carried out at the foundry in Glasgow where the pipes are produced. It was found, as the results of these experiments, that the unhooped pipe burst at a tensile strain of 18,885 lbs. to the square inch; while the hooped pipe did not burst till the pressure was 26,677 lbs. to the square inch-showing an advantage of 41.2 per cent. derived from the steel hoop. In the case of the unhooped pipe, too, it was observed that the fractured part was forced altogether out; but that in the case of the hooped pipe the cast iron was only fractured, the hoop remaining intact, and preserving the pipe in a more serviceable condition than the other—thereby limiting very much the amount of water which would escape. The new pipes are from 1 to 1¾ inches thick.—Journal of Gas-Lighting.

On the Midland Railway in England, adhesion of locomotives is promoted by the use of a very fine jet of sharp sand blown under the tread of the wheel by a blast of compressed air or steam. In France water has been used for the same purpose with good effect.

WOODEN WATER-PIPES IN COLORADO.

THE water-works company, of Denver, Col., is now laying wooden water-mains in certain localities which at present are so thinly settled as not to warrant the expense of iron-pipes. While the use of "temporary" construction in place of permanent work is not usually to be recommended, even at a considerable saving in first cost, there sometimes are places where, owing to the cost of transportation, or other difficulties, or the smallness of the revenue to be derived, the question is not between cheap work and good work, but between cheap work or none. We, therefore, present the details of the Denver system, whose advantages are: Small first cost; rapidity and cheapness in construction, requiring no skilled labor; facility in transportation, the component parts being small and light; sufficient strength and reasonable durability.

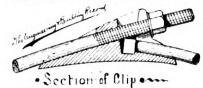

As the illustrations show, the pipe is formed of staves similar to those of a barrel, which are hooped together by

THE COLORADO WOODEN WATER PIPE

round iron bars. The ends of each hoop are held in a cast-iron clip or socket, one end having a T-head and the other being threaded to furnish means of tightening. The staves are about 3½ inches wide, of any

THE COLORADO WOODEN WATER PIPE

convenient length and dressed from 2-inch stuff to the required thickness, which varies from 1½ inches to 1¾ inches, according to pressure. The hoops are of ½-inch round iron and are spaced according to the size of the pipe and the pressure to which it is subjected, from 7 inches to 2½ inches apart. Inasmuch as the bursting pressure is

diem. The quantity of wood in feet, B. M., required per lineal foot is as follows: 24-inch pipe, 13 feet; 30-inch pipe, 20 feet; 36 inch pipe, 29 feet; and of iron from 20 to 40 pounds: 30-inch pipe therefore costs per foot about as follows:

or about one-quarter that of cast iron. Any kind of wood will answer for the staves which is fairly straight-grained and free from knots and shakes. In Denver California red wood is used, having been found superior, although more expensive than the native pine. The system is patented by Mr. Charles P. Allen, Chief Engineer of the Denver Water Company. We are indebted for the above facts and illustrations to Mr. W. Barclay Parsons, Jr., Mem. Am. Soc C. E.

EXPENSES OF THE WAR DEPARTMENT FOR PUBLIC WORKS.

THE total expenditure of the War Department during the last fiscal year on public works was \$9,863,552. Over \$100,000 has been spent on each of the following works during the year ending June 30, 1887-viz.: Building for State, War and Navy Departments, \$355,000; increasing the water-supply of Washington, D. C., \$348,000; purchase and reconstruction of Aqueduct Bridge, District of Columbia, \$121,000; improving harbors at Baltimore, Md., \$171,591; at Charleston, S. C., \$106,000; at Savannah, Ga., \$150,250; improving Gedney's Channel, New York, \$142,500; removing obstructions in East River and Hell Gate, New York, \$114,165; improving Delaware River, \$129,000; improving Potomac River, \$268,000; improving Great Kanawha River. \$112,500; improving Sabine Pass, \$165,000; improving Tennessee River, \$168,500; improving Kentucky River. \$121,000; improving Ohio River, \$224,762; improving Mississippi River. \$746,058; improving Mississippi River between Ohio and Illinois Rivers, \$194,018; improving Mississippi from St. Paul to Des Moines Rapids, \$148,500: constructing jetties and other works at South Pass, \$150,000: improving Missouri River, \$370,735; damages by improvement of Fox and Wisconsin Rivers, \$129,403 improving Columbia River at Cascades, \$112,497.

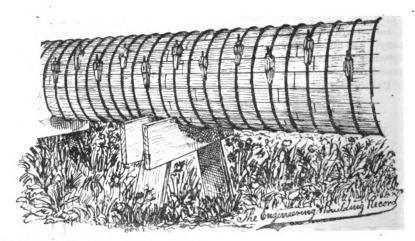

SANITARY IMPROVEMENTS IN BUENOS AYRES.

PROGRÉS de l'hygiène dans la Republique Argentine Par le Dr. E. R. Conè. 266 pp. Royal 8vo. Paris. 1887. The title of this book is somewhat misleading, since it relates mainly to the sanitary improvements which have been made in the city of Buenos Ayres, and include a very good description of that city from the point of view of the sanitary engineer.

a very good description of that city from the point of view of the sanitary engineer.

It contains twenty plates illustrating water-works, sewerage, schools, hospitals, etc. The descriptions are sufficient for general readers, the rules and regulations affecting municipal hygiene are given fully, and the whole gives

THE COLORADO WOODEN WATER PIPE

resisted entirely by the hoops, their spacing for any given head is readily calculated. The cast-iron clips, of which there is one to every hoop, weigh $2\frac{1}{2}$ pounds each. The pipe is used in Denver in four sizes, 24, 30, 36, and 48 inches diameter, and is subject to pressure varying from 50 to 120 feet of head. It has been laid to a radius of 175 feet. The cost of labor of laying, exclusive of excavation, is shout 20 cents per lineal foot for 24 and 30 inch pipe in Denver, where common labor is worth \$1.75 per

one a very good idea of what has been done recently to improve the hygiene of the city.

AN AUTOMATIC CUT-OFF.

C. HOLCROFT has patented in England a device to prevent overwinding in mine hoists. The hoisting rope passes between a pair of shear blades, which, if the cage is lifted too high, automatically cut the rope, while safety catches prevent the fall of the cage.

THE PROPOSED NATIONAL BUREAU OF HARBORS AND WATERWAYS.

NEW YORK, February 20, 1888.

SIR: Senator Cullom's bill seems to have t SIR: Senator Cullom's bill seems to have two objects in view—viz., to do away with requiring an able and experienced civilian engineer to report to a younger and less experienced man, and to prevent, as far as possible, some of the abuses of the present system, such as appropriations for unprofitable improvements, and the much greater loss resulting from failure to provide funds for work in progress either through political dissensions or the vetoes of appropriation bills in obedience to demagogical clamors.

The first object seems reasonably well secured though

The first object seems reasonably well secured, though as no man need hold the position of civilian assistant on Government works who does not like it, it would not be worth while to trouble the legislators of our country for the first object alone, and furthermore, the bill still contemplates a close corporation of engineers in which promotion by seniority, a rigid regard for "record," precedent, and esprit du corps, combined with the authority of the older and more conservative members of the corps, will tend to prevent able and progressive engineering and still further settle on our practice the tendency, induced by our schools, to become repeaters of the practice of others.

I do not see that the Cullom bill would, any more than the present system, enable the country to avail itself of the genius of Eads, for instance, if he was still living, and think that one of the amendments referred to as possible in Mr. Corthell's letter should enable the country to secure the advice of able engineers whenever it may prove

As far as the bill under consideration goes in providing that the total estimated cost of an improvement should be appropriated at once, it cannot be too highly commended, as it will stop a fertile source of waste. The principal reason why Government work is more expensive than corporate or private work lies in the fact that nearly always appropriations are too small for an economical prosecu-tion of the work in hand; when to that is added the fail-ure of appropriations, sometimes leading to large expen-ditures for simple maintenance, as was the case at Flood Rock, or to a loss of a large part of the work done, as at Charleston harbor, for instance, the wasted money may amount to a large percentage of the cost.

In a discussion of Mr. Corthell's paper on "South Pass Jetties," read before the American Society of Civil Engi-

neers, the undersigned suggested that before any improvement was undertaken, a report on its necessity, on the plan to be adopted and its cost, should be made by a board composed of three civil engineers and three military engineers, associated with three or four persons interested in the commerce and industries of the lo cality to be served by the improvement, the appropriations to be made as provided in the Cullon bill.

provided in the Cullom bill.

Supposing that only the composition of the board may be seriously objected to, it is urged that the civil engineers or those not connected with the corps charged with river and harbor improvements, and hence not in danger from the displeasure of the older members, would not have their judgment hampered by a regard for the prejudices of these older members, or, in other words, new and independent views would be brought into each board, while the business men might and probably would be better judges of the necessary scope and extent of the proposed improvement and the resources which would be tributary to it than a board composed largely of strangers as the to it than a board composed largely of strangers to the

It is understood that Senator Plumb proposes the whole subject of public buildings out of the hands of Congress and placing it in charge of the Secretaries of the Treasury and Interior and the Postmaster-General." It is well known that various surveying and executive departments connected with engineering report to different sccretaries, and often do overlapping work. Would it not be well to create a new department presided over by a Secretary of Public Works charged with all surveys, construction, and maintenance of Government property except fortifications and ships?

EDWARD P. NORTH.

> U. S. ENGINEER'S OFFICE. QUINCY, ILL., February 17, 1888.

SIR: Referring to the Cullom bill for a National Bureau of Harbors and Waterways, I would say that I believe in an "indictment." It is necessary that all the facts and motives shall be expressed that the prisoner the facts and motives shall be expressed that the prisoner may know what is charged against him. So in a civil process a bill of particulars, or the petition itself, presents reasons and grievances, and asks for remedies, etc. Now it does not appear to be necessary that in legislative action any similar course should be followed. Were the analogy complete, the Corps of Engineers might ask wherein it had failed, and what grievances existed to make a change necessary? From the bill itself it would appear that an enlargement only was intended, resulting eventually in a separation from the Corps of Engineers of all duties connected with the improvement of the waterways of the country.

Country.

I cannot see any foundation for such action resting upon good ground. I believe I am reasonably well posted in the history of the Corps of Engineers and of its works, but I do not find therein any larger percentage of errors than are encountered in all lines of business. Therefore I fail to see any need for a change.

I do know, however, that beginning with the selection of candidates for the appointments to cadetships at West Point, and following through their subsequent education there, and after graduation, there is in existence in this country no fairer or more democratic and unpartisan sys-

tem of selection of men than is there found. I can readily believe that this system could be expanded to advantage, even by enlarging the educational course and varying it, so as to give attention to special subjects if necessary.

Very truly yours, etc., E. H. RUFFNER,

Very truly yours, etc., Capt. of Engineers.

United States Engineer Office, GALVESTON, TEX., February, 18, 1888.

Senator Cullom's bill to establish a National Bureau of Harbors and Waterways proposes to take from the Corps of Engineers of the Army the management of river and harbor improvements, and to place it in the hands of a new corps, which it creates, to be composed exclusively of civilian engineers. It also concerns exclusively of civilian engineers. It also concerns itself with some matters of detail which may be executed by the old organization as well as by the new one. Vast interests, involving the expenditure of from ten to twenty million dollars per annum, are suddenly transferred from an experienced corps to a new and inexperienced one. Under Section 22 every clerk and civilian engineer in service is turned out of it the day the bill becomes a law. So sudden and radical a change can be justified only by some great and pressing evil in the present system.

The present system may be described as including the

I. The inauguration of a work or the selection of waterway which is to be the subject of public expenditure, is retained by Congress in its own hands. Congress could delegate this power to the Executive if it chose, but it has not so chosen. The bill makes no change in this feature.

2. Plans and estimates of cost are prepared by a competent officer, and are then subjected to the scrutiny and criticism of superiors before being submitted to Congress, and must then have the approval of Congress before the work is begun. This feature is substantially adopted in

3. The money for carrying on the works for one year at a time is appropriated by Congress in annual appropria-tion bills. An improvement in this feature can be effected by the rules established by Congress for its own guidance, but not by legislation intended to govern the Executive but not by legislation intended to govern the executive. Section 14 of this bill seems to be aimed at some such improvement, but, if so, it fails entirely of its object. Its effect would be merely to put a sudden stop to every permanent work of river and harbor improvement in the United States. It would, in my judgment, be a very great improvement upon this feature of the present system if Congress would, upon the inauguration of any work, appropriate funds sufficient to complete it, the amount to become available for expenditure during each year being fixed in advance. In nearly all cases where the results of river and harbor works have been unsatisfactory the evil may be traced to the system of annual partial appropriations. This bill offers no remedy, and no bill, except an appropriation bill, can offer one.

4. Finally, the works are executed by the Corps of 4. Finally, the works are executed by the Corps of Engineers, a military organization, recruited exclusively from the most distinguished graduates of the U. S. Military Academy. This corps not being large enough to provide for all parts of all the works, its officers are compelled to employ a considerable number of civilian engineers as assistants. It is only in exceptional cases that civilians are placed in independent charge of works, or are concerned with the disbursement of money. They usually remain in subordinate positions, and they are not assured of permanent employment. Their number is increased or diminished according to the necessities of the service. Their number is increased or With appropriations varying in amount from year to year so largely as they have done, the number has fluctuated so largely as they have done, the number has fluctuated considerably. Worthy men have been thrown out of employment, without fault of their own, when there was plenty of work for them to do (but no money to pay them with), and other worthy men have had their promotion stopped at the grade of principal assistant with salaries usually not exceeding \$2,400 per annum, and with no prospect of further advancement. These are two evils which should, if possible, be corrected. They are evils, however, which affect the personal interests of a very sall number of men, and in correcting them care must be taken not to inflict injury upon great public interests. be taken not to inflict injury upon great public interests.
It is to be remembered that there is no breach of contract. These gentlemen have accepted their positions with the conditions now attached to them, and could abandon them at any time if more favorable positions were open to them elsewhere.

It must be assumed that, as a rule, the officers of the

It must be assumed that, as a rule, the officers of the Corps of Engineers are fully competent as engineers to plan and conduct these works, and that they are faithful to their trusts. The truth of these assumptions has not been questioned by disinterested persons. Certainly Congress will not assume the contrary without careful investigation. I will not now discuss the matter.

On the 1st of January, 1888, the number of officers connected with river and harbor improvements was 67, and their total annual pay including allowance for quar-

connected with river and harbor improvements was 67, and their total annual pay, including allowance for quarters, was \$246,354. Of these 27 were engaged also upon other duties, their salaries amounting to \$126,352. The last full statement of civilian assistants employed upon these improvements is for October 31, 1886 (see Ex. Doc., No. 126, 49th Congress, 2d Session). At that time there were 104 assistants in service, upon a total annual pay of \$207,300, and this may be considered as approximately the average number employed in years when appropriations have been made. The number of officials, civil and military, is therefore about 171, and their total annual pay is about \$453,654, or if the

salaries of officers engaged also upon other duties be omitted, the total annual pay is about \$327,302. This constitutes a flexible body of officials, which can be entired and distributed according to the appropriate of months. larged or diminished according to the amount of work that it may have to do. With the uncertainty and irregularged or diminished according to the amount of work that it may have to do. With the uncertainty and irregularity which now characterize the annual appropriations, it is perhaps as efficient and economical an arrangement as could possibly be devised. The new bill proposes to replace it with a body of 615 officials, whose total annual pay is to be \$1,180,000. This increase is greatly in excess of the needs of the service at present or in the near future.

The present Corps of Fregingers was critically assets.

The present Corps of Engineers was originally created partially for the purpose of conducting works of internal improvement. It has always had charge of the river and harbor works, upon which it has expended some \$125,000,000 or more. Works of this kind are as much its specialty as are fortification or military mining or map-making. Necessarily its officers are more experienced in this branch of engineering than other engineers. Their civilian assistants have gained experience also, and some of these are thoroughly fitted in character, talents, and experience to take independent charge of works. But the great majority of them are of course better fitted for the subordinate positions which they occupy. The number of civilian engineers in the country who are now competent equally with the officers to manage these work and the number of these who would be available for appointment in the new organization is still smaller. Yet the bill provides that out of the 615 positions created only fifty-three, or one-half of each of the four highest grades, and one-fifth of the next grade, may be filled from the present corps, either by appointment or by temporary detail for not more than two years. The remaining 562 officials are to be taken from civil life. And at the end of two years every officer must sever his connection with the works or give up his commission in the army. This is to throw the management of the works very largely into the hands of persons who, at least for the present, are unskilled and inexperienced.

Passing to a consideration of the bill by sections many defects of detail are found.

In Section 3 provision is made for a larger number of officials in the lower grades than are necessary, but with very imperfect arrangements for their supervision. An very imperient arrangements for their supervision. An advisory board drawn only from one grade, in which are but four officials in all, would not be a good one. The board should be selected by the chief without regard to rank, and should be composed of five or seven members. There is no provision for inspection of works or proper supervision of money accounts. supervision of money accounts.

By Sections 4 and 6 new appointees are placed over the heads of the men who have had charge of these works. A reflection is thus cast upon these latter which is unjust Section 7 is somewhat obscure, but seems to contemplate

Section 7 is somewhat obscure, but seems to contemplate giving to army engineers the option of accepting or declining temporary appointments in the new corps. The President should have the power to order them to perform these duties. It may be doubted whether many of them would accept the duties voluntarily upon the terms prescribed in the bill scribed in the bill.

Section 8 is obscure. If it means that no more appointments below the grade of Department Engineer are to be made than are needed, the language should be altered. Authority should be given to some person or persons to determine what the necessary number is.

In Section 9 the rates of pay are very much higher than those now paid for the same services.

In Section 10 retirement upon half pay at the age of sixty-five is provided for without reference to leave the

sixty-five is provided for, without reference to length of service, which is in violation of the principle upon which such allowance should be made.

such allowance should be made.

In Section 13 the requirements that there must be from 9 to 11 departments, and that every department must be under a department engineer, would put some of them into unfit hands. The number of the departments and the assignments to their command should be left to the Executive as in the army. tive, as in the army.

Section 14, so far as it changes present law, has already been alluded to. It simply stops all permanent works.

Sections 15 and 16 are mere statements of routine, fol-

lowing military precedent, and may better be left to the "Rules and Regulations," for which separate provision has already been made in the bill.

has already been made in the bill.

In Section 17 there is much statement of routine which would better be left to the "Rules and Regulations." The object of the section would be accomplished by simply requiring the Secretary of War to report annually upon the subject referred to. It may be doubted, however, whether such a report is needed annually. It may be made from time to time as Congress may call for it, or as the Secretary of War may think desirable.

Section 22 has already been alluded to. It dislocates in a violent manner the present administrative machinery for

a violent manner the present administrative machinery for

carrying on the works, and cannot fail to do great harm.

There are numerous other defects, but sufficient bave been mentioned to show that the bill as a whole is not in the interest of efficiency and economy, and should not receive the indorsement of any patriotic citizen.

receive the indorsement of any patriotic citizen.

The imperfections in the present system have already been pointed out. It is greatly to be hoped that Congress will soon adopt the policy of providing, at the beginning of any work, the funds necessary for its completion. Such a policy would carry with it greater care in the inauguration of new works; and it would make the position of the civilian engineer a less precarious one. Whether an improvement in the organization could then be made may be open to discussion. I am inclined to think not. In be open to discussion. I am inclined to think not. avoiding the minor imperfections which exist in the present

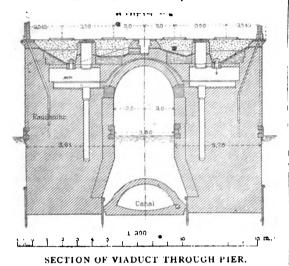

Digitized by GOOGI

organization it will be easy to fall into much greater ones. The difficulties of properly recruiting a corps of this kind from any but a special Government school seems almost insuperable. At all events, no change in the organization is at present present upon desirable. is at present necessary or desirable.

Very respectfully, your obedient servant,
O. H. Ernst, Major of Engineers.

THE BERLIN METROPOLITAN RAILWAY.

THE translated description of this work was concluded in our issue of February 11, but in this and a succeeding issue we shall give a number of illustrations of typical stations, bridges, etc., on different parts of the line. The

section of street crossing given below is of interest, as showing the arrangement of road-bed, support of rails and methods of drainage. The structure of which it is a section is not shown. Other arrangements of rail support, ballast and drainage are shown on the section of bridge over the Humboldt Basin, showing pier, and also on the section of viaduct through pier, which is a section of the viaduct through blocks shown on the opposite page, where the bridge over the Humboldt Basin is also to be found.

The "Canal" shown on section of viaduct through pier is an overflow or storm-sewer.

The wrought-iron pendulum column has a ball-bearing top and bottom, and is used under the continuous girders of the Koeingstrasse crossing, which will be shown in a succeeding issue. It will, of course, be readily perceived that the bridge over the Spree at Bellevue Park is on a skew, and that the other bridge over the Spree, shown above, it is not really continuous with the viaduct through blocks, but has been so drawn merely for convenience and contrast.

(To be continued.)

PAVING AND PARKS FOR BROOKLYN.

MAYOR CHAPIN, of Brooklyn, favors the issue of \$1,700,000 of bonds to provide for street improvements, such as paving, constructing sewers, erecting buildings for educational purposes, or securing eligible sites for such buildings, and \$300,000 of bonds to provide small parks in regions remote from any existing park. Of such small parks Brooklyn has a great and increasing need, and its rapid growth is rapidly increasing both their necessity and the expense of providing them.

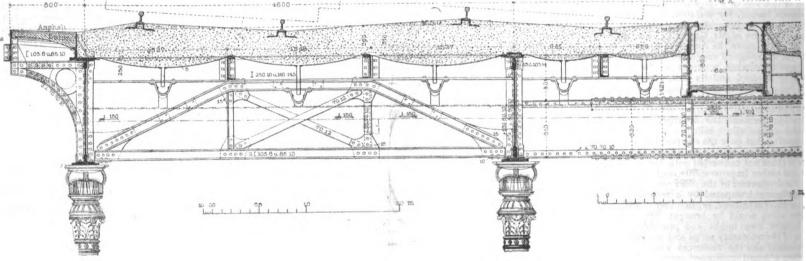

THE NORTH RIVER BRIDGE.

MAYOR HEWITT, of New York City, has been officially requested by the New Jersey Commissioners of the New York and New Jersey Bridge Co. to take such action as may be necessary to secure the appointment of similar commissioners by the Legislature of New York to co-operate with them. It is proposed to locate the bridge near Spuyten Duyvil Creek.

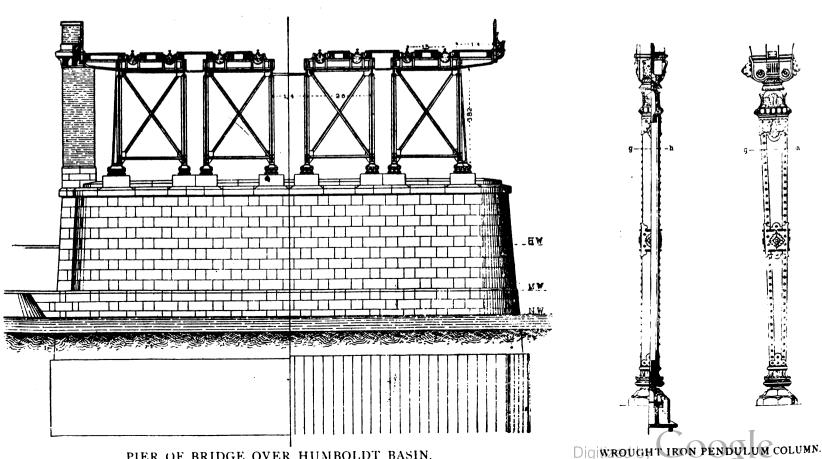

NEW YORK RAPID TRANSIT PLANS.

THE Board of Aldermen have requested the Legislature to pass an act, by which the Commissioner of Public Works is to be directed to prepare, under the Mayor's direction, for the more rapid transportation of passengers, mails, and freight within the limits of the city by underground railway or otherwise. The city is vested with power to have property needed for the purposes of the proposed road condemned, and is authorized to contract with any railway company having a terminus in this city for the construction, maintenance, and operation of the proposed railroad. No more than five cents shall be charged each passenger using the proposed road. Any motive power other than animal power may be used.

SUIT has been brought in New York City to put an end to the maintenance of a Babies' Hospital in a residential quarter, on the ground that it is a nuisance and dangerous to the health of the neighborhood.

SECTION OF STREET CROSSING.

PIER OF BRIDGE OVER HUMBOLDT BASIN.

PLUMBING IN THE RESIDENCE OF MAX NATHAN, ESQ. No. III.

(Continued from page 184.)

FIGURE 10 illustrates a device for suspending pipes from the ceiling. A ceiling strip of wood is secured to ceiling as shown, and hangers fastened to it. These hangers are made of wrought iron, three-fourths of an inch in width, and one fourth of an inch in thickness, and convex on lower side. The sketch shows the pipes suspended about twelve inches below ceiling, but the length is controlled by position of pipes desired.

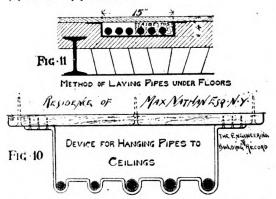

Figure 11 illustrates the manner of laying pipes under floors, and is utilized wherever pipes are laid under floors in the hall and dressing-room. A recess under floor is lined with sheet-lead in the form as shown in section, and is connected with waste-pipes that extend to cellar, and therefore if any leak in the pipe should occur the water will be removed without injury to ceiling below. The cold-water pipes are covered with asbestos mortar to prevent adjacent hot-water pipes from heating the cold water.

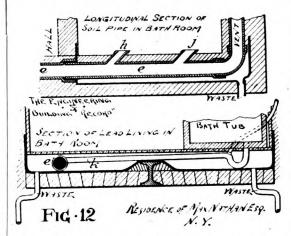

All vertical pipes in the partitions are inclosed in tubes of a la ger diameter, and the lower end of these tubes are also connected with safe-wastes extending to cellar.

In Fig. 12 is shown sections of soil and waste pipes in the bath-rooms. The entire floor of bath-room is lined with sheet-lead, which extends up the walls back of wain-scot. This lead lining is indicated by heavy black lines. Fire-proof blocks are utilized for filling above the lead lining up to the tiled floor. At the point where the soil-

pipe passes out of the room the lead lining is inlaid into the hub as shown. Safe-waste pipes connected with this lining are carried down to cellar. The lead lining is laid about seven inches below surface of floor, which gives a space of four inches over the iron girder. This depth of seven inches will allow the necessary space for the traps required under the bath-tubs.

The illustration in Fig. 13 represents a horizontal boiler suspended from ceiling, and in Fig. 14 is shown the detail of hangers, which will first be described.

A tube of galvanized iron is let into wooden beams and T-collars slipped over it, and into these T-collars sections of pipe are screwed in lengths to give the requisite height of boiler. At / is shown a detail of connection with boiler. Copper bands about four inches in width pass around the boiler with the ends projecting above, and in between these a copper plate is inserted, secured to them by means of bolts. The opposite end is circular, and is screwed to the tubes described above.

This boiler will contain 160 gallons, and is divided into two sections by a vertical plate in the centre. A' shows the low-pressure boiler, and B' the high-pressure. This form of boiler was used on account of the narrow space between the range and outer wall of building.

In Fig. 13 this system of pipes is shown which will now be described. The cold water for low-pressure supply passes from cellar up A entering boiler at top and passes out down A to B, thence up into heater and out through pipe C returning to boiler. From boiler the hot water flows through D to elevator-shaft in the laundry, which is located here in the extension. The branch D' runs to fixtures in rooms above. M is a circulation pipe on low pressure, and N circulation for high pressure. The pipe B extends down to cellar, thence to laundry-range. The pipe E branches from B below heater, thence up to ceiling, and also to laundry-range; but the direction of the

flow will be down the pipe B to range, and returning through E.

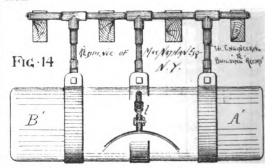

The high-pressure supply passes down G to boiler B, thence to pipe H, and thence to range through I, returning through J and H to heater, and through K to boiler. The hot water flows out through L to elevator-shaft and up to bath-rooms. The branches G' L' N' carry supply to fixtures in rooms above basement. F is an intermediate supply between high and low pressure, having a stop-cock which cuts off the flow. This pipe is continued from D over boiler down to sink to supply hot water. The cold supply for sink branches from A. The pipe H terminates at the floor. The cut-off shown in Fig. 5 is on second floor, located as described for No. 22.

This heater is intended for use in dwelling houses where two systems of water-supply are utilized.

The ordinary methods employed for this purpose are either connections with two water-backs set in a range, or with a boiler made in two sections, the hot-water circulation in the outer section heating the cold water in the inner. When two boilers are used, one for high and one for low pressure, this heater is set between them.

This device is circular in form, 8½ inches in diameter and 13 inches in height, and is made of heavy copper, the outer shell being made separate, permitting the inner chambers to be detached.

The form of the chambers is shown in plan, the circle at H representing the position of the tubes connecting the chambers. The small circles at E F are braces to increase the strength of the chambers, and are required on account of the unequal water-pressure. A brace is also set in the centre of each chamber, the position being indicated by dotted line at G. The heights of each chamber and spaces between them are each three-quarters of an inch.

METHOD OF HANGING HORIZONTAL BOILER TO CEILING .

The high-pressure supply, after being heated in the range, enters at A, thence passing up through each chamber, as shown by broken lines in section, leaving the heater at B to supply the upper stories.

The cold water from low pressure enters at C, flowing from lower to higher chambers through openings shown in plan and section at E E, occupying the entire space shown in white, and exposed to a heating surface of more than 1,000 square inches before passing out at D.

This device, invented by Mr. John Tucker, of the firm of Byrne & Tucker, plumbers, New York, who executed the work here described, is an improvement on a former one for a similar purpose.

The architects were William Shickel & Co., of New York.

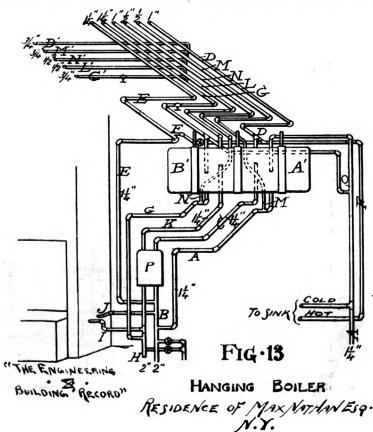

THE RESULTS OF LEAD POISONING.

In some obscure cases of lead poisoning at Sheffield, England, which have been referred to in a recent issue of the *Local Government Chronicle*, the result is stated to have been the production of indigestion and pain in the limbs in mild cases, and in more severe cases paralysis of the wrist and hand, and granular disease of the kidneys. The water dissolves not only the lead in the pipes, but also in some instances the lead to be found in kettles.

In England the working hours of a plumber during the twelve weeks following November 9 have just been agreed upon between the Central Association of Master Builders and the United Operative Plumbers' Association as follows: 7 to 8, 8:30 to 12, 1 to 4:30; on Saturdays, 7 to 8 and 8:30 to 12, giving a weekly total of 44½ hours. The hours will apply to both society and non-society men.

WE are surprised to learn from the Omaha Bee that that city is without hospital accommodations. A movement is on foot to secure land on which to erect a city hospital. Certainly an enterprising city like Omaha should not be without suitable hospital buildings.

ON MAKING LEAD BENDS IN PLUMBERS' SHOPS.

BOSTON, February 6, 1888.

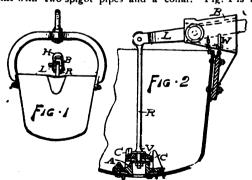

SIR: I have been much interested in your Milwaukee correspondent's description of how to keep the plumbers out of mischief during the winter days by employing them in making lead bends, page 90 of your issue of January 7; also L. H. D.'s criticisms thereon, page 137 of January 28. All such shop-made bends would be sure to find their proper place in the scrap and old lead bin and would never be used on a job. Mr. Nicholson's method is antediluvian, and no doubt was invented by some genius a few short years after Noah's flood and at a time when the plumbers worked eighteen hours a day and the bosses charged twenty-four. Yet with all this L. H. D. should not criticise a system that his own antedates, since his method would necessitate the keeping up of a moderatesized lumber yard as a sort of annex, with steam saw and planer attachment for the manufacture of plugs. All this means that the boss would have to furnish each man with a mule team or pony express to cart round his kit. This pony express would look well going up Broadway, reminding one of the mounted brigades of sightseers leaving a Manitou hotel for Pike's Peak, only a little more ludicrous. This would be a fine subject for the funny man of the press, which he could fatten on.

As I stated above, shop-made bends might amuse the plumber, but it would be money in Mr. Nicholson's pocket to furnish each of his men with an easy chair and let them pass their time away smoking their T. D. pipes, and not use his men in destroying lead pipe. If L. H. D. had not mentioned the tapering of his plugs and adding the holes in the ends, his criticisms might be passed over. If he knows anything about pipe-bending he should know that a tapered plug used at the end, to be taken hold of during bending, if the bend is to be made near the end would not only cause a bulging of the pipe at the back, but a kink at the front, caused by that part of the plug which is in the pipe being tapered, which it should not

A plumber can whittle out a plug with his pocket knife in two minutes which would fit the pipe tightly without any taper. A piece of wood he can always find on the job and dispense with the pony express. J. T.

LEAD LADLE FOR PIPE-JOINTING WORK.

THE accompanying engravings illustrate a lead ladle made from a patent of Mr. H. Nicholson, and described in the Engineer, to facilitate the running of the molten lead into the joints of water and other cast-iron pipes. The objects are to prevent the admission into the joint of scum or dross, to dispense with any necessity for skimming the lead, to enable the lead to be run without tilting the ladle, and to minimize the danger to the operatives. It has, further, for its object to enable the lead to be run simultaneously on both sides of the collar when making a joint with two spigot pipes and a collar. Fig. 1 is a

front view; Fig. 2 is an enlarged section of the valve rod and lever. These improvements consist in attaching to the bottom of the ladle a raised valve seating A, within which is a conical or cylindrical hole for the exit of the metal. The plug or valve is constructed partly of fire-clay, and is attached by means of a rod R to a lever L, the fulcrum of which is mounted upon a bracket B secured to the rim of the ladle. This bracket has stops for limiting the amount of angular motion of the lever L, so as to prevent the valve or plug being lifted beyond the range of the guides C. To prevent the accidental escape of the molten lead by an accidental move-ment of the lever, between the lever L and the bracket B a key or wedge W is inserted, which is removed when the joint has to be run.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for addional information before printing their communications. Anonyous letters will not be noticed.

WHAT IS THE BEST WATER-PRESSURE REGULATOR?

54 BEEKMAN STREET, NEW YORK, February 17, 1888. SIR: Kindly inform me which is the best water-pressure regulator and where it can be got, and oblige
Yours respectfully, Louis Waefelaer.

[Referred to our readers.]

NOISE CAUSED IN THE MAINS OF A STEAM-HEATING APPARATUS BY AN IMPROP-ERLY-ARRANGED RELIEF-PIPE.

GRAND FORKS, DAK., January 17, 1888.

SIR: We have lately warmed a separate building two hundred feet distant from our main building. The pipes in the new building are exceedingly noisy at times, snapping and pounding, and all our efforts to prevent it have thus far been only partially successful. We therefore apply for advice through your journal, sending sketch made by our janitor, and hope you will be able to suggest a remedy.

HOW TO PROPORTION RADIATING SURFACE.

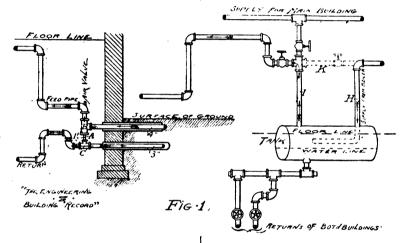

BUCYRUS, O., February 18, 1888.

SIR: Will you, either by personal letter or through the columns of your journal, give me a comprehensive rule for determining the proportion of radiating surface to cubic contents in rooms to be heated by steam, together with allowance usually made for exposed situa-tions, etc? We are building new offices, and would be glad to have some information of this kind with which to work. Yours very truly, W. R. CRITTENDEN.

There can be no very accurate rule for determining the heating surface by the cubic contents of rooms or buildings. The method followed by many of allowing 1 square foot of radiating surface to 25 cubic feet of airspace as a maximum, to I square foot to 200 cubic feet as a minimum, is of no service except in the hands of a man of considerable practical experience, and then serious blunders are made with it.

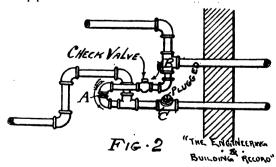

A room of 1,000 cubic feet in a tower with windows on all sides, would probably require "1 to 25," and in windy weather that might not do.

The same room on a corner of a building, with windows and outside walls on two sides, would probably require I to 40; a middle room of same size, with windows on one side, I to 55, or thereabouts. Now, if the latter room is made twice as large, by increasing its front measurement only, it will require just the same pro-

A shows connecting-pipe, 1 1/4 inches in diameter, between the live-steam pipe B and the return-pipe C. This connecting-pipe, which is only two or three inches long, is open, and allows the live steam to meet the returning water. At least I so understand it, but I am not engineer enough to know the philosophy of it. H. B. S.

[From the data sent, we are able to give you very little advice in the matter of the noisy pipes. In other words, we are unable to determine whether the trouble is a defect of principle or of detail. We are of the opinion, however, that should you alter the connection A in such a manner that you can put a check-valve in it the noise may stop. If the tee B is too close to the tee C to put in a connection with a check-valve, connect B to some other part of the return-pipe, say as shown by the extra lines in Fig. Use a swinging check-valve the full size of the pipe (11/4-inch), and have it open from the main into the return-pipe.

We are unable to see the good accomplished by the pipe H-the main steam-supply from boilers-entering the receiving-tank as shown, and the steam thence passing from the tank through the pipe I to the coils, etc. We rather consider it a disadvantage by causing unnecessary friction and condensation. If after trying the check-valve in the relief main the water still rises or remains in the main at B, connect the pipe H to I by the direct pipe K (dotted lines), and either remove the pipes H and I or put valves in them so they may be closed. If you do the latter, put a valve also in K as shown.]

portion (1 to 55) as above, because the cooling surfaces increase in the same ratio as the cubic contents, whereas, if this room was made twice as large by increasing its depth only it would require very little more surface than it did when it had only 1,000 cubic feet.

Now take a room of 10'x10'x10', or 1,000 cubic feet, on a corner, with windows and outside walls on two sides, and it is evident it will require as much surface as a room 20 feet on the front by 10 feet deep and 10 feet high.

The radiating surface in a room must vary in the proportion of the outside walls and windows, and not in the ratio of its cubic contents.

There is no accurate rule that we know of, but the most comprehensive on the wall and window surface is found on pages 26 and 27 of "Steam-Heating for Buildings," the summary of which is to allow three-quarters of a square foot of surface to each square foot of glass or window opening, and the same for each 7 to 10 square feet of outside wall surface. This is for low-pressure steam, with good efficient radiators or coils. With some radiators that are sold, however, three-quarters of a square foot would not be sufficient.]

CAUSE OF DAMPNESS ON HOUSE-WALLS.

NEWARK, N. J., October 24, 1887.

NEWARK, N. J., October 24, 1887.

SIR: Will you please inform me what causes dampness on inside hall walls? It shows through the paper all the way up to the top of second story hall. There is no water in the house, and the washing and cooking is all done in an extension. The roof is good, and there is a good cellar under the house. The hall runs straight through the centre of the house. The dampness shows on parlor and library side of hall partition, and it was never noticed until this year. The cellar side walls are a little damp sometimes.

OLD SUBSCRIBER.

[If the facts are exactly as stated we can suggest no explanation, but we strongly suspect that a more careful examination will show the roof to be at fault, most likely where it joins with some chimney, if any flues go up in the partition. If this snound has further particulars may give some clue. the partition. If this should not be the case, perhaps

FILTERING STEAM.

MILWAUKEE, February 7, 1888.

SIR: I would like to ask if you can give some advice or recommend some way of filtering steam. The instance is this, black specks, resembling soot, accumulate, and I know they originate in the boiler. I have been experimenting with felt and caught the diminutive black specks through a fine wire screen, and now am positive they come from the boiler. If you can give me any information regarding the filtering of steam, so as not to decrease the pressure very materially, I shall be very thankful.

A SUBSCRIBER.

[We have had no experience with the filtration of steam, and refer this question to our readers. Presumably our correspondent desires to use steam in some process of manufacture where specks of foreign matter carried with the steam are objectionable. If it were our case we would collect sufficient of the specks to examine or analyze them, and determine whether they are particles of iron, or rust, or oil, or earthy matter. Then, after ascertaining what they are, some means of collecting them can probably be determined. It is very probable, no matter what they are, that they may be deposited if the steam is carried through a chamber large enough to so lessen its velocity that the objectionable particles may have an opportunity to settle to the bottom. A few baffle-plates might be used within it to advantage, but they should be so arranged that the steam would strike their surfaces with a very slow velocity; otherwise there will be no deposit. If the steam as it enters the chamber is directed against water lying in the bottom, the water will also help to collect the foreign substances, provided the steam has not velocity enough to disturb the water and keep it in agitation. Oil is separated from steam in this manner (see page 171 of "Steam-Heating Problems"). A layer of asbestos fibre between a pair of wire screens might also arrest the particles. Its area, however, as compared to the pipe is a matter of speculation, and, presumably, it should not be less than 100 times greater than the pipe. This would become saturated in time and have to be renewed.]

CAN A HIGH-PRESSURE STEAM APPARATUS BE RUN MORE ECONOMICALLY THAN A LOW-PRESSURE ONE.

SIR: We are asked the question whether a high pressure steam-heating apparatus cannot be run more economically than a low-pressure one, for heating pretty large buildings, and are told that engineers and firemen say they can carry sixty pounds of steam with less fuel than forty pounds. Is this true or false? We should like any information you can give on these points.

[The lower the pressure of steam carried on an apparatus the cheaper it can be run, all other things remaining the same.

The average condensation of steam per square foot of surface at one pound pressure is about $\frac{1}{4}$ pound weight per hour; at 40 pounds pressure it is about $\frac{1}{3}$ pound per hour, and at 60 pounds $\frac{1}{10}$ pound.

A high-pressure apparatus may be constructed by using smaller pipes and less heating surface that can be run as cheaply as a low pressure, and do the same work, but it cannot be run cheaper.

It sometimes happens that an engineer has a set of boilers in his care that supplies steam for engines and heating apparatus as well. By carrying a high pressure he may then find he uses less fuel, in which case the saving done by using high pressure in the engine more than compensates for the extra loss in the heating apparatus.

If he uses steam through a reducing valve for heating and carries no more pressure on the house than before, then there is no increase of condensation in the pipes, and the saving in the engine is more apparent in the coal-heap, and is apt to be credited to the wrong cause.]

WHERE CAN ASPHALT BE OBTAINED FOR PAVING?

____, February 17, 1888.

SIR: Please let me know if any concern has the monopoly of imported asphalt such as is used for paving streets; if not, whom can asphalt be bought of? Any information you can furnish me on this subject will be appreciated. I made a suggestion that this city organize an asphalt paving department, but was told that it could not be done, for the reason that the Barber Company and the Warren-Scharf Company control the importation of Trinidad asphalt.

Referred to our readers, with the suggestion that our correspondent inspect our advertising columns. We believe he is correctly informed in regard to the control of the importation of Trinidad asphalt by the parties named, but there are other paving asphalts.—ED.]

Novelties.

Juder this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

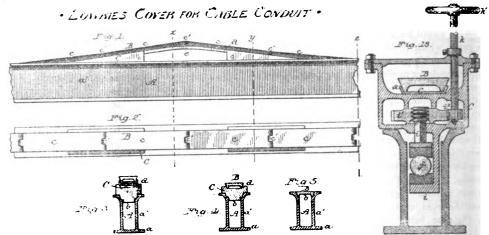

COVER FOR SLOT OF CABLE CONDUIT.

A RECENT invention of interest is a device for keeping the slot of a cable conduit constantly closed, devised by Mr. H. C. Lowrie, City Engineer of Denver, Col. It consists essentially of a series of plates, c, hinged together and forming collectively a continuous and flexible covering, B. Figures 3, 4, and 5 show sections on lines x, y, and z, respectively, in Fig. 1. A is any convenient form of conduit, with suitable cover seats at the top; C is the cover-lifter, tapering at each end, and having a groove in its upper surface to support and guide successive sections of B; e is an opening transversely through C to admit the grip.

GAS BY THE WEEK.

A CURIOUS proposal is being debated in various quarters in England, that gas companies in large towns should encourage the use of gas in working-class dwellings by taking weekly payments for the gas-supply. It is said that this would tend to supersede the use of petroleum. The Engineer thinks that if the consumption of volatile burning oil among the humbler classes could be diminished by the more general use of gas, a considerable sacrifice of life would be prevented. Fatal accidents with lamps are painfully prevalent, and great fires have sometimes arisen in a similar way.

THE "proverbial uncertainty of the electric-light"—as the gas journals say—is aptly illustrated by the following little incident, which the London Electrician believes to be authentic. A lamp had been hung from the kitchen ceiling by insulated wires; so when the housemaid wanted a light in the cellar she did not hesitate to cut off thelamp and hang it from the bell-wire. Then she said she "didn't never believe in these here new-fangled notions."

C travels with the grip and continually raises the cover sections in front and guides them back to their seat behind. The sides of C are closed, except at ϵ , and this opening is filled by the grip-bar, thus never leaving an opening to admit snow, dirt, etc.

Figure 18 is a detail showing cross-section of conduit and a suitable arrangement of grip.

The covering and lifting devices are applicable to electric and other conduits, and may be widely modified in many respects, as indicated in patent.

A NOVEL PATENT.

WHATEVER some people may think of the value of many claims in American patents, we know of nothing quite so absurd as a case recently noticed in Great Britain. According to the London *Electrician*, three years ago last May Her Majesty's Letters Patent were granted for an "invention" of a surprisingly novel and ingenious character. The specification contains only one claim, which reads as follows: "Having now particularly described and ascertained the nature of my said invention, and in what manner the same is to be performed, I declare that what I claim is combining with an article of furniture a primary or secondary battery substantially as described."

The inventor now informs the *Electrician* that he has reason to believe that certain person or persons (unnamed, probably "too numerous to mention,") have defrauded him of his just rights by making and selling articles of furniture combined with primary or secondary batteries substantially as described, without having obtained from him, the aforesaid first and true inventor thereof, a license so to do. The hope is expressed that this public notice will be sufficient to check such palpable reprehensible malpractice.

SEWAGE TREATMENT, PURIFICATION, AND UTILIZATION. By J. W. Slater, F. E. S. 271 pp. 8vo. London: Whittaker & Co. 1888.

This little book is announced as being "a practical manual for the use of corporations, local boards, medical officers of health, inspectors of nuisances, chemists, manufacturers, riparian owners, engineers and ratepayers." It is in reality intended to maintain the superiority of a particular mode of the chemical treatment of sewage, which is, however, not definitely described, and which is probably a patented method.

The objections to all other modes of dealing with sewage are very well presented, though the author is a "man with a grievance," which grievance is the folly of all Government officials who have to deal with sewage, and which crops up in a more or less amusing way throughout the book. 'Bazalgettism' is a word which evidently delights him much.

He remarks that "there is no subject outside the range of party politics on which so much envy, hatred, malice, and all uncharitableness prevail as on the treatment of sewage." Matters must be worse in England than in this country, if we may judge from this statement taken in connection with the hints given to officials in charge of sewage-works as to the precautions they are to take in allowing any one to have a sample of the effluent for analysis or for preservation. In the first place, he says that the sewage-works must be so arranged that it shall be impossible to take a sample surreptitiously, and that the manager shall always be able to state upon oath whether a given person did on a specified day receive a sample or not. In the second place, no visitors are to be admitted, and no sampling allowed at times of flood.

The act of taking samples is to be done in the presence of both parties, and a sample is to be given to a visitor solely on the condition that he takes and seals at the same time a check sample to be left at the works for analysis. We have not yet got to the point indicated in this advice, which we have no doubt is very sensible for the locality for which it was written. While Mr. Slater's book is more valuable as a summary of objections to most methods of sewage disposal than as giving positive directions as to how sewage should be disposed of, it is nevertheless a well-written work, with a slightly acid, but not unpleasant, flavor, and a book which we commend to engineers as being both amusing and instructive.

TWO REPORTS ON RESEARCHES CONCERNING THE DESIGN AND CONSTRUCTION OF HIGH MASONRY DAMS.

BY B. F. CHURCH AND A. FTELEY.

THESE valuable reports are published by the Aqueduct Commissioners of New York, to whom they were made. They are not intended as full treatises upon the subject, but were written for the information of the Commissioners to aid them in the consideration of the plans for the Quaker Bridge dam.

The first, written by Mr. Church, the Chief Engineer, discusses the question of dams curved horizontally as compared with straight dams. He arrives at the conclusion that curved dams, except where very short, are not advisable.

His first proposition is that when a curved dam has sufficient area of cross-section to resist the water-pressure by its own weight it cannot act as an arch. The inertia of the cross-section will prevent the necessary horizontal movement, whereby alone thrust can be transmitted to the hillside abutments.

He next supposes the curved dam to be reduced to from 80 to 100 feet in thickness, and sufficiently elastic to act as a horizontal arch against the water-pressure. He finds that with a radius of 900 feet the pressure on the radial joints would, even if uniformly distributed, be from 42 to 39 tons per square foot, which is entirely too much for safety, and the flattening of the horizontal arch that would be caused thereby would create dangerous tensile strains on the concave side.

He then considers the effect of increasing the cross-section, the radius remaining the same, until the pressure is reduced to sixteen tons per square foot on radial joints. The result is a dam with twice the section required by a gravity dam having the same limit of pressure.

He concludes that "there is no valid reason for risking the complicating and serious rupturing strains which a curved dam will produce, or for the increased expense it would entail." We commend this conclusion to those who are constantly advocating the arched form as the only proper one to adopt for this important structure.

One strong reason for rejecting the curved form he finds in the fact that the vertical joints have no load upon them while building, and for lack of that initial compression are not in nearly as good shape to resist the strains due to the arch action as the horizontal joints are to resist the strains in a straight dam.

Mr. Church next discusses the form of section required for the dam, assuming the masonry to weigh 1561/4 pounds per cubic foot, that the pressure at toe is limited to sixteen tons per square foot, and that the resultant of pressure passes within the middle third of the base. The theoretical form thus obtained would be triangular to a depth of 205 feet from water surface, and slightly curved outward on both faces below that to keep within the limiting pressure. This form is then modified to resist ice thrust and wave and wind action, and for certain constructive reasons and finally a practical section is obtained.

Mr. Fteley, Consulting Engineer, presents plans and sections of the most important high masonry dams now in existence, with a resume of the literature on the subject. He points out the excess of material used in the older dams, and shows that the more modern sections are very similar to the one adopted for the Quaker Bridge structure. The pressures in some of these old dams are comparatively high, in at least one instance reaching 14 tons per square foot, and their long and successful operation proves that the low limit of pressures recommended by some modern authorities can be safely exceeded.

He then proceeds to show how the actual profile of the dam was designed, representing these well-known conditions as follows:

First.—The resultant of the forces acting on the dam, whether the reservoir is full or empty, must pass through the middle third of the base.

Second.—The pressures on the masonry at either face, and at any point, must not exceed a certain safe point.

Third.—The sections of the dam at any point must be such that no sliding can take place.

The limiting pressure finally adopted was fifteen tons. Careful studies were made of various proposed sections. A method based upon the principle of moments, although preceded by successive approximations, was found to be most simple and expeditious. It was checked finally by graphic and analytical methods.

Mr. Edward Wegemann, Jr., special assistant and divis-

ion engineer, devised a simple and exact analytical method for determining directly the profile of a masonry dam. It is based primarily on the fundamental formulæ for the distribution of pressure, and on the first two of the three conditions already given.

After a full discussion of the question of transmission of strains through masonry (as modified by the elasticity of the material); of the kind of masonry to be preferred; of the impracticability of the arch form, etc., the conclusions are reached that "a dam of such a length as the Quaker Bridge dam, if acting as an arch, would be subjected to excessive strains;" that "with the profile recommended, it can successfully resist, in all its parts, the pressures applied to it without any additional support;" that "if built on a curve it would not act as an arch, and would be more expensive;" that "it is advisable that the dam be built on a straight line."

The top of the parapet is fixed at an elevation of 13 feet above ordinary high-water mark.

The overflow, it is recommended, should have a capacity sufficient to carry off, in 24 hours, a volume of water equivalent to six inches depth over the whole watershed.

The following recommendation from Mr. E. S. Chesbrough is quoted with approval: "The superstructure should be composed throughout of uncoursed, broken range rubble masonry, built of quarry stone of irregular sizes, laid with full beds and joints. The use of cut stone should be confined to such appropriate ornament as may be desired, none being used in the body of the work, not only on account of expense, but also to avoid the introduction of two different classes of masonry. While, as above stated, coursing should be avoided, it would be proper to keep the work roughly leveled up over its entire lengthsay every five feet in height—so as to secure an even settlement as the structure goes up." To secure perfect bedding of the stones it is advised that none of them weigh more than two tons, and that most of them should weigh much less.

Imported Portland cement, mixed in the proportion of one part of cement to two of sand, is recommended in commencing the work in order to secure perfect connection of the structure with the rock, and also in the last season on the upper and final portions of the dam on account of its more rapid hardening in case the dam is subjected to full pressures immediately after completion.

For the bulk of the dam good domestic cement in the same proportions, or Portland cement with three parts of sand to one of cement, is expected to suffice.

Several valuable suggestions are added as to methods of construction and obtaining material. The reports are accompanied by interesting tables, diagrams, and illustrations both of proposed and existing work.

THE CONSTRUCTION OF BRIDGES OVER THE MUSKINGUM RIVER, OHIO.

A VERY brief report on this subject has been made to the Secretary of War by a board of engineers consisting of Colonel William C. Merrill, Major L. H. Beach, and Lieutenant C. E. Gillette.

It is gratifying to find that the matter of obstruction to the free navigation of streams is so carefully treated by the U. S. Engineers whenever they have an apportunity of so doing.

In the draft of a law submitted to Congress for the governance of these structures they have tried to meet the reasonable views of all parties. The locks being but 180 feet long and 34 to 36 feet wide, they consider that draws of two clear openings of 80 feet at water-line, and smooth crib-work or masonry projecting both up and down stream 100 feet from the axis to a height of four feet above highest locking stage to be sufficient. Continuous spans are to have a channel span of at least 250 feet, with a clear elevation above highest locking stage of at least 40 feet.

Before any bridge can be built, full notice of intention to build is to be given by publication in newspapers in the locality. Drawings of the bridge and piers, and the topography of the banks one-quarter mile above and below, with soundings, contour lines two feet apart, and current lines at high navigable stage and low water, are to be submitted to the Secretary of War. The Secretary is to appoint a board of engineers, or refer the matter to the engineer officer of the river. Said board or officer is to hold a public session at some convenient point, and, after full examination, report to the Secretary, who has full power of approval, rejection, or modification of the plans.

The full right is observed of subsequent alteration or removal of all structures without cost to the Government.

RESISTANCE OF STONE TO CONCENTRATED LOADS.

M. L. DURAND-CLAYE has been making at l'Ecole des Ponts et Chaussées some experiments on the crushing of blocks loaded on portions only of their surface, published in the A'evue Industrielle, that are of interest in their relation to structural conditions where a stone, as for instance a column base, is subjected to a more or less concentrated load.

In the experiments a square cut stone was supported completely on one surface and received pressure through a small square cast-iron block bearing against the centre of the opposite surface.

The results, though somewhat contradictory, did not vary much more than ten per cent., and furnished data (rather insufficient, it is admitted) for the formula P - RAa. P - total crushing pressure applied through small block; R - crushing strength per unit of surface of stone when uniformly loaded on whole surface; A - side of square stone, and a - side of square pressure-block.

In other words, the concentrated crushing load per square inch on the pressure-block is, other things being equal, inversely as the diameter of the pressure-block and directly proportional to the diameter of the stone. While this can hardly be absolutely correct for extreme proportions, it is perhaps a good working approximation.

Few, if any, experiments have been heretofore made in this particular direction, and the practical value of the results make it an inviting field for some original research.

REPORT OF THE WATERBURY WATER-WORKS.

THE twenty-first report of the Water Commissioners of Waterbury has been received. It contains the ordinary statistical record. The receipts for water rents for the year were \$48,728.33, being an increase of over eight per cent. There are 128 meters of various makes now in use. Some 3,486 feet of 16-inch and 5,600 feet of 18-inch iron pipe have been laid during the year.

As bearing on the use of cement water-pipe, the engineers (Messrs. Wetton and Bonnett) report respecting 1,500 feet of 12 inch cement-pipe, that its life or strength is gone, and it cannot be long before leaks will show themselves, hence they recommend that it be relaid.

This pipe has been in use, however, for a long time. Surveys and estimates have been made for an additional supply by a storage reservoir about five miles distant on Hop Brook. This will have a capacity of 400,000,000 gallons, and, with the necessary supply, is estimated to cost \$180,000. The water-shed has an area of about 2½ square miles.

A BIG PONTOON.

A MONSTER pontoon has just been completed at Dangar Island on the Hawkesbury River, in connection with the work now going on at the Hawkesbury railway bridge, for the purpose of conveying the heavy iron-work to be used in the construction of the bridge. The pontoon is built wholly of Oregon pine, and has a length of 340 feet, breadth of 61 feet, and depth of 10 feet 6 inches. The Union Bridge Co., of New York, are the contractors for the bridge.

ISTHMIAN MARINE TRANSIT.

THE Maritime Association of New York has asked Congress to adopt such measures as will enable private enterprise to open a route for Isthmian marine transit at the earliest possible day.

THE Holstein Canal, commenced last year, will, when finished, unite the North Sea with the Baltic, and will be of material service to commerce.

THE Kings County Elevated Railroad of Brooklyn is said to have made arrangements to run its first train through Fulton Street on April 1.

A SPEED of as much as 16 feet of completed tunnel in a day of twenty-four hours at one face has been attained in the tunnels under the Thames for the City of London and Southwark Subway, and at the present time about a mile and a half of the tunnels have been driven.

Digitized by GOGIC

ENGINEERS' CLUB OF PHILADELPHIA.

A MEETING of the club was held February 4. Past President L. M. Haupt in the chair, Howard Murphy,

Secretary; 19 members present.

Prof. L. M. Haupt submitted, with comments and explanations, the bill introduced in Congress relative to the establishment of a bureau of harbor and waterways, to be officered by a corps to be known as the Corps of U. S. Civil Engineers.

Civil Engineers.

The secretary presented, for Mr. Rudolph Hering, the preamble and resolution recommending the supply of automatic self-registering rain gauges at all U. S. Signal Stations, which had been passed by the American Society of Civil Engineers, and which, after some discussion, with the substitution of the name of the club, were adopted.

Mr. A. Marichal read a paper on "Rainfall," calling the attention of the club to the importance of continuous and detailed observations. The rainfall is one of the most capricious of phenomena, and unless our observations be very numerous and complete in detail, it is impossible to make any useful deductions.

The tables and diagrams required are numerous, includ-

The tables and diagrams required are numerous, including the rainfall all over a given country, per day, per month, per year, with corresponding height of barometer, temperature, and direction of wind; the rainfall compared with the stream flow; the rainfall compared with the sani-tary condition of cities and towns; in the case of an epi-demic, the rainfall compared with the progress of the dis-ease, and the rainfall compared with the age of the moon,

etc.
Mr. Marichal presented, also, diagrams showing the mean annual rainfalls over the world, ranging from 527 inches (Rhasia Hills, India) to 0 (Sahara and coast of Peru), and showing that the localities where an enormous rainfall was recorded were as unhealthy as those where only fifteen inches and less was falling annually; that, generally, the death-rate was a minimum where the rainfall was about 35 to 45 inches, as in Philadelphia, which is among the healthiest cities of the world; that the maximum rainfall was near full moon, and the minimum near new moon; that a 28 years' experiment in France, and a 20 years' one in Germany gave practically the same results.

Mr. A. Ely and others offered a resolution to the effect that the club approve and adopt the 24-hour system of time notation. Its consideration was postponed until the next meeting.

ENGINEERS' CLUB OF ST. LOUIS.

THE club met February 15, President Ho'man in the chair, W. H. Bryan, Secretary; thirty members and four visitors present. Edward H. Connor, E. C. Parker, and Bathurst Smith were elected members.

On motion, the report of the Special Committee on the Waddell Pamphlet on Highway Bridges was taken from the table. After a very general discussion the matter was made the special order of the day for the next meeting.

Mr. O. L. Petitididier, presented a paper on "Practical

Mr. O. L. Petitdidier presented a paper on "Practical Notes on Masonry and Stone Laying." He called attention to the great antiquity of the subject and its interest to engineers. He mentioned many points of value in such construction, and necessary precautions to be taken. Among other points touched upon were mortar, cements, sand, pointing, expansion, laying, masonry, transportation, and plant. Messrs. Holman, Seddon, and Johnson took part in the discussion. Papers by Prof. II. B. Gale and S. F. Burnet were announced for the next meeting.

ENGINEERS' CLUB OF KANSAS CITY.

A REGULAR meeting of the club was held February 6, fourteen members and eight visitors present.

Mr. J. A. L. Waddell was elected as Treasurer, and Messrs. H. A. Lasley, A. W. Boeke, and F. L. Mills as members.

The paper of the evening, on "The Inspection of Iron Bridges and Viaducts," was read by Mr. B. L. Marsteller and discussed by Messrs. Goldmark, Chanute, Waddell, and Breithaupt.

The committee appointed to consider Mr. Waddell's pamphlet on "Highway Bridges" presented their report, and it was proposed to devote the regular meeting of April to a discussion of the pamphlet, and to invite several eminent bridge engineers and builders to take part.

ENGINEERS' SOCIETY OF WESTERN PENN-SYLVANIA.

THE regular monthly meeting of the society was held at Pittsburg February I. There was a very large attendance, delegates to the meeting of the National Electric-Light Association then in session in the city having been invited to meet with the society.

A programme appropriate to the occasion had been arranged in the presentation of a paper on "Electric Railroads," by Mr. R. McK. Lloyd, prefaced by a brief talk on "Electrical Terms and Methods of Measurement," by Prof. Altred E. Frost, of the Western University of Pennsylvania. Prof. Frost stated that one of the first by Prof. Altred E. Frost, of the Western University of Pennsylvania. Prof. Frost stated that one of the first questions asked about electricity is, "What is it?" and while this was something difficult to answer, while it might not be possible to tell what the thing is, we yet have means for measuring it. A parallel case might be found in trying to answer what is gravitation. We cannot tell what the force is that causes the pound weight to drop to the earth, but we have a means of measuring the force.

Electricity has now become something more than a mere plaything, the pith-balls of the school-room have given way to the many applications now made of this mysterious force.

He began with its simplest form of its development— by friction—explaining that the first of the terms used by electricians is what is called "the motive difference of poillustrating by means of reference to water-levels.

Then followed the production of electricity or the electrical state by two substances coming in contact, as in galvanic electricity; putting the zinc and copper in some acid which will act upon the zinc more than on the copper and in that way the "difference of potential," which was started by the mere contact, is maintained by the chemi-

Lastly he came to the dynamo and illustrated elabo-

rately how the electrical current was produced by it.

Turning to another term, he said we are accustomed to speak of a current passing through a wire. We do not know that anything is going on in the wire, but we do know a great deal is going on in the vicinity of the wire. We speak of the current going over the wire; of the wire offering a "resistance," which adds another term to our vocabulary. He illustrated this point by referring to a water-pipe, stating the wire was similar in this respect; that the larger the pipe or the wire, with the same amount of water or fluid, the resistance would be less than in a smaller pipe or wire; further, that the resistance is dependent not only on the diameter, but also on the length of the wire.

of the wire.

From the foregoing could be deduced the fundamental electrical formula C = E + R, which means, translated, the current strength is equal to the electro-motive difference of potential, divided by the resistance in the circuit. E is measured by a certain unit called a "volt," and "R" by a unit called an "ohm," the strength of the current "C" being measured by a unit called an "ampere."

But to return to the starting point we must learn to law

But to return to the starting point we must learn to lay aside the question, "What is electricity," and substitute for it, "What is it doing?" "What work is it performing? how measure it?" and then we shall have something tangible to work on.

tangible to work on.

Mr. Lloyd, in his paper on "Electric Railroads," gave a general description of the parts of such a road, with the manner of operating the same. He stated the amount of work obtained from the dynamo equaled eighty-five to ninety per cent. of the theoretical, while with the steamengine but fifteen per cent. was obtained.

Two plans were pursued in the operation of an electric railroad—either a constant current of varied intensity or a

Two plans were pursued in the operation of an electric railroad—either a constant current of varied intensity or a varied current of constant intensity. He recommended the latter, which was used by the road with which he was connected. He did not recommend the use of storage batteries, claiming they are expensive and unwieldy and do not produce adequate results. He believed that cars should be lighted by electricity, but all other electrical contrivances should be discarded as requiring more care and attention than results obtained would compensate. As to ice and snow, he had found in his experience that they interfered as much with electrical roads as with horse As to ice and snow, he had found in his experience that they interfered as much with electrical roads as with horse cars, but, all things considered, electric cars could be run for less than half the expense of horse cars, and at the same time afford the people better service. He stated that such ratlways could be built in any street in Pittsburg for \$25,000 per mile, while cable lines would cost \$100,000, and the cost of operation would be fifty per cent. less, while electricity is as reliable as either the mule or the cable

Dr. Moses, of the National Electric-Light Association, in a few remarks gave the development of the electric railway system abroad, stating its use was contemplated in the Underground Railway of London, the only system of rapid transit in that city. The conditions, he stated, of rapid transit in that city. The conditions, he stated, were all favorable, and he thought there was little doubt of the adoption of the system, and of an American system

In Paris, also, plans were under consideration, some of the features being novel. The cars are to be run on high tension currents in a multiple arc, and feeders are to be placed along the line for the purpose of supplying the current. To preserve these from the attacks of the small boy, the inventor has arranged that when the car reaches soly, the inventor has arranged that when the car reaches a certain rail it covers the vulnerable point, obtains its supply, and, when passing off the rail, the feeder is again covered and protected.

This plan is proposed in opposition to the cable lines, and he thought it would be approved.

MINNEAPOLIS ENGINEERS.

THE Minneapolis Engineers' Club met last week with a large attendance. A. H. Linton and George E. King were elected to membership. Messrs. Abbot, Sturtevant, and Huntress were appointed a committee on national public works. At the next meeting there will be a paper on the St. Paul Cable Line by E. T. Abbot.

THE BOSTON WATER-METER TESTS.

THE tests of water-meters begun by authority of the Boston Water Board in the latter part of April, the Boston Water Board in the latter part of April, 1887, were concluded in October, and the gentlemen constituting the commission to make the tests, Messrs. L. Frederick Rice, Charles Carr, and N. M. Lowe, have completed their report. There were thirty-five meters entered for testing, but only twenty-six were actually furnished. The results are presented by means of elaborate tables and analyses of the tests.

WORD comes from Connecticut that the present high pr. ce of coal has revived the cord-wood industry there and is keeping the wood-choppers very busy. Of recent years owing to the almost exclusive use of coal for fuel, there which it is to be hoped will continue.

HENRY KNICKERBACKER, JR.

HENRY KNICKERBACKER, IR., a graduate of the Rensselaer Polytechnic Institute of Troy, N. Y., in the class of 1887, and a young man who gave promise of a bright future, died suddenly at Saratoga Springs, N. Y., on February 13, aged twenty-two.

ENSIGN BENNETT.

ENSIGN BENNETT, better known as Col. Bennett, died at Buffalo, February 21. He was born at Portland, Chautauqua County, N. Y., on September 5, 1831, where he early developed a liking for engineering, and assisted in laying out the eastern end of what is now the Lake Shore and Michigan Southern Railway.

Coming to Buffalo, he became connected with the office.

Coming to Buffalo he became connected with the office

of the City Engineer.

Leaving Buffalo Col. Bennett went to Lyons, where he was appointed resident engineer of the Erie Canal. He was connected with this public work when its earlier limits were being changed for something more substantial. After the war broke out he entered the Government employ, and for a time he directed the construction of fortifications at Boston and Plymouth, Mass.

Colonel Bennett lived for a number of years at Brazil

Colonel Bennett lived for a number of years at brazil and Michigan City, Ind., and was extensively engaged in railroad building. Returning to New York he located at Rochester and built the Valley Canal Railroad, now part of the Western New York and Pennsylvania. This work finished, he continued his connection with the road by

taking charge of its coal interests.

He gave up railroad building and returned to Buffalo in the spring of 1882, since which he has been known as the General Manager of the Fairmount Coal and Iron Company, North-Western Coal and Iron Company, and the Buffalo Coal Company, all of which are owned by the above road. A widow and three sons survive him.

GEORGE H. CORLISS.

GEORGE H. CORLISS died suddenly in Providence, R.I., GEORGE H. CORLISS died suddenly in Providence, R.I., February 21. Mr. Corliss was born in Easton, Washington County, N. Y., June 2, 1817. In 1825 his father moved to Greenwich. After serving several years as general clerk in a cotton factory he spent three years in the Academy at Castleton, Vt., and in 1838 he opened a country store in Geenwich. He first showed mechanical skill in temporarily rebuilding a bridge that had been washed away by a freshet, after it had been decided that such a structure was impracticable. He afterward constructed a machine for stitching leather before the invention such a structure was impracticable. He afterward constructed a machine for stitching leather before the invention of the original Howe sewing machine. He went to Providence in 1844; in 1846 began the development of his steamengine improvements, having associated himself with John Barstow and E. J. Nightingale under the firm name of Corliss, Nightingale & Co.

Mr. Corliss won a large number of medals and had many honors conferred upon him. He carried away

Mr. Corliss won a large number of medals and had many honors conferred upon him. He carried away the highest competitive prize at the Paris Exhibition in 1867; was presented the Rumford Medals in 1870, the late Dr. Asa Gray, President of the Academy, making the presentation, and won the grand diploma at the Vienna Exhibition in 1873, although he had neither machinery nor representatives there. Foreign builders had, however, exhibited engines claimed to be built on his system, and the system won the award. In 1879 Mr. Corliss was awarded by public proclamation the Montyon prize of the Institute of France for 1878, which, in the Old World, is the highest honor known for mechanical achievements. In February, 1886, the King of Belgium made Mr. Corliss an officer of the Orcer of Leopold.

Mr. Corliss was a Commissioner for Rhode Island at

Mr. Corliss was a Commissioner for Rhode Island at the Centennial Exhibition, and was one of the Executive the Centennial Exhibition, and was one of the Executive Committee of seven that was intrusted with the preliminary work. He submitted plans for a single engine of 1,400 horse power to move all the machinery in the exhibition, which was completely successful. Mr. Corliss spent, it is said, \$10,000 upon it above the appropriation for building it. He was actively interested in public affairs, but kept himself out of public office, his only public service being as Presidential Elector for Hayes in 1876 and State Senator for several terms.

Senator for several terms.

He was often urged to run for Mayor or Governor and as often refused, once declining a nomination for Governor after a convention had unanimously tendered it. He was one of the commissioners who built the City Hallin Providence. Mr. Corliss was twice married, first in 1839 to Phebe F. Frost, of Canterbury, Coun., who died in 1859, and again in 1866 to Emily A. Shaw, of Newburyport, Mass. who survives him. He leaves a daughter and son by his first wife.

PERSONAL.

E. R. Jones, who has been connected with the Eastern Division for thirty-four years as Assistant Superintendent and Superintendent, has resigned his position on account of age and failing health.

DEXTER BRACKETT, who has been connected with the City Engineer's Department of Boston for the past nineteen years, has been appointed Superintendent of the Eastern and Mystic Divisions of the Boston Water-Works.

J. H. Brown, who has been Superintendent of the Mystic Department, has been placed in charge of the Mystic Valley sewer.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

CHITECTURAL COMPETITIONS.

IINNEAPOLIS.—Plans for the new courtse and city hall have been opened. The iding will cost \$1,500,000. The scheme of ipetition was decided on as already noted hese columns, and twenty-six sets of plans e submitted. The award will be made r. The main plans and the styles of archiure proposed were as follows:

ure proposed were as follows:

'ost Brothers, Minneapolis—Rough and ssed stone, six stories high, with one centower 400 feet, and four towers; central inda, 112 feet square, finished in marble plastering, the general appearance being ilar to the Pittsburg Court-House.

V. H. Dennis—Romanesque design in

v. H. Dennis—Romanesque design in ssed stone, resembling the Pittsburg build; four stories high, with central and three all towers, and an open central court.

orff Brothers—French Gothic design, five ites and basement, with a high tower on the orth Street side.

Irth Street side. landy & Cady—Italian style, four stories, ha grand entrance on Fourth Street, of ssive appearance; also a French Gothic ign, four stories and basement, with two

ers and a portico.

& A. L. Haley—Renaissance, three stories l basement, with an imposing central dome ring a low clock.

Mex Murrie—Gothic building, four stories

Alex Murrie—Gothic building, four stories I basement; central tower and grand enace on Fourth Street, modeled after the result of Glasgow Scotland.

y Hall of Glasgow, Scotland.

V. D. Kimball & Co.—Four stories and ement, with a high arched entrance, a lare tower on Fourth Street, and an open it in the centre.

ong & Kees, two plans—One of classic le; H-shaped, four stories and basement, h large central dome and closed central int; the other of Romanesque style, ssed stone, with high tower on Fourth eet, two smaller towers opposite, high of and high arched entrance on the north

3. E. Hoover—Classic design, three stories I basement, square and plain, with large stral dome and entrance starting on the sement level.

Meyer & Thorn, St. Paul—Italian Romanque in style, four stories and basement, th roofs and entrance, with high tower Fourth Street, and a number of smaller vers

H. Maltby—Byzantine style, with central me and four smaller ones on the corners, d liberally ornamented walls.

Edbrook & Burnham, Chicago—Romanjuestyle, H-shaped, with main entrance resed on Fifth Street, large central tower, d winding stairway leading to a lookout at

J. Gast, San Francisco—Renaissance, four ries and basement and four towers.
C. F. Collum, Philadelphia—Design mas-

C. F. Collum, Philadelphia—Design masee, with central tower on the Fifth Street le.

M. E. Bell & Co., Chicago—Romanesque hitecture, five-story and basement in 1gh stone, large central tower and arched trance

McDonald Brothers, Louisville—Romanlue, four stories and basement, with high of and open court, relieved by a high tower the Fourth Street side.

the Fourth Street side.

E. E. Meyers, Detroit—Romanesque style, cidedly ornamental, rough stone exterior, th large tower on the north-west corner and nilar ones in the rear; high roofs and open ntral court from the fourth story to the sement.

STORM LAKE, IOWA.—Plans are wanted re for a court house, until April I. J. W. avren, County Auditor.

FALL RIVER, MASS.—The Fall River edical Society has addressed a communicant to the aldermen of this city calling their tention to the imperfect system of plumbing id se werage which exists in certain quarters, if which is, it claims, a fruitful cause of disses of typhoid and diptheritic type. It is to be that improvements in the system as be ordered by the city officials.

ALB ANY, N. Y.—It is proposed to improve adison Avenue, at a cost of \$250,000. A mail the chas been appointed who have the alter mader consideration.

For works for which proposals are requested see also the "Proposal Column," pages i-lv-viii-207.

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtain ing early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

WHEELING, W. VA.—It is probable that the Board of Aldermen will soon take conclusive steps towards making the proposed improvements to the water-works system. The idea is to have one basin of 1,000,000 gallons capacity, to be used as a settling basin, the water to flow down an incline from it into the 2,000,000 gallons distributing basin. The total cost of the improvement is estimated at \$50,000.

MEMPHIS, TENN.—The new water-works company has about finished the plans and specifications for the \$75,000 improvement, and it is probable bids for the work, etc., will soon be advertised tor. The city engineer can give details of the proposed work.

FARMINGTON, ME.—Concerning the water-works question here, the chairman of the Board of Assessors writes us, under date of February 16, as follows: "The question is being agitated, and will probably be decided two weeks from to-day. I will try to send you the result."

LOCKLAND, O.—About \$15,000 is to be expended on the sewerage system here.

EDGAR, NEB.—A. A. Richardson, engineer, of Lincoln, Neb., is preparing plans and specifications for a system of water-works for this place to cost \$20,000.

ASHLAND, Wis.—The city will vote, on March 6, on the question of issuing the sum of \$100,000 in bonds for additional sewers and other improvements.

WILLIMANTIC, CONN.—Concerning the extending of the sewerage system here, our correspondent writes as follows: "Proposals are now being prepared and plans made for additional sewers, for which \$91,214 (estimated) will be expended. We have decided to use vitrified earthenware tile, and have estimated the amounts needed as follows: 1,320 feet 8-inch, 960 feet 15-inch, 280 feet 18-inch, 600 feet 20-inch, 2,880 feet 24-inch, and 620 22x-32 brick. G. W. Meloney, of the Sewer Committee, can give details."

SOUTH FRAMINGHAM, MASS.—Our correspondent writes: "The result of the election held here February 20 to determine whether or not the sum of \$140,000 should be expended on a sewerage system resulted in favor of the project. The Committee on Sewerage was instructed to petition the State Board of Health to affirm its plans, and in six weeks we expect to be ready to receive bids."

CHAUTAUQUA, N. Y.—Concerning a published report that water-works were to be erected here, our correspondent writes as follows: "No water-works as yet proposed."

CANYON CITY, COL.—Concerning the report that the water-works here were to be improved, our correspondent writes as follows: "The State Penitentiary is located here, and the State Commissioners are putting in waterworks for the prison, which they have pretty well advanced towards completion, but the plant is a very temporary one."

TECUMSEH, NEB., will vote on honds for water-works February 28. Amount of bonds, \$21,000. Plans and specifications by A. A. Richardson, engineer, of Lincoln, Neb.

ABERDEEN, DAK.—The Pullman pumping system has been adopted for the sewer-work. The approximate cost is to be \$40,000.

FORT BENTON, MONT.—Our correspondent writes: "Water-works have been established here and are about ready for operation. They are the Holly system, and were put up by George F. Woolston, of Boston, Mass."

OWATONNA MINN.—Concerning the waterworks question here our correspondent writes as follows: "A petition of citizens has been presented to the Council asking for some system of water-works. The petition was referred to the Fire Department Committee in whose hands it now is. The chairman of this committee is James Brown."

IRON MOUNTAIN, MICH.—Concerning the water works project here our correspondent writes as follows: "Estimates have been made. The question of bonding the city in the sum of \$85,000 was submitted to the people February 14, at which election there were only thirty votes cast against it out of a population of about 5,000. Contract will be let April 2. Plans and specifications are being prepared by O. Burlingame, Menominee, Mich."

READING, PA.—Our correspondent writes: The City Council, at its next meeting, will introduce an ordinance to divide the city into sewerage districts, and at once commence the erection of said new sewers, as an appropriation of \$45,000 has been made for said purpose."

ALBANY, N. Y.—The agreement between the Central-Hudson road and this city relative to certain lands to be secured by the latter for water-works is about ratified. The railroad desires to obtain title to the waters and lands under the waters of Patroon's creeks from the southerly line of the lands of the company near the culvert, about 1,500 feet east of the Russell road, to the southerly line of the lands of the company near the culvert opposite the west end of Tivoli Lake. For these lands \$50,000 is to be paid the city to lay a trunksewer for the company, into which the city can drain if it sees fit. The railroad company will allow the special water commission to cross, either above or below its tracks, with a force-main to carry water from the gang-wells now being sunk on the flats near the Hudson River, north of the city of Albany, at a point to be determined hereafter.

YANKTON, DAK.—City Council will adopt plans for \$4,000 system of sewerage.

ROCHESTER, MINN.—C. F. Loweth, C. E., of St. Paul, has been selected to draft plans for a complete system of sewerage. Work is to be commenced this summer.

GERMANTOWN, PA.—A movement has been made by the taxpayers towards improving the sewerage system. A resolution declaring the entire system a nuisance prejudicial to public health was adopted by the Board of Health, and a request was made to Councils to furnish means for abating it as early as practicable. It is probable that immediate steps will be taken towards the end desired. Medical Inspector Taylor can furnish details.

DULUTH, MINN.—At a recent meeting of the directors of the Duluth Gas and Water Company steps were taken to secure the construction of a new and larger reservoir. In addition to this, the general work of laying mains, etc., throughout the city will be continued.

FAYETTEVILLE, N. C.—Concerning th water-works project here our correspondent writes as follows: "This town wants a modern system of water-works. Enough interest is felt in the subject to favor a local company to put in the plant; but no one here seems to know exactly how to manage it. One or two proposals have been made on the 'franchise plan,' but the matter is still open. The Town Board appointed a 'water-works committee,' which has the subject under consideration. No specifications have been adopted as yet; water-supply near by, pure and abundant. The town will at an early day employ a competent engineer to survey its streets and to make estimates for a canal by which the water of the Cape Fear River can be brought through the town, thus augmenting its present fine water power."

Los Angeles, Cal.—The Tiyunga Water Company has been incorporated in this city. Capital, \$500,000. F. C. Garbutt and others, incorporators.

HAYWARD, WIS.—The Hayward Water-Works Company was incorporated February 16, with a capital stock of \$50,000. E. H. Holbert is at its head.

WATKINS, N. Y.—Carrol Ph. Bassett, of Newark, N. J., has been engaged to prepare plans and report on water-supply and sewerage systems for this place.

LANARK, ILL.—Address D. S. Licht, City Clerk, for details of new water-works project.

PEABODY, MASS.—The water-works system here is to be improved.

OGDEN, UTAH—It is proposed to improve the water-works system.

ELKTON, MD.—Water-works will probably be constructed here. John S. Wirt is chairman of the committee in charge.

ST. IGNACE, MICH.—It is reported that water-works are contemplated here.

RED JACKET, MICH.—Joseph Herman is at the head of a committee to investigate the feasibility of establishing water-works.

PAINESVILLE, O.—Concerning the published report that water-works were to be erected here, A. N. Peebles, engineer of the Painesville Water-Works, writes us as follows: "I am not aware of any new system of water-works contemplated for Painesville. There is a very good system of water-works here, of which Mr. B. F. Stephens, of Flatbush, N. Y., is superintendent and general manager."

BRIDGES.

BELLEVILLE CITY, CANADA.—A \$60,000 bridge is to be constructed by the city over Quinte Bay.

LONG LAKE, N. Y.—Concerning a report that a bridge was to be erected here our correspondent writes as follows: "A small bridge is to be erected here, but there is no prospect of anything being done at present."

ASHTABULA, O.—Address the County Commissioners for details of a bridge to be erected by them.

MAURICETOWN, N. J.—The Cumberland County Freeholders have decided to erect an iron bridge costing \$50,000 over the Maurice River at this place.

STREET-WORK AND PAVING.

ST. PAUL, MINN.—The Board of Public Works has reported favorably on considerable street work, and bids will soon be asked for doing the work. The total cost of the improvements is \$125,200.

WASHINGTON, D. C.—The Street Committee is considering the question of appropriations for paving several streets, and it is probable that the work will soon be ordered done.

GAS AND ELECTRIC-LIGHTING.

DELPHI, INDIANA.—An electric-light plant is to be established here.

FREMONT, NEB.—This place is to be lighted by electricity.

JACKSON, OHIO.—An electric-light plant is to be established here.

NORTHAMPTON, MASS.—An electric-light company is being organized here.

OSWEGO, KANSAS.—The Oswego Electric-Light Company has been incorporated. Capital, \$60,000. F. L. Greene and others, incorporators.

MEDFORD, MASS.—The Medford Electric Light Company has been incorporated; capital, \$20,000. William H. Warren and others, incorporators.

EVERETT, MASS.—The Everett Electric-Light Company has been incorporated; capital, \$10,000. F. S. Pearson, Treasurer.

DAVENPORT, KY.—The People's Light Company has been incorporated; capital, \$10,000. James Thomson and others, incorporators.

TAUNTON, MASS.—The electric-light plant at this place is to be extended.

NEWPORT, R. I.—An electric-light plant will probably be established here.

Dover, N. H.-An electric-light company has been organized here, with F. Abbott its president. The capital stock is \$75,000.

WATERVILLE, ME. - The Waterville Electric-Light Co. will expend several thousand dellars on improvements.

CANTON, O.—This city will shortly advertise for bids for 20, 30, 40, and 50 electric lights, from 150 to 300 gas lights, and from 400 to 800 gasoline lights. Address the Committee on Street Lighting.

MANCHESTER, N. H .- The officials of this place are discussing the question of purchasing an electric-light plant. The plan is to be considered further at the next meeting of the Common Council.

FREDERICK, MD.—The New York Electric Construction Co. has offered to light the streets of this place for \$4,000 per year. The offer has not been accepted, and the officials are still considering the matter.

DULUTH, MINN.—It is probable that additional lighting facilities will soon be wanted

in this city.

The question of making a change in the system of manufacturing gas, with the idea of providing a better service, was considered by the directors of the Duluth Gas and Water Co. at a recent meeting. With this object in view, Manager Craig has left for Chicago, and will probably also go to Buffalo, to inspect the parious systems in operation and the plants various systems in operation and the plants used, the idea being to secure the most improved plant for the new works to be erected here.

BROOKLYN, N. Y .- The Edison Electric-Light Company has applied to the Mayor and Common Council for permission to open and Common Council for permission to open the streets and to lay its conduits, cables, and wires. It promises, in case the franchise is granted, to furnish the city and the citizens with incandescent electric-lights twenty-five per cent. cheaper than the present service.

FLATBUSH, N. Y.—A difference exists between the Flatbush Gas Company and the Highway Commissioners which may result in a break of contract between the two parties. The town has heretofore paid \$31 a year per lamp, but now the officials declare that they will not pay more than \$25. The gas company will not sign a contract at that figure and the matter remains unsettled.

BIDS OPENED.

ST. PAUL, MINN.—The contract for the steam-heating of the new St. Paul, Minneapolis and Manitoba Railway office building has been awarded to Allan Black, of this city, for

CINCINNATI, O .- Synopsis of bids for furnishing, etc., at the Front Street pumping sta-tion an amount of boiler power equivalent to tion an amount of boiler power equivalent to the evaporation of 36,000 pounds of water per hour, and at the Hunt Street station one of 15,000 pounds per hour, opened February 16 by the Board of Public Affairs. Bids on Front Street boiler: Dun & Laidlaw Co, Cincinnati, O., Galloway boilers, evaporation, 12, \$20,795; Abendroth & Root, New York City, Root boilers, evaporation, 10.95, \$21,603.40; Charles Ward, Charlestown, W. Va., evaporation, 8, \$20,000; Home Safety Boiler Company, St. Louis, Mo., evaporation, 9, 5, \$17,115. Hunt Street, Dun & Laidlaw Co., \$10,430; Abendroth & Root, \$9,965; Charles Ward, \$9,500; Home Safety Boiler Co., \$7,250.

MOUNT CARROLL, ILL.—Our correspondent writes: "The U. S. Wind Engine and Pump Co., of Batavia, Ill., received the contract of furnishing machinery, materials, and construction of a water-works system for our city, February 15, at the amount of \$15,200.

CHICAGO, ILL.-The firm of Riter & Conley, Pittsburg, Pa., has received a contract from Mr. Onderdonk, the contracter who has secured the job, to supply this city with purer water. They will construct a large caisson for the purpose of being sunk four miles out in the lake to be used in the tunnel extension. The outside caisson will be 75 feet in diameter, the intermediate one 31 feet. The entire transmill be 66 feet by the crongly broad. mass will be 60 feet high, strongly braced with bars, angles, and T-iron, and will weigh tons. Carnegie, Phipps & Co. will supply the firm with the steel.

The work will cost from \$25,000 to \$30,ooo. After the caisson is sunk in the lake four miles out, a tunnel will be commenced at that point and dug under the water until the present tunnel is reached. The same firm will also build the second caisson.

FINDLAY, O .- The following bids for furnishing water-works materials were opened February 15 by the water-works trustees, John W. Hill, of Cincinnati, O., Consulting Engineer:

John W. Hill, of Cincinnati, O., Consulting Engineer:

Cast-iron water-pipe and specials—2,627.69 tons of 2,000 pounds, 114,000 pounds of specials. Addyston Pipe and Steel Co., Cincinnati, \$70,074.40; Hueston & Freeman, \$70,074.40; Lake Shore and Foundry, Cleveland, \$72,089.63; Ohio Pipe Co., Columbus, \$75,253.97; W. H. Campfield, \$75,253.97; National Pipe and Foundry Co., \$78,710.33; R. D. Wood & Co., Philadelphia, \$79,075.24; Dennis Long & Co., Louisville, \$33,301.77; Mellert Iron and Foundry Co., New York, and Reading, Pa., \$86,170; Builders' Iron and Foundry Co., Providence, specials, \$2,600.

Pipe-laying and concrete—5.370 feet 20-inch, 7,770 feet 16-inch, 1,450 feet 14-inch, 4,310 12-inch, 10,913 feet 10-inch, 16,636 feet 8-inch, 38,136 feet 6-inch, 5,016 feet 4-inch; concrete, 55.63 cubic yards, James J. Rumsey, \$22,820.71; W. H. Campfield, \$25.537.69; P. Sullivan, \$26,355.33; A. G. Pugh, \$27,785.61; Snyder & Williams, \$28,316.20; Hueston & Freeman, \$33,920.05; P. E. Sullivan, \$37,168.65; Vanston & McCarthy, \$38,398.48.

Stop-valves—2 20-inch, 218-inch, 56.6-inch, and

\$38,398.48.
Stop-valves—2 20-inch, 4 16-inch, 1 14-inch, 3 12-inch, 12 10-inch, 21 8-inch, 56 6-inch, and 8 4-inch. James Flower & Bros., Detroit, \$2,086; Galvin Iron and Brass Works, Detroit, \$2,086; Galvin Iron and Brass Works, Detroit, \$2,130.50; Bourbon Copper and Brass Works, \$2,222; Ludlow Valve Co., Troy, N. Y., \$2,224.80; Eddy Valve Co, Waterford, N. Y., \$2.263.50; Chapman Valve Co., Indian Orchard. Mass., \$2,338.47; Hueston & Freeman, \$2,357; Holly Mfg. Co., Lockport, N. Y., \$2,566.50; Mellert Foundry Co., New York and Reading, Pa., \$2,400.

\$2,505.50. Henert Foundry Co., New York and Reading, Pa., \$2,409.

Stop-Boxes—207 required—Galvin Iron and Brass Works, \$267.50; Bingham & Taylor, \$346.10; Eddy Valve Co., \$347.75; A. W. Morgan, \$337.05, \$353.10, \$371.29; Hueston & Freeman, \$481.50; Mellert Pipe and Foundry Co., \$1,605; Builders' Iron and Foundry

& Freeman, \$481.50; Mellert Pipe and Foundry Co., \$1,605; Builders' Iron and Foundry Co., \$321.

Fire-hydrants—133 16-inch hydrants, 6 4-inch hydrants—Without frost-cap, Ludlow Valve Co., \$3,716.94 and \$3,949.69; Chapman Valve Co., \$4,162.42. With frost-cap, Galvin Iron and Brass Works, \$4,140; Ludlow Valve Co., \$4,231.24, and \$4,255.64 without frost-cap; Bourbon Copper and Brass Works, \$4,548; Bourbon Copper and Brass Works, \$4,548; Galvin Iron and Brass Works, \$4,557; Chapman Valve Co., \$4,633.05; Bourbon Copper and Brass Works, \$4,823; Mellert Foundry Co., \$4,835; Ludlow Valve Co., \$4,898 90; R. D. Wood & Co., \$4,925.75; Bourbon Copper and Brass Works, \$4,932; Hueston & Freeman, \$4,953; Holly Mfg. Co., \$5,161.50; James Flower Bros., \$5,281.90; Holyoke (Mass.) Hydrant Works, \$5,405.89; Bourbon Copper and Brass Works, \$5,479 and \$5,754; Chapman Valve Co., \$5,787.49; Ludlow Valve Co., \$5,974.07; Eddy Valve Co., \$6,020. Without frost-cap, Chapman Valve Co., \$5,113.22; Ludlow Valve Co., \$5,13.19.

Co., \$5,213.19.
Pumping Machinery—2 2,500,000 gallon com. duplex non-condensing pumping with 3

com. duplex non-condensing pumping with 3 66'x16' boilers complete.

Gordon & Maxwell Mfg. Co., "A," \$15,-600; Gordon & Maxwell Mfg. Co., "B," \$14,700; Holly Mfg. Co., "A," \$21,700; Holly Mfg. Co., "B" (rotative), \$24,700; Deane Steam Pump Co., Holyoke, \$27,700; Cooper Mfg. Co., \$18,300.

Proposals for pipe, specials, hydrants, stop-valves, stop-boxes, pipe-laying and concrete complete:

complete:
Snyder & Williams, \$108,674.42; Hueston & Freeman, \$112,085.59.

CINCINNATI, O.—Synopsis of bids for the excavation, concreting foundations, brick work, cut-stone work, iron work, copper and slate work, interior concreting, fire proofing and asphalt for the erection of the proposed new City Hall, opened February 20, by the Board of City Hall Trustees. The bidders were as follows:

were as follows:

Excavation—John Sperry, \$4,950; John Sperry (concrete), \$6,486; Henry Dieckman, \$5,300; Geo. S. Gleason, \$3,500; F. H. Schroder & Son, \$4,164; Henry Sweeney, \$3,300; James O'Malley, \$7,683.

Excavation, Concrete and Foundation—H. Meiners & Son, \$2,1000; foundations P.

Meiners & Son, \$34,900: foundations, P. Murry & Son, \$22,850; foundations, John Sperry, \$29,858; excavations, concrete and foundation, P. Murry & Son, \$33,237; foundations and concrete, D. Flaherty & Bro., \$36,550; foundations, J. H. Finnegan, \$25,-

545. Brick Werk—Jacob Megley & Son, \$87,844; J. M. Blair's Sons, \$75,275; N. C. G. Parker,

\$ 76,661 (additional at rate of \$11 per 1,000); J F. Tuttle & Son, \$85,384; Cornell Fuerst. J F. Tuttle & Son, \$85,384; Cornell Fuerst, \$74,547 (additional at rate of \$11 per thousand); C. E. Iliff, \$78,000 (additional at \$12 per 1,000); Mason & Bro., \$85,575 (additional \$11 per 1,000); H. Jacob & Holscher, \$80,339 (additional \$11 per 1,000); McGarvey & Bro., \$78,175; H. B. Lucky & Son, \$84,637.

Cut stone-work—William Graveson, \$329,-998; David Hummel, \$326,500; foundation concreting, Pugh & Stagge, \$4,308; concrete interior, Charles Kuhl, \$18,915,04; foundation and interior concrete. Frank Bauer. \$27,038

interior, Charles Kuhl, \$18,945.04; foundation and interior concrete, Frank Bauer, \$27,938; foundation concrete, P. Gleason, \$7,750; interior concrete, P. T. Scabill, \$10,475; interior concrete, Pugh & Stagge, \$11,941; foundation concrete, J. H. Finnegan & Co., \$7,176; interior concrete and fire-proofing. L. Grace, \$32,979; foundation concrete, H. Dieckmeier, foundation and interior concrete and \$6,525; foundation and interior concrete and fire-proofing, Pugh & Stagge, \$45,560; interior concrete, Whitson & Pickering, \$14,-

500.
Fire-proofing—Pugh & Stagge, \$29,611;
Summit Brick Co., \$28,230; J. H. Finnegan & Co., \$18,645; William B. Owen, \$30,000;
Wight Fire-proofing Co., \$22,293.40; Pioneer

Vignt Fire-probling Co., \$22,293.40; Floheer Co., \$19,900.

Iron-work—Snead & Co., Louisville, \$141,-850; Haugh, Ketchum & Co., Indianapolis, \$132,000; L. Schrieber Sons & Co., \$130,890; M. Clements, \$125,700; Lane Bros., Newark, O., \$134,390.
Galvanized iron, copper, and slate-work—

Thomas Lee, \$32,860.

PROPOSALS. (Continued from page viii.)

ELECTRIC-LIGHT.—Proposals are wanted at Fairhaven, N. Y., for erecting, etc., an electric-light plant. No date specified. Address the Mayor.

DREDGING.—Proposals are wanted at Cleveland, O., until March 1, for dredging in the Cuyahoga River. Address Walter V. Rice, City Engineer.

STREET WORK.—Proposals are wanted at Hol-yoke, Mass., until March 2, for paving, curbing, etc. Address Henry Winkler, Chairman, Committee on Highways.

DREDGING.—Proposals are wanted at Jersey City, N. J., until February 29, for dredging, crib-work, and rip-rap, to be done in Morris Canal Basin. Address the Engineer's Office, L. V. R.R., Washington Street,

STEAM-HEATING.—Proposals will be received by the School Trustees for the Ninth Ward, New York City, at the Hall of the Board of Education, No. 146 Grand Street, until Monday, March 5, for steam-heating apparatus to be placed in the Annex Building for Grammar School No. 3, in Grove Street.

BRIDGE.—Proposals are wanted at Fond du Lac, Wis., until March I, for erecting an iron bridge across the Fond du Lac River. Said bridge to be of iron, sixteen feet roadway in the clear, and sixty-one and one-half feet long, in one span, with sidewalk each four feet eight inches wide on each side, and of ample strength for all kinds of road traffic. Address E. Delany, Jr., City Clerk.

RETAINING WALL.—Proposals are wanted at Jefferson City, Mo., until February 29, for about 60,000 cubic feet of masonry, range work and cut-stone work. Address J. B. Legg, architect, Governor's office, as

FIRE-ALARM TELEGRAPH.—Proposals are wanted at Mobile, Ala., until March 31, for furnishing, erecting, etc., a fire-alarm telegraph system, containing 40 signal boxes, 9 engine-house gongs, 2 private gongs, 25 miles of wire and other apparatus to make the system complete. Address John F. Summersell, City Clerk.

TOWER.—Proposals are wanted at Albany, N. Y. until March 1, for the erection, etc., of a stone tower for the Cathedral of the Immaculate Conception. Address Messrs. Withers & Dickson, architects, Albany, N. Y.

PROPOSALS.

Proposals for Building Sewers.

Proposals for Building Sewers.

TRENTON, N. I., February 25, 1888.

THE Common Council of the City of Trenton, in the State of New Jersey, will receive, at their meeting, to be held in the City Hall of said city, on Tuesday, the twentieth day of March, A. D. 1888, at eight o'clock in the evening, sealed proposals for building in said city the following-nemed sewers:

A main sewer with about two thousand feet of vitrified pipe of fifteen inches diameter, about two thousand feet of egg-shaped brick sewer from 18226 of to 2924 and 42 about four hundred feet of cast-iron pipe 24 and 42 diameter, about five hundred feet of vitrified relief-pipe 12 and 15 diameter, and with fifteen mac-holes and flushing-basins.

Also a pipe-sewer about eight hundred feet in length, 8 and 10 diameter, with two man-holes.

Also a pipe-sewer about three thousand feet in length, 8 to 20 diameter, with nine man-holes and flushing-basins.

Also arain-water drain, to be an egg-shaped brick structure about thirty-three hundred feet in length, from 1710 x2 9 to 40 x5 0, with thirteen man-holes and flushing-basins, and eighteen inlets.

Also arain-water drain, to be an egg-shaped brick structure about one hundred and seventy-five feet in length and about 3 2 x4 9.

Plans and specifications, with a draft of the contract, and of the bonds required to be given, may be seen at the office of the Engineer, at No. 18 West State Street, Trenton, N. J., on and after March 6, 1888.

Each proposal must be made on a blank form, which will be furnished by the City Clerk, and must be accompanied with a satisfactory bond, with at least two surcties, in the sum of five hundred dollars, conditioned that if the proposal be accepted the person or persons making it will execute the coctract required to be furnished within five days after the acceptance of the proposal.

Separate proposals must be made for each of the above-mentioned sewers, but any person submitting

furnished within five days after the acceptance of the proposal.

Separate proposals must be made for each of the above-mentioned sewers, but any person submitting proposals for two or more sewers may stipulate thereon that he shall not be bound to execute any contract unless all of the proposals made by him shall be accepted by the Common Council.

The proposals must not be filed with any city official, but must be delivered by the bidder, or his agent, to the Common Council, at their meeting, above mentioned, when the same shall be called for by the President of the Common Council.

The Common Council reserves the right to reject any or all proposals.

By order of the Common Council. Dated February 23, 1888.

W. W. L. PHILLIPS, 14

Proposals for City Building.

Proposals for City Building.

THE undersigned will receive bids until noon of SATURDAY, MARCH 17, 1888, for the erection of a new city building at a cost not to exceed \$35,000.

Bids to be accompanied by plans and specifications, and marked "Proposals for City Building."

THE PROPOSED BUREAU OF PUBLIC HEALTH

THE Committee on Commerce of the House of Representatives is disposed to report favorably to the House the bill to establish a Bureau of Public Health in the Department of the Interior introduced by Mr. Davis, of Massachusetts, being H. R. bill No. 1526.

This is the same bill that was before the last

Congress, being the one prepared by a committee of the American Public Health Association and endorsed by that body. It is also approved by the Association of State Boards of Health.

It provides for the appointment of a commissioner of health with a salary of four thousand five hundred dollars per year. He is to obtain and furnish information with regard to the sanitary condition of ports and cities both in this country and abroad, and is to have investigations made into the causes and means of prevention of disease.

The only opposition to the bill is from Dr. Hamilton, the Chief of the Marine Hospital Service, who wishes to perform these duties himself and to be known as the chief sanitary official of the United States. The motives for his hostility are so frankly personal and selfish and the objections to placing public health matters under his control are so strongly felt by the great majority of State and municipal health officers that it might be supposed that his opposition would have little weight. It must be remembered, however, that for the last six or seven years Dr. Hamilton has been able to prevent the formation of a national public health organization, his position being that if such an organization is not under his control it is needless. The chief reason why he has thus been able to defeat the efforts of the sanitarians of the country is because these sanitarians have not been agreed as to what they wanted. Some wanted a board, others a bureau; some want the United States to control quarantine, others that the Federal authorities shall have nothing to do

From the beginning of the agitation on this subject, ten years ago, this journal has maintained that this country ought to have a Central Bureau of Health, that a Commissioner is better than a board, that this bureau should not be under the control of the Marine Hospital Service or of the Army or Navy Medical Departments, and that its best and most useful work would be the promotion of scientific investigations into the causes of disease with a view to its prevention. This bill is, therefore, one which we heartily approve, and one which we advise not only sanitarians and medical men, but those having commercial interests at heart to support by communicating with members of Congress and Senators and urging its passage.

PROPOSED APPROPRIATION FOR EN-LARGEMENT OF THE ERIE CANAL.

A BILL has been introduced into the New York Legislature proposing an appropriation of \$1,000,000 to start an improvement of the State Canal System, at an ultimate "estimated" cost The proposed dimensions of the of \$5,000,000. locks of the Erie Canal are to be: length, 220 feet; width, 18 feet, and depth, 9 feet. The plan is in accord with the recommendations of the Canal Improvement Convention held at Rochester last summer.

While there is no doubt that the Erie Canal should be enlarged, a serious protest should be made against the adoption of the plan proposed; that is, commencing the enlargement by an appropriation of \$1,000,000. An expenditure which a non-professional convention "estimates' amount to \$5,000,000, without any data to show that it will not be \$15,000,000 before completion, is altogether too serious a matter to be undertaken without consultation with the State's constitutional professional advisor, the State Engineer and Surveyor, and the presentation of a full and detailed estimate covering the cost and advantages of the proposed enlargement and any alternative plan that may be presented.

THE DRINKING-WATER OF VIENNA.

THERE is no large city in Europe which has a more satisfactory supply of drinking-water than that which Vienna now possesses and has enjoyed since 1874. Prior to that date the supply of the city was largely from wells, of which there were 10,000 in 1861. The water from these wells was found in 1859 to be polluted, containing organic matters and infusoria of various kinds.

Besides these wells, the city had a limited general supply taken more or less directly from the Danube, and the water from a few springs was distributed to a few palaces and public buildings. Work was commenced on the new water-works in 1870, and in 1886 only eleven per cent. of the houses were using well-water or any other supply than that brought in by the new works from mountain springs and lakes. The water from the Danube is only used for watering and cleansing the streets.

The daily supply of pure drinking-water in 1886 was about 130,000 cubic metres for a population of 764,000, or about 170 litres (37 gallons) per head. The result of this improvement in water-supply upon the health of the city is interesting, and has been made the subject of several statistical investigations, of which the latest is by Dr. Mosny, published in the Revue d'Hygiene for January, 1888. Dr. Mosny discusses more especially the statistics of the typhoid fever in Vienna in relation to the watersupply, showing that the mortality from this cause has steadily diminished from 2.2 per 1,000

inhabitants in 1857 to 0.2 per 1,000 in 1884-86. The following table shows the difference in mortality from this disease between houses which have and those which have not the best spring water-supply:

	PERCENTAGE OF DI	RATHS FR	OM TYPHOID IN HOUSES.	
Years.	Having Spring Water	Not Having Spring Water- Supply.		
1874		1.73	3.11	
1875	During epidemic.	1.97	4.21	
1875		1.40	2.86	
1876	1.30	2.75		
1877	18 7 7	1.38	4.50	
1877	During epidemic.	1.04	10.00	
1878		1.01	1.98	
1879		1.13	1.21	
1880		0.86	1.21	
1881		1.04	0.70	
1882		1.03	0.69	
Mean.	•	1.26	3 02	

In the epidemic of typhoid which broke out Vienna in 1877 the proportion of deaths to nhabitants was nearly ten times greater in those houses supplied with water from the Danube than it was in those furnished with the pure supply. Among the soldiers located in barracks in different parts of the city the number of cases of typhoid per 100 men in the barracks supplied from the Danube was 2.69, while in those having the pure water-supply it was 0.15.

The evidence is very strong that typhoid fever in Vienna has been connected with the water-supply, and that those who make use only of the present general supply run very little risk of taking this disease. Cases are now rarely seen in the hospitals, and when they do come it is almost invariably from some suburb to which the general supply has not yet been extended. Dysentery has also nearly disappeared, no deaths from this cause having been reported for the years 1881-86, and the whole statistical record gives excellent evidence as to the good effects produced by an unpolluted water-supply.

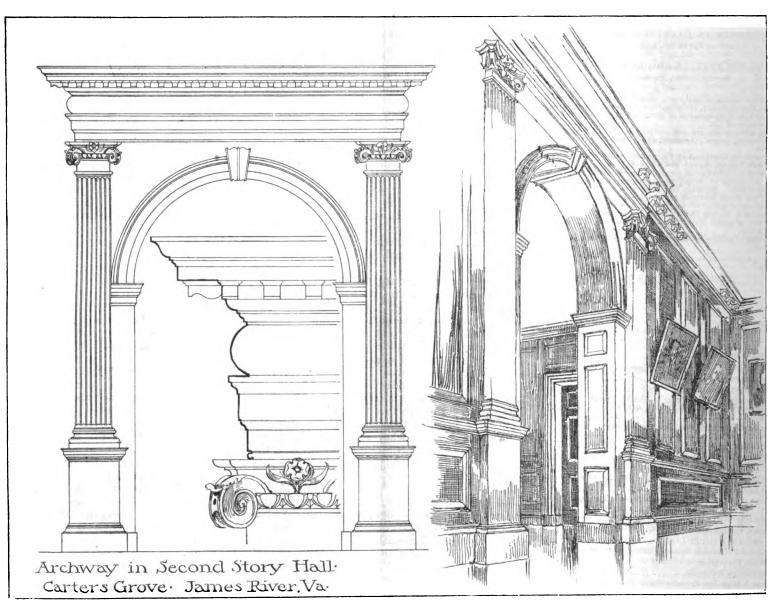

London bounded by Cheapside and Fleet Street on the north, and Queen Victoria Street and the Embankment on the south, at a cost of £26 per lamp, instead of the full cost of about £40, in consideration of a concession of the exclusive right of way for their electric lighting lines, etc., for private lighting for a term of not less than seven years. The total charge for the proposed 169 arc lamps for street lighting would be £4,394, representing an addition to the city rates of about one-eighth of a penny in the pound.

The development of electricity in its application to carriers has found a new instance at Brighton. Mr. Volk, who has for some time past exhibited an electric railway there, has recently exhibited an electric dog-cart. The trap weighs forty pounds, and with a load of two persons has given a speed of four miles an hour on a macadamized road. On smooth surface it gave better results. It is fitted with a ½ H.P. Immisch motor, situated under the trap, the current being supplied by 16 E. P. S. accumulators.

while standing in the pipes, they keep their water running to waste, so that it shall not stand. The Corporation are publishing statements showing the enormous and unac counted increase of consumption.

The Directors of the Great Northern Railway have recently issued an order to their firemen and engine-drivers which should be the imitation of similar regulations throughout the various railways in the country. No fireman or engine-driver is to be allowed to go on duty unless he has had at least nine hours' rest. Such an instruction should not be necessary, but being necessary, its issuance is no less a boon to the men than a source of safety to the public.

A question as to whether it is necessary and profitable to burn pyrites in the open air is creating considerable discussion in Spanish mining circles, and especially at the Calanas Mine. The municipal authorities, exercising what one should take to be an undoubted right, prohibited the burning on sanitary grounds, owing to the

FAVORING IMPROVEMENT OF NEW YORK CANALS.

PRESS dispatches from Buffalo state that the bill appropriating a million dollars for the improvement of the canals is receiving endorsement from all the leading institutions and business interests. Preparations are making for a monster mass meeting. Efforts will be made to interest New York in the gathering and to secure speakers from that city.

SOME FOREIGN NOTES.

(From our London Correspondent.)

THE Anglo-American Brush Electric-Light Corporation has made the first serious attempt to cope with the difficulties created by the Electric Lighting Act. It is probable that the A. A. B. Co. reckon on the assurance pretty generally entertained in electric light circles, that the "old iron clause" will be repealed by the present Parliament session.

At the meeting of the City Commissioners of Sewers, held on the 14th inst., the Streets Committee reported that the A. A. B. Co. have offered to light a section of

A new microphone transmitter has just been patented in Vienna. The principle is a series of hollow carbon cones within each other, the object being a frequent change of surfaces in contact. Siemens & Holske are the patentees.

The Finsbury Technical Institute is being well worked. A series of lectures, illustrated by working drawings and dynamos, and in connection with a Jrawing class, is announced, the subject being the mechanical engineering involved in the manufacture of dynamos and motors. Professor Perry is the lecturer.

The Merchant Tailors' Company have recently voted ten guineas to the Parkes Museum to aid in its work of practically teaching and demonstrating sanitary science.

The trouble in connection with alleged presence of lead in the Sheffield water-supply, which attracted considerable attention some little time since, is again making itself felt. The consumers are adopting a very rough and ready method of protecting themselves from lead poisoning. On the supposition that the lead is taken up by the water

fumes. The Governor of the district suspended the order, but the Minister of the Interior upheld the municipal order against the Governor. The fumes are admitted to be a nuisance, and expert opinion is divided as to the necessity of open-air burning.

A RECENT? dispatch from Madrid says: "The Government is gradually suppressing open air calcinations at the Rio Tinto copper mines. It was on account of these calcinations that the miners and peasants rioted recently."

FITCHBURG DEPOT AT WALTHAM.

THE station of the Fitchburg Railroad at Waltham, Mass.. illustrated in our last issue, of which Messrs. Hartwell and Richardson, Boston, are the architects, is of brick with stone trimmings finished throughout internally with hard wood, and cost something less than \$25,000.

EXAMINATION OF MUNICIPAL AND SANI-TARY ENGINEERS IN ENGLAND.

THE Association of Municipal and Sanitary Engineers and Surveyors, Joseph Gordon, M. Inst. C. E., President, have undertaken the holding of voluntary pass examinations for candidates for surveyorships under municipal corporations and the local Government acts.

The examinations will be by written papers and viva vece, upon the four following subjects:

- (I) Engineering as applied to municipal work.
- (2) Building construction and materials.
- (3) Sanitary science as applied to towns and buildings.
- (4) Public health acts, and rivers pollution acts.
- Candidates will be allowed two hours to answer the questions under each of the four heads.

The total number of marks required to constitute a pass will be 50 per cent. in each of the subjects.

Further details and particulars may be obtained on application to Mr. Thomas Cole, Secretary, 6 Westminster Chambers, Victoria Street, S. W.

The following examination papers were used October, 1887, and serve as examples of questions proposed under the different sections.

ENGINEERING AS APPLIED TO MUNICIPAL WORK. E. B. Ellice-Clark, M. Inst. C. E., Examiner.

- (1) Instrumental Work.—Before commencing observations with the theodolite it is necessary to adjust (a) the telescope; (b) the horizontal limb; (c) the vertical limb. The adjustment of the telescope is to make provision for two important errors. What are they?
- (2) Surveying.—Sketch the main lines and ties you would chain in surveying the streets shown on the accompanying plan. If you consider it necessary to use a theodolite, show the manner in which you would enter the angles in your field-book. How would you indicate the levels of the surface and sewers?
- (3) Leveling.—In giving the levels for the construction of a sewer, describe the method you would adopt to ensure the invert being laid to the correct depths and gradients.
- (4) Hydraulics.—What is meant by the term "Wetted perimeter?" What causes a syphon to work? How many feet in height will an overhead syphon work in practice? What does the height of the barometer indicate in relation to the working of a syphon?
- (5) Sewerage.—Sketch* an open trench, in a wet clay subsoil, for a sewer 4 feet 6 inches by 3 feet—depth 20 feet to bottom of cutting. Show the necessary timbering. Write the distinctive names, and figure the dimensions of each piece of timber used in securing the trench.
- (6) Sketch* the egg-shaped sewer, 4 feet 6 inches by 3 feet, with diagram showing how the radii of the invert, sides and arch are determined. Give the thickness of brick-work necessary under the conditions named in Question 5.
- (7) Presuming good ballast could be obtained as an aggregate for concrete, show how you would dispose the material in constructing a concrete sewer, giving (a) dimensions; (b) proportions of cement to aggregate.
- (8) What are the advantages and disadvantages of using wholly mass concrete for such a sewer in the principal streets of a large town? (a) temporary; (b) structural.
- (9) In calculating the capacity of outfall sewers, what rainfall in twenty-four hours would you provide for in the town where you reside? State town.
- 10. Without a separate system. In making provision for the relief of sewers from storm waters—i. e., heavy falls in short periods—what information is necessary to determine the capacity of the necessary relief works?
- (11) How would you gauge the flow of a sewer, if the inclination were not known?
- (12) Paving, -- Under what conditions would you consider it necessary to abandon macadam, and pave a street with pitchers?
- (13) How would you ascertain the annual burden borne by a street, and what unit would you adopt so as to compare your calculations with those of other engineers?
- (14) Lighting.—What is meant by "average meter indication?" Give a description of it, and the appliances used to effect it successfully?

Building Construction, Etc.

W. George Laws, M. Inst, C. E., Examiner.

- (1) Name the woods chiefly used in ordinary buildings, and the qualities and uses of each.
 - *Sketches need not be made to scale.

- (2) Give the composition of good mortar. What are the most common faults of mortar used in "jerry" work, and how are they detected?
- (3) Describe "Ashlar," "Block in Course," "Snecked Rubble." Specify briefly for a wall built in one of these modes.
- (4) What is "Stoothing?" Describe its construction, and say where it is applicable, and where not.
- (5) What is the difference between "flat" and "tuck" pointing? Give a sketch of each. What is meant when joints are specified "to be drawn in with a key?"
- (6) Describe the process of "plastering" inside walls, naming each coat, and its composition.
- (7) Sketch a "Queen post" roof couple, and name the members. In what cases is it applicable?
- (8) What are the chief precautions to be taken in arranging the "exits" from a public building (say a theatre) as regards doors, passages, and stairs?
- (9) Give a sketch section of an ordinary house floor, showing the joists and flooring boards, and the ceiling of the room below, and describe how they are put together. Show how "deafening" is put in.
- (10) What are the requirements of the model by-laws as to the thickness of house walls? Give these briefly in your own words.

SANITARY SCIENCE.

Joseph Gordon, M. Inst. C. E., Examiner.

- (1.) Ventilation.—State the general features to be kept in view to secure as perfect a ventilation of town areas as possible; (a) width of streets; (b) length of streets without cross streets; (c) minimum area of open space at rear of each building, and minimum width or depth thereof between outbuildings and fence wall at the rear; (d) state what other means of ventilation than by windows and fireplaces are desirable for the interior of dwellings; also, for public halls, churches, hospitals, etc.; (e) why is it requisite that sewers and house-drains should be ventilated, and what are the usual methods resorted to in each case?
- (2) Building site and sanitary arrangements.—What precautions does sanitary science require should be taken to secure a healthy site and conditions for dwellings; (a) Suppose the subsoil to be of a doubtful character, how would you deal with the site to be built upon; (b) What position would you assign to water-closets in the interior of dwellings in order to insure proper light and ventilation and the greatest possible isolation from dwelling and sleeping apartments, and give sketch to illustrate your views as to the position of water-closets, sinks, baths, etc.?
- (3) Sewage disposal.—Give description of the chief methods of sewage disposal and treatment, and state (a) under what circumstances chemical treatment seems more practicable than an application of the sewage to land, with particulars of some of the chemical methods at present in use: (b) when and under what conditions intermittent filtration is resorted to, with some particulars of this method of sewage disposal, and quantity of land requisite per 1,000 inhabitants or per million gallons of sewage; (c) give some particulars of the application of sewage to land upon the broad irrigation system, and the area of land requisite per 1,000 inhabitants or per million gallons, according to the nature and quality of the soil and subsoil; (d)is the difficulty of disposing of the sewage at the outfall of any sewerage system at all lessened or attended with less expenditure where the earth-closet or pail system is chiefly in vogue instead of water closets; and, if so, is it at all commensurate with the increased cost of collection of the earth-closets or pails in large towns?
- (4) Sewering of towns.—In sewering a town how would you proceed to determine the maximum dry weather volume of sewage during the day to be carried off through the sewers, and what provision beyond this would you make for rainfalls per hour in determining the sizes of your sewers?
- (5) What minimum velocity is requisite for sewers to be reasonably self-cleansing, and how would you obtain this in localities where the natural levels of the districts do not admit of gradients producing such a velocity?
- (6) Why are so-called dead ends objectionable in sewerage systems, and how would you avoid them? Illustrate a case in point, and show what alterations and additions to a system of sewers are requisite to dispense with them.
- (7) Under what conditions would the separate system—that is, one set of sewers for rain-water and another for sewage—be advantageous?
- (8) Water-supply.—What are the usual precautions taken to prevent the possibility of the water-supply for

- culinary, drinking, and other domestic purposes, becoming contaminated from water-closets, etc., within a house?
- (9) House-drainage.—Describe the chief features to be kept in view in designing house-drainage under the following headings; (a) How baths should be dealt with, and under what conditions you would consider it essential to ventilate a bath waste-pipe; (b) how would you deal with the soil-pipe of a water-closet, and of what materials would you construct it; in what manner would you ventilate it, and under what conditions would you consider it essential to disconnect it or other parts of the house-drainage from the public sewers? (c) where disconnection is considered essential, in what positions would you place the disconnecting syphons, and what gradient would you consider essential on the house side of the syphon to keep it clean; and under what conditions would you consider such a syphon inadmissible? (a) where it is impracticable to drain a house without passing the drainthrough it, what materials would you use, and what other precautions would you take, to secure healthy conditions? Illustrate your views by a sketch section through house, showing drain and precautions referred to.

Public Health Acts and Rivers Pollution Acts.

H. P. Boulnois, M. Inst. C. E., Examiner.

- (1) Mention the acts which empower persons to break up the public streets for different purposes.
- (2) Under what powers can an Urban Sanitary Authority execute following works: (a) fix a bracket lamp against a wall of private property; (b) fix a street "name plate" against a wall of private property; (c) erect a urinal in a street, "not repairable by the inhabitants at large"?
- (3) What are the conditions laid down in the Public Health Act, 1875, under which existing cellars may be let or occupied as dwellings?
- (4) State the surveyor's legal duties when he finds a house within his district to be "without a sufficient watercloset, earth-closet, or privy."
- (5) How many acts and amendments thereto are there in force with regard to artisans' and laborers' dwellings and lodging-houses?
- (6) What is the maximum length of drain an owner can be compelled to construct to connect his premises with a public sewer?
- (7) What restrictions are placed upon the choice and construction of a cemetery under the Cemetery Clauses Act, and give the date of this act?

PUBLIC HEALTH REPORTS.*

THE various annual and special reports made by Mr. Simon as Medical Officer of Health of the city of London and as Medical Officer of the Privy Council, rank among the most important literature of sanitary science and preventive medicine.

The strong presentation of the evils of filth and overcrowding, which is made by their vigorous English, has given them great influence, and has made them widely quoted. As stated in the preface to the work whose title heads this notice, "this author of axioms now universally accepted may possibly be forgotten by the outside world, because his works are entombed in a mass of blue books, and in reports not very easy of access to the student of to-day."

For this reason the Sanitary Institute has caused them to be collected and edited with the aid of Mr. Simon himself, producing as a result two handsome volumes, which should be in the library of every sanitarian.

The contents of these volumes are of course very heterogeneous, treating of almost all the subjects which are of interest to a municipal health officer, and discussing the problems which come before a national health bureau. The first volume contains abstracts and extracts from the city of London reports, beginning with the first one made in 1849, and including the subjects of house-drainage, water-supply, condition of the poor, offensive trades, care of the dead, and cholera. It also contains Mr. Simon's report to the General Board of Health on the history and practice of vaccination, a report on the sanitary state of the people of England, made in 1858, and certain papers relating to the organization of medicine and pharmacy. The second volume includes the reports made to the Privy Council and the Local Government Board from 1858 to 1876, an article on contagion, and a copy of an address on experiment as a basis for preventive medicine. These papers have all in their day been eagerly read and have exerted a great influence. It is not our purpose to attempt to summarize or criticise them, but only to point out the fact that they are now collected and made easy of access to those who wish them, and the number of these in this country ought to be large.

*By John Simon. Edited for the Sanitary Institute of Gre a Britain by Edward Seaton, M. D. 2 vols., 8vo. London, 1887.

THE PRESERVATION OF BUILDING STONE.

A RECENT issue of La Semaine des Constructeurs reviews the report of Professor Tetmajer, of Zurich, who has been engaged in experimental investigation of this subject since 1884. The following abstract gives the most interesting results.

The principal injury to many building stones, especially argillaceous-calcareous stone and sedimentary sandstone s the scaling and disintegration caused by water absorbed in the pores and freezing there. This cannot be practically and satisfactorily remedied by covering the stones, nor by varnishing the surfaces, so that it has been attempted to fill the pores with some substance that will exclude moisture and strengthen the material of the stone Among the agents proposed, the "fluosilicates," invented by MM. Faure and Kessler, have given decisive results. The fluosilicates or fluates are introduced into the stone in a liquid state, and decomposing the carbonate of lime, the silicic acid formed is precipitated in a gelatinous state, liberating insoluble oxides which, with the silicic acid, fil1 the pores, while the fluorides increase the resistance and durability of the stone.

M. Tetmajer's experiments were with a fluosilicate of alumina and magnesia, Al.₂ Si.₃ Fl.₁₈. Mg. Si. Fl₆. + 6H₂ O, and a fluosilicate of magnesia and zinc, Mg. Si. Fl.₆. Zu Fl Sv₆. + 12H₂O.

The first is sold in liquid form, and the second in crystals soluble in water. They are colorless and do not affect the color of the stone. The principal experiments were made on two varieties of soft sandstone from the Ostermundigen quarries near Berne; one blue containing 18.8 per cent. of carbonate of lime, and the other yellow, containing 19.9 per cent. Fifty-two similar specimens of each kind were used.

The following results were obtained from tensile tests:

Condition of Specimen.	Resistance per square	in kilograms centimetre.	Number of tests whose mean is		
Condition of Speciment	Bluestone.	Yellowstone.	here given.		
(Anhydrous	14.6	16.0)		
Natural Dried at 1100 Saturated with	9.0	7.0	} 5 to 8		
water	3+4	3.6	! j		
Impregnated with magne-					
518	23.9	22.6	i <i>t</i>		
Impregnated with alumina	17.2	13.9	5		
Natural, frozen	11 4	13.1	10		
Impregnated with magne-					
nesia, frozen Impregnated with alum-	25 1	23.7) 5		
ina, frozen	14.4	2.5	1 1		

The anhydrous specimens were subjected to no treatment or preparation.

The saturated specimens had been immersed in water 38 days, after which those so marked were dried at a temperature of 110°.

The impregnated specimens were immersed for ten hours in the fluosilicate solution and then dried for ten days until they attained a constant weight.

Untreated or natural specimens were saturated with water and then subjected to 30 successive congealations at a temperature of 10° C., and specimens that had been impregnated with the fluosilicate were similarly treated.

M. Tetmajer concludes that this method of impregnation by magnesia is an excellent preservative for calcareous oolitic stones and for porous calcareous sandstone, but that impregnation with alumina is injurious on account of the amount of carbonic acid produced.

THE NEW STEEL CAST GUN.

THE new 6 inch steel-cast gun is being annealed after its preliminary boring to a diameter of 51/4 inches. After being annealed and hardened it will be rebored to a diameter of 53/4 inches and again turned down outside.

From present appearances the gun, when polished, will be a splendid piece of steel, and no doubt is entertained but that it will prove an eminently satisfactory piece of work. The Government will pay the manufacturers \$3,300 if the gun is accepted.

work. The Government will pay the manufacturers \$3,300 if the gun is accepted.

When finished the gun will be about 16 feet in length, and is expected to cost about \$20,000, against \$100,000, the cost of a built-up gun of the same calibre. Ordnance officers consider it the greatest success in gun-making that has been attained since the days of Dahlgren, Rodman and Parrott. It is expected to reach Washington by April 1, where it will be rifled.

ERECTION OF THE POUGHKEEPSIE BRIDGE

This double-track railroad bridge, of nearly 6,800 feet total length and 130 feet clear elevation above high water, comprises two cantilever spans of 548 feet and one of 546 feet, two connecting spans of 525 feet and two shore spans of 200 feet each, with long and lofty approach viaducts at each end. When completed it will, between Albany and New York, form the only link connecting the New England railroad system with the great Western lines, and will effect a considerable saving of time and mileage in an estimated annual traffic of 3,000,000 tons of coal, together with miscellaneous freight and passengers enough to afford a total annual revenue of \$690,000.

A charter was granted by the Legislature in 1873, and in 1875 the Poughkeepsie Bridge Co., having been organized with \$2,000,000 capital stock to build the bridge and four miles of connecting railroad, awarded the contract for the former to the American Bridge Co., of Chicago, who commenced work on piers 2 and 3, but abandoned it in 1878, leaving pier 2 twenty feet above high water, and crib of pier 3 one foot above high water and sunk forty teet through the mud bottom.

Operations were not resumed until 1886, when the Manhattan Bridge Co, secured all the property and privileges of the original company and let the contract for the completion of the entire work to the Union Bridge Co., of New York City, who commenced work in September of that year and have prosecuted it to its present advanced stage, expecting to complete and open it for traffic this year.

The superstructure is constructed by the Union Bridge Company in their shops in Buffalo, N. Y., and Athens, Pa., and the other branches of the work are done under their direction by sub-contractors. The dredging was done by the Atlantic Dredging Company, of Brooklyn, N. Y. The foundations and masonry were built by Messrs. Dawson, Symmes & Usher, of New York. The pile-driving, false-work, and erection of superstructure is done by Messrs. Ross, Sanford & Baird.

The engineering is done by The Union Bridge Company of New York, and is in charge of Mr. J. F. O'Rourke, at bridge site, where the Poughkeepsie and Manhattan Bridge Company are represented by engineers P. P. Dickinson and A. B. Paine, respectively.

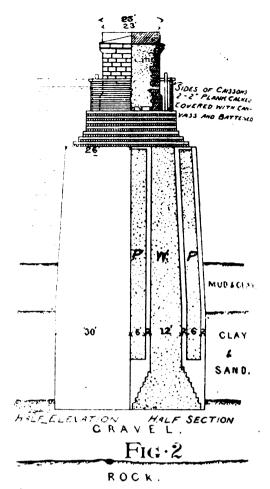

On the resumption of work in 1886 the plans, although modified, permitted the utilization of work already done on piers 2 and 3, except that the masonry of pier 2 was not of sufficient area for the steel towers and had to be rebuilt.

As shown in general profile (Fig. 1), the main spans rest on iron piers carried on a substructure (Fig. 2) which consists of a chambered timber crib resting on a stratum of gravel on a rock bed about 140 feet below high-water level, and capped with crossed grills of 12x12 square timber, carrying the masonry faced with massive coursed limestone and filled with concrete.

The cribs were built of 12x12 hemlock timber. Each course was spiked to the preceding by 425 1-inch round drift-bolts, thirty inches long, having a total estimated resistance of over 1.600 tons against any upward pull. The side, centre and end chambers (PP, Fig. 2) of the crib were closed on the bottom, forming pockets, which were weighted in the cribs at piers 4 and 5 with gravel, and at 2 and 3 with concrete, to assist the sinking. As the crib descended through the mud, clay, and sand, clam-shell dredges, working in interior chambers W removed all the underlying material and facilitated its downward progress. When the cribs had attained a support on satisfactory hard bottom the chambers W were filled with concrete, as shown in Fig. 3.

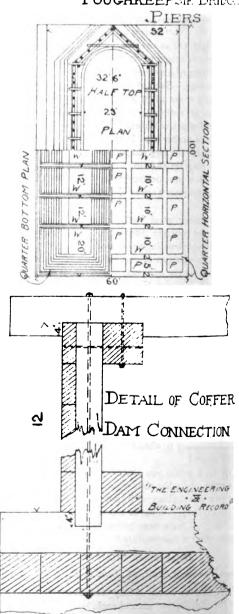

A large scow, properly moored, received gravel and cement on an elevated platform, whence it was fed into the hopper of a steam-mixer, which delivered the concrete to a pair of buckets alternately presented, which descended and were emptied by means of a latch and hand line. The loaded bucket descended to the bottom, dumped its contents and was returned to place before the other was filled, so that the mixing and filling went on uninterruptedly. When the chambers were filled the concrete was leveled off by divers and the grillage laid on top.

The caissons were then brought to approximate position over the grillage, and the masonry commenced inside on their bottoms, which were from 6 to 14 feet thick, of solid 12x12 hemlock. The caissons were sunk until nearly in contact with the cribs, when they were carefully placed in exact position, and there fixed by building on sufficient additional weight at high tide.

Coffer Dam and Crib

Poughkeepsie Bridge

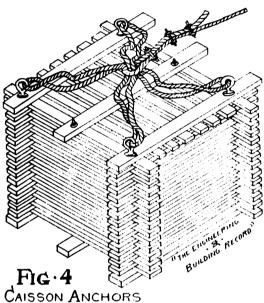

After the top of the masonry rose above high water, the sides of each caisson, which were bolted down to its bottom, were ready for removal.

Much difficulty was experienced in handling the great cribs, whose weight and inertia were enormous, and whose least surface exposed so great an area to the pressure of the stream.

After being built near the shore they were towed out by steam-tugs in the interval between tides, and anchored by boxes (Fig. 4) 6x6x6 feet inside, made of 3x10 planks 9 feet long, bolted through the corners and middle, floored top and bottom, and filled with stone. They weighed about 10,000 pounds each in water, and were attached by steel wire ropes 1 and 1½ inches diameter about, 600 feet long, to the corners of the cribs.

The great difficulty lay in adjusting the anchor ropes so that all were alike strained at once and worked efficiently with the changing tides. When once this was accomplished it was comparatively easy to draw the crib up to its exact position. The strain was very liable to come on one anchor only, which would be immediately started from its bed and all the rest dragged in succession.

Poughkeepsie Bridge

Cribs 2 and 3 got away several times. Crib 2 was once carried three miles up the river, and brought back by two steamers with great difficulty. Neither 2 nor 3 were sunk in exactly the right position, but they were close enough to be well within the limits of adjustment of the caissons.

Crib No. 4, drawing fifty-two feet of water, encountered a heavy freshet, which, with the ebb tide, added to the normal 2½-mile current of the river, carried the crib, six anchors, and three steamers several miles. It was stopped and returned on a flood-tide, but a similar experience was repeated three times before it was finally safely sunk.

Pier 5 was provided with eight anchors up stream, six down stream, and four on each side, and, profiting by past experience and the subsidence of the freshet, it was sunk without trouble.

For the above data and description, and the drawings from which our illustrations have been prepared, as well as for many other courtesies, we are indebted to Mr. Robert Baird and to Mr. O'Rourke, engineer in charge for the Union Bridge Company.

RINGS AS EVIDENCE OF AGE IN TREES.

AN agent of the U.S. Forestry Department, Mr. R. W. Furras, who has given much study to rings in timber as indicating the age of trees, has reached the following interesting conclusion:

"Concentric or annual rings, which were once accepted as good legal evidence, fail, except where climate, soil, temperature, humidity, and all other surroundings are regular and well balanced. Otherwise they are mere guess-work. The only region, within my knowledge, where either rings or measurements were reliable indications are in the secluded, even, and regularly tempered valleys of the Southern Pacific coast. Annual measurements of white elm, catalpa, soft maple, sycamore, pig hickory, cotton-wood, chestnut, box elder, honey locust, coffee tree, burr and white oak, black walnut, osage orange, white pine, red cedar, mulberry and yellow willow (nineteen species), made in south-eastern Nebraska, show that an 'annual growth is very irregular, sometimes scarcely perceptible, and again quite large,' and this he attributes to the difference in seasons. As trees increase in age inner rings decrease in size, sometimes almost disappearing. Diminished rate in growth after a certain age is a rule. Of four great beeches mentioned in London, there were three, each about 17 feet in girth, whose ages were respectively 60, 102, and 200. Mr. Furras found twelve rings in a black locust six years old, twenty-one rings in a shell-bark hickory of twelve years, ten rings in a pig hickory of six years, eleven rings in a wild crabapple of five years, and only twenty rings in a chestnut oak of twenty-four years. An American chestnut of only tour years had nine rings, while a peach of eight years had only five rings."

THE BERLIN METROPOLITAN RAILWAY.

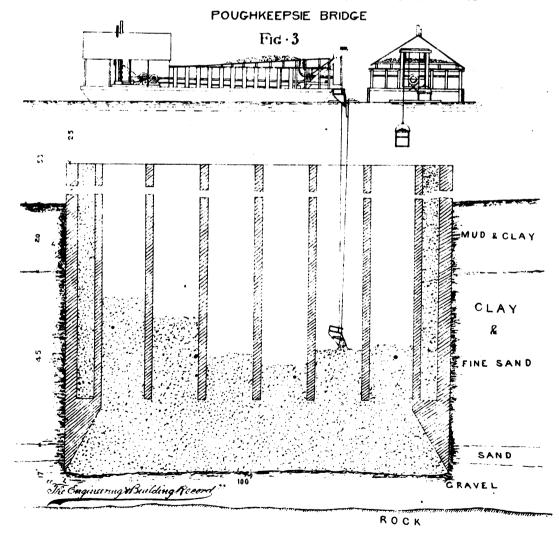

WITH the nine illustrations on pages 214 and 215, we conclude our description of the Berlin Metropolitan Railway.

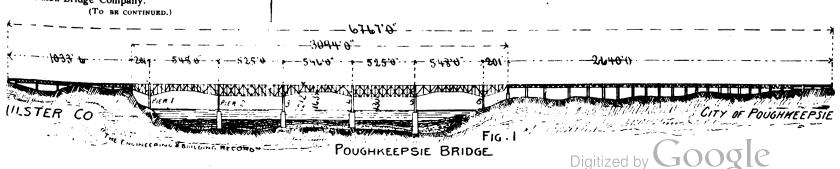

Our readers will remember that the pendulum columns used under the Koenigstrasse crossing were illustrated in our last issue. We cannot doubt that they have shared the interest we have felt in reproducing this most important and instructive work, especially interesting to those residing in New York City, where so much has been already done in the way of rapid transit and where so much more remains to be done and is indeed now being actively discussed. The Berlin Railway in its general features embodies in many respects our idea of what would best answer the requirements of rapid transit in New York City, and we commend it to the careful study of those upon whom the solution of that problem depends.

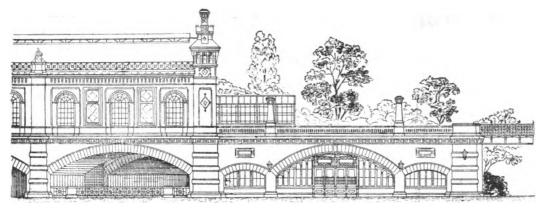

SLEEVE-JOINTS FOR LARGE WATER-PIPE.

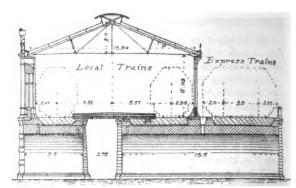

Of the Thirlmere extension of the Manchester Corporation Water-Works fifty thousand tons of pipes have been ordered for the first main. Mr. G. H. Hill, the engineer, has taken a somewhat new departure in making a large proportion of the pipes plain-ended, or plain tubes 12 feet long, the tubes being connected, and the joints made with collars. The joints are also exceptional, yarn being dispensed with and the total weight of piping and the cost of jointing thereby materially reduced. The first main which is now to be laid will deliver 10,000,000 gallons per day. The pipes in the lake district are 48 inches in diameter, those in the middle of the line 40 inches in diameter, and those near the Manchester end 36 inches in diameter.—Engineer.

HEATING AND VENTILATING WORKSHOPS.*

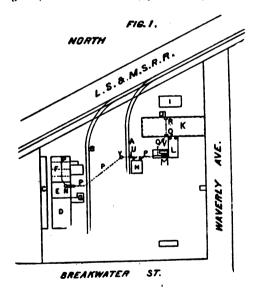

WHILE extending the works of the Walker Manufacturing Co., at Cleveland, O., in the fall of 1886, the subject of heating the shops received considerable attention, mainly on account of the shops being somewhat scattered. We desired to establish some system that would be adapted to extensive shops, and at the same time be economical. After looking over the various methods of steam-heating, and that of heating by hot air, we decided to try the latter. It occurred to us that hot air had been successfully used in drying almost all conceivable kind of articles, and espeing almost all conceivable kind of articles, and espedrying almost all conceivable kind of articles, and especially lumber, so that its adoption to heat workshops by discharging hot air into same could scarcely prove unsuccessful. The peculiarity, however, of the location of our shops, their distance apart being considerable, presented

shops, their distance apart being considerable, presented difficulties for conducting the heated air from one shop to the other. In order that you may better understand same, I have provided a plan of our works (see Fig. 1).

The entire enclosure being about seven acres, and bounded on the east by Waverly Avenue, on the south by Breakwater Street, 520 feet to the lot line; on the west by the lot line, and on the north by the L. S. & M. S. Rail-

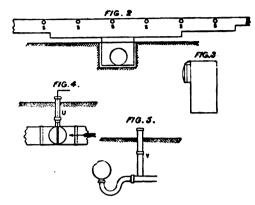

way.

The railroad switches are represented by A and B; the original part of works is shown on the west side, C being machine-shop two stories in height, original part of works is shown on the west side, C being warehouse, D being machine-shop two stories in height, E being blacksmith-shop, F being No. I foundry, G engine and boiler-room No. I; the north-east portion is the new part of works, H being the office, I machine-shop, J pattern vault, K toundry, L melting-house for foundry, M engine and boiler-room No. 2; the distance from engine and boiler-room M to receiver of hot air N at the original part of works is as a feet; in boiler-room No. 2 we pleased and boiler-room M to receiver of hot air N at the original part of works is 355 feet; in boiler-room No. 2 we placed a 6x9 Sturtevant blower, perpendicular diameter of housing being 120 inches, the outlet 42x42 inches square, driven at a speed of from 50 to 275 revolutions, according to our requirements. Immediately in front of the outlet of blower we placed our vault for steam-pipes, which contains several thousand feet of 1-inch piping built in the form of a radiator, and in addition to these about one thousand feet of 2-inch piping, all supplied by a 4-inch steam-pipe from the boiler; also 5 inch steam-pipe from engine exhaust. The only reason for using two systems of heating pipes was on account of our peculiar location, not having room enough to place sufficient 1-inch pipes vertically. We found

that we required not less than ten square feet of pipe-surface per one thousand cubic feet of space in buildings. The conduit receiving the hot air radiating from these pipes at a temperature of from 100 to 180 degrees, is about four feet square, built of brick, cemented and covered with 4-inch flags; from this conduit or receiver, we laid 24-inch sewer-pipes in the direction of the lines O and P; the line O passing into foundry K, a building 200x58 feet; after entering the shop underground into receiver Q, we pass across same with 18-inch sewer-pipes to second receiver R; from these two receivers we connect galvanized piping of rectangular shape above ground (see Fig. 2), starting at the receivers with a section of 24x10-inch pipe, and that we required not less than ten square feet of pipe-surthe receivers with a section of 24x10-inch pipe, and diminishing at about every 20 feet to a smaller section un til at the end of the line we terminate with an 8x8-inch pipe. Along the line of this rectangular piping we place 6-inch openings in its side, as shown at S (see Figs. 2 and 3), which have a loose cover much the same as a milk-can cover, secured in place with chains, and can be placed over the openings or left off at will, so

that any desired part of the shop may be warmed. that any desired part of the shop may be warmed. In passing under doors or openings in the buildings, we invaribly used sewer-pipe under ground, and connected same to the galvanized piping after passing said doors; the line P passes under No. 2 engine foundation, through into the yard as shown, in the rear of office, where at points T T we take off two 10-inch branches at right angles, to heat the office, which is a building 40 feet angles, to heat the omce, which is a building 40 leet square, two stories in height; we carry the sewer-pipes into the building, and then connect rectangular galvan-ized pipes immediately under the floor between the joists, and open same on the first floor with four 9x12-inch ordi-nary registers, and then pass vertically against the wall with 12x6-inch galvanized piping to the second floor,

with a similar pipe again under the floor and between the joists, which opens on the second floor with four 8x12-inch ordinary registers.

ordinary registers.

At the point U in the 24-inch sewer-pipe we placed a valve, as shown in Fig. 4, so that we could regulate the amount of hot air delivered to the original portion of our works, and retain as much as we needed for the new portion of works and office; this valve is operated from the surface outside, the stem of valve passing up through a 6-inch sewer-pipe, which has a cover on its upper end for 1-inch rod to work in; after leaving the point U the 24-inch sewer-pipe passes under the railroad switch A, across the yard on an angle as shown, and underneath railroad switch B into receiver N, then through the shops, underground as before, to suitable points for outlets. underground as before, to suitable points for outlets, which are provided with similar arrangements, as shown

in Figs. 2 and 3.

The locations V being the lowest in the line of piping. The locations V being the lowest in the line of piping, we deemed it necessary to provide an arrangement for draining off the water should any find its way into the 24-inch main. Fig. 5 is an illustration showing the way this was accomplished; we coupled to the bottom of main an ordinary bend, as shown, so that the water accumulating in the main would pass off through the 6-inch trap and pipe, as shown. We provided a vertical pipe coming above ground with a cover on same, so that we could look down into the 6-inch drain at any time and see if any water was passing: the exposure of a 6 inch surface of water in the passing: the exposure of a 6 inch surface of water in the main peoved to be of no serious objection; in rainy or thawing weather the 6-inch drain would show a small amount of water passing continually, but in frosty weather same would cease.

weather same would cease.

From the description given, you will notice that the entire line of mains are underground, which was quite a questionable undertaking, as the amount of absorption of heat by the earth was likely to interfere with its successful working. After being completed, and having started the blower, we found this to be the case for several days, but after running the blower four days and nights we then got heated air at the receiver N, which showed that the earth surrounding the pipe had been absorbing the heat; on the fifth day, after running the blower continually. earth surrounding the pipe had been absorbing the heat; on the fifth day, after running the blower continually, we found that the snow melted on the ground, locating the line of pipes throughout the yard. After this we continued to run without any perceptible loss from radiation; the ground had, no doubt, been dried out for a diameter equal to eight feet. We continued the use of the plant for the entire winter with excellent success, but we found that at the receiver N, and at the various openings in the original shops that we had not sufficient heat for the coldest of weather, and at once put in a series of pipes about twenty feet in advance of the receiver N, so as to reheat the air on its passage to shops; same was supplied with steam from boiler No. I, and proved entirely satisfactory. In operating the manifold pipes in vaults it is necessary to let the steam enter so that it will pass to the greatest number of pipes, always allowing the water from condensation to pass by gravitaallowing the water from condensation to pass by gravita-tion to a trap. In this arrangement we provided a tank some four feet in diameter and nine feet deep underground in boiler-house No. 2 to receive the condensed water from the pipes through trap. By this means we were enabled to use full boiler pressure on the manitold pipes, which gave us the greatest amount of heat, and could change to exhaust steam in moderate weather. In the same tank we placed a float-valve from the city water-works, and mixed the water at will. The water was returned to the boiler at about 180 degrees temperature, thus saving considerable water and heat with same by using the water over again instead of blowing same through the steampipes, as is usual in steam heating in buildings.

It will be seen that no steam-pipes leave the boiler-room, hence they are all protected against frost and leakage, the water being trapped out as fast as it accumulates.

I'he advantages of this system are:

First.—It is economical in use.

Second.—It is economical in repairs.

Third.—There is no danger of bursting pipes and flood.

Third.—I here is no danger of bursting pipes and flooding the shops with water.

Fourth.—Cleanliness; the engineer firing his boiler ausual, and wheeling out his ashes, and to all appearance there is nothing more going on than would ordinarily be expected about an engine and boiler-room.

Fifth.—The displacement and circulation of air in the workshop by foreign the ways making. This is a satisfact.

workshops by forcing the warm air in. This is particularly advantageous in our foundries, where the introduction of This is particularly heated air carries away the smoke incident to to the various operations of a foundry. It will also be seen that when the heated air is introduced the cold air must be dis-

placed, passing out at whatever place it can.

Sixth.—The galvanized pipes of themselves are warm with the heated air, and serve as an excellent means for keeping cores dry for molders' use; and whenever a molder wishes to dry off his patterns he can do so without injury, let them be ever so delicate, by placing them near the galvanized pipes.

Seventh.—In summer time the entire system is applicable to cooling and ventilating the works without the slightest change, same as the man who cooled his dinner and warmed his hands with the same breath, nothing further

steam can pass through into the manifold pipes.

It would be safe to say that the temperature in our office during the hot days of the past summer was lowered from five to ten degrees, and the circulation of air was perfect by this means

So far as we are aware, this is the first time that bot air has been attempted to be carried a long distance under ground, and we consider the success of this case quite an important demonstration, where similar systems may be needed or useful.

CONTAMINATION OF WATER BY LEAD.

THERE has been quite a lead-poisoning scare in Shelfield, Eng., which has called out the usual number of theories and suggestions. Among others Dr. Sinclair White has proposed a simple remedy—namely, filtration through lime-which seems likely to be adopted.

The Journal of Gas-Lighting directs attention to aletter recently addressed to the Sheffield Telegraph by Mr. Alfred H. Allen, F. I. C., F. C. S., President of the Society of Public Analysts, in which some suggestive remarks are made. The proportion of lead which is generally considered to render water seriously objectionable is one-twentieth of a grain per gallon; but Mr. Allen says there is some reason to believe that in cases in which serious effects have been observed in Sheffield, the proportion has considerably exceeded this limit. It must not be supposed, however, that there is any danger in drinking a glass of water containing such a minute proportion of lead. It is not the single dose or a dozen doses which will produce any ill effects, but the constant use of such contaminated water. Lead is a cumulative poison, and each successive dose becomes stored up in certain organs of the body until the poisonous effects ensue. Further, it must not be supposed that every one is equally susceptible to the effects of lead, there being a great difference in this respect.

Mr. Allen adduces a striking instance, which came within his own experience, of the way in which lead poisoning may occur. A year or two since a member of his family suffered from symptoms which her medical adviser considered to be due to lead-poisonieg. The water drawn from the tap the first thing in the morning contained half a grain of lead per gallon, and about half this proportion after being allowed to run. By passing the water through a particular description of carbon filter every trace of lead was removed; but tea made from such pure water was sometimes found to contain 0.75 grain of lead per gallon. Analysis showed that the tea as bought was free from lead, and for some time Mr. Allen puzzled to account for its presence. It was afterwards found that the fur, or deposit, inside the kettle contained a considerable proportion of lead, some of which became dissolved in the water boiled in it. The kettle being replaced by a new one, the symptoms of lead-poisoning disappeared under proper treatment. He attributed the lead in the deposit to a servant having habitually filled the kettle from the hot-water tap, for hot water, it appears, acts on a lead pipe much more vigorously than cold.

It is reported by the Medical Officer of Health (Dr. A. Mackintosh) that from 100 to 150 more people are suffering from lead poisoning in Chesterfield, Eng.

La Genie Civil is publishing a very comprehensive illustrated description in serial form of the drainage of Boston, by a Quebec engineer, M. C. E. Gauvin.

^{*}Paper read by John Walker before the Civil Engineers' Club of Cleveland, and published in the Journal of the Association of Engineering Societies.

THE PROPOSED NATIONAL BUREAU OF HARBORS AND WATERWAYS.

NEW YORK, February 28, 1888.

SIR: The bill introduced into the United States Senate by Senator Cullom appears to me to be a step in the right direction, but to be faulty in several respects. There is no good reason that I can see for placing the public works of the country in the hands of the War Department. It would be better to establish a Bureau of Public Works in the Department of the Interior, or better yet to create a Department of Public Works, the head of which should be a Cabinet officer, and control all the surveys, designs, and constructions which come under the jurisdiction of the general Government. The coast, geodetic and geological surveys, the improvement of harbors and waterways, the construction of highways which may be needed for easy transportation of troops to quell insurrection or repel invasion, the design and construction of public buildings and probably other scientific works, should be placed under one head and so organized that the best talent and experience available can be applied to the work.

If this cannot be done now, or is not considered expedient by those having the matter in charge, the present bill may perhaps be accepted as an improvement in some respects on past practice, inasmuch as it makes it possible for civil engineers who have not been educated at the expense of the Government to attain positions commensurate with their abilities and attainments from which they are debarred by the existing system.

But the scope of the bill is too narrow and there are two noticeable provisions in it which make it look as if the proposed "Bureau of Harbors and Waterways" was to be used as an asylum for aged and infirm incapables. Pirst and second assistant engineers may be appointed from civil life without limit as to age, and at sixty-five years of age shall be retired on half pay for life. It will be a very easy matter for members of Congress to get a good many old engineers settled on the pay-rolls at \$900 to \$1,350 per annum for life under this provision.

There does not appear, moreover, to be any provision for getting rid of incompetent men who have once gotten into the corps. Again, officers of the Engineer Corps of the Army cannot be assigned to duty in this new corps after its first organization. Two-thirds of vacancies are to be filled by promotion of existing members of the corps, and the other third by new men from outside, but not from the army. The Government ought to be permitted to avail itself of the services of the men it has educated.

The express provision that the Secretary of War can call on experts outside of the corps only when Congress has made a special appropriation for the purpose is most unwise, and will lead to an immense lobby business by adventurers who have patent schemes of improvements, and will prevent honest experts from being consulted.

Taken altogether, the bill appears to have been drawn to enable a few of the former Mississippi River engineers to get good positions, and civil engineers in general cannot be expected to take much interest in procuring its passage.

J. J. R. Croes.

NEW YORK, February 29, 1888.

SIR: To express my views on the pending Cullom bill, looking to the creation of a Bureau of Harbors and Waterways, I send you the following notes.

The evils of the present system of conducting the work of river and harbor improvements under the auspices of the War Department are, as I understand them to be, substantially as follows:

First. — Irregular appropriations, some years there being none at all.

Second.—The uncertainty, mainly on this account, of continuing and completing improvements, which entails considerable expense to preserve unfinished work from natural destruction.

Third.—The promotion of army officers by seniority, which makes it sometimes possible to have the less competent man occupy a position of greater responsibility.

Fourth.—The difficulty for one person to master at the present time the varied knowledge and practical experience necessary to excel in all the branches of engineering which now fall under the direction of the War Department; modern military engineering being a branch which alone occupies the entire time of the respective officers in the most important European countries; harbor and river engineering likewise being a branch in which alone prob-

ably no one can in future distinguish himself without devoting all his time and energy exclusively to the same. Therefore some branch must necessarily suffer under present conditions.

Fifth.—The fact that able and experienced civilians engaged as assistants by the U. S. Engineers are sometimes required to report to young and inexperienced officers and to submit to their direction.

Sixth.--The impossibility of promotion among civilians to the higher positions of responsibility equal to those held by the army officers, and their liability to be discharged at any time on account of the failure of an appropriation bill.

I think that among most of the army officers the existence of the above evils will be acknowledged and that they would be glad to see a remedy suggested.

The proposed bill intends to separate the essentially military branches of engineering from those pertaining to the improvements of waterways and harbors. It would enable both of them to receive more attention through a greater concentration of duties, and in this way could not fail to be a great advantage.

The bill further proposes to engage the most meritorious applicants for the new corps up to the rank of, but not including, division engineer, where the duties begin to be mostly administrative and of necessity require a considerable knowledge of the routine work, which can be gained only through experience in the bureau itself. In this point, too, the bill would accomplish an improvement, because the material for eventually filling the higher positions would not be confined to the graduates of one, but extended to those of all engineering schools.

Furthermore, the establishment of a separate bureau with a permanent force would require the appropriations to be made with some regularity, and thus remedy what is probably the greatest defect of the present system.

Yet, withal, I believe the bill as now before Congress has serious defects, which might possibly equal in degree those which now exist.

In the first place, promotion by seniority, which is incorporated in the bill for every position above that of assistant, cannot but expose the bureau to some of the same evils which are now complained of. Even among the assistants, promotion will go by seniority, if the Examining Board finds the oldest member just good enough to pass, and a really better man may remain behind. In all Government work, which is fully as important as private work, if not more so, merit and special fitness for the higher position should alone decide.

This excellence is not attained simply with age. It is attained by peculiar opportunities during early life, by hard individual work and innate capabilities. The channels of knowledge and of experience are spreading over such large territory that nothing but carefully regulated and steady work enables an engineer to follow the few channels which he has selected for himself. And who will to-day doubt the great influence of heredity in helping us to success? Some men have naturally a bent in this or in that direction. If they follow it they encounter less resistance and reach a further point than those who lack the innate ability. This is particularly true when comparing the executive faculty with that for purely scientific work. An engineer may be an excellent scientist but a poor executive officer, and no amount of training will change the relation. The positions upwards from the grade of Division Engineer should be filled by those who are thorough gentlemen, and who will make the best executive officers, whether they are the oldest or not, because their main duties will be of this nature. We take this view generally in private business. Why should we not take it also in public business?

The promotion by seniority takes away the natural incentive to progress which is due to a fair competition. It causes relative stagnation, such as we sometimes find in the older countries, instead of constantly inducing individuals to do better work.

I think another objectionable feature of the bill is the large number of new positions created by it. According to Major Ernst's statement the number of persons engaged at present is 171, the number of those provided fot in the bill is 614, or if the cadets are excluded, 364. It does not seem wise nor even necessary to establish so many new and permanent positions without considerable previous training. It would produce a very heterogeneous body, and might takes years for proper adjustments. Ambitious, but less competent and less honorable persons

than the service should have would, under such conditions, contrive to get an early foot-hold and possibly devote most of their time and energy mainly to acquire a position which they do not deserve, and who would eventually cast discredit upon the service.

It is, of course, easier to criticise than to do better yourself—easier to tear down than to build up. So in this case I do not feel able to offer a better substitute for the bill. The following stray thoughts, however, have passed through my mind, and I will put them down for what they are worth. I trust that out of all these discussions some one with a synthetic turn of mind may find the right solution.

While I believe that a department of public works with a Cabinet officer would ultimately give us the best results, both in quality of work and economy, yet I also believe that at the present time such a change could not be accompliched. Therefore a bureau, as a branch of the War Department, now seems the only solution. The Corps of Engineers so far have had charge of all the work. We cannot accuse them of incompetency, but must acknowledge from the results that they have generally succeeded well, the exceptions being due to causes which could be remedied from within. Why not therefore have the proposed bureau manned substantially with the same officers who have now charge of the works, but giving them promotions and new titles somewhat as suggested in the bill? A sudden large increase over the present force does not seem warranted, because the appropriation for public works will probably not be increased in the same proportion. And, further, to obviate the objections to the present system, mentioned at the beginning, is it not feasible to establish a system of promotion in such a bureau altogether on grounds of merit and fitness instead of seniority? Is it not practicable, as suggested in the bill, to open the doors of such a bureau to all engineers, not the graduates of West Point only. who may desire and are competent to enter in the lower ranks and follow in the line of regular promotion with the rest? The present army officers having had more experience, will at first naturally be at the head, and as they are pensioned make room for those following them in merit. Every officer of the bureau should be employed for life and have the assurance of a pension in accordance with his rank when reaching old age.

My impression is that these questions could all be answered in the affirmative, and that the present evils could in that way be most readily overcome. It would but slightly change the personnel and greatly improve the system.

RUDOLPH HERING.

SEA-COAST DEFENSES.

UNDER this heading an extract from the annual report of the Chief of Engineers of the U. S. A. has been published. It opens with a regret that lack of funds has paralyzed all action during the past year. The list of appropriations estimated as required this year amounts to \$5,234,000, of which \$2,840,000 is for construction of gun and mortar batteries at the chief seaports, and \$30,000 for torpedo experiments and practical instruction of engineer troops detailed for the service. The report states that a large amount of practical work can be done in the way of defence and putting present earth-protected batteries in an efficient state without waiting for a decision on the question of the character of armor to be used in land defences.

In the appendix is a report by Major W. R. King, now in charge of torpedo experiments at Willett's Point, and of the "Post and Engineer School of Application" there. During the year six engineer officers completed the three years' course, and three artillery officers the seven months'

The recommendation is made that since all officers coming from West Point have already had a four years' course of study from text books, the course at Willett's Point be made practical, wherever text-books can be replaced by observation and experiment. For example, the weight and dimensions of a torpedo case, an anchor, etc., etc., might be obtained and recorded by each officer for himself, just as he would obtain corresponding data if traveling in a foreign country. In the same manner let them use the testing-machine for ascertaining the strength of rope and building materials.

An account is given of the test of three Sims' fish torpedoes steered and propelled by electricity. They obtained speeds of 8.67 to 10.17 miles per hour; but the experiments were not entirely satisfactory in all respects.

A number of other practical suggestions are made, and in two other appendices the courses of instruction for winter and summer are given.

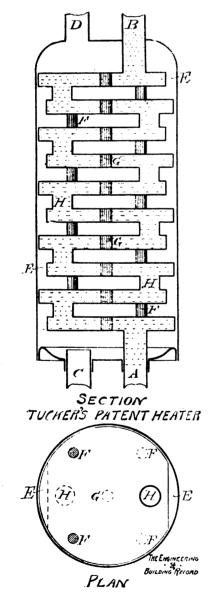

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

A HIGH-LOW PRESSURE WATER-HEATER.

THIS device is intended for use in cases where there are two systems of water-supply of different pressures in the same building and it is desired to draw hot water from both systems without the complication of two waterbacks or a double boiler. It is simply an arrangement for heating the water of one system by that of the other by bringing the two systems together in one vessel with a large surface of thin metal between them to facilitate the transmission of heat. As here shown, the high-pressure supply, having been heated in a water-back in the usual way, enters the apparatus at A, and, passing through various disk-shaped chambers connected by passages H H, emerges at B. The low-pressure supply which it is desired to heat enters at C, and rising around the heated chambers, its passage being facilitated by their being cut away on alternate sides, as shown at E E, is finally warmed and discharged at D.

The braces G G and F F are to keep the chambers in position and to resist the distorting effects of the difference of pressure. The apparatus is 8½ inches in diameter and 13 inches high, and is made of heavy copper, so arranged that by removing the bottom the chambers can be taken out. The height of the chambers is three quarters of an inch, and the distance between them is the same.

This heater is used in the residence of Max Nathan, Esq., and is referred to in the description of its plumbing, which was concluded in our last issue. It is the invention of Mr. John Tucker, of the firm of Byrne & Tucker, plumbers, New York City.

Gas and Electricity.

ELECTRIC LIGHT FROM AN ARTESIAN WELL.

An electric-light plant is about to be put in at Yankton, Dak., to supply 500 incandescent and twenty-five heavy arc lights, requiring about forty horse-power. The power is expected to be supplied by an artesian well now flowing, and if the experiment is successful another well will be bored and the capacity of the light plant doubled.

A NEW INSULATING MATERIAL.

A VERY valuable insulating material, decribed in the Chronique Industrielle, has just been produced, that is composed of one part Greek pitch and two parts burnt plaster, by weight, the latter being pure gypsum, raised to a high temperature and plunged in water. This mixture when hot is a homogeneous, viscous paste and can be applied by a brush or cast in molds; it is amber-colored and possesses the insulating properties of ebonite, and can be turned and polished. Its advantage is its endurance of great heat and moisture without injuring its insulating properties.

DETECTING GAS LEAKAGE.

To DETECT the leakage of gas, Dr. Bunte in the Canadian Magazine of Science, suggests the use of paper dipped in palladium chloride solution. Such paper changes its color in the presence of gas coming from leaks imperceptible by the odor, and which produce no effect upon the earth covering the pipes. Dr. Bunte suggests the following method of practically applying the test to street-mains: Above the pipes are excavated, at intervals of two to three yards, holes twelve to sixteen inches deep, corresponding to the joints and sleeves. In each opening is placed an iron tube, half an inch in diameter, within which is a glass tube containing a roll of the test paper. The air from about the main enters the iron tube, and the trace of gas which may be present reveals itself by coloring the paper brown or black, according to its quantity. If, after 10 or 20 minutes, the paper is still white, it may be certainly concluded that at the point tested there is not the smallest escape of gas. Various authorities who have experimented with Bunte's method certify to its efficacy

A THEORY OF THE ORIGIN OF PETROLEUM.

Annales Industrielles reports that Prof. Mendelejef has recently advanced the idea that petroleum is of purely mineral origin, and that the formation of it is going on every day. He has, moreover, succeeded in producing artificial petroleum by a reaction that he describes, and he states that it is impossible to detect any difference between the natural product and the manufactured article. His theory is as follows: Infiltrations of water, reaching a certain depth, come into contact with incandescent masses of carburets of metals, chiefly of iron, and are at once decomposed into oxygen and hydrogen. The oxygen unites. with the iron, while the hydrogen seizes on the carbon and rises to an upper level, where the vapors are condensed in part into mineral oil, and the rest remains in a state of natural gas. The petroleum strata are generally met with in the vicinity of mountains, and it may be granted that geological upheavals have dislocated the ground in such a way as to permit of the admission of water to great depths. If the centre of the earth contains great masses of metallic carburets, we may, in case this theory is verified, count upon an almost inexhaustible source of fuel for the day when our coal deposits shall fail us. - American Gas-Light Journal,

THE PARKES MUSEUM, 74a MARGARET STREET, REGENT STREET, LONDON, W., February I, 1888. SIR: H. R. H. the Duchess of Albany has graciously consented to become patroness of Parkes Museum, of which H. R. H. the Duke of Albany was president until his decease. E. White Wallis, Secretary.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

WHAT IS SANITARY ENGINEERING—WHERE IS IT TAUGHT?

TUBBSVILLE, HENRY Co., O., February 14, 1888.

SIR: Will you please give me some information in regard to learning sanitary engineering, and oblige,

ALFRED S. TUBBS.

[We are not quite certain as to what is meant by "sanitary engineering" in this question.

What we mean by this term includes all branches of engineering which are connected with municipal sanitary work or with the sanitation of buildings—in other words water-supply, sewerage, house-drainage, heating and ventilation, etc.

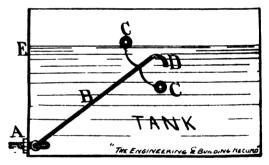

We do not consider that the knowledge required by an inspector of plumbing is that which a sanitary engineer should possess, and no one should claim to be, or should be considered a sanitary engineer who cannot make the surveys and prepare the drawings and specifications for a system of water-supply or of sewerage for a city of 50,000 inhabitants.

This is to be learned in the technological schools which have been formed in this country for training engineers. The School of Mines of Columbia College has formulated a special course in sanitary engineering, the schedule for which it will no doubt forward on application. This is for a four years' course of study, the first two years including the same studies as the ordinary engineering course.]

SURFACE SUCTION.

NEW HAVEN, CONN., February 11, 1888.

SIR: Seeing your plan for drawing water from the water-line of a tank or cistern by a hose, which in time, if constantly immersed, will rot, I will make public a better plan applicable for either a cistern or tank.

C C are two copper balls which in a large tank should be about six inches diameter, and weighted so as to keep the supply two or three inches below the surface of the water. A is a hollow core cock with threaded shank passing through end E of tank and receiving outside a coupling and a lock nut. When B is turned up against E it shuts stop-cock A. B is house supply-pipe, that will also serve to fill the tank with, and should then have the bend D to prevent the water from being thrown over the side of the tank, and a check-valve just above the pump-valve to prevent back-pressure.

Thomas A. Jarrett.

OVERHEAD STEAM-HEATING.

DETROIT, February 18, 1888.

SIR: Will you kindly inform us in your next issue if there is a patent on the overhead system of steam-heating?

M. B. & Co.

[There is no patent on simply taking the steam-main to the top of a building and feeding downwards if you have separate steam and return connections on each radiator.

The "Mills Patent System," that many seem to think covers all methods of steam-supply from overhead mains, really includes only the use of a descending main, answering at the same time both for steam-supply and for return water, to which the radiators are connected by a single pipe each with no other connection. This is a single pipe system as far as the radiators are concerned, but, of course, there has to be an independent rising steam-main to supply steam to the upper end of the descending main or mains, and its only effect is to avoid having steam and water going in opposite directions in the same pipe. If by "overhead system" our correspondent simply means putting coils or radiators in the upper part of the room to be heated, there is no patent on that.—ED.]

ICE-MACHINES.

FORT RINGGOLD, TEX., February to, 1888.

SIR: Mr. Jacob Scheuhle, of San Antono, Tex., is the manufacturer of a simple and excellent ice-machine. It is in use at this post and gives satisfaction.

A SUBSCRIBER.

[Answering inquiry on page 121.]

MANUAL TRAINING IN PUBLIC SCHOOLS.

THE exhibition of drawing, clay modeling, and other specimens of manual work by the pupils of the public schools of Columbus, Ohio, and St. Louis, Mo., began February 28 at the rooms of the Board of Education, New York City, to be continued for a few days. The drawings were very interesting, as showing the progress made by the pupils in cities where the manual training system has been in use for three or four years. A similar system is about to be tried in New York City by opening a work-shop in one of the grammar schools.

TRESPASSERS FINED FOR CUTTING LUMBER ON STATE LANDS.

THE first money from trespassers on the State lands of New York was received by the Forest Commissioners February 24. A lumbering firm, who had been cutting timber on State lands, sent \$822 to the commission with the request that it be not proceeded against. This is a good beginning.

A NEW MAP OF MASSACHUSETTS.

THE third annual report of the Commissioners of the State Topographical Survey announces the practical completion of the work of preparation of a new map of the The work was begun in 1884 with the co-operation of the United States Geological Survey, the National Government agreeing to pay half the cost up to \$80,000 and the whole cost above that amount. The area of the State is 8,315 square miles. Besides completing this area the survey has been extended into the adjoining States of New York, Vermont, New Hampshire, Rhode Island, and Connecticut to a limited extent for the purpose of com pleting certain atlas sheets which project into these States. Thus an area of nearly 600 square miles has been surveyed in addition to that of Massachusetts. The total cost of the work was \$115,400.

LIME KILN CLUB METEOROLOGY.

JUDGE OPENHOUSE CABIFF, chairman of the Committee on Meteorological Disturbances, reported that the thermometer invented especially for the club by Professor Moses Clingstone, of St. Louis, had not been found up Moses Clingstone, of St. Louis, had not been found up to his warrant. During the heated term in August it registered from 8 to 10° below zero right along, and during the cold wave of November it marked 250° above zero for several cays in succession. It had been greased with bear's oil, boiled in milk, and baked in the oven, but there it was at that moment on the wall registering over 100° below zero. He didn't suppose that a difference of 20° or 25° in either heat or cold made any great difference to any member, but such a wide margin as had been recorded was piling it on rather too thick. He recommended that it be cast aside, and that Professor Cling stone be notified to remove it within thirty days.

On motion of Shindig Watkins, who is inventing a col-

On motion of Shindig Watkins, who is inventing a colored man's thermometer himself, the recommendation was adopted .- Detroit Free Press.

A BILL TO REGISTER PLUMBERS AND SUPER-VISE PLUMBING IN THE STATE OF NEW YORK,

THE following is the text of a bill introduced by Senator O'Connor, in the New York Senate, February 15, and referred to the Committee on Public Health, Senator Van

AN ACT to amend an act entitled "an act to secure the registration of plumbers and the supervision of plumbing and drainage in the city of New York.

SECTION 1. Section 1, chapter 450, laws of 1881, entitled "an act to secure the registration of plumbers and supervision of plumbing and drainage in the city of New

ork " is hereby amended so as to read as follows:
"Sec. 1. On or before the first day of September, 1888. every master plumber carrying on his trade in the city of New York shall, under such rules and regulations as the Board of Health shall prescribe, register his name and address at the health department of said city within which such master plumber shall be conducting his business, and after the said date it shall not be lawful for any person to carry on the trade of plumbing in either of the said cities unless his name and address shall be registered as herein-before provided. Every such master plumber applying for before provided. Every such master plumber applying for registration shall be required to pass an examination as to his practical knowledge of plumbing and sanitary laws before a Board of Examiners consisting of three master plumbers, to serve without compensation, a Sanitary Inspector, who shall be a practicing physician, and a Sanitary Engineer, to be appointed by the Board of Health of the city of New York, and no license shall be issued by the Department of Public Works of said city to any plumber not duly registered by the Board of Health of the city of New York."

Sec. 2. Section 6 of the said act is hereby amended so

SEC. 2. Section 6 of the said act is hereby amended so as to read as follows:

"SEC. 6. Any person violating any of the provisions of this act, or of the act hereby amended, shall be deemed guilty of a misdemeanor, and, upon conviction, the name of such person shall be struck from the registry of master plumbers made or kept under the provisions of this act. Any such person, however, within 20 days after the receipt by him of notice of the removal of his name from the registry of master plumbers kept in the city of New York may apply to the said Board of Examiners for reinstatement, and, if upon a review of the facts resulting in the conviction of such person under the provisions of this section, the said Board of Examiners, by the concurrent vote of the members thereof present at any regular meeting of such Examiners, shall certify that such person is entitled to reinstatement and to the restoration of his name to the said registry of master plumbers, then, and in that case, the Board of Health in charge of such registry may duly reinstate such person, and restore his name to the roll of master plumbers."

THE NICARAGUA CANAL.

DISPATCHES to the New York Times from Nicaragua dated January 30 state that all the surveying parties having been established in camps and the work of locating the route progressing favorably, Mr. Peary, who is in charge of the survey, proceeded to Managua on the 15th inst. to pay his respects to the President of the republic and his Cabinet. The journey by rail to the capital was a novel one, and possibly no engineer has ever before traveled in like manner to visit the chief of a nation in whose territory he was inaugurating a great public work. Arriving at Granada the Superintendent of the road, as the scenery could not be viewed from the passenger coach, suggested the cowcatcher as the most available place for looking about, and the offer was accepted at once.

At Masago a delegation arrived on a special train and the cowcatcher had to be abandoned. The President met the party and escorted them to his office and reception room, where Mr. Peary made an address, at which the President expressed his pleasure.

While riding from Granada to Managua, in cuts through the earth about ten feet deep in some places, it was noticed that in all cases the earth was so firm that the sides of the excavations were perpendicular. It is said that this char_ acteristic is not a local one, but that the canal can be built in a similar manner, which will save the expense of excavating more earth than is absolutely needed to form the canal bed.

After leaving Managua Mr. Peary started for Brito, the Pacific terminus of the canal route and made an examina-tion with a view of determining the most expeditious and best location of surveying parties when they shall be transferred there, probably in the early part of April.

THE old method of sinking wells or shafts by a wooden crib surmounted by masonry walls is superseded of late in Belgium by the use of hollow cylindrical sections of cement tubing of the required diameter, smooth externally, with inside collars jointed with liquid cement. As the excavation proceeds sections of the tubing are added at the top until the required depth is obtained, when the opening is closed with a cement slab, having a manhole in the centre.—La Semaine des Constructeurs.

CONVICTIONS OF "SKIN" PLUMBERS CONFIRMED.

"JOHN ELLIS and Thomas White, 141 East Fifty-ninth Street, were arrested for defective plumbing in four houses at the north-east corner of Tenth Avenue and Ninety-third Street, where Inspector H. D. Dickinson found many open joints nearly all filled with putty to deceive the inspector. They were convicted in the Court of Special Sessions December 14 and fined \$250 each."

The above paragraph appeared in our issue of December 31 in an account of the excellent work done by the New York Health Department in securing the punishment of "skin" plumbers. It affords us pleasure to add the. following affirmative opinion from City Judge Rufus B. Cowing, of the Court of General Sessions, to which the cases had been appealed:
"Both of the cases came up to this court on appeal from

judgments of the Court of Special Sessions, and inasmuch as substantially the same questions arise on both appeals,

they may both be disposed of together.

"The appellants seek to reverse the judgments of the

courts below upon various grounds.

"First—They claim that Chapter 450 of the Laws of 1881, and upon which the complaints are predicated, is superseded by Chapter 410 of the Laws of 1882 known a the

Consolidation Act.

"Second—That there is no crime charged in the complaints within the contemplation of either of the above-

named laws.
"Third—That the provisions of Chapter 450 of the Laws "Third—That the provisions of Chapter 450 of the Laws of 1881 and Sections 501 and 537 of the Consolidation Act were repealed by the Penal Code before the happening of the acts complained of in the complaints.

"Fourth—That there is no charge in the complaints specifying a failure to perform the work in accordance with plans approved by the Board of Health.

"Fifth—That the complaints are indefinite and uncertain and give the defendants no information as to the

tain, and give the defendants no information as to the nature of the charge against them; and

Sixth—That there is no crime recited in the warrant

of arrest.
"The foregoing, together with numerous exceptions taken on the trial to the acceptance and rejection of evidence, comprise all the grounds upon which the defendants

(appellants) seek to have the judgments reversed

After a careful examination, I have come to the conclusion that Chapter 450 of the Laws of 1881, upon which sion that Chapter 450 of the Laws of 1881, upon which the complaints are predicated, has never been repealed, either expressly or by implication. The sections in the Consolidation Act, numbered 501 and 537, do not expressly or by implication operate as a repeal of Section 3 in Chapter 450 of the Laws of 1881. The Consolidation Act, as its title indicates, was a declaratory act, all Sections 501 and 632 declare and reaffern substantially Section 5 of and 537 Jeclare and reaffirm substantially Section 3 of chapter 450 of the Laws of 1881 and do not repeal said section either expressly or by implication, and, so far as the Penal Code is concerned, it not only nowhere expressly or by implication repeals the said Law of 1881, but on the or by implication repeals the said Law of 1881, but on the contrary Section 725, Subdivision 4, provides that nothing in the said code affects any acts defining and providing punishment of offenses not defined and made punishable by the code, and inasmuch as the said code nowhere defines and makes punishable the acts described in the third section of Chapter 450 of the Laws of 1881, said section is especially excepted from the operation of the said code. The law never favors the the operation of the said code. The law never favors the repeal of a statute by implication, and where a previous and subsequent statute are not inconsistent or repugnant in the absence of an express repeal they should both stand. I am therefore of the opinion that Chapter 150 of the Laws of 1881 has never been repealed, and that it was at the time of its alleged violation by these defendants in full force

time of its alleged violation by these defendants in fair force and effect.

"The defendants put great stress upon the facts that Section 3 of Chapter 450 of the Laws of 1881 requires the plumbing to be executed in accordance with 'plans' to be approved by the Board of Health, and that the word 'plans' has a fixed meaning and does not include specifications which may be filed with them. I cannot agree with the defendants in the parrow construction of the statute. cations which may be filed with them. I cannot agree with the defendants in the narrow construction of the statute. It will be observed that in the same section there is a reference to 'suitable drawings and descriptions,' and the intent of the Legislature was undoubtedly to include in the word 'plans' whatever was filed with them as a part of them and describing and explaining them. In these cases I am of the opinion that the word 'plan' included the drawings and specifications, and that the two together constituted the plans under which the plumbing was to be executed.

The complaints upon which the defendants were tried and convicted are not justly, in my judgment, subject to the criticism made upon them by the defendant's counsel; they fully and fairly set forth all the facts necessary to bring them within the statute, and they charge the defend-ants with its violation in such manner as to fully inform and apprise them of the nature and character of the charge made against them, and fully and specifically inform them of all the facts necessary to enable them to prepare their defence, and this is all that is required.

"After carefully reading the evidence returned by the Special Sessions, I am convinced that there were no errors committed by the trial court prejudicial to the defendants, and, therefore, the judgments in both cases must be affirmed, and it is so ordered."

ENGINEERS' CLUB OF PHILADELPHIA.

A REGULAR meeting of the club was held February 18, 1888, Vice-President John T. Boyd in the chair; 19 members and 2 visitors present.

Prof. L. M. Haupt presented, by title, the memoirs and summary of papers relating to the re-organization of national public works, presented to the President of the United Stated November 11, 1887; compiled by the Executive Board of the Council of Engineering Societies on National Public Works.

The Secretary presented for Mr. W. H. Ridgway an illustrated description of a direct-acting steam crane, and for Mr. Fred H. Robinson an account of the manufacture of sewer-pipe by the Delaware Terra-Cotta Company.

Mr. Henry G. Morris presented the following under the title of "How Not to Do It."

"The object of this note is to call attention to an example of faulty construction which will, I think, appeal to those interested in the erection of modern buildings where the use of elevators is so universally demanded.

"In a recently completed building in this city can be seen a system of four hydraulic elevators of what is considered approved construction, running in the four corners of a hollow square, the head works being carried by heavy wrought-iron beams extending from one wall to the other.

"The sheaves carrying the hoisting ropes of all four elevators are properly placed on top of the beams mentioned, but owing to the fact that the hoisting ropes are all carried through the west wall it became necessary to place the sheaves carrying the counter-balances of the two elevators nearest the west wall, so that they would not interfere with the ropes of the elevators next the east wall.

"The method of doing this is the point which I desire to criticise. The shafts of these counter-balance sheaves, instead of being so placed as to be supported by the beams, are hung from the bottom by what are apparently cast-iron bearings, attached to the lower flange of beams by means of two three-quarter stud bolts. Aside from the uncertainty of obtaining a good thread when it has to be made in place, as these have evidently been done, there is added the uncertainty of the condition of the same, as well as of the bolts, by reason of the combination of 'the monkey wrench, and the intelligent workman' who may have made the final adjustment.

"In such cases where so many safety appliances are attached to prevent accidents, the faulty construction noted would seem to call for prompt remedy, as the giving way of the suspension boxes or bolts by reason of a sudden jar could hardly fail to cause an alarming accident, if not resulting in loss of life. A little forethought on the part of the designer of the machinery, or of the architect, would have suggested in this case a ready means of overcoming the difficulty encountered."

Professor L. M. Haupt read some extracts from the report of the Commission appointed by the State of New York to provide for the internal navigation of the State, dated Albanv, March, 1812, and signed by Gouverneur Morris, Schuyler Van Rensselaer, De Witt Clinton, Simeon De Witt, W. North, Thomas Eddy, and Robert R. Livingston, and accompanied by the bill which was prepared for the National Legislature, providing for the construction of an extensive internal system of navigation, to be executed by the several States, and guaranteed by grants of public lands.

He then explained how the benefits of the Erie Canal might be extended to other parts of the country, and believed it would be to the interest of Philadelphia to encourage the completion of a more expensive water route between Lake Michigan and the Mississippi River.

Mr. Howard Murphy expressed the opinion that water transportation in general has been artificially crushed out in this country by railroad influence and manipulation, and that, in the natural course of events, it would in the future regain the natural and important place to which it is entitled.

M. F. W. Whiting noted a recent case in his practice where he examined the attic of a building on account of complaint of the frequent presence of smoke in the room, and found the cause thereof to be that the smoke-flues of the building had been arranged to discharge into that room.

SIR ROBERT RAWLINSON.

AMONGST the official announcements made on the first day of the New Year was one to the effect that the Queen had made Sir Robert Rawlinson a K.C. B. on his retirement from the post of Chief Engineering Inspector to the Local Government Board of Great Britain.

Sir Robert is seventy-six years of age, and while the members of the engineering world generally will regret his retirement, they will, without doubt, appreciate the recognition he has received of his earnest and conscientious life-work in the profession of a sanitary engineer.

This distinguished gentleman, whose communications to the columns of THE ENGINEERING AND BUILDING RECORD will be well remembered by our readers, is thus referred to by our English contemporary, the *Builder*:

The long-expected retirement of Sir Robert Rawlinson from official life is at last about to take place. At the ripe age of seventy-six, Sir Robert thinks it is time to rest from the toils of office. He has held his appointment of Chief Engineering Inspector to the Local Government Board ever since that Board was formed, and his name is synonymous with the progress of sanitary engineering, of which he may be said to be the father.

synonymous with the progress of sanitary engineering, of which he may be said to be the father.

Born in 1811, at Bristol, Robert Rawlinson, whose father was a builder and an engineer, commenced his career at an early period under the paternal eyes. At the age of twenty he was sent to Jesse Hartley, the famous dock engineer, and remained with him at the Liverpool Docks for five years. He was then engaged for four years under Robert Stephenson on the London and Birmingham Railway, now part of the North-Western, and there he was resident engineer on the important cutting near Blisworth. He underpinned upward of a mile in length of rock resting on clay, in a cutting 55 feet deep, and executed the whole of the masonry, bridges, culverts, etc., of the heaviest cutting on the line. When, in 1840, the line was completed, he obtained the appointment of Assistant Surveyor to the Corporation of Liverpool, which post he retained for three years. He then was recommended by Jesse Hartly for the post of Engineer to the Bridgewater Canal Trust, in which he remained for four years, during which time most important works in connection with the feeding of the canal, and its improved working were brought about by him

the Bridgewater Canal Trust, in which he remained for four years, during which time most important works in connection with the feeding of the canal, and its improved working, were brought about by him.

His next public work was in connection with the building of St. George's Hall, Liverpool, of which Mr. Elmes was the architect. In 1847 Mr. Elmes became a victim to consumption, and was compelled to leave this country for a milder climate. Before leaving he confided the completion of his great work to Sir Robert. The late Sir William Tite supposed that young Rawlinson held but a subordinate position, and was clerk of the works, but this Sir Robert has refuted. He has satisfactorily proved that Mr. William Hughes was clerk of the works, and that he himself really took the place of Mr. Elmes, in regard at least to the

constructive portion of the work.

The water-supply of Liverpool next engaged his attention, and he submitted a scheme for supplying the town from Bala Lake and the River Dee. This scheme, the wisdom of which has been justified by events—for Liverpool has had recently to adopt something very similar in taking water from the River Severn—was considered too fast for the wants of Liverpool and was therefore rejected.

the wants of Liverpool, and was therefore rejected.

When, 1848, the Public Health Act was passed, Mr. Rawlinson was appointed first Engineering Inspector, and ever since that date his career has been inseparably bound up with the progress of sanitary engineering. He inspected a great number of towns, commencing with Dover, and completely reorganized the drainage and sanitation of the principal provincial towns of this country. He retained his appointment for seven years, at the end of which he tound his private practice increasing to so enormous an extent that he retired from office and devoted himself to the more lucrative occupation of Consulting Edgineer. He was consulted for upwards of fifty towns, and devised schemes of water-supply for Birmingham and Wolverhampton. The city of Carlisle owes its sewerage system to him, which he completed at a cost of less than £23,000, though other engineers had estimated the cost at as much as £70,000 and £80,000. During this period he constructed upwards of a hundred miles of sewers.

In 1855 Mr. Rawlinson was appointed Engineering Commissioner to the Sanitary Commission that was sent out to the seat of war in the Crimea. The operations of that Commission are matter of history, and it will suffice to say that whereas before the arrival of the Commission the death rate among the troops had reached the alarming figures of 420 per 1,000 per annum, when they left it had declined to but little over 2 per cent. Here Rawlinson was wounded whilst in the pursuit of his duties, and he had to return home to be cured; but his services were not forgotten, and when a Permanent Army Sanitary Commission was formed in 1860 he obtained a seat on it which he has always retained

Mr. Rawlinson's next great work was the administration of the fund raised for the Lancashire cotton famine. He carried out public works in ninety-three Lancashire towns, involving an expenditure of £1,050,000, every penny of which has been refunded. The administrative charges did not amount to more than 3s. 6d. per cent. The cotton operatives were saved from starvation and pauperism, and the Lancashire towns were drained and paved. It is estimated that the streets and roads thus improved represent an area of 800 acres, and a length of 400 miles. For his

distinguished services to his country, Mr. Rawlinson was made a C. B. Subsequently, on the recommendation of Mr. Gladstone, he received the honor of knighthood in 1883.

Sir Robert Rawlinson has served on numerous Commissions, and was Chairman of the Rivers Pollution Commissions of 1865 and 1868, and of the Royal Sanitary Commission of Dublin of 1879. He is a Vice-President of the Society of Arts, and a member of Council of the Institution of Civil Engineers. Sir Robert is the author of numerous scientific reports and papers, and of "Suggestions" for the use of local surveyors and sanitary engineers, which have been accepted as authoritative both in England and abroad. His work on "Chimney Shafts" is also well known.

SUBTERRANEAN DISTURBANCES IN OHIO.

Some remarkable fissures in the earth have recently appeared near Akron, O. They radiate from a common centre, in one place coming up through the cellar of a house, splitting the walls wide open. Where the fissures pass through earth covered by sod, the turf is laid back in long furrows as if thrown back by ploughs. The chasms have been explored to the depth of thirty feet, without reaching bottom. The principal openings are on sandy hills of considerable elevation above the surrounding land and the centre of the disturbance in each case is near the highest part of the hill. The earth covering of the rock in that neighborhood is said to be about forty feet in thickness. Geologists there advance the theory of shale gas which being "sealed" up by the freezing of the ground forces its way out and causes the explosions. But gasdrillers, however, within the last year, not in the immediate field of disturbance, but in the neighborhood, put down a hole 2,100 feet deep and found scarcely enough gas to make a flame. Other similar disturbances have occurred several times previous to this and always in the winter months when the earth is frozen.

THE American Water-Works Association will hold its next meeting in Cleveland, O., on April 17 next.

WILLIAM C. KELLY.

WILLIAM C. KELLY, whose death has been already noticed, is credited with being the discoverer and first user of what is called the Bessemer process of converting pigiron into steel. Mr. Kelly was the proprietor of the Suanee Iron-Works and Union Forge in Lyon Co., Ky., where he made charcoal blooms mainly for boiler-plates. Finding the necessary fuel very expensive, he devised the plan of purifying the molten pig by forcing an air-blast through it which burnt out the carbon, thus producing a low steel in his attempts to make wrought iron without puddling. He continued to use and experiment with this process for ten years despite the discouragements from his friends and advisers, until his customers refused to use blooms not made in the old way, and he was compelled to pursue his investigations secretly.

Shortly after the return to their native country of some skilled English workmen who had been in Mr. Kelly's employ, Henry Bessemer, an English ironmaster, announced the discovery of the process which bears his name, and applied for patents in England and in this country. Mr. Kelly immediately made a claim of priority of invention, which was allowed and the patent granted to him.

Mr. Kelly's process was barely successful until perfected by Robert Musshult, a prominent English ironworker, and he gained from his invention very little of the credit or reward that was justly due to the discoverer of a process that has revolutionized the manufacture of the world's most important industrial product.

PERSONAL.

MAJOR WILLIAM LUDLOW, late Engineer Commissioner of District of Columbia, is now engineer of Fourth Lighthouse District, with station in Philadelphia.

PROFESSOR THOMAS GRAY, of the University of Glasgow, Scotland, has been appointed to the chair of dynamic engineering in the Rose Polytechnic Institute. Terre Haute, and has signified his acceptance of the same.

MR. DOMINGO GARCIA Y CARTAYA, until recently a member of the Nicaragua Canal survey, met with an accidental death at Granada, February 27. Mr. Cartaya was an engineer and chief of one of the parties in the field. About a month ago he resigned on a surgeon's certificate of failing health. He was a resident of New York City.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

RCHITECTURAL COMPETITIONS. GALVESTON, TEX.—Plans are wanted here ntil March 15 for a school building, to cost more than \$35,000. Address R. V. Javidson, as above.

STONE LAKE, IOWA.—Plans are wanted ere until April I for a court-house. Address. W. Warren, as above,

MARSHALL, TEX .- Plans are wanted here or a court-house to cost from \$45,000 to \$60,No date specified. Address Judge eller, as above.

MINNEAPOLIS, MINN.—Plans are wanted ere by the Y. M. C. A. for a new building. o date specified. Address the secretary,

CAMBRIDGE, MASS .- The following archicts have been invited to compete for the new ity Hall, to be erected here at a cost of 150,000: Peabody & Stearns, Van Brunt & owe, Chamberlain & Whidden, Longfellow, lden & Harlow, and John Lyman Faxon.

A PROPOSED CAPE BRETON CITY.

A RECENT dispatch from Halifax to the ew York Times states that a party of Boson capitalists who purpose building up a city id summer resort near Port Mulgrave, on its Straits of Canso, have purchased five miles I and for \$30,000 cash. They have also I and for \$30,000 cash. They have also in chased a coal mine. As this port is the also certain winter port of Cape Breton, they ope to build up a large city. The company trying, it is said, to have the Atlantic erminus of the railway system of Canada there also to have all Atlantic steamers call

or works for which proposals are requested see also the "Proposal Column," pages i-v-viii-223.

Persons who make any use of the information they id in these columns we trust will not omit to me не Engineering & Building Record as the sc

ur readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE. ETC.

ST. IGNACE, MICH.-Frank S. Walker, the ity Clerk of this place, writes us, under date February 23, as follows: "No steps have yet been taken as regards water-works. In authorized now by the Common Council write to water-works parties, and try to get ome company to come and put in a plant, le city giving a franchise. If you know ome good company in the business please let le know."

ROCHESTER, PA.-Concerning the waterorks project here our correspondent writes s follows: "I understand sufficient encourgement has been given the projectors to jus-fy them in going ahead with the enterprise. The attorney for the water-works company is ohn M. Buchanan, Beaver, Pa., or A. W. IcCoy, Rochester, Pa."

ELKTON, MD.—In reference to the water-orks project here our correspondent sends to following information: "At a town meeting held February 22, the report of the comnittee recommending the establishment of ater-works was adopted. The charter of the wn will be amended so as to authorize the with will be antended so as to authorize the win to subscribe a fixed sum annually for a ater-supply for fire purposes. The town ill not issue bonds, and the capital will have be furnished by outside parties. It is not spected that anything will be done until new wn commissioners are elected in April:"

CIMMARON, KAN. — Our correspondent rites from here as follows: "Our city voted ater-works bonds the 18th of this month, nd will place in a plant this spring; probably all be ready in March."

matters here our correspondent writes as fol-lows: "The contract for water LANARK, ILL.—Concerning water-works of Lanark, Ill., was made last fall to Wood & Sneadley, of Dubuque, Iowa. City is bonded to the amount of \$13,500, and bonds sold or contracted for at par. The work has commenced and expected to be finished by June 15, 1888."

CHEYENNE, WY. TER.—The question of obtaining a supply of pure water continues to be the chief theme here. City Engineer Miller, assisted by a committee of the Common Council, has presented a scheme which, it is Council, has presented a scheme which, it is claimed by these gentlemen, will solve the problem. The present supply has been found adequate for the demands of the city in quantity, but the quality has been pronounced unwholesome. The report of Mr. Miller and his assistants recommends a system of filtration. Several other plans are under discussion, and, under the instruction of the council, an expert from the East will be called upon to

GRAFTON, W. VA.-An election will be held here March 20 to settle the water-works question. It is thought that the town will favor the scheme.

ASBURY PARK, N. J .- See our proposal columns for information as to supply of castiron pipes and fittngs, fire hydrants, valves, etc., wanted

ALBANY, N. Y.—At a special meeting of the Common Council, held February 27, called to consider the report of the law committee on the proposed agreement of the city with the Central-Hudson railroad, by which the city, through the special water commission, transfers to the company certain lands in and about Patroon's and Sand Creeks for \$50,000, the committee made a favorable report and the committee made a lavorable report and the contract was ratified. Commissioner Sickles explained the proposed route of the driven well system, which is to be carried to a point on Patroon's Creek near Russell Road, where two reservoirs are to be built, thence to a gate-house at the confluence with Sand Creek road and then down to Tivoli Lake, from which point the city will be supplied. In addition to the \$50,000 consideration the company has given the city the right to lay pipes on their lands and to cross the tracks to carry water to The railroad asks in return that the city give to them a small portion of land near the proposed reservoir. The railroad also proposes to allow city to connect their drains with the proposed new trunk sewer which is being built; also to save the city the cost of conveying the pipes along the line of the new water route, by doing it themselves, which, it put altogether, would amount to about \$100,-

WATER-WORKS,-See our Proposal Column for information regarding water-works and water-works supplies at following places: Bristol, Tenn.; Washington, Mo.; Iron Mountain, Mich; Americus, Ga.; Lapeer, Mich.; Fernandina, Fla.; Jersey, City, N. J.; St. Louis, Mo.; Providence, R. I.; Washington,

NEW LONDON, CONN.—It is probable that considerable sewer work will be done here this spring. For details address the Sewer Board.

PHENIX, N. Y.-Basset Bros., of Buffalo, are preparing plans for a complete system of water-works to be built here next summer.

MONTGOMERY, ALA.—The sum of \$75,000 has been appropriated by the City Council for the construction of additional sewers, for which plans and specifications have been made by Rudolph Hering. For details ad-dress the Committee on Sanitation.

GREENVILLE, MISS. - As soon as the weather permits the water-works company will begin laying pipe throughout the city. The water for fire purposes will be taken from the river and artesian wells will be driven to obtain a supply for drinking purposes. The machinery used will be the Gordon-Maxwell pumps, in connection with the Hayne safety boilers.

TRENTON, N. J .- As announced in our Proposal Columns last and again this week, several thousand dollars' worth of sewerage works is to be done here at once.

JERSEY CITY, N. J.—At a recent meeting of the Board of Public Works it was decided to postpone the question of a system of filtra-tion of the water-supply for three weeks in order to obtain further information concerning the question. The reason for the postponement was because Andrews Brothers & Co., ment was because Andrews Brothers & Co., of the Oliphant Filtering Company, wanted an opportunity to present a bid, and also desired the Board of Works to visit Springfield, L. I., to investigate the system of filtration used by this company in supplying Brooklyn with a portion of its water.

CANTON, O.—Bonds in the amount of \$50,000 will probably be issued by the city for the purpose of constructing a main sewer. The Sewer Commissioners can give details. William Dannemiller is chairman.

HOWELL, MICH.—The question of establishing a \$25,000 system of water-works here is to be decided at the polls on March 5.

PANA, ILL.—It is reported that water-works are to be erected here. Address the Town

VINTON, IOWA .- It is said that H. T. Lauderbaugh can give details of a water-works project here.

INDIANOLA, NEB.—Water-works are to be established here.

GREENPORT, N. Y.—Water-works will probably be established here. For details address Mr. Wells, of the committee in charge.

FORT FAIRCHILD, ME.—The water-works question is being agitated here. Address the City Clerk for details.

ALEXANDER, ARK.—The water-works question is being agitated here.

KEYPORT, N. J.—The water-works question is being agitated here. Address Mr. Lufburrow for details.

LIVERMORE FALLS, ME.—Concerning the report that water-works were to be erected here the Town Clerk writes: "Some talk has been made in regard to water-works, but no steps of a definite character have been taken as

WOODHAVEN, N. V .- The Woodhaven Water-Supply Company has been incorporated, with a capital stock of \$50,000. Florian Grosjean and others are interested.

NEW BRUNSWICK, N. J .- The break in the water-works dam here has not as vet been repaired, and it is stated that an engineer is to be employed to devise a means of speedy re-

BATESVILLE, ARK.—It is reported that water-works are to be erected here, and that A. A. Webber can furnish details.

KUTZTOWN, PA .-- The question of establishing a system of water-works here is being agitated. For details address Dr. J. S. Trexler.

ASHEVILLE, N.C.—It is reported that this place will probably expend \$60,000 on a place win prosent sewerage syetem.

BRIDGES.

DAYTONIA, FLA.—Address W. F. Stewart for details of a bridge to be erected here.

MOUNT MORRIS, N. Y .- It is reported that a \$20,000 bridge is to be erected here.

HARRISON, N. J.—It is probable that a bridge will be erected over the Passaic River by the Freeholders of Hudson and Essex Counties. The structure is to cost \$100,000.

NEW LONDON, CONN.—The N. V., P. & B. R. R. will erect a large bridge over the Thames.

BAY CITY, MICH .-- Concerning the bridge election here, our correspondent writes: "Bridge question voted upon by the people February 20 was carried."

GAINESVILLE, ALA.—A bridge is to be erected over the Noxubee River. Address the County Commissioners for details.

RACINE, WIS .- The city will build a bridge across Root River at the end of Sixth Street.

BRIDGES.—See our Proposal Column for information regarding bridges at following places: Thomaston, Ga.; Montreal, Can.; Las Animas, Col. MAURICETOWN, N. PROPOSALS.

Proposals for Building Sewers.

Proposals for Building Sewers.

Trenton, N. I., February 25, 1888.

The Common Council of the City of Trenton, in the State of New Jersey, will receive, at their meeting, to be held in the City Hall of said city, on I uesday, the twentieth day of March, A. D. 1888, at eight o'clock in the evening, sealed proposals for building in said city the following-named sewers:

A main sewer with about two thousand feet of vitrified pipe of fifteen inches diameter, about two thousand feet of egg-shaped brick sewer from '8 'xz' o' to 2' o'xz' o', about four hundred feet of cast-iron pipe 24' and 42' diameter, about five hundred feet of vitrified relief-pipe 12' and 15' diameter, and with fifteen mail-holes and flushing-basins.

Also a pipe-sewer about eight hundred feet in length, 8' and 10' diameter, with two manl-holes.

Also a pipe-sewer about there thousand feet in length, from 1' 10' xz' o' diameter, with nine manl-holes and flushing-basins.

Also a rain-water drain, to be an egg-shaped brick structure about thirty-three hundred feet in length, from 1' 10' xz' o' to 4' o' x5' o', with thirteen manloles and flushing basins, and eighteen inlets.

Also a rain-water drain, to be an egg-shaped brick structure about one hundred and seventy-five feet in length and about 3' 2' x4' 9'.

Plans and specifications, with a draft of the contract, and of the bonds required to be given, may be seen at the office of the Engineer, at No. 18 West State Street, Trenton, N. J., on and alter March 6, 1888.

Each proposal must be made on a blank form, which will be lurinsh d by the City Clerk, and must be accompanied with a satis actory bond, with at least two sureties, in the sum of five hundred dollars, conditioned that if the proposal be accepted the person or persons making it will execute the contract required to be executed, and furnish the bond required to be furnished within five days after the acceptance of the proposal.

Separate proposals must be made for each of the above-mentioned sewers, but any person submitting

furnished within five days after the acceptance of the proposal.

Separate proposals must be made for each of the above-mentioned sewers, but any person submitting proposals for two or more sewers may stipulate thereon that he shall not be bound to execute any contract unless all of the proposals made by him shall be accepted by the Common Council.

The proposals must not be filed with any city official, but must be delivered by the bidder, or his agent, to the Common Council, at their meeting, above mentioned, when the same shall be called for by the President of the Common Council.

The Common Council reserves the right to reject any or all proposals.

or all proposals.
y order of the Common Council. Dated February 1888.
W. W. L. PHILLIPS,
Chairman Sanitary Committee.

23, 1888. 14

W E desire to draw the attention of Engineers, Municipal Authorities, etc., to the advantages of the SHONE HYDRO-PNEUMATIC SEWERAGE SYSTEM. By the advantages of the SHONE HYDRO-PNEUMATIC SEWERAGE SYSTEM. By the introduction of Pneumatic Ejectors any required gradient can be given to the small pipe sewers necessary. The velocity of flow renders the sewers self-cleansing. The sewage is carried away while fresh, and there is, consequently, no generation of sewage-gas. The Ejectors are absolutely automatic, and any number may be worked from one compressed-air station, situated at any distance therefrom. We invite application for the fullest particulars.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MRYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 15.

PUBLISHED EVERY SATURDAY.

NEW YORK, MARCH 10, 1888. LONDON, MARCH 24, 1888.

Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE. Subscription, 20s. per annum in advance, post paid.

SINGLE COPIES TEN CENTS

THE ENGINEERING & BUILDING RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

OFFICE IN GREAT BRITAIN,

TERMS, 201. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record (New York), and crossed ———& Co.

Continental subscriptions are also received by F. A. Brockhaus, Esq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5: China, Japan, Sandwich Islands, Mexico and Cuba, \$5: South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

THE NEXT CENSUS.

ALTHOUGH more than two years must elapse before the eleventh decennial census of the United States will be taken, it is none too soon to begin to give careful consideration to this subject. A bill has already been introduced in the House of Representatives by Mr. S. S. Cox to provide for the taking of this census, and the Superintendent of the last census, General Francis A. Walker, has published a paper on the subject in the Quarterly Journal of Economics for January of this year.

There has been a good deal of dissatisfaction with the methods and results of the census of 1880, due mainly to the great delays in the publication of the final reports, which delays, as General Walker explains, were due to the financial embarrassments of the census office owing to the fact that the cost of the work had been much underestimated. There were other reasons, it is true, but this was the main one.

The actual cost of the tenth census was not excessive, but it was met by a series of deficiency appropriations, which gave rise to the feeling that there must have been extravagance or mis-

It is very certain that Congress will not authorize for the next census such special reports and semi-statistical investigations as formed a large part of the last one, and the interesting question is, How far and in what direction should the reduction be attempted? The bill introduced by Mr. Cox provides that the schedules of inquiry shall be the same as those used in the last census, with such modifications as the Secretary of the Interior may approve, thus giving the Secretary full discretion as to the inquiries which are to be made. Authority is given for the employment of experts and special agents to collect manufacturing and social statistics, but this is not compulsory, so that if this bill becomes a law the Secretary of the Interior will have full powers to collect data of any kind, subject only to the limitation that the total cost of the work, exclusive of printing and engraving, shall not exceed six millions of dollars. This sum is probably ample. The cost of the last census, excluding printing and engraving, was \$4,853,350, but the work was not all completed. Had all the compilations and reports been prepared which were intended, it would probably have cost a little over five millions of dollars

General Walker seems to be of the opinion that the work of the next census should be devoted exclusively to population statistics and to those of agriculture, and to be very doubtful as to whether it is worth while to attempt to collect mortality statistics by census agencies.

It is very true that the reports of deaths collected by the census are incomplete, and that as to the causes of death they are inaccurate; nevertheless, we think that they do give valuable data, and that, for the next census, at least, it would be very unwise to omit these schedules

If Congress should see fit to authorize the organization of a permanent census bureau it would perhaps be better to have the statistics of machinery, railroads, municipal improvements, etc., collected at another time than that fixed for the enumeration of population, although even then there are great advantages in taking the day on which the population count is made as the centre of the statistical year for such sub-

Meantime we think Mr. Cox has done wisely in leaving these matters to be settled by the Secretary of the Interior and the Superintendent of the Census, and it is to be hoped that his bill will be enacted without material change.

THE POLLUTION OF STREAMS.

THE paper by Mr. Hering, which we print on another page of this number of the paper, fairly sums up the empirical rules which at present would influence an engineer in forming an opinion as to whether a given stream is or is not so polluted as to make it necessary to take steps for its improvement. The first and main consideration is as to whether the stream is or is not used as a source of drinking-water supply. If it is to be so used, it is certain that our present knowledge as to the limit of sewage impurity which may be considered permissible is very vague and wanting in scientific precision, and that there is much need of a series of careful observations on the effect of time and distance of stream-flow on diluted sewage, and especially on such pathogenic bacteria as the sewage of a community is liable to contain. The action of the ordinary bacteria of a sewage effluent is not harmful, but beneficial, and it is probable that there are other forms of bacteria, not contained in large numbers in ordinary sewage, but which are specially valuable as purifiers of such material and which exist in great abundance in those soils in which oxidation and nitrification are rapidly produced.

It is quite possible that these oxidizing bacteria might be cultivated in large quantities and added to sewage, but to enable them to flourish and do their work it is necessary that they should have a large supply of oxygen. This they have in soils which are not allowed to become too moist, but they do not have it in water, unless by agitation or in some other way air is mingled with the

Even with our present imperfect knowledge there is one fact which is tolerably clear, and that is that any stream of small or moderate size which lies in the midst of a populous and growing district is polluted, and will probably become more polluted, that this process is one of gradual increase, and that while we may not be able to predict a definite time in which it will become a nuisance or dangerous to health, we can see that it will become so sooner or later—as, for example, Mr. Hering states such will be the case with the Schuylkill.

The experiments now going on under the direction of the State Board of Health of Massachusetts to obtain a continuous series of chemical and biological analyses of samples taken from different points of polluted streams will probably give results of much value from the point of view in which Mr. Hering considers the question, and it is a pity that a corresponding series of analyses could not be obtained for the Chicago River.

In commending Mr. Hering's paper to the attention of our readers we would only add that while it is very desirable to know what is the maximum proportion of sewage pollution permissible, it is good practice to secure the minimum proportion of pollution that can be ob-

DAY'S WORK VERSUS CONTRACT WORK.

CITY ENGINEER RINKER, of Minneapolis, Minn., has submitted to the City Council a statement showing the cost of laying water-pipe during the year 1887 by contract and by day labor. The City Engineer makes a strong showing for letting by contract. The comparisons were made upon the lines for which proposals were received and that were laid by day's work. Allowing the city the same price for setting hydrants, valves, and for rock excavation as the specifications allowed the contractor for the same work, the cost of lumber and tools being estimated by deducting the amount on hand, as per inventory of the supervisor of water-works, from the actual amount purchased, the comparisons are as follows:

Cost of day labor, 159,570 lineal feet, at an average per foot of 47.03 cents, \$75,038.31; salary of three timekeepers and one roundsman, \$1,308.06; total, \$76,346.37. Cost, if done by contract, as per proposals received, 159,570 lineal feet, averaging 31.12 cents per foot \$51,259; salary of eleven inspectors that would have been required if done by contract, 1,517 days at \$3 per day.

pany,' the officers of both companies were given positions, the price of gas was raised 30 per cent., and a series of experiments begun in making gas of the worst possible illuminating power. The unanimous testimony of consumers is that it is necessary to burn nearly double the amount of gas that they did formerly to produce a light at all possible to read or work by, and the amount of soot given off by the combustion is enormous and very annoying. There is no redress for this swindle, for the proprietors of the Trust are in Philadelphia and the local officials can only shrug their shoulders and say, in reply to complaints of 'poor gas,' that the tests show the gas to be very 'rich,' and it ought to give good light."

A MODEL ARCHITECTURAL COMPETITION.

The generosity of the advertisers of architectural competitions becomes more and more embarrassing. According to the London *Builder* the latest development in this method of making use of the profession is in a recent advertisement for a design for an Armada Tercentenary

THE ARCHITECTURAL LEAGUE.

THE Architectural League held its regular monthly meeting at Morello's, 4 West Twenty-ninth Street, on the evening of the 6th inst., with the President in the chair. Some fifty members were present, who enjoyed a most interesting and entertaining paper on "Houses on the Bosphorus," read by Mr. A. D. F. Hamlin, and illusrated by the aid of a stereopticon.

LONDON CORRESPONDENCE.

THE prospects of a repeal, either in part or whole, of the stringent clauses of the Electric-Lighting Act of 1882 is creating interest and consequent business stir in lighting circles. The latest instance is the floating of the House-to-House Electric-Light Company. This company proposes to establish central stations for the generation and distribution of electricity for lighting purposes. The probability of increasing business is advanced on the returns of the Brighton Electric-Light Company, the promoters stating that the consumption of electricity at Brighton in December, 1887 was 6,372 units, as against

HOUSE OF E. M. HUNTINGTON, JAMAICA PLAIN, MASS.-W. R. EMERSON, ARCHITECT,

\$4,557; total, \$55.810. Difference of cost of day labo over contract, \$20,536.37.

The above comparison is of interest, but would have been of more value had it been made between two similar pieces of work done under like circumstances by contract and by the day, respectively. The relative economy of the two systems depends on circumstances which vary in different places, and while every record of actual experience is of value, it will probably never be safe to say that either system is always preferable.

THE EFFECT OF COMPETITION IN SUPPLY-ING GAS IN YONKERS.

A RELIABLE correspondent in Yonkers writes us as follows:

"The citizens of Yonkers, N. Y., are suffering from an aggravated case of 'Trust.' The old gas company for several years furnished good gas at a pretty high price. A new company entered the field and competition lowered the prices, but the gas was still good. Not long ago a third company was formed and then all three were united under the title of 'The United Gas Improvement Com-

Memorial to be erected on the Hoe, at Plymouth, so which the committee "are prepared to receive gratuitous designs." Many people in this world "are prepared to receive" anything they can get gratuitously, but they do not all state the sact in so candid a manner.

Nevertheless the Building News says there were a large number of "gratuitous" competitors of whose designs that of Mr. Herbert A. Gribble was chosen. It is a dignified and original composition consisting of a boldly-treated pedestal surmounted by an heroic statue of Britannia, standing in an attitude of defence, with the Drake and other Armada worthies are placed on the four faces of the monument, and sitting at its base are two large symbolic figures representative of Naval Warfare and Navigation, sitting one on either side. The inscription, "He blew with His winds and they were scattered," is carved along the frieze over a bas-relief panel, representative of the Armada. At the base are cannon-balls and anchors.

3,175 in December, 1886, while the quarter ending December 31, 1887 totalled 15,757 units, as against 8,795 units in the corresponding quarter 1886. The prospectus frankly recognizes the fact that the light will be more expensive than gas, but points out the per contra of absence of damage by noxious fumes.

An exhibition of motors and addenda, for use in handicrafts, will be held in Munich from August 1 to October 15 next. Exhibits will be in two classes: (1) Prime movers; (2) machine tools and other mechanical appliances. Heavy machinery will only be admitted in the form of models. This embraces apparently motors exceeding 3-horse-power. The exhibition is being organized by the Allgemein-Gewerbeverein, and applications for space must be made not later than March 1 to the directors.

A HIGHWAY BRIDGE FLOOR SYSTEM.

THE City Bridge of Fort Wayne, Ind., for which the Massillon Bridge Company, of Massillon, O., are the contractors, is being built from designs prepared by the engineer of the Bridge Company.

A total distributed load of 100 pounds per square foot on the entire floor, and a concentrated load equal to the weight of a Porter & Aveling road-roller, at any point of roadway; was assumed, and sections determined in accordance. It is an ordinary double-intersection Whipple truss bridge, with 17-foot panels. It has two 5-foot sidewalks, and a 26-foot roadway carrying one streetcar track.

The floor system, by its extreme rigidity, well distributes the concentrated loads and prevents shocks and vibrations.

The roadway is of 3-inch oak plank, laid transversely on 3x4-inch oak joist, spaced about 16 inches in the clear, on 5-inch transverse rolled-steel beams, which are 27 inches apart on longitudinal plate-girder stringers, 24 inches deep and 8 feet apart at centre, and 18 inches deep and 9 feet apart at the sides. The floor girders are 3 feet deep, with reinforced top chord. The sidewalk is of 2½-inch oak plank, laid crosswise on three longitudinal rolled iron stringers, 7 inches deep, a centre beam of 18 pounds per foot, with 10½-pound channels at sides. These rest on the 5-inch steel transverse roadway beams, which project cantileverwise beyond the side longitudinal stringers, and are supported at the truss-posts by angle-iron braces.

Both floor-girders and stringers have thoroughly riveted web connections, and the truss-posts are reinforced by transverse webs and brought down to the bottom of floor-girders, a portion of the web of which is removed to admit lower chord-pin. The lateral rods are double and secured by pins through connecting plates across foot of posts, thus transmitting their strain in the direct lines of lower chords of trusses and floor-girders and avoiding fl-xure of post or twisting of floor-beam. The chord-pin is omitted in plan for sake of clearness.

EXPANSION OF PORTLAND CEMENT AFTER SETTING.

MUCH attention is being devoted to the several failures of Portland cement concrete at Aberdeen, Maryport, and elsewhere, and the analyst has been busy on the subject. The London Engineer states that the presence of an excessive quantity of magnesia seems to be a chief cause of the expansion by absorption of water, and consequent failure of concrete work after more or less considerable lapse of time. Mr. Harrison Hayter mentioned several cases of failure in a discussion at the Institute of Civil Engineers last November. In one case a wall 35 feet in height had been listed two and a half inches, and in all cases a white substance of the consistency of cream was seen in the concrete. An analysis showed that it contained 80 per cent. of magnesia hydrate, consisting of about twothirds magnesian oxide and about one third water. Mr. Hayter recommends the use of cement of a lower tensile strength than is usual, and a chemical as well as a mechanical test. The action of magnesia has been long known. and more than about two per cent, considered a dangerous quantity, so that it seems curious if magnesia is the cause of the failures that an excessive quantity has been allowed to enter into the composition of recent cements. According to the English experiments on Portland cement, republished in a report of the committee of the American Society of Engineers, on compression of cements, etc., the expansion in a mixture of I cement and 3 sand, containing 2 per cent. of magnesia, was about one-twentieth of I per cent., and for a 5 per cent. mixture about 1/2 per cent. The matter is of the greatest importance, especially when we consider the possible effect of expansions of the kind on the foundations of large bridge piers; and although nothing yet indicates any general cause other than the presence of magnesia, we learn that some chemists are busy on the subject and will probably soon publish the results of their inquiries.

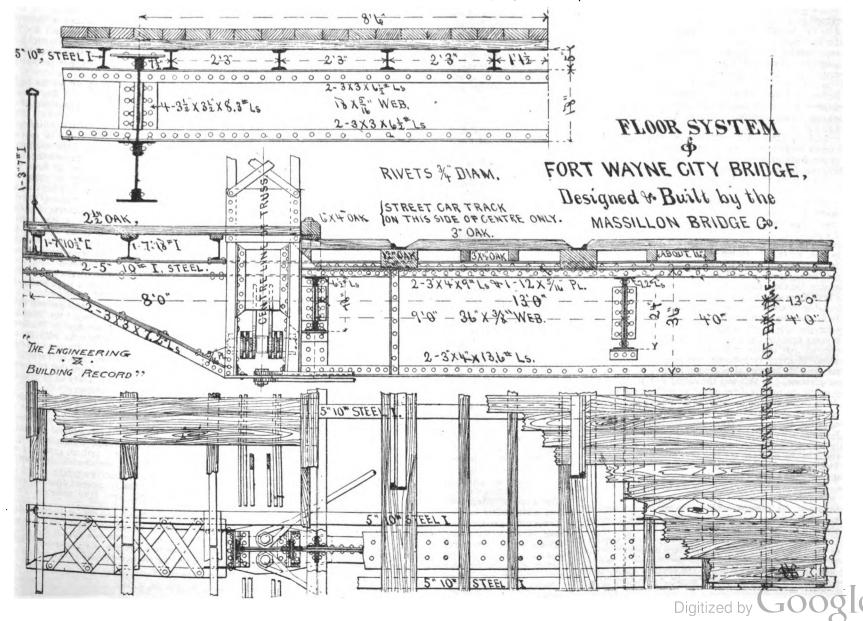

A BELGIAN syndicate is said to have obtained a concession from the Shah of Persia, and to be preparing plans to build a railroad from Teheran to the Holy City.

A METEORIC FURROW.

ON the 25th of October, 1887, about 9 P. M., a bright, white globular body, about half the size of the full moon, and leaving a long train of sparks, was visible in the sky at Tayninh, in Cochin China, for about thirty seconds, moving from west to east. Some days later a letter was received by the Governor of the Province from the Chief of the district of Treisin-Hoa, stating that at the abovementioned time, after considerable rain and thunder, an unknown animal had stopped there in his flight, ploughed up the ground for a distance stated, and disappeared in the sky.

On November 3, R. P. Boutier, an Apostolic missionary, and M. De Larmey, captain of marine artillery, visited the spot and found a vast hole about 32m. long, 6m. wide and 2m. deep, somewhat in the shape of an elongated pear, with two wings. The soil was very moist and thickly matted with roots and turf, and seemed on one side to have sustained great pressure. The ground was roughly torn, and towards the end the earth had been thrown a long distance. The furrow indicated the passage of the aerolite from west to east. The bottom of the furrow had a uniform unbroken surface, and no traces of a foreign body could be found in the vicinity. All the circumstances indicated that a meteor had just touched the earth and richochetted; a theory which is confirmed by MM. Besset and Benout, Secretary of the Arrondissement and artillery officer respectively, who observed it at points 5 kilometres apart, and heard two noises, a sharp report, followed by a rumbling sound, which artillerymen say is characteristic of a richochetting shot when it strikes and leaves the ground.

The Chronique Industrielle, from which this account is taken, states that upon these observations and the measurements of the furrow some very ingenious estimates have been founded, which give the aerolite a length of 32m., maximum diameter of 8m., volume of 579 cu. m., and weight of 2,895 tons; velocity of impact 2,000m. per second; angle of incidence, 10 degrees; velocity after deflection, nearly 2,000m, angle of deflection, 34 degrees; amplitude of ricochet, 1,040 kilometres, which would bring it to the middle of the China Sea.

NOTES ON THE POLLUTION OF STREAMS.*

THE proposition of permanently discharging the sewage of Chicago into the Desplaines and Illinois Rivers recently gave me an occasion to inquire somewhat closely into the existing facts concerning the supposed self-purifi-cation of polluted streams. Owing to circumstances this inquiry is not, and may not, for the present, be completed. While I therefore regret that I cannot give you a paper on the subject, I believe that a few data and some inferences may perhaps interest you at this time and perhaps be of some value, in view of the importance the subject is gaining in many parts of our country. The Ohio River Valley will soon require serious attention. Its numerous cities, some of them quite populous, discharge their sewage into some of them quite populous, discharge their sewage into and take their water supply from the same source. Typhoid fever is unusually prevalent in the valley. Likewise, the Schuylkill River furnishes a number of small cities and finally Philadelphia with water, after receiving above the and the wash-water drainage from 85,000 persons, Here also the death-rate from typhoid fever is high. And a large number of other streams are beginning to cause trouble from similar conditions, though perhaps of less magnitude than those mentioned.

Evidently, it is becoming a pressing question to know with greater certainty just how far we may safely carry this system of pollution or whether we must entirely abandon it. Much work will yet have to be done and many investigations will have to be made before the subject is cleared up, in a way that will allow of a treatment which is just to both those who must have drainage and to those who, residing further down on the samestream, must have

potable water

In discussing the question of water pollution and the setting up of a standard of purity, or of a minimum proportion of sewage, or perhaps of the necessity for its entire exclusion, a distinction must be drawn at the outset. The problem must be viewed very differently when the sewagepolluted water is to be used for potable purposes, or when, as often occurs, it is simply to be inoffensive, not destructive to fish, nor objectionable to manufacturing interests

and to the residents along its course.

With reference to the first case, we have a large number of observations, data, and opinions, yet withal they are insufficient to give a positive answer to the selection of a water-supply in every case. The engineer who is employed to advise on the selection is sometimes confronted with great difficulties from the want of reliable evidence regarding the real danger from pollucion. Is he to reject a pal-atable water and perhaps by far the most economical source of supply because 50 or 100 miles above another community discharges some sewage into it? Is he to be governed at all by the degree of dilution it has received and by the number of days or weeks since the polluted water has had a chance, during its flow, to convert the sewage matter into organic compounds? And is he to consider the agration of a stream as effecting the gradual destruction of disease germs in the same measure as it effects the destruction of the dead organic matter?

Before engineers can receive definite answers to these and other questions from the medical and allied professions, they must, in order to help their clients, continue to say as follows: We know, as for instance in the case of Plymouth, Pa., that clear and tasteless water from a mountain brook may cause an epidemic of typhoid fever by being used for drinking purposes within a few miles of the point where the dejects of a single patient entered the stream. We do not know the conditions under which the dangerous germs may be deprived of their vitality in a living stream. We, therefore, assume, for want of further evidence, that in water, previously polluted, but through dilution or other cause containining a minimum quantity of organic matter and a maximum of dissolved oxygen, the danger from the pathogenic germ gradually vanishes. And to be reasonably safe, we further assume that potable water must not only be of good quality chemically speaking, but that before being used it must have run in the stream for a considerable distance, depending upon circumstances, after it has been even slightly polluted by sewage matter, whether detectable by chemical analysis or not.

In an investigation of the projects for a new water-sup-ply for the city of Philadelphia, which was undertaken a few years ago, the chemical work was supplemented by a survey of 450 square miles of water-shed, showing the location of every farm-house, building, manufactory or other possible sources of pollution in their relation to the other possible sources of pollution in their relation to the water-courses. In this way the actual and possible pollution could be readily determined as well as the practical ways of preventing it in each case. Such surveys, which in a smaller way have often been undertaken, I consider invaluable to the discussion of water-supplies likely to suffer from sewage discharge, and the results should naturally have a far greater weight than those of the chemical analysis of the water at the foot of the drainage area.

The present researches in bacteriology will no doubt The present researches in bacteriology will no doubt soon throw an abundance of light on this question, and the engineer is anxiously awaiting the results, in order that he may solve the practical problems in the selection of a water-supply, if possible with a degree of certainty and safety approaching that which he secures when dealing solely with the laws of mechanics.

The second case I referred to concerns polluted water not to be used for notable purposes, perhaps because it is also

to be used for potable purposes, perhaps because it is alto-

gether impracticable to preserve a high standard of purity or because better sources for a domestic supply are available The Desplaines and Illinois Rivers, for instance, receive the sewage of Chicago and other towns, and no drinking-water is obtained from the same, except some at Peoria, 160 miles below the main sources of pollution. The Blackstone River in Massachusetts also serves as a sewer and will probably always continue to do so, and the Schuylkill River in Pennsylvania will, I believe, likewise have to be entirely abandoned to drain the cities and manufactories

There are a number of other streams in our country which will have to perform this duty, and if there are other and better sources for a city's supply, it cannot reasonably

be objected to on economical grounds.

The question then arises, how much sewage should be permitted in such a case? In other words, what is the proper standard of purity to satisfy the various interests?

This is the subject on which I endeavored to get some light in the Chicago investigations, but, as I said, the data are not complete.

The first point to settle is a proper measure for the permissible pollution. This is best assumed as being the quantity of water which can safely receive the drainage from a unit of population; in other words, the least number of cubic feet of water per minute which should flow down the stream for, say, every 1,000 persons draining into the same.

By using this measure we eliminate the difficulties arising from a varying quantity of water consumption and dilution of sewage before reaching the stream. In England the quantity of sewage ranges from 30 to 60 gallons per head; in America from 50 to 150 gallons per head. But the quantity of refuse per inhabitant does not vary much. Where factories discharge considerable waste matter of a particular kind, or where large slaughtering establishments drain into the rivers, some additional allowance for them may be required, but otherwise the amount of waste matter per inhabitant will be pretty constant, and therefore convenient as a measure.

The problem then is, how much running water must we have to dilute the sewage from every 1,000 persons in or-der to make it inoffensive, not objectionable to manufac-

turing interests, nor destructive to fish?

The standard for inoffensiveness must of necessity be one of personal judgment, and can only be approximate. The admissible sewage pollution of water used for manufacturing purposes depends on the particular industry, some mills requiring a much higher standard than others, and, unless in any particular case the nature of the industry is a governing element, we are again obliged to resort to personal judgment as to what is a fairly clean water for average cases. A standard of pollution which, thirdly, will prevent the destruction of fish depends on the particular species which it is desired to retain. Yet, as we find fish living in sewage polluted water, which is sufficiently diluted to answer the first and second requirements, we can usually ignore this one, except in occasional instances, where it assumes special importance, and where special experiments will become necessary.

There are three ways in which we may get a solution of the problem from this point of view. In the first place we can obtain a sample of the average sewage per inhabitant from a sewer and mix it with enough water to make it what is believed would be unobjectionable, and thus determine the dilution. This method can be applied in small towns; not so well in large cities where the sewage varies in different sections owing to different classes of population and manufactories.

In the second place we can observe the gradual increasing pollution of a water-course caused by the successive discharge of a number of sewers, and, after determining the point at which we find the condition of the river to have become objectionable, either to the senses or for use, we can measure the flow and find the population which

we can measure the flow and find the population which has drained into it at this point.

It is usually difficult to get a satisfactory answer in this way, owing to the imperfect mixture of the sewage with the river water until it has run a long distance. It was intended, however, to make some observations in this man Chicago, where the river serves as the main outfall sewer for the city, with the hope of fair results, notwith-standing the additional difficulties there encountered, due to the frequent stirring up of the sludge by the tugs and vessels. But, owing to want of funds, this, as well as other inquiries, has not been undertaken.

The third way in which we can throw light on the question is to observe the gradual so called self-purification of polluted streams. On this subject, taking a little broader iew than required for the above special purpose, I have

the following notes to present:

It has been asserted in England by Drs. Miller, Odling and Letheby that organic matter of sewage is rapidly oxidized during the flow of a river into which it is discharged, and that if the dilution is at least twenty times, the sew-age* will not only be made inoffensive, but be ut-terly destroyed within a "dozen miles or so." But the Rivers Pollation Commission of Great Britain, in 1878,‡ after a careful direct investigation, prove that this assump-tion is altogether wrong as far as the rapidity of oxidation is concerned, and state that there is no river in England long enough to allow of a complete disappearance of sew-age-matter discharged into it.

The main causes of the apparent disappearance of such matter are dilution, subsidence, and oxidation. Let us consider them for a moment.

sewage. + Report, Vol. VI.

When sewage is discharged into a comparatively large volume of water it becomes dispersed throughout the and lost to sight and even to chemical tests if the dilution great enough.*

The measure of relative dilution can usually be ascer. tained by the mineral salts in solution, and, particularly, by the chlorine in common salt conveyed to the stream by the sewage, because they are not liable to undergo any change which would cause their disappearance.

Subsidence of the heavier organic and mineral matters is sewage has a marked influence in clarifying a polluted It is observed immediately below outfall sewers and is caused by a reduction in the velocity of the sewage after emerging from them, which permits the suspended particles to deposit. This deposit or sludge continues to undergo decomposition until the matter is reduced to its inorganic components. During floods the increased velocity of the water stirs them up, mingles them with the earthy matter generally suspended in flood waters and allows them to be again deposited at another place lower down the river, usually in a less objectionable condition than before Factory refuse often contains chemical agents such as lime, alum, and metallic salts which precipitate much of the sewage matter and thus tend to increase the amount Metallic oxides unite with the sulpheretted hydrogen of decomposing sewage and form insoluble compounds and harmless deposits.

Oxidation and total destruction of sewage matter by de-

composition was for a long time thought to be the main cause for the clarification of polluted rivers. To-day it is known to be but a minor cause compared with dilution and subsidence, and if the sewage is discharged in a fresh condition into a stream of water its destruction is in par. due to fish and other aquatic animals. Some of the refuse from stockyards is disposed of no doubt in this way. Most of the sewage, however, is decomposed or oxidized, as it is usually termed, by the myriads of microscopic plants, microbes, or bacteria contained in both air and water. which at once seize upon the dead organic matter. It is true that chemical changes, not caused by life, assist in converting the organic matter into simpler compounds,

but their effect is comparatively insignificant.

The English River Pollution Commissioners state that sewage oxidation is more active in sunshine than in shade. and is almost arrested at night and when the thermomete approaches the freezing point, showing its dependence on the condition favorable to the lower orders of life. Since then it has been quite conclusively proven that the question of sewage oxidation in a polluted stream or even in the soil of sewage farms, is practically one of a sufficiency of micro-organisms and of air and other conditions that

sustain their life.

Dr. Dupré‡ sterilized sewage and kept it for weeks without the slightest change. By adding a little non-sterilized sewage decomposition at once began. Mr. Warrington has found similar evidence. Dr. Emmich & has shown that sterilized sewage continuously aerated by sterilized air did not oxidize perceptibly nor purify itself

If the aeration of rivers can be kept up to the highest practicable point, it would on a summer day offer the most favorable conditions for a disappearance of the organic matter.

Applying these facts, we can say that for purifying the sewage discharged into a river oxidation can be depended upon only to a limited extent, because of the comparative slowness with which it takes place. Subsidence of the heavier matter tends to clarify it before it flows many miles; dilution with a sufficient quantity of clean water prevents an offensiveness almost at once; but oxidation equires many days under continuous aeration of the river

Therefore, by examining actual purification of polluted streams and realizing that oxidation is a comparatively small factor, we are furnished with some evidence as to the proper dilution of sewage in the case under consideration, which cannot be far wrong, and may serve a useful purpose until more information is obtained.

The data which are now available are not many, because opportunities to establish the same on a large scale, which alone is of practical value, have seldom offered.

In our country instances are the Desplaines and Illinois Rivers, receiving the sewage of Chicago; the Blackstone River in Massachusetts with the sewage of Worcester; and the Merrimac River in Massachusetts with the sewage of Lowell and Lawrence. In Europe the most instructive case is the River Seine below Pari time when it received all the sewage from that city Paris, at the rivers are the Irwell, Mersey, and Darwen in England, and the Oder, Isar, and Elbe in Germany.

It would be tedious to descrize to you in detail the changes taking place in each case, and I will confine myself to some general remarks. Profiles were platted of some of these streams, showing their general descent, 10 indicate their relative facilities for oxidation, also the average dry weather flow at all points, gradually augmented by the affluents. The results of the chemical analyses were platted at the respective points.

It was clearly shown how the increased dilution lowered the percentages of albuminoid and free ammonia almost

& Chem. Central Blatt, 1885, P. 333. igitized by

^{*} Read at the Annual Meeting of the American Public Health Association, at Memphis, November 10, 1887, by Rudolph Hering,

See Report Philadelphia Water Department, 1888.

^{*} English sewage is from 2 to 3 times less dilute than American

^{*} According to Dr. Konig (" Pollution of Water-Courses." Berlin 1887) the minimum quantity of organic matter which can be detected by chemical means is 1 milligram in a dilution of 1:1,000,000; of ammonia 0.05 milligram in a dilution of t: 20,000,000. Chloring can be detected as o. 1 milligram in a dilution of 1: 10,000,000.

⁺ Sixth Report, 1879. p. 176.

^{\$} Proc. Inst. C. E., Vol. 88, p. 215.

in exact proportion to the increase of dilution, and that the

in exact proportion to the increase of cliution, and that the apparent purification, which was often supposed to be due to oxidation, was due mostly to greater dilution.

The sewage of Chicago, mixed in a proportion of about one of sewage to four of lake water, or of 60 cubic feet per minute per 1,000 persons, is pumped into a canal and flows, without further increased dilution, for nearly thirty the incompany hours, and its condition, which is flows, without further increased dilution, for nearly thirty miles in about as many hours, and its condition, which is quite offensive, is not changed very much. Then it descends over several dams, mingles with the water of Desplaines River, and within a few miles it is visibly improved. When, forty-five miles below Chicago, it unites with the water of the Kankakee and forms the Illinois River, the water causes a dilution twice as great as that in the canal, and the river loses its offensiveness during the the canal, and the river loses its offensiveness during the greater part of the year. At Peoria, 158 miles below Chicago, the sewage has a dilution of nearly three times Chicago, the sewage has a dilution of nearly three times that in the canal, and, except when ice has covered the stream for some time, no odor can be detected, and the water is even partly used for the city's supply. Here there is a flow of 170 cubic feet per minute for every 1,000 ersons draining into it.

persons draining into it.

Owing to the fact that the velocity in the canal is greater than that in the rivers at its two ends, deposits are formed in the Chicago River before entering the canal, and again in the Desplaines River after leaving it.

I will say that the analyses upon which these deductions are based were made under the direction of Dr. John Rauch, Secretary of the State Board of Health of Illinois, and that the conclusion that in winter t80 cubic feet of water per minute per 1,000 persons draining at Chicago would be sufficient to prevent objectionable conditions all search the river, is originally his. along the river, is originally his.

The Blackstone River, in Massachusetts, which is quite foul below Worcester and receives much additional sewage on its way, becomes unobjectionable at ordinary times for all but potable purposes, about 15 miles below the city,* with a dilution at the rate of 140 cubic feet per 1,000 persons draining into it, together with considerable manufacturing refuse, and after there has been a chance for complete subsidence and some oxidation due to a large number of dame. ber of dams.

In Paris the sewage of nearly 2,000,000 people was turned into the River Seine before the irrigation fields were turned into the River Seine before the irrigation helds were put in operation. The organic matter in this sewage per inhabitant is, from the analysis, hardly one-half that of our sewage, because excrementitious matter was almost wholly excluded from the sewers. The dilution which rendered the polluted river entirely inoffensive in summer was 60 cubic feet per 1,000 people after a flow of 14 miles and after subsidence of the suspended matter had taken

If we reduce the recommendations of Dr. Miller and others for England as mentioned above, to our measures, we find that they believe a dilution of say 120 cubic feet of water per minute for 1,000 persons to be sufficient to guard against offensiveness. But this recommendation probably

against offensiveness. But this recommendation probably applies to small cities not devoted to manufacturing. By comparing these results and also those of the other rivers mentioned we can observe much similarity and consistency, and, for the present, we may draw the following inference: Rivers not to be used for water-supplies, but to be inoffensive to communities residing a few miles below to remain for for ordinary manufacturing purposes. low, to remain fit for ordinary manufacturing purposes, and to sustain the life of fish may receive the sewage from 1,000 persons for at least every 150 to 200 cubic feet of minimum flow per minute, supposing that natural sub-sidence of the heavier matter takes place immediately below

the town discharging the sewage.

Where for some reasons it is necessary to dilute it at once so that it is quite inoffensive before subsidence, which cases are rare, a somewhat greater dilution may be required. Inasmuch as the flow governing the minimum dilution occurs in summer no attention need usually be paid to the larger dilutions required in winter, because the natural flow of the water is much greater at such time.

Beyond the above limit it appears to be advisable when Beyond the above limit it appears to be advisable when arranging for a sewage disposal to resort to its purification at once by land or other filtration, or by chemical precipitation, in order to prevent the river-water from becoming objectionable to others. It is to be hoped, however, that more investigations will be made on this subject so that the limits which sometimes may be very important from the limits, which sometimes may be very important from an engineering and financial point of view, can be more

While the above figures may be a useful guide in many instances, yet they are but empirical formulæ, to be used only by those who thoroughly understand the subject, and to be applied only in cases similar to those from which they were deduced.

CAR-HEATING BY HOT AIR.

H. ASHMEAD, Civil Engineer of the Allegheny Valley Railroad Company, is said to have patented a device for warming trains by indirect radiation from a steam coil attached to the locomotive from which the hot air is forced through suitable ducts to the different cars. With this arrangement all danger, even of being too warm, is avoided.

THE PROPOSED NATIONAL BUREAU OF HAR-BORS AND WATERWAYS.

In response to our invitation for an expression of views, we have received the following additional letters for publication .

> DEPARTMENT OF PUBLIC WORKS, COMMISSIONER'S OFFICE, 31 CHAMBERS ST., NEW YORK, March 6, 1888.

SIR: I received your letter of the 15th ult. in regard to a bill for a "National Bureau for Harbors and Rivers." I have been a good deal indisposed since the date of the receipt of your letter, and when I was at the office there was an increased pressure of work which has delayed my reply.

I have not read the bill you speak of, but, without reading it, I think I can make a few practical suggestions.

In the first place, as regards a "National Bureau for Rivers and Harbors," that the Government already has. The Bureau of Engineers in Washington has been in charge of that business since the Government has undertaken the task of the improvement of rivers and harbors. If any improvements are necessary it seems to me that these could be easily grafted upon an institution already existing. If it should be attempted to found a new bureau, of necessity it would be composed of a large body of engineers to be educated in duties which are new to most of the profession, and a necessity of throwing aside and neglecting the experience and information already possessed by the Corps of Engineers.

It would be found that it would take a long time and a costly experience founded on repeated mistakes before the new bureau would be efficiently managed.

These are the ideas that occur to me as almost selfevident, and within the observation of any one who will give the subject a little consideration.

Respectfully yours,

JOHN NEWTON, Commissioner of Public Works.

CHICAGO, ILL., March 5, 1888.

SIR: I have seen few points in the criticism thus far that will not answer themselves by a close study of the bill. Several suggestions have been made publicly and by correspondents with a view to making its provisions clearer. Most of them, however, pertain to rules and regulations, and come within the province of the details which these are intended to cover.

The principal difference of opinion seems to be in regard to the matter of promotions. The bill aims to take middle ground between a military and civil system, as at present practicable. Whatever the final result of all the discussion indicates as wise and adapted to a large organization will be advocated by this board.

The report of the Executive Board of the Council of Engineering Societies on National Public Works will, I think, clear up the matter and justify the purposes for which the bill was drawn.

I am surprised that men should say that the number of the personnel and the cost thereof will be increased. In the comparison by Major Ernst the cost of the supervisory force only is given, while in the bill is included the technical working force as well. The total numbers less than have been employed on some river and harbor bills.

L. E. COOLEY. Yours very respectfully,

NEW YORK, March 7, 1888.

SIR: I have read Senator Cullom's bill in reference to the establishment of a National Bureau of Harbors and Waterways, but I do not see that much would be gained by it either for the service or for civilian engineers, for the proposed organization is too much in the form of a closed corporation to admit of much vitality and progress, excepting through the inherent spirit and ambition of the members which would compose it, and it soon would be the old organization under a new name.

The spirit of the institutions of the country is against the establishment of elaborate Government bureaus which would naturally drift in political channels if taken out of the hands of the military or naval departments. I would rather see the establishment of a National Bureau of Public Works as part of the Interior Department, and including in its scope all national engineering works, excepting those of a purely military or naval character, but deting those of a purely military or naval character, but determining only on the necessary works and on specifications as to the results intended to be accomplished and then letting private competition and enterprise turnish the plans and the execution.

Respectfully. ALBERT LUCIUS.

University of Pennsylvania PHILADELPHIA, March 2, 1888.

SIR: In compliance with your request to have me express my opinion upon the provisions of the bill now pending in Congress, proposing to reorganize the public civil works, I beg leave to represent that I believe all parties are agreed as to the desirability of a change. Whatever differences of opinion exist are based upon the manner in which it may be brought about.

As I have already expressed myself rather fully upon the subject of a reorganization, and as the provisions of the present bill embody many of the ideas so generally entertained and accepted, I cannot do better than to refer to my article published in Lippincoit's Magazine for October, 1837, showing the incongruity of the present system, pointing out some of its prominent defects and suggesting certain remedies.

In comparing these requirements thus suggested with the bill in question it will be seen that provision is made for some, but not all, of the important elements. The notable omissions are for ridding the corps of worthless timber and for creating emulation. The first defect may be supplied by the rules and regulations intended to be formulated by the Commission, but the second is not so readily adjusted. The corps will consist of over 600 members and promotion above a low grade is by seniority. Thus each man must pass along single file and, after once falling into line, there is no use in being in a hurry, for those ahead will have the choice of seats. But the line is so long that the chances are that in an ordinary lifetime the "cadet" will not pass the rank and pay of an "assistant." What inducement, then, for an energetic man to enter the service? In the present Corps of U.S. Engineers it has required about fifteen years to reach the grade of captain, and about twenty-one years to reach that of major, under very favorable conditions, but if the number beincreased tenfold the prospects for a living compensation are poor indeed. My opinion on this point is that promotion should be based upon relative ability and not upon a military succession.

In all development there must be at times a temporary derangement incidental to the introduction of new and enlarged working parts of the system, and it would be evidence of depreciation if such conditions did not exist at times in our body politic. Hence I am not of those who see only disaster in any modification of the existing regime, nor, concerning the personnel, do I think that it would be a change merely from the experience of years of service to the ignorance of amateurs. The men to whom the door would be opened are also tried and experienced in these very works, many of which have been designed by them in the capacity of civil assistants, and I believe that unless the Government will establish a special technical school for the education of men having charge of her extensive public civil works, as is done in foreign countries, that she must make it possible for the graduate of the many excellent scientific schools and universities of this country to enter her service, with the expectation of remaining in it during life. As an alumnus of the Class of '67 of the U. S. Military Academy, and as an instructor in a civil institution for over fifteen years, I would say that it is not possible to arrange a curriculum which shall in four years take a youth of average intelligence from the ordinary walks of life and properly prepare him for the rigid and high attainments of both the civil and military professions.

There is another element for which provision should be made in the bill, and that is the financial or administrative duties of the corps. These do not belong to engineering, and should be kept separate therefrom to avoid, as now, the serious encroachments upon the officer's time to the detriment of his work. Much more effective results will be obtained by permitting him to save by judicious designing and expenditure than by requiring him to employ some one else for this purpose, whilst he examines details of accounts "in triplicate" (?) to see that they are all straight." This would involve an accounting bureau similar to that of every large establishment or corporation-More might be said, but I forbear.

Very respectfully yours, LEWIS M. HAUPT.

A PROPOSED SOUTH AFRICAN RAILROAD.

It is reported from Natal, South Africa, that the Council there is considering the advisability of ceding a portion of its revenue from customs to any inland State which will carry forward the Natal Railroad from the border.

Digitized by GOGIC

This was the case at the time the analyses were made, some 12

MOVING THE HOTEL BRIGHTON.

It is said that south of the Coney Island shore a bar is being formed, westwardly, at the rate of about 700 feet a year, and that in consequence the shore just beyond its head is being greatly invaded by the waves; be this as it may, the sea is rapidly encroaching on Brighton Beach, and the high-water line has advanced so far inland as to cut into nearly equal parts the ground occupied by the Brighton Beach Hotel, and necessitate prompt measures for its security.

The hotel is an irregular wooden structure, covering a space, inclusive of the wide piazzas and projecting rear wings, of about 70.000 square feet, with 460 feet front and over 200 feet maximum depth. The main part of the structure has a sea front of about 420 feet and depth of 60 feet, exclusive of piazzas, and is three stories in height, besides basement and attic, with four towers each one story higher.

The hotel is supported on wooden columns, about 20 feet apart each way, carried up through the basement to the transverse girders under the first floor; the columns stand on small brick piers built on timbers bedded in the sand.

The ground is a fine, compact white sand, nearly level behind the hotel, but sloping from a height of about 6 feet below the first floor at the rear of the building to 18 feet at the front line, although before the recent washout it must have been much more nearly level.

A thin face wall of brick enclosed the basement and formed an apparent support for the building, but in reality carried no weight except that of the piazza. The sea has torn down all the front and much of the sides of this wall, and attacked the column piers, causing irregular settlements of as much as ten inches in some places, destroying plaster and decorations in the upper stories and doing other damage.

It was determined to move the whole building and its wings, extensions, etc., bodily 595 feet straight back from the sea and there re-establish it on piles sunk in groups of three each, to a depth of 15 feet in the sand and capped with IOX12 inch transverse stringers on which will be placed the original columns, supporting the building as at first.

In preparing for the move extra sills have been placed where requisite under the wing walls and openings made in the rear walls to admit 24 lines of standard gauge railroad track which have been placed close alongside the transverse rows of columns. The seaward ends of the tracks are carried on stringers supported by 1,200 piles set 8 feet deep in the sand, and having an aggregate transverse area 50 per cent. greater than that of the pier foundations under the old columns. These piles have been sunk entirely by the use of a 1½-inch jet of water at 60 pounds pressure, washing the sand from beneath the pile as it is lowered. Those for the new foundations will be similarly managed.

Continuous lines of flat cars, extending from front to rear of the hotel, are run under it on each of the twenty-four tracks, and carry, close to every longitudinal row of columns and on each side of them 12x24-inch longitudinal stringers, 21 and 42 feet long, resting transversely in two and three cars respectively, and breaking joints. It will, of course, be understood that the long way of the hotel is parallel to the beach, and that the tracks are at right angles therewith, so that the stringers longitudinal to the hotel span two or three tracks each.

The transverse girders of the building hvae joints on top of every column. Every section of the transverse girders is shored up at the ends by vertical posts set on hydraulic jacks, which are pumped until all the weight is removed from the old columns. These are then removed, and the jacks slightly depressed until the transverse girders rest on the longitudinal stringers, and are supported through them by the cars. As soon as the entire building is thus loaded on the cars, it is proposed to plant twelve anchorages at suitable distances in the direction of removal, and attach triple-sheaved sets of blocks and tackle to them, and the front cars on alternate tracks. The hauling lines will be led in symmetrical pairs to two locomotives, which will be placed on the eleventh and fourteenth track, and each reinforced by three other locomotives coupled in front. These are expected to pull evenly and unitedly, and easily move the 3,600-ton buildlng without racking, cramping, or injuring it further than to crack the plastering, which is already nearly destroyed.

The flat cars are not braced nor secured to the building in any way, except by the imposed weight. A rope will be stretched across the 24 tracks as near the front of the cars as possible, and fastened to each train.

The raising, moving and placing on new foundations is done by Contractors B. C. Miller & Son, of Brooklyn, N. Y., and the remainder of the work by the Brooklyn, Flatbush and Coney Island Railroad Company, who own the property, and whose superintendent, Mr. J. L. Morrow, is the engineer in charge of the work, assisted at the site by Architect W. J. Farquhar and his principal assistant, Theodore Melius.

Nearly 100 men are now employed, and one 90-ton and four 60-ton hydraulic jacks are in use, and about 120 flat cars are required. Mr. Farquhar estimates the approximate total expenses, inclusive of grading, repairing and redecorating, together with some new buildings and improvements, at \$100,000.

THE HIGHLAND BRIDGE.

WHEN the construction of the Poughkeepsie Bridge was commenced a good deal was said about a bridge to cross the river near Peekskill, but the former was vigorously pushed on while the latter was not heard from. Within a short time, however, it has been announced that the scheme has been revived, the matter put in definite shape, the engineers sent out to survey the site and stake out the work. The scheme was first brought up nearly twenly vears ago by General E. W. Serrell, who is acting as engineer for the new company. The bridge, which is known as the Highland Bridge, will cross the Hudson with a single span of 1,680 feet from Anthony's Nose to Fort Clinton, just above Peekskill, the river at this point being sufficiently narrow to permit of a suspension bridge spanning from shore to shore, while the topography of the country is of such character as to obviate the necessity of long shore spans or trestle approaches. The whole length of the bridge will be about 2,500 feet, from the water to the rails 195 feet, and to the top of the towers 320 feet. It is not decided whether wire cables or link and pin suspension chains will be used. The construction is estimated to occupy two years. The towers will be of steel. There will be a double-track railroad and a 17 foot roadway. In general appearance it will somewhat resemble the great New York and Brooklyn Bridge. The direct railroad communication will be with the New York, Lake Erie and Western Railroad on the west, and the New York and Northern on the east, the latter giving access to the elevated railroads of New York. There will also be connections with the important roads of New England, and on the west side of the river.

A FIRE-PROOF THEATRE CURTAIN.

In a letter to the Royal Institute of British Architects Mr. W. Heath thus describes a fire-proof theatre curtain of his invention:

"Below the stage (or the mezzanine floor, where an orchestra door exists) a curtain of very strong but absorbent material, preferably asbestos cloth quilted on strong canwas, is rolled on a roller over a narrow tank of water, the width of the roller, and in unrolling it passes under another roller at the bottom of this tank, thus rising perfectly saturated. Its upper edge is laced to a light iron girder extending 30 inches on each side beyond the proscenium opening. At each end of this girder flat iron chains pass upwards and over pulley-wheels of large diameter, their extremities terminating in a counter-balance weight slightly in excess of the weight of the curtain and girder, and this is the only motive power. The curtain is wound around the roller by simple winch and gearing, thus raising the counter-balance weight, which, if possible, is placed outside the building. Where this cannot be done it is placed in a corner and cased in. A simple catch retains the curtain in its position below the stage. The instant this catch is released, either by hand or automatically, the counter-weight descends, and the curtain rises thoroughly saturated with water. As soon as the girder reaches the top of the proscenium opening it engages two cams which are attached to the upper ends of two strong iron flanges, which immediately close on the curtain and grip it tightly against the back of the proscenium wall, entirely excluding smoke and flame. At the same time an equilibrium-valve is opened, by contact with the girder, and water admitted to the horizontal perforated main over the top of the curtain, thus interposing a wall of water between it and the fire.

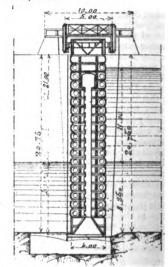

"As it would not be possible, without great expense, to test this against fire in an actual theatre, a model of the stage of a theatre, about nine feet in height by seven in width, has been constructed of strong iron plate on three sides, and the fourth (being the proscenium opening) is inclosed by the curtain. The stage is one-eighth the size of Drury Lane Theatre's, and the contents are 100 cubic feet. It has been filled with fuel, and a fire of great intensity has been maintained for more than an hour. The iron structure has become red-hot and distorted, while the curtain remained uninjured."

PROPOSED LOCKS FOR THE PANAMA CANAL

M. DE NANSOUTY describes in Le Genie Civil the essential points of the mechanism designed and contracted for by M. Eiffel to operate the great locks necessitated by the high-level modification of the Panama Canal.

As we have previously explained, this lock system is represented as merely a temporary device to permit a speedier utilization of the canal while the higher portions are being dredged to sea level.

There are to be two locks of 8m. (26.25 feet) rise and two of 11m. (36.09 feet) rise on the Atlantic side, and one of 8m. and three of 11m. rise on the Pacific side, each having an effective length of 18om. (590.58 feet) and gates 18m. (59.06 feet) wide.

TRANSVERSE SECTION AT GATE
FIG. 3

The ordinary double-leaved revolving lock-gates, introduced by Leonard de Ninci and now constructed at the Liverpool Channel Docks up to 40 feet in height, are wholly impracticable here, where they would fail both in durability and requisite ease and rapidity of action, which must indeed be almost continuous.

Long flights of low locks are far too tedious. The patent system of M. Knipple has therefore been adopted. It is especially adapted for dry docks and similar basins whose gates require to be rapidly opened and closed, and has been used since 1874 at the dock at New Gravel Greenock, and in docks at Montevideo and in English Columbia. It is essentially a floating rectangular metallic

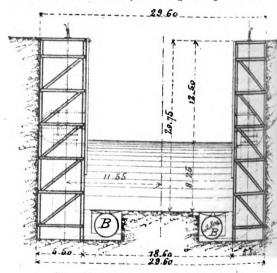

FIG. 4. SECTION ON A-B
PANAMA CANAL

caisson that recedes into a recess perpendicular to the side wall of the dock. It is divided into two water-tight chambers by a horizontal partition near the lower water-level. The lower chamber contains sufficient air to nearly buoy up the weight, and valves admit or discharge water from the upper part so as to regulate the equilibrium. This caisson slides on the bottom and is guided at the upper part.

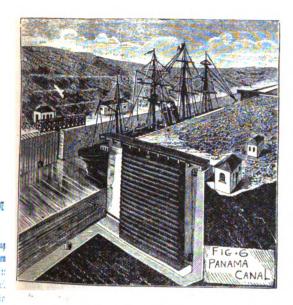

The Panama system as modified and projected by MM. Eiffel and Ph. Bunare-Varilla is as follows:

The caissons are carried by trucks rolling on a track that is supported over the recess or side pocket by a fixed

Digitized by GOGIC

iron frame of transverse girders and bracing, and over the opening of the lock by a counterweighted iron swing-bridge 5.5m. (18.05 feet) wide, with arms 23.8m. (78.09 feet) and 10.4m. (34.12 feet) long. After the caisson has been drawn into its recess the bridge is swung through 90° into a position on the canal bank parallel to its axis, leaving the opening clear for the passage of vessels.

The gates or movable caissons will be rectangular boxes stiffened by internal horizontal girders Im. (3.28 feet) apart vertically, and will be divided into a lower working chamber and nine upper chambers by horizontal and vertical partitions. Each chamber will have valves and connected into for filling it with water or compressed air at will, and the lower or working chamber will be arranged to libe utilized for a pneumatic caisson for laying the foundation of the pivot pier of the swinging bridge. Each caisson will be hung from the track above by links that will permit some vertical movement and some tranverse play on the rails.

For an IIm. lock the tail gate will be 21.6m. (70.87 feet) long, 4m. (13.12 feet) wide, and 21m. (68.90 feet) high, and the head gate 21.6m. long, 3m. (9.84 feet) wide, and Iom. (32.81 feet) high; for an 8m. lock the height only of the gates will vary.

The clear opening will be 18.6m. (61 feet) wide at bottom and 20.6m. (67.58 feet) wide at top.

The locks will be cut in solid rock, which, with a slight sheathing for a fender-guard, will form the side wall. The side walls immediately below the gates will be made with iron frames filled with concrete and faced with cast iron. The dimensions of this portion will vary with the size of the lock. For an IIm. (36.I feet) lock they will be 30m. (98.4 feet) long, 24.25m. (79.6 feet) high, and 5.5m. (18.05 feet) thick.

The chambers for receiving the gates when opened will be 7m. (22.96 feet) wide and 30m. (98.4 feet) long, covered by a permanent floor.

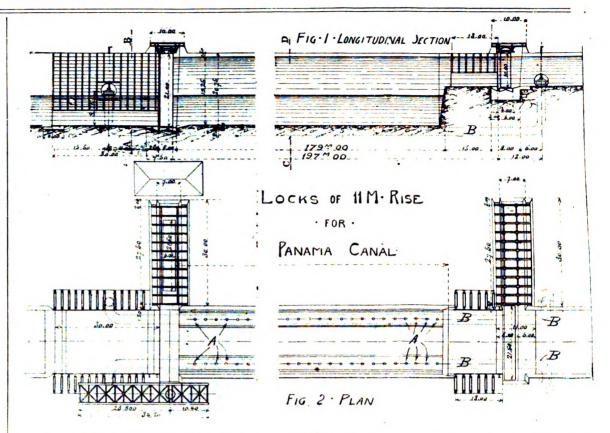

The gates and swing-bridge will be moved by chains leading to drums driven by turbines, using water from the head-level. Hand-gear will also be provided for emergencies.

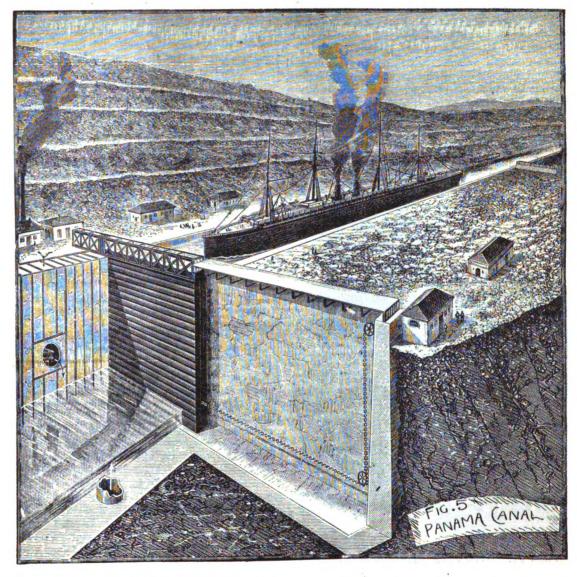

The reception or discharge of 40,000 cu. m. (1,412,420 cubic feet) of water in fifteen minutes is to be accomplished without violent currents by a system of longitudinal pipes (B B, Figs. I and 2), one each side of the lock, which will have holes (A A, Figs. I and 2) 0.4m. (1.31 feet) in diameter and 2m. (6.56 feet) apart to discharge or receive the water. The longitudinal pipes are 2.8m (6.82 feet) diameter and extend 15m. (49.2 feet) above and 12m. (39.4 feet) below the lock, where each terminates in a vertical section 9.75m. (32 feet) high, and provided with a valve at the top set in a chamber in the iron-faced portion of the canal wall.

The construction of this system of locks will require about 15,000 tons of wrought and 20,000 tons of cast iron, and it is specified in the contract that French materials must be used.

THE MEXICAN INTERNATIONAL RAILROAD.

A DESPATCH to the New York Times from the city of Mexico states that the International Railway was opened for business March 1. It runs through rich mineral and agricultural country from Piedras Negras, opposite Eagle

Pass, Texas, to Torreon, on the line of the Mexican Central Railway. It was built by C. P. Huntington and associates without a dollar of subsidy from the Mexican Government. It is practically part of the Southern Pacific system. It is a substantially-built broad-gauge road, and is equipped with Pullman buffet cars.

Only one change of cars is necessary between the city of Mexico and New Orleans or Washington or New York or other American cities. The road shortens the time to the United States by 24 hours, and reduces the distance to New York or Washington 553 miles. The road passes through the coal deposits in north-western Mexico acquired by Mr. Huntington some years ago,

A PROPOSED INTER-LAKE CANAL.

A DISPATCH to the New York Times states that New York and Minneapolis capitalists propose to construct a canal connecting the head of Big Bay De Noc, in Lake Michigan, with South Bay, in Lake Superior. The distance is forty miles, and it will save about 300 miles by water. The estimated cost of the canal is \$5,000,000, and competent engineers are said to have pronounced the project perfectly feasible. It seems probable that work will be begun as soon as the necessary capital can be secured.

March 3	24.53	19.57	20.95	29:75	28 21	22.38	28.91

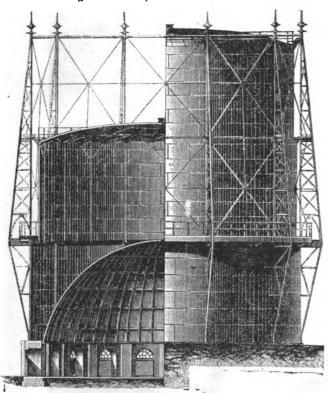

SPEAKING of the half-yearly meeting of the South Metropolitan Gas Co., held on the 22d inst., Mr. George Livesey, the Chairman. expressed regret that the amalgamation scheme proposed to the Gas-Light and Coke Co. had not been carried out, and gave his opinion that under such an amalgamation the price of gas over London would be reduced to 2s. 5d. (58c.) per 1,000 cubic feet. He strongly objected to the continuance of the coal dues, and said that their abolition would at once reduce the price of gas 1d. (2c.) per 1,000. The company obtained 7s. 1d. (\$1.78) per ton for their residual products last year, as against 6s. 3d. (\$1.50) the previous.

AN ABOVE-GROUND GAS-HOLDER.

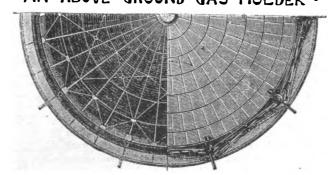

A GAS-HOLDER, constructed by M. A. Klonne for structures where foundations must be shallow and the soil is not compact, is thus described in the *Revue Industrielle*.

The tank is hemispherical in the bottom, and is supported on a solid structure of double T-iron. The holder is made with heavy channel or angle iron curbs at top and bottom, with vertical stiffeners of the same. The holder is guided between ten latticed radial columns of double T-section by automatically-adjustable rollers.

The columns are connected by two strong polygonal horizontal systems of channel-iron braces, with vertical, horizontal, and diagonal ties of round iron, and are further stiffened by a heavy gallery around the top of the tank. The figure represents a gasometer of 65.61 feet diameter and 78.74 feet lift, with a capacity of 266,000 cubic feet. A single section may be first built, as shown in the vertical

· AN ABOVE-GROUND GAS HOLDER

section, and a telescopic section added when necessary, as shown in the partial elevation.

The advantages claimed for the hemispherical tank bottom are: ready access to all parts, the easy detection and stoppage of any leak, the smaller quantity of water required, and consequent diminished pressure on the bottom, rapidity of filling and emptying the tank, large decrease of load on the foundations and underlying soil, and advantage of space gained under the concavity which makes a desirable storehouse.

Some of these claims are valid, but it looks as if the gain of diminished total weight was largely counterbalanced by the concentration of the whole load on the outer wall and its foundation and that the construction of this hemispherical surface, and its special foundations would be very much more costly than the usual arrangement and only defensible in special and exceptional circumstances.

IS ELECTRIC WELDING RELIABLE? LYNN, February 9, 1888.

SIR: My attention has been called to a brief notice in a late number of your journal, under the caption "Is Electric Welding Reliable?" the tendency of which is toward doubt in relation to the strength of electrically welded joints; and whilst I think the criticisms made on the results of the action of the electric arc, which has been used in St. Petersburg and Paris for a so-called electric welding, but which is more truly an electric burning together of the metals, may be and probably are correct, yet I can say most positively that in relation to the results of the electric welding process devised by me, and in which the current heats the metal without the intervention of the arc or a flame, experiments have shown that the results obtained in iron and steel are much superior to ordinary blacksmith work, and that butt welds by my process are stronger than the regular lap welds of the blacksmith.

The heating of the pieces of metal under perfect control can be kept within any desired limits, or maintained at that temperature which will weld without burning the material, and as a consequence of this, my process is applicable to the welding of most of the metals.

In the arc method a temperature far beyond the softening or melting temperature is unavoidably present. Some metals undergo a partial volatilization, the tendency of this being to boil out the occluded gases and to make the metal spongy, while by my method a temperature of sufficient softening to cause union if gradually reached, and either a low or a high temperature can be steadily maintained.

It will readily be seen from what has been said that the process I use, when applied to iron or steel, can result in no other action on a material than would have resulted had the pieces been heated with a forge fire or a flame; besides, in my process there are the advantages of a far more perfect control of temperature, and consequent rapidity and accuracy of work.

A full series of tests of the tensile strength of electric welds in iron, copper, steel, brass, etc., have been made at the U. S. Government Arsenal at Watertown, with butt welds hammered and unhammered and variously treated, and these tests have been compared with tests made of lap or scarf welds made by the blacksmith process. The result has been greatly in favor of electric welding, the welds showing much greater strength and homogeneity. Tests by bending have shown that there is an almost complete union of the metals, a homogeneous welding having taken place. The ordinary mechanical tests by twisting, bending, etc., have proven the strength of the welds, and given me great confidence that the process will reach a large industrial development in the near future.

Yours very truly, ELIHU THOMSON.

BRILLIANT IGNORANCE.

THE Journal of Gas-Lighting says: "The remarkable freedom of newspaper writers from knowledge of the subjects upon which they compose their brilliant leading articles is at length beginning to irritate the electricians. An electrical journal falls foul of the Morning Post for publishing a mass of nonsense about the difficulty of adapting electric-lighting to ordinary household use. In the course of it the wonderful idea was promulgated that in years to come the prudent householder would 'store up against the winter his stock of electric accumulators, just as the Irish peasant builds his stack of turf.' Imagination fails to indicate to a reader possessed of the merest sprinkling of technical knowledge what manner of man must be that newspaper writer who, living sufficiently in the world to know electrical accumulators by name, yet finds it in him to mention these articles in the language cited above."

THE LINEFF ELECTRIC TRAMWAY.

A SHORT length of electric tramway on the Linefl system in operation in the depot of the West Metropoli. tan Tramway Company, Highroad, Chiswick, is thus described in London Engineering: The current is led to the car through a conductor laid in a tube or trench in the centre of the track. The copper strand or rod which car. ries the current is contained within an iron pipe carried in brackets bolted to the side of the trough. This tube is covered with insulating compound, and between it and each of the brackets there is interposed a layer of non-conducting material. About every four feet there occurs in the pipe a T-piece pointing upwards, and into each of these fittings there is screwed a plug which binds tightly against the copper conductor at the bottom, and at the top carries a trough-like head. This head serves to convey the current to a flexible contact piece carried by two grip. per arms which are fastened to the car and pass through a slot formed in the top of the trench. Between the arms there is loosely stretched a wire rope on which are threaded a number of gun-metal ferrules to give it weight. This rope lies in the trough-like heads of the plugs mentioned above, making contact with four or five of them at a time The current then flows up the gripper arms to the motor on the car. In the example shown, there is a current of ten amperes and 220 volts, and this drives an Immisch motor at 1,000 revolutions per minute, the motion being conveyed to the wheels by two Reynolds chains. The car is provided with an electric brake worked by a pair of solenoids and a horseshoe core. It has also a buffer boardateach end. If this board strikes an object on the track it is forced inwards, and in moving it operates a switch, which (1) cuts off the current from the motor and directs it into the brake magnet; (2) reverses the brushes on the motor; and (3) switches the current back into the motor. Thus the car is automatically reversed. The novelty lies in the method of carrying the conductor, and making contact between it

WATER-WASTE PREVENTION IN ENGLAND.

In connection with the water-supply of towns, there are few questions which are of such importance as the prevention of waste, and this must ere long be seriously taken up with reference to the supply of London from the Thames. It is not too much to say that fully one-third of the whole of the water taken from the Thames by the London water companies is wasted without direct or indirect advantage to any one. Without reducing the quantity of water used by the consumer, the waste at present occurring under the streets and from the use of bad sys tems of distribution, and bad fittings, might be effectively stopped by means of a waste-water detector system, with the inestimable advantage that for many years, if ever again, nothing would be heard of threatened shortness of the available water-supply of London, or of expenditure for new sources of supply. - The Engineer.

NEW ENGLAND WATER-WORKS ASSOCIATION.

The regular quarterly meeting of this association will be held at Young's Hotel, Boston, on Wednesday, March 14, 1888. The rooms will be open for members' use at 11 o'clock. At 2:20 o'clock Prof. William T. Sedgwick, of the Massachusetts Institute of Technology, will read a paper entitled "The Biological Examination of Water," and the discussion will be opened by Messrs. Dunham. Fitz Gerald, and Stearns. Members are invited to suggest for discussion at future meetings any topics which they may deem of interest to the association. Members of water boards are cordially invited to be present. Applications for membership will be considered, and for this purpose blanks may be obtained of the Secretary, who would be pleased to correspond with any parties desiring information on this point.

The seventh annual convention of this association will be held at Providence, R. I., on Wednesday, Thursday; Friday, June 13, 14, 15. The headquarters of the association will be at Narragansett Hotel. The Associate Members are invited to prepare for an exhibit of such supplies as they represent. Space for such a display will be provided by the Executive Committee. Edwin Darling. President; R. C. P. Coggeshall, Secretary, New Bedford, Mass.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

CONTROLLING THE DAMPERS AUTOMATICALLY IN A HOT-WATER APPARATUS.

BOSTON, MASS., February 28, 1888.

Boston, Mass., February 28, 1888.

SIR: We notice in your issue of February 18, 1888, an article from one of your readers entitled "Controlling the Dampers Automatically in a Hot-Water Apparatus," and your reply recommending the "Geyser" regulators sold by the E. H. Cook Co., Rochester, N. Y.

Now, we think we have something better and more simple adapted for the purpose of regulating a hot-water apparatus—that is to say a "hot-water indicator". It is

connected on a flow-pipe running from the heater by means of a 2x 1/2 inch tee, and since its introduction has been extensively used, and will be found useful in regulating an apparatus.

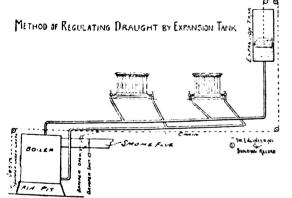

We are very truly yours.

GURNEY HOT-WATER HEATER CO.,

JOHN A. FISH, Managing Director,

[If our correspondent will again turn to the article in the issue of February 18, and read it carefully, he will notice we do not recommend the "Geyser" or any other heat-controlling apparatus. What we did say was that the parties named "have an apparatus that they claim will control the heat, etc.," and, further, "that we believe there were other contrivances for the same purpose, but we are not conversant with them." Had we known of your apparatus we would have mentioned it at the same time and in the same way. If these matters are called to our attention while they are novelties we will be very glad to illustrate them, that our readers may draw their own conclusions as to their merit. etc.]

BILLINGS, MONT., February 23, 1888. SIR: In answer to W. P. Powers' inquiry, in your last issue, in regard to an automatic device to govern dampers on hot-water apparatus, I respectfully send the inclosed cut that I think will explain itself to any good workman. I have used it with good success in my practice. The device, of course, is intended tor an open tank system, and

can be regulated for any temperature of water by adjusting chain. The float and damper should be counter-balanced. On the end of lever, attached to smoke-flue damper, there should be an iron or lead weight to close damper when float rises. Hoping this may be of some use to your readers, I am yours respectfully, A READER.

[Our correspondent's method is not unknown to many in the hot-water trade. For some reason, however, it has not received the recognition it would appear to command. Like almost everything else. it has a weak point, which is the trouble to keep the desired level in the expansion-tank. It cannot be used when a ball-cock is used, as the ballcock keeps a constant level unless it is submerged to operate only at a very low point; and when there is no automatic supply, unless the apparatus is absolutely tight, the variation in the tank destroys the regulation. In the hands of one who will look after the careful regulation of the height of the water it should give good results.]

TO PREVENT SYPHONAGE OF A TRAP.

OFFICE OF POST HOSPITAL, FORT SUPPLY, I. T., February 28, 1888. Sir: Will you please answer the following, either by letter or reference to THE ENGINEERING AND BUILDING RECORD, what prevents the water-seal of a water-closet outflow-pipe from being syphoned out by sudden rush of water?

Very respectfully,

P. BOLAND.

[To prevent syphoning it is only necessary to admit air to the top of the syphon, which destroys the vacuum. To do this in practice a bent pipe should be run from the highest point of the branch waste-pipe, between the trap seal and the main, either into the main waste-pipe at some higher point, or to some place where it can safely communicate with the outside air. The plumbing regulations of our leading cities have for a number of years required these vent-pipes? quired these vent-pipes.]

TO PREVENT RUST IN HEATING BOILERS DURING THE SUMMER.

WASHINGTON, D. C., December 27, 1888.

SIR. I notice in some of the trade circulars of firms engaged in steam and hot-water heating directions for preservation of the pipes and radiators, to, at close of winer's work, empty all the apparatus and then to fill again with fresh water.

with fresh water.

Is not this a mistake? Water itself, in absence of air, does not corrode iron. But living water, fresh from streams or springs, delivered through city pipes, has always a certain quantity of air, richer than atmospheric air in oxygen, absorbed by the water. It is this free oxygen which supports the life of fishes, and which supplies the oxygen to rust iron in contact with it. Boiling expels this air and oxygen, and the water which has remained unchanged for weeks in a steam or hot-water heater should be thoroughly free from air and free oxygen and the best be thoroughly free from air and free oxygen and the best fitted to prevent oxidation or rusting or corrosion of the

inside of iron boilers and pipes.

Does experience contradict this reasoning, which seems at least to be justified by the laws of chemistry?

Is it not safer to preserve in the apparatus the water long used and freed from air and free oxygen by repeated boiling?

M. C. MEIGS.

[It is a mistake to draw off the water from a heating apparatus in the spring and fill it with fresh water. The condensed water that remains over the winter with more or less oil, etc., in it should be let remain. It is more desirable, however, to fill the boiler to the stop-valve with water than to draw it off and leave it empty, and therefore when there is no condensed water to fill it with, fresh water has to be added. Draw all this water off in the fall, clean the boiler, and fill with fresh, clean water for the winter's use.]

HOW TO REMOVE IMPURITIES FROM SOLDER.

SCRANTON, PA., March 2, 1888.

SIR: Can you give me information regarding the treatment of solder to remove impurities? JOHN PURVIS.

Mr. Alfred Ivers, one of the oldest master plumbers of New York, explains as follows the method he has used with satisfactory results for many years. The solder is simply melted in any convenient amount and when it is all liquefieu a piece of sulphur is thrown in and causes the impurities to gather in a floating scum that is skimmed off and leaves the pure metal ready to be cast into cakes or bars for required use. A lump of sulphur the size of a hickory nut is sufficient to refine ten or fifteen pounds of solder. Some plumbers have a small ladle with the handle bent down instead of up, fill the cup with powdered charcoal, and force it, bottom side up, into the kettle of melted solder. When it reaches the bottom it expels the impurities which rise to the top and are skimmed off as before. Mr. Ivers says this method answers well, but that he uses and prefers the sulpher treatment.]

THE USE OF ANEMOMETERS.

TORONTO, February 24, 1888.

51R: I nave for some time used an anemometer in working out problems in ventilation, but do not feel satisfied that I obtain correct results on account of the way in which the correction for error is stated. The label inside the lid of the box reads: "Add 30 per minute to the observed reading of the air-meter." SIR: I have for some time used an anemometer in work-

Now, it appears to me that, as the error is due to fric-Now, it appears to me that, as the error is due to friction, it must be in the same ratio for every revolution of the wheels, so that the correction ought to be so much per cent. on the number of feet registered. Applying the rule as given, the result would be as follows (and looks absurd):

1000 + 30 = 1030, 01 3 per cent. 100 + 30 = 130, 01 30 " 10 + 30 = 40, 01 300 "

A letter to the makers only elicited the reply that the error is due to friction and that the correction is properly stated. I shall be obliged if you will kindly throw some light on the matter.

[We have had the same experience with a well-known make of anemometer as our correspondent, and could get no better answer from the New York dealer than he has received. That the amount of error should be constant per unit of time seemed hardly probable or at best merely an approximation. We were dissatisfied, therefore, with this uncertainty, and consequently, as a rule, test, at least approximately, any anemometer we have to use. Our method of test, though not without possible error, is reasonably reliable and always easily made, as no instrument but a tape line and a large closed room-the larger the better-is necessary. We measure a track around the room of 100 feet or any other convenient distance. Then holding the anemometer at arm's length on small rod at right angles to the way we face, we go

around the track in different directions and at different speeds, noting the error, whether fast or slow. By reversing the direction of motion about the track the effect of local currents in the room is eliminated and the danger of setting all the air in motion in one direction around the room is avoided. If an anemometer is held before the operator or near enough to his body so his motion will affect the air the anemometer is passing through the experiment will not be reliable. There are other methods, but they require special contrivances.1

"SKIN" PLUMBING IN NEW YORK AS DE-TECTED BY THE INSPECTORS OF THE BOARD OF HEALTH.

ON January 18, 1888, David Durie, Jr., and James H. McManus, of East One Hundred and Seventy-sixth Street, were arrested for violations of the health laws in the plumbing of twelve houses on One Hundred and Fifteenth Street. east of Sixth Avenue. Inspectors E. P. Eastwick and I. P. Corcoran reported many open joints, split hubs, hubs placed downwards, drain-pipes laid level, and joints with no lead. The Justice granted a delay of two weeks to permit rectification of the work. After a second two weeks the work was reinspected by the Health Department, and seven of the original violations were found remaining.

. The defendents were fined \$250 each, although they produced two plumbers at the trial who swore that the work was perfect.

January 5, John Foley, of 385 Second Avenue, was held for trial before Special Sessions for violations of Health Board rules in doing a piece of plumbing in addition to the work called for in the original job and for which no plan had been filed.

Inspector J. T. Corcoran found open joints, unvented traps, and open joint in main drain. Mr. Foley pleaded sickness that prevented his personal supervision of the work and was sentenced, January 20, to a fine of \$25.

Kirchof & Brown, 210 East Eighty-sixth Street, were held December 28, 1887, for violations in two houses, Nos. 38 and 40 Morton Street, where Inspector H. F. Barkley found a total number of 78 joints that were defective, open, strained, or packed with oakum only, some of which were covered by plastering.

They were tried before Court of General Sessions January 25, and fined \$25 each.

Frank M. Clemmens, 1507 Avenue A, who, as we recorded in our issue of December 31, was held for violations in house No. 93 East Eighty-fifth Street, was tried before Court of General Sessions February 8, and fined \$50, the particular charge being open and defective joints.

Several cases are still pending before the Court of General Sessions that have been delayed since before the above were commenced. Among them that of John Kelley, who was held December 3, as stated in our report of December 31, and Plumber Francis Callaghan, whose case dates back nearly five months.

The case of Herman Hoeffer, who was held December 13. 1887, for trial by Court of General Sessions for violations in the large apartment house at north-east corner of Fifty-fifth Street and Broadway, where the pipes were found plugged up to mislead the inspectors, is still in abeyance, notwithstanding its particular flagrance. The activity of the Health Board in the matter of these prosecutions is having a salutary effect and much less bad work is being reported by Chief John C. Collins and his inspectors.

HORSES' POWER AND HORSE-POWERS.

A PAIR of good horses can exert a pull of quite 1,300 pounds for a short distance. At a speed of only three miles an hour this amounts to ten indicated horse-power, and is actually often exerted, horses being able, for short periods, to put forth at least five times more than their normal power.

CAR-WHEELS made of paper, under hydraulic pressure have for some years past been on trial on some of the railways in Germany. Recent reports give instances of failure, and investigation has shown that in the majority of cases of failure and collapse of wheels the periphery of the wheels has been burst, owing probably to the action of the brakes. The wheels have lasted some years before

THE New York and Harlem Railroad Company has asked permission from the Board of Aldermen to use electric motors on the Fourth Avenue surface road in New York City. Digitized by GOOGLE

SOME DETAILS OF WATER-WORKS CON-STRUCTION

CUP-JOINT VERSUS WIPED-JOINT.

OUR readers will be interested in the following correspondence, which sufficiently explains itself, Mr. Kirk's letter to us having been sent to Mr. Billings for reply:

TORONTO, February 25, 1888.

SIR: In your paper of February 11, 1888, page 166, under the head of "Water-Works Construction," Mr. W. R. Billings, C. E., speaks disparagingly of the wiped-joint, and claims equal, if not greater, strength for what he terms the cup-joint. Now, I propose a fair question to Mr. Billings. Has he ever made a practical test of the strength of these two kinds of joints? that is, taking a tair sample of each; if so, what was the result of such test? In the making of both these kinds of joints it is necessary to open or widen the end of the pipe, and as a result the pipe is thinner than it formerly was; in the case of a wiped-joint the thin portion of the pipe has been covered well with solder, which is not the case with the cup-joint (as is shown in the cut on page 88, Vol. 17). The only argument in favor of the cup-joint is cheapness; it can be done by labor of inferior skill. Yours respectfully,

BENJAMIN KIRK.

TAUNTON, MASS., March 5, 1888.

SIR: I take pleasure in replying to Mr. Kirk's courteous note of February 25 by frankly admitting to begin with that I have not made any comparative tests of strength of the cup and the wiped joints, and furthermore, that if Mr. Kirk has records of any such tests I should esteen it a great favor to be allowed to see them. In the absence, then, of special tests one must base his opinion upon the experience of himself and others, and upon the special features of each joint as developed in a study of the structure of the two. I know that the cup-joint has been used in Boston, Mass., for many years, and has given satisfaction, and I know that it has been used in Taunton for two years without developing any signs of weakness, and that, too, under severe treatment. Now, if Mr. Kirk will make a full-size drawing of a longitudinal section of each joint he will agree with me, I think, in saying that the source of strength in each joint lies in the perfect union of the metals over the surfaces in contact, and that in the wiped joint there is an excess of solder. By way of illustration, though I admit the inexactness of the comparison, we may speak of the wiped joint as one in which the edges are butted together and held by a strap of solder, while the cup-joint is a lapped joint held by a perfect cement. I am told, moreover, by experienced plumbers that a wiped joint under changes of temperature, such as will occur in a hot-water pipe for example, will open at the edges, and when brass is connected with lead, the unequal expansion of the large mass of solder, the lead, and the brass, makes this statement seem more than probable.

brass, makes this statement seem more than probable.

Mr. Kirk says "the only argument in favor of the cupjoint is cheapness," and, properly understood and applied, this is argument enough. It is one of the commonplaces of engineering that we should obtain the maximum of useful effect with the minimum expenditure of material consistent with safety.

WILLIAM R. BILLINGS.

QUICKSAND IN THE SHORE SHAFT OF THE NEW CHICAGO WATER TUNNEL.*

(Special Correspondence from Chicago.)

ACTING CITY ENGINEER W. R. NORTHWAY says: " Having struck a very large pocket of quicksand containing limestone boulders, it is evidently impracticable to run the city's new water tunnel into the lake from that point. Mr. Onderdonk will sink a new shaft at some point in Lake Park to be determined by boring, and from this the lake tunnel will be projected. The old shaft was sunk some 77 feet-about its full projected depth-when this quicksand pocket of unusual extent was encountered, along with water, and though 500 gallons a minute were pumped out for a week or more, further progress on the shaft was inappreciable. The quicksand is so extremely fine that a magnifying glass scarcely shows the grains. It is so diluted that in a tumblerful left to settle, four-fifths is pure water above the sediment. A superficial depression has taken place along a strip between 200 and 300 feet wide, and extending from near Michigan Avenue east to the lake shore under the railroad tracks, the whole length perhaps 1,000 feet, with a depression in no place over two feet, despite newspaper sensations representing wrecked trains, collapsed houses, the disappearance of too yards of breakwater, and an earthquake havoc generally. At the same time it has been held really unsafe to go on. The limestone boulders, some of which had to be go on. The limestone boulders, some of which had to be blasted, were of various dimensions, from the size of your head to four feet in diameter, and they were often worn perfectly smooth. The water encountered does not rise head to four teet in chameter, and they note that apperfectly smooth. The water encountered does not rise in the shaft to within thirty feet of the lake surface, showing, of course, that they are not connected. The old shaft will be utilized for the land tunnel, and boring is already in progress to locate the new works, which will require three and a half years to finish. They will certainly be needed by that time."

AMERICAN SOCIETY OF CIVIL ENGINEERS.

A REGULAR meeting was held Wednesday evening, March 7. Director Mendes Cohen presided over an unusually large attendance of members and visitors. The usual business routine was followed by the announcement of the decision of committees examining prize essays who awarded the Norman Medal to the paper on "Evaporation," presented by Desmond Fitz Gerald, M. Am. Soc. C. E., and the Roland Prize to the paper on "Steel, some of its properties, its use in structures and in heavy guns," by William Metcalf, M. Am. Soc. C. E. The Secretary then read a paper by John W. Hill, M. Am. Soc. C. E., on "Test of an Edison incandescent electric lighting plant." The paper was a description, report, and tabulation of an elaborate eight days' working test of the cost, efficiency, and relative value compared with gas of the Edison plant in the Union Central Depot at Cincinnati, O.

Very complete data were given of all the physical, mechanical, and electrical conditions and the detailed results secured. The lamps of 16 and 32 nominal candle-power were carefully tested by a voltameter, consisting of a bath containing two zinc plates through which a fixed proportion of the total current was passed, and caused a reduction in weight of one of the plates. This loss was assumed proportional to the current, and agreed satisfactorily with the galvanometer results, and accounted for 65 per cent. of the illumination.

It was stated that the cost of illumination increased directly with the age of the lamp and was about doubled after a few weeks, when the brilliancy was decreased in the same ratio. Variations of 20 per cent. to 30 per cent. in the intensity of illumination were observed while making the photometric tests. About 69 per cent. of the indicated horse-power of the engines was transmitted to the dynamos, of which 45.5 per cent. was utilized in actual illumination.

Mr. Hill found that, considering the actual illuminations compared, that of the electric lamps cost thirty-nine per cent. more than the gas-light. He considered that the results of the tests indicated so great a loss of power between the engines and dynamos, that electricians should be stimulated to remedy it.

After the conclusion of the paper it was discussed by J. F. Flagg, Mem. Am. Soc. C. E., and some explanations presented by Mr. Howell, who witnessed the tests as a representative of the Edison Company, who explained the low efficiency of the engines as due to an excessive amount of counter-shafting, and their working at one-eighth of their regular load; notwithstanding which the electric light was found ten per cent. cheaper than gas.

The results of the vote on amendments to the constitution showed that the proposed change establishing a student grade was lost by 137 affirmative to 142 negative.

The amendment providing for election of members by committee was lost by 67 affirmative to 212 negative.

The other proposed amendments relative to admission of foreign applicants and reconsideration of ballots were carried by votes of 251 and 226 affirmative to 32 and 55 negative respectively.

The meeting was then adjourned, and the members enjoyed the usual collation and social meeting.

The following gentlemen were elected:

As Members—Fred. James Amweg, Engineer in charge of Market Street Bridge over Schuylkill River for city of Philadeiphia; Oberlin Matthies Carter, in local charge of River and Harbor Improvements and Fortifications in Georgia and North-eastern Florida, Savannah, Ga.; Charles Sewall Gowen, Division Engineer, Division r, New York Aqueduct Commission, Sing Sing, N. Y.; Charles Davis Jameson, Consulting Engineer, New York City; Edward John Landor, Chief Engineer Wrought Iron Bridge Co., Canton, Ohio; Hunter McDonald, Assistant Engineer Nashville, Chattanooga and St. Louis Railway, New Market, Ala.; George Romaine Olney, Assistant Engineer Section 10, New Croton Aqueduct, Morris Dock, N. Y.; Francis Ensor Prendergast, Assistant Engineer New York and New England Railroad, Newton Highlands, Mass.; George Henry Robinson, in charge of Works at Marysville, Montana; Edward Wegmann, Jr., Division Engineer New Croton Aqueduct, Englewood, N. J.; Arthur Owen Wilson, conducting a general engineering office. Birmingham, Ala.; John Young, Engineer Geneseo Water-Works, Genesco, N. Y.

As Associate.—John Haines Warder, engaged at Edge Moor Iron Works inspecting Bridge Work and Material for the Balt more and Ohio, New York and New England, and Richmond and Danville Railroads, Wilmington, Del.

As Juniors—David Sylvanus Carll, Assistant Engineer Grand Avenue Cable Co., Kansas City, Vo.: Charles Alfred Hasbrouck, Assistant Engineer Detroit Bridge and Iron Works, Detroit, Mich.

PERSONAL

PROFESSOR BYRON W. CHEEVER, A. M., M. D., Professor of Metallurgy in the University of Michigan, died at his home at Ann Arbor, aged 46 years.

MR. L. L. BUCK, M. Am. Soc. C. E., has just returned to New York from the superintendence, at Pasco Junction, Wash. T., during the winter, of the construction of his recently, designed large combination bridge over the Columbia River for the Northern Pacific Railroad.

ARCHITECTURAL COMPETITIONS.

OFFICE OF
BOARD OF COUNTY COMMISSIONERS,
LANCASTER COUNTY,
LINCOLN, NEB., March 3, 1888.

Lincoln, Neb., March 3, 1888.

SIR: The architects' competition in the submission of plans for a court-house was awarded to F. M. Ellis, architect, of Omaha, Neb., being fourteen architects in the contest, from the following places: James Tyler, W. S. Gray, O. II. Placey and J. II. W. Hawkins, Lincoln, Neb.; F. M. Ellis, F. & C. Mendelson and Hodgson & Son, Omaha, Neb.; George F. Hammond, Cleveland, O.; Weary & Kreamer, Akron. O.; M. E. Beebe & Son, Buffalo, N. Y.; J. W. Yost, Columbus, O.; Schrage & Nichols, Kansas City, Mo.; Eche & Mann, St. Joseph, Mo. A fine lot of plans and hard to decide what plan to adopt, the building that was selected being 100x150, of stone, and fireproof.

Vours truly,
O. C. Bell, Clerk.

MISCELLANEOUS.

New York CITY.—At a meeting of the Aqueduct Commissioners held March 3 to award the contract for Section 16 of the New Aqueduct. Counsellor L. Laflin Kellogg and Arthur H. Smith, his associate, served an injunction on the Commissioners, and O'Brien & Clark, contractors, preventing the Board from awarding the contract to O'Brien & Clark, and restraining that firm from accepting it. The injunction, which is temporary, was granted by Judge Barrett in a suit brought by Jacob Ebling, a liquor dealer, as a taxpayer, setting forth the circumstances of the bidding and awarding, and alleging that the awarding is illegal and against public policy. He asks for a permanent injunction.

He asks for a permanent injunction.

The Commissioners have been notified to appear in Supreme Court Chambers Monday, March 12, and show cause why the injunction should not be made permanent. It is stated that in Section 16 there were several bidders. The proposals called for bids of three kinds:

(1) For the entire work; (2) for the iron-work;

(3) for excavating and laying pipes. O'Brien & Clark bid \$1,052,365 for the entire work—the lowest bid of that kind made. The Warren Foundry and Machine Company bid \$674,730 for the iron-work, the lowest bid of that kind. William E. Dean bid \$315,648.25 for excavating and laying pipes, the lowest bid of that kind. When the bids were opened O'Brien & Clark were decided to be the lowest bidders for the entire work in lump. Mr. Ebling asserts in his complaint that the bids of the Warren Foundry and Machine Company and Mr. Dean added together are \$61,937.75 less than O'Brien & Clark's bid for the same work, and that therefore they ought to have the contract. He alleges by the affidavit of Mr. Charles Jones, a contractor, that Mr. Dean and the Warren Foundry and Machine Company are honorable and pecunious contractors, who can be implicitly trusted to do their work honestly and well.

PHILADELPHIA, PA.—A Committee of Prison Inspectors opened bids on February 17 at the County Prison in Philadelphia for the construction of the outer stone wall of the new County prison, two portals, a guard-house, about 60 feet square and 45 feet high, and the rotunda from whence the cells will extend. The chamber of the rotunda will be 84 feet in all and 45 feet high, and there will be 1,800 linear feet of outer wall, which will be seven feet thick at the base, 3 feet 6 at the top, and 35 feet high.

The bidders were as follows: James J. Ryan. \$167,000; Charles McCall, \$165,500; T. H. Doan, \$137.233; Richard A. Malone, \$129,500; Frank Sweeny, \$169,000. The contract was awarded to Malone.

awarded to Malone.

NEW ORLEANS, LA.—Congress has received a report from Captain Black to the effect that

a report from Captain Black to the effect that it will cost \$50,000 to make a channel 200 feet wide and twenty feet deep through the two sandbars near Little Mangrove Point, so as to allow vessels to enter Tampa Bay. He also estimates that it will cost \$300,000 to properly improve the northwest channel near Key West.

[•] The specifications for this work were abstracted and illustrated on page 620 of our issue of October 29, 1887.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

For works for which proposals are requested see also the "Proposal Column," pages 1-v1-v11-v111-236.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtain ing early and reliable news for our "Contracting littlegence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

ORANGE, N. J.—The Commissioners on Drainage, appointed by the courts some time ago to consider the condition of the Second River, Doddtown, have decided to recommend the widening and deepening of the stream.

CENTREVILLE, MD. — Water-works will probably be established here. Address the Town Clerk.

TECUMSEH, NEB.—Our correspondent writes as follows: "The water-works election held here was almost unanimous, there being only six votes against the proposition; \$21,000 bonds were voted. Bids will probably be opened March 29."

Kutztown, PA.—Concerning the water-works question here our correspondent writes as follows: "We have in contemplation to erect or establish water-works in our town. We had engineers here and had some proposals. The plan we have now in view is considered a very good one. I will inform you of what action will be taken at the next Council meeting.

ALEXANDER, ARK.—Concerning the report ALEXANDER, ARK.—Concerning the report that water-works were to be erected here the Clerk of Monroe County writes us as follows: "No water-works in contemplation in Monroe County, Ark., as far as my knowledge."

will be resumed about May I, to be completed in July; additional pipe-hydrants are likely to be required. R. B. C. Bement is the engineer in charge of construction; works owned by Superior Water Co., R.J. Wermyss, President, West Superior.

CLEVELAND, O.—The Secretary of War has transmitted to the House a report by Major Overman, for the Engineer Corps on the proposed extention of the breakwater at this city. The estimate of the proposed extension of 2,000 feet is \$100,000. 2,000 feet is \$300,000.

MILWAUKEE, WIS.—Specifications are being made for about \$200,000 worth of sewer construction to be done here this spring.

CAMBRIDGE, INDIANA.—Concerning the report that water works were to be erected here our correspondent writes as follows: "No steps have been taken to establish waterworks; have wells and cisterns."

BIG STONE, DAK.—The Board of Trade favors diking Big Stone Lake and opening navigation from the lake to Lake Traverse.

ROCKLAND, MASS.—Concerning the reported water-works extensions here our cor-respondent writes as follows: "Extending of mains was left to Water Commissioners. Verv little, if any, is contemplated the present

Montgomery, Ala.—See our Proposal Column for advertisement of bids wanted for sewer construction here. It is probable that other work will follow, and information may be obtained by addressing R. B. Snodgrass, City Clerk. Rudolph Hering, C. E., of N. Y. is the consulting engineer.

LODA, ILL.—Concerning the published re-LODA, ILL.—Concerning the published report that water-works were to be erected here, we are informed as follows, by O. L. Closson, Village Clerk here: "We are not at the present time nor perhaps in the near future contemplating putting in any excensive waterworks. We sank two public wells last season and will do nothing more at present."

FORT FAIRFIELD, ME.-We are in receipt of the following communication from the Town Clerk at this place: "At a meeting of the Sarsfield Water Co., of Ft. Fairfield, Me., it was voted to transfer its charter rights to any party or parties who may contract for a water-supply with the Village Corporation Assess-

NORWALK, O .- It is probable that there NORWALK, O.—It is probable that there will be extensive changes made to the waterworks system here at an early date. The question of improving the present plant has been discussed for a long time, and recently a joint committee of members of the Water-Works Board, the Common Council, and private citizens investigated the matter and sub mitted a report to the city officials. The report recommends the building of two or more storage reservoirs, new pumping engines, and the recommends the building of two or more storage reservoirs, new pumping engines, and the addition of several dams, the whole cost of which is estimated at \$50,000. The matter is to be settled at an election to be held in April, and should it result in favor of the measure bonds in the sum required will be issued. Further investigation is to be made by an expert hydraulic engineer. For details address Frank Sawer, Town Clerk.

St. Paul, Minn.—The Fire Department talks of purchasing stand-pipes for use at fires in upper rooms of high buildings.

FARM'NGTON, ME.—We are in receipt of the following from E. J. Merritt, Chairman of the Board of Assessors of this place, dated March 3: "The Village Corporation voted yesterday not to contract with the water company. Our business men think it will come in pany. Our business men think it will come in the near future."

INDIANOLA, NEB.—City Clerk I. H. Berge. of this place, sends us the following communication in reference to the reported water-works project here: "The Board of Trade of this city is corresponding with different parties endeavoring to learn what the cost will be to dig a canal from one-quarter to one-half mile, with a fall of about ten feet south side of the with a fall of about ten feet, south side of the The committee appointed for this work have not reported yet, therefore cannot tell what success they have had so far. But a canal will be made, and that soon. For further particulars address S. R. Smith, Secretary Board of Trade, this city."

Braintree, Mass.—Concerning the report that the water-works here were to be improved we have received the following communication from Col. A. C. Drinkwater, of the Water Commission. "The town of Braintree, Mass., entered into contract with John Cavanagh & Son, of Boston, September 8, 1887, to put into our town a complete system of water-works, consisting of 12 miles of pipe, 100 hydrants, 100 gates, stand-pipe of iron, 100 feet high, 30 diameter pump of 15 000,000 gallons daily. The works are in process of building, and will be completed early in the spring of this year."

ASHEVILLE, N. C .- Concerning the report that a system of sewerage was to be erected here we have received the following communi-cation from F. M. Miller, the City Clerk: "An election has been ordered to be held on the 3d day of April next, to obtain the consent of a majority of the qualified and registered voters, to issue bonds of the city to the amount of \$60,000 for the construction of a system of sewerage."

St. Joseph, Mo.—Concerning the report that extensive sewerage construction was to be done here our correspondent writes as follows: "No action yet taken in regard to sewers except some small contracts for districts." Nothing will be done until after April.

ATCHISON, KAN .-- It is reported that plans are prepared for a sewerage system for this city, which is to cost, according to reports, \$1,000,000.

GRAFTON, W. VA .-- An election will be held here March 20 to decide for or against the construction of a system of water-works to cost \$28,000, from plans, etc., already made. The Mayor has charge of all details.

GUYANDOTTE, W. VA.—A water-works company has been incorporated to build a system here. The capital stock is \$100,000, and T. E. Stout, of Huntington, W. Va., is titched. at its head.

DALTON, GA.—It is stated that the Water-Works Committee will take immediate action towards the construction of the system heretofore reported.

BENTONVILLE, ARK.—It is reported that a system of water-works will be erected here by parties from Kansas City, Mo.

SALISBURY, MD. - It is said that the Water-Works Committee will proceed at once toward the details of the proposed system.

PINEVILLE, KY .- It is reported that waterworks will be erected here by the Pineville Coal, Iron and Land Co.

HOT Springs, Ark.- It is reported that the plant of the Hot Springs Water-Works Co. will be enlarged.

BATESVILLE, ARK.—A. A. Webber, Esq., writes: "The Batesville Water Company is not organized as yet, but will be in a few days—just as soon as a balance of \$2,000 is subscribed. Capital stock, \$10,000. Soon as all stock is subscribed the company will be organized and work will commence at once." ized and work will commence at once.

HEBRON, NEB.—Water-works are to be erected here. Details can be had of the Village Clerk.

CAPAC, MICH.—Water-works may be established here. For details address the Water-Works Committee.

COLUSA, CAL.—An 80 foot tank is to be erected here for fire protection. Water Works Superintendent J. B. Cook can give details.

SYRACUSE, N. Y.—The Syracuse Water Company has submitted the following proposition to the authorities of that city conditioned on a guarantee that they shall have the exclu-supplying at least 20,000,000 gallons in 24 hours; (2) to furnish the highlands with a full and ample supply: (3) to extend its present sys-tem in all the old wards and throughout the three new wards, which will require the laying of at least 30 miles of pipe; (4) to begin work immediately and complete it without any unnecessary delay.

MARION, O., will build a system of sewerage this season. Plans now being made.

LAKEFIELD, ONT.-A \$5,000 water-works is contemplated for this place.

WHITEWATER, WIS. -Address Mayor Engerbretsen for details of a contemplated rater-works system here.

PARK HILL, ONT.—A water-works system may be established hete. For details address

WATER-WORKS.—See our proposal column for information regarding water-works and water-works supplies at the following places: Paisley, Ont.; Merriton, Ont.; Albany, N. Y.; San Antonio, Tex.; Columbus, Ga.; Asbury Park, N. J.; Raleigh, N. C.; Newport, R. I.; Fort Riley, Kan.; Montgomery, Ala.; St. Paul, Minn.

BRIDGES.

WILKINS, WYO.—A 60 foot iron bridge is to be erected here. See our Proposal Col-

VERNON, TEX.—A \$32,000 bridge is to be rected here. Address the County Commiserected here. sioners for details.

MONTREAL, CAN.—Reports say that engineer Henry Malingee is preparing plans for the proposed new bridge to connect this city with Longueuil, to cost between \$4,000,000 and \$5,000,000.

MONORA, IOWA.—A bridge is to be erected over the Missouri River by the counties of Monora, Iowa, and Burt, Neb.

MILWAUKEE, Wis. — The Chicago and N.W. Railway will build a \$10,000 iron bridge Digitized by

BRIDGES.—See our Proposal Column for information regarding bridge construction, etc., at the following places: Montreal, Can.; Wilkins, Wyo.; Thomaston, Ga.

HUNTSVILLE, ALA.—An iron bridge is to be erected over Pinhook Creek. Address the Town Clerk of this place for details.

TOMAHAWK, Wis.—A 468-foot bridge is to be erected over the Wisconsin River at this

THOMASTON, GA.—Concerning the report that a bridge was to be erected here over the Flint River our correspondent writes as fol-lows: "The bridge has been built, but the contract to inclose and cover it will be let to the lowest and best bidder on March 20."

RAILROADS.

BROOKLYN, N. Y .- The Common Council has received an application from the Fort Hamilton and New York Elevated Railroad for a franchise to build and operate an elevated road from Fort Hamilton through Third Avenue to Atlantic and thence to South Ferry.

DAVENPORT, JA .- The Rasmussen cable system will be put in the street-car line. Dr. W. L. Allen has bought a controlling interest.

CHICAGO, ILL.—It is said that the Chicago. Milwaukee and St. Paul Company will soon build a link connecting the line from Mazoma-nie to Prairie du Sac with the main line at

WINNIPEG, MAN .- Premier Greenway has, it is said an offer to build the Red River Valley Railway from a reliable firm. The offer is to build the road from West Lynne to Portage La Prairie, the Government to pay a small cash bonus and an annual subsidy for a period of twenty years.

STREET-WORK AND PAVING.

LINCOLN, NEB .- The City Engineer can furnish details of considerable paving. etc., to be done here.

PLATTSMOUTH, NEB.—It is reported that considerable street work is to be done here this spring.

FINDLAY, O.—Several miles of asphalt paving will be laid here in the spring. F. Arford can give details.

COLUMBUS, O .- Address the City Clerk for details of a large amount of street work to be done here soon.

ST. JOSEPH, Mo.—Our correspondent here sends us the following communication con-cerning street-work: "People are talking of vitrified bricks and cedar blocks, and something in this line will probably be done during the summer, but have nothing definite to report as yet.

NEWPORT, R. I.—See our Proposal Column for information regarding paving to be done in this city.

GAS AND ELECTRIC-LIGHTING.

MACHIAS, ME.—An electric-light plant is to be erected here.

PITTSFIELD, Mr.—Two electric-light com-panies have been organized here. Darius Burns is at the head of one and Davidson Walker leads the other.

WARE, MASS.—The electric-light company at this place will purchase a 50 horse-power engine, two boilers, dynamos, etc.

VINEYARD HAVEN, MASS .- An electriclight company has been organized here, with Otis G. Stanley as president.

BROOKLINE, MASS.—The Citizens' Electric-Light Company has been organized here and will at once begin the erection of a plant.

WAKEFIELD, MASS .- The electric light question is being agitated here.

PLYMOUTH, MASS. The local gas-works are to undergo extensive additions.

THAYER, KAN.—C. T. Ewing is at the head of a newly organized electric-light company here.

JOPLIN, Mo.—The Joplin Electric-Light and Power Co. has been organized here and a plant is to be erected at once.

PATCHOGUE, L. I.—The Patchogue Electric Light Company has been incorporated. The capital stock is \$20,000, and the incorporators are J. S. Havens, George D. Gerard,

NEW BRIGHTON, S. I.—This place is to be lighted by electricity by the Richmond Light, Heat and Power Company.

NORWICH, N. Y.—It is reported that this place is to be lighted with electricity.

MILLERSBURG, O.—The officials will put in a 50-light electric-light plant.

PINEVILLE, KY.—Reports say that the Pineville Coal, Iron, and Land Co. will establish gas-works here.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 16.

EDITORIALS:

PUBLISHED EVERY SATURDAY.

NEW YORK, MARCH 17, 1888.

LONDON, MARCH 31, 1888.

SINGLE COPIES. TEN CENTS. Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE. Subscription, 201. per annum in advance, post paid.

THE ENGINEERING & BUILDING RECORD. conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prebared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

> OFFICE IN GREAT BRITAIN, 02 & 03 FLEET ST., LONDON

TERMS, 201. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record new York), and crossed — & Co.

Continental subscriptions are also received by F. A. Brockhaus, Esq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden. Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5. Ihe date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested. Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered etter or by eneck or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

NEW YORK'S SNOW EMBARGO.

PROBABLY no one now living can recall such a snow-storm in New York as the one which visited that city on Monday of this week. A fall of about two feet, accompanied by gales of wind, made streets impassable for vehicles, stopped travel for days on the surface railroads and for one day on the elevated railroads. Business was suspended; factories and office buildings found themselves without coal to make steam for heating or to run machinery; restaurants on Tuesday put out signs, "No coal, no food"; communication by telephone and telegraph was interrupted. Indeed it is not possible to convey to any one who did not experience it the completely prostrated condition of the metropolis. providential absence of any serious fire alone saved it from a calamity such as visited Chicago in 1871. The managers of the elevated rail-roads were the first to offer any assistance to the public, as they were able to get their trains running with regularity on Tuesday afternoon, and, considering the difficulties they had to contend with, deserve great credit. And in Brooklyn credit is also due Chief Engineer C. C. Martin, of the Brooklyn Bridge, and Colonel Martin, the Superintendent of the Brooklyn Elevated Road, for the admirable service they rendered the public.

The advocates of the various tunnel schemes of rapid transit will no doubt be able to make a strong argument for tunnels as against Mayor Hewitt's suggestion for an open-Yet, notwithstanding our expericut route. ence of the last week, we still adhere to the belief that a viaduct is much the best for rapid transit routes in this city. Even with such a storm as this, travel on a four-track viaduct road would not have been interrupted more than half a day, and we believe the people would rather suffer such a detention one day in a year than ride every day in a tunnel. The worthlessness of suspended telephone, telegraph, and electric-light wires was again fully demonstrated, and the impossibility of communicating by telegraph added greatly to the embarrassment of the snow embargo. It is to be hoped that within a year we may see every wire placed underground; and if the storm will hasten the municipal improvements that are plainly imperative to those familiar with municipal prob-lems, it will have proved a blessing in disguise.

OCEAN WEATHER CHARTS.

THE monthly Pilot Charts issued by the Hydrographic Office of the United States Navy Department, in charge of Commander J. R. Bartlett, are weather maps of the North Atlantic Ocean, containing a general summary of meteorological conditions prevalent during the preceding month and a forecast of the weather for the month following. Much information of interest and value to mariners is graphically represented on the chart—viz.: Direction and force of winds, limits of trade winds, region of equatorial rains, fog belts, probable limit of fog, probable limit of field ice and icebergs, names, position and character of wrecks and other dangerous obstructions, trade routes, in both directions, between the equator and New York and between the equator and European ports, transatlantic steamer routes, notices to mariners, bar-

ometric comparisons, storm cards and directions in case of cyclones, and frequently reports of the use of oil to smooth the sea, and other similar items of interest.

These charts are issued gratuitously by branch hydrographic offices in the principal ports in return for meteorological journals kept by ship captains, from which the information on the charts is chiefly compiled.

During the year ending June 30, 1887, 527 meteorological journals of ships were received, representing careful and detailed observations made daily during voyages of the following vessels: 142 British, 127 American, 18 German, 13 Norwegian, 6 Italian, 5 Hawaiian, 3 Austrian, 3 Danish, 3 Swedish, and 1 Dutch.

It is intended to loan standard meteorological instruments to all captains who will agree to keep journals for the Hydrographic Office, and the small necessary expense would be amply justified by the value of the records.

In many cases the captains use the Pilot Charts as track charts, and make meteorological observations thereon, plainly indicating the value of the forecasts.

Weekly supplements are issued for the Atlantic coast of the United States, and in time it is hoped to embrace the whole world in these or similar charts of weather probabilities.

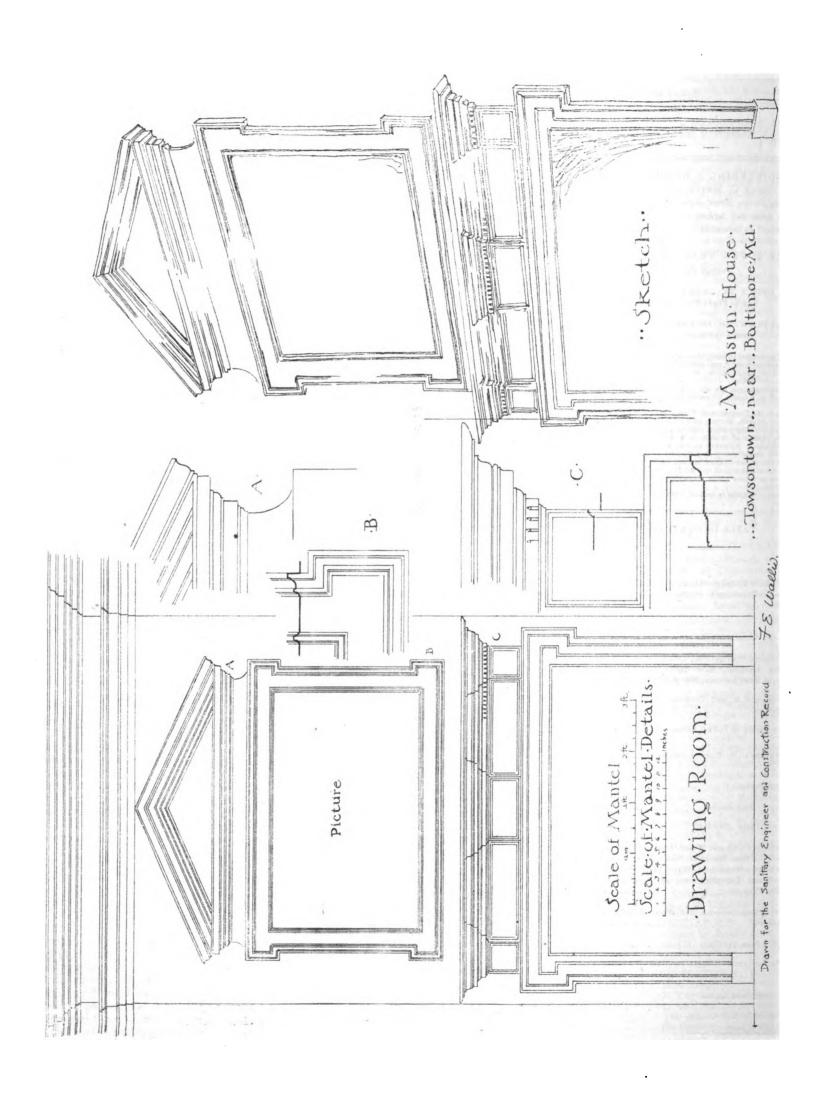

PATENT SEWER-GAS DESTRUCTORS.

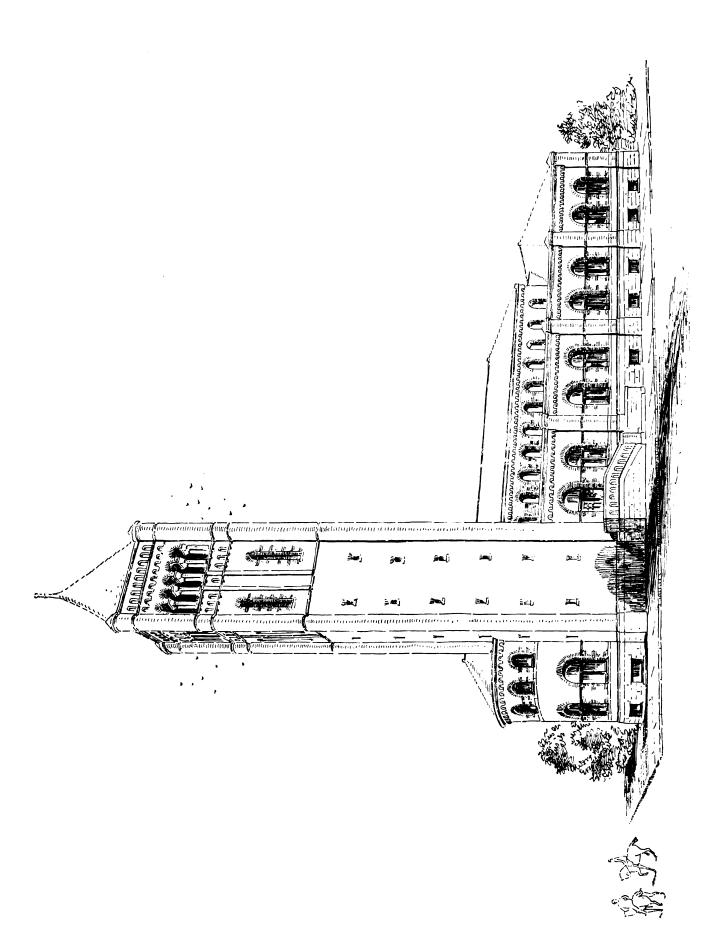

Among the list of the pleasures of life the orator of the future will probably class that of discovering how to ventilate sewers and disinfect sewer-gases by means of fire. The number of people who make this discovery annually seems to be considerable, and it is only necessary to hear them discourse for five minutes on the subject, or to read an account of the results obtained by their patent systems, to be convinced that this good old discovery gives just as much satisfaction now as it did eighteen hundred years ago, when it was proposed as a means of ventilating the Cloaca Maxima in Rome.

In view of this fact it seems cruel on the part of skilled engineers to continue pointing out, as they do, that all schemes of this kind are worthless, because of the great expense which they involve, and because equally good results can be obtained very much more cheaply.

The real cruelty, however, would be to permit cities to waste the people's money on such contrivances.

Take, for instance, one of the latest devices patented, and noticed in a paper read before the English Society of Medical Officers of Health, called "a sewer-gas extractor and destructor, which is described as consisting of "a hollow iron column similar in appearances to a gas-pillar, having in the interior of the base a gas-furnace of peculiar and novel construction". This iron solution This iron column is to be six struction. inches in diameter, the velocity of the current through it is to be from four to five feet per second—that is, it is intended to pass fifty cubic feet of air per minute or 3,000 cubic feet per hour, by the combustion of six cubic feet of coalgas. How many such iron columns would be required to ventilate the sewers of New York City, and how much gas would it take to run them throughout the year? There "are millions in this scheme" for some iron-works and some gas company if they could only get the necessary appropriations for it.

THE SANITARY ENGINEER & CONSTRUCTION RECORD ILLUSTRATED SERIES.

Digitized by Google

This, however, is merely a type of what has been proposed a hundred times before, and which no doubt will be proposed several hundred times more in the future. How it is possible to patent these things as "useful inventions" is a mystery to any one but a patent expert. The only people to whom they are useful, so far as we can see, are the printers and advertising mediums, but as sources of happiness to their inventors they are no doubt temporarily successful, and they show that there is still some faith left in a few, at least, of the dwellers in this wicked world. We have some reason to think that there would be a large increase in the number of announcements of such inventions if the correspondence of the inmates of our insane asylums were less carefully scrutinized and weeded out, and it may be that the Government is in this way deprived of a certain amount of revenue in the shape of patent fees; but the time is probably not yet ripe for agitating for reform in this matter, and we only mention it to show that we understand and fully sympathize with inventors of this class.

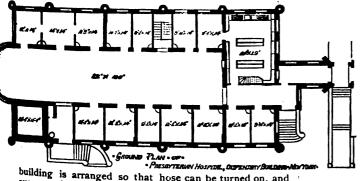

PROPOSED ABOLITION OF DUTY ON CEMENT.

The proposition to place cement on the free list in what is known as the Mills Tariff Bill has brought out a statement from those interested in the cement industry in this country, which we publish in another column.

Cement is certainly a manufactured article. In view of this fact, therefore, and that even tariff reformers only urge that strictly raw materials and articles not produced in this country be put on the free list and are agreed that the tariff on articles should be so adjusted as to interfere as little as possible with the wages of laborers in the United States, it would seem from the statement elsewhere published that the abolition of the small existing duty of twenty per cent. on cement is not justified. The result would be to lower the rate of wages of those engaged in that industry and check the manufacture and increase by at least a portion of that twenty per cent. the income of foreign manufacturers.

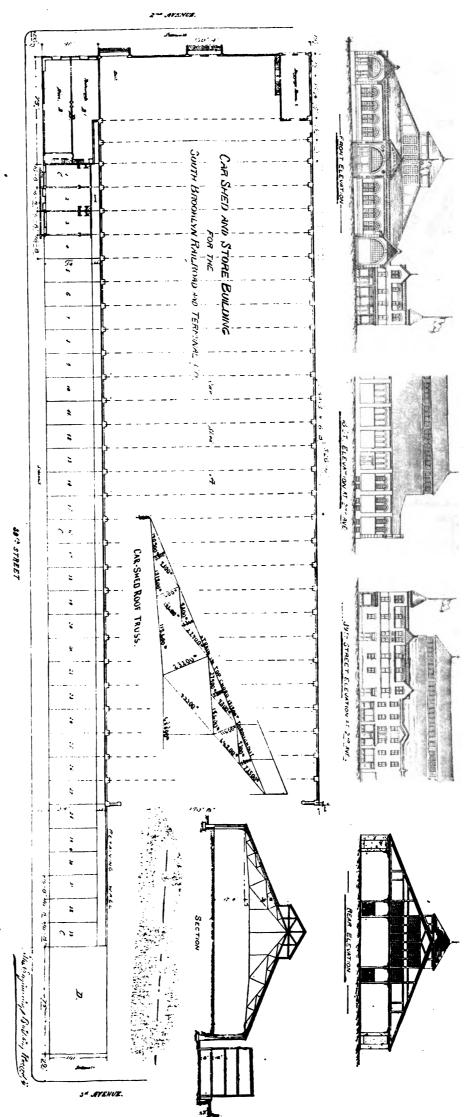

OUR ARCHITECTURAL ILLUSTRATIONS. DISPENSARY BUILDING, PRESBYTFRIAN HOSPITAL, NEW YORK.—J. C. CADY & CO., ARCHITECTS.

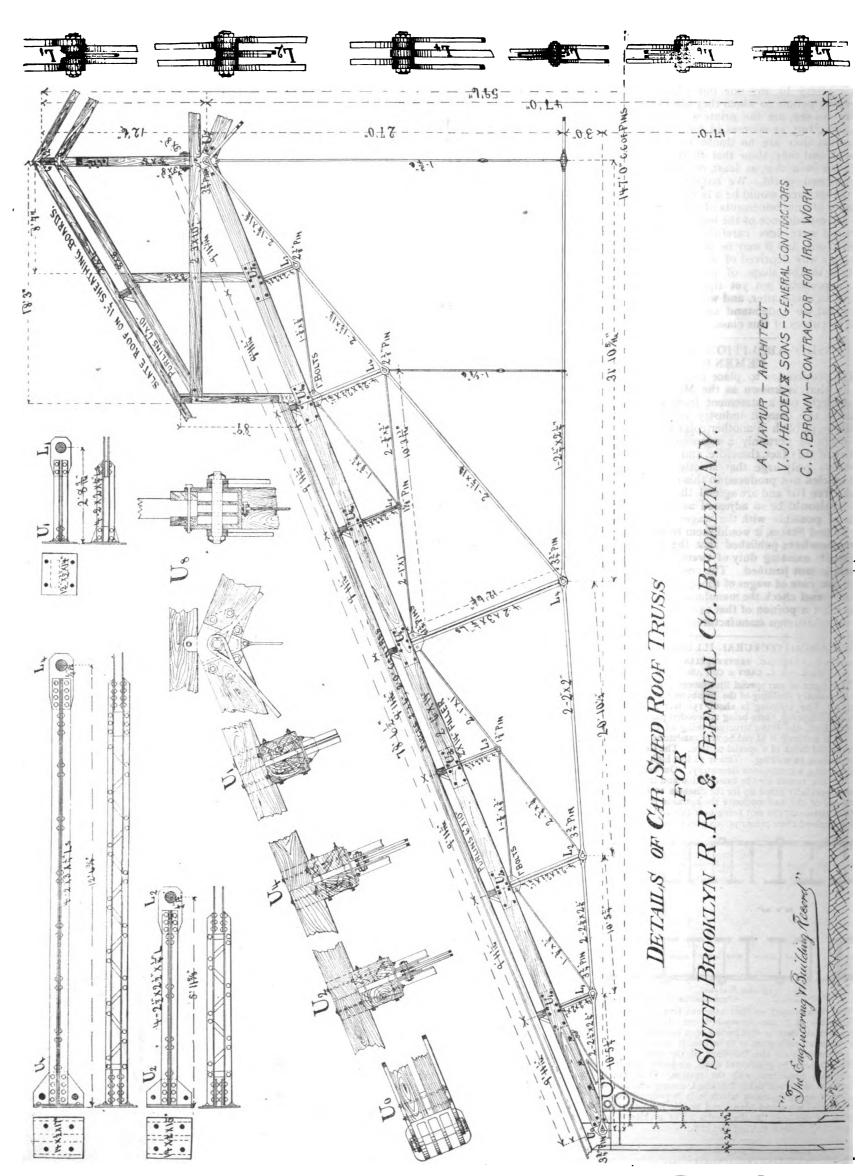

THE subject of our special illustration this week is the new Dispensary Building of the Presbyterian Hospital in this city. The building is about 150 feet long, 50 feet wide, and fireproof, there being no wooden partitions, furring or beams, the entire structure being of masonry and iron. The exterior is of red Scotch sandstone and Baltimore pressed brick of a special pattern. The Central Hall is for patients in waiting. This is 30 feet high, the upper portion being a continuous clear story. On each side of this hall are rooms for the examination and treatment or patients, specially fitted up for the diseases to be treated. At the end of the hall opposite the entrance is an apothecary's department, the exit being near this so that patients having received their prescriptions pass directly out. The

building is arranged so that hose can be turned on, and every portion of it can be washed out, all crannies and places to retain dust or dirt having been carefully avoided. The tower at the corner is to be used in connection with the ventilation of all the buildings of the hospital, with which it connects by graduated ducts, air being forced by several fans connected with the system. Plans are in preparation for several other buildings, among which is to be a model operating-room which, it is hoped, will represent the most advanced views and be the most complete building of the kind in the world. The architects are Messrs, J. C. Cady & Co., of this city.

MANTEL IN DRAWING ROOM, MANSION HOUSE, TOWSON-TOWN, NEAR BALTIMORE, MD.

Digitized by Google

STATION OF THE SOUTH BROOKLYN R. R. AND TERMINAL COMPANY.

This station is to afford a common terminus for the Coney Island and Long Island Railroads, and is designed to accommodate about ten tracks in the car-shed.

It is being built for the S. B. R. R. & T. Co. under the superintendence of A. Namur, architect, by V. J. Hedden & Sons, general contractors, and C. O. Brown, contractor for iron-work.

The depot and car-shed occupy a space 526' 6" x 150' 4", with an annex 40' x 175'. The brick walls are 24 inches thick, with "36-inch buttresses at truss-seats. The slate roof is supported by trusses spaced nearly 17 feet centres, and is lighted by a ventilator 36 feet wide, with side walls 8 feet high.

The main roof trusses are 147 feet span, 30 feet total rise, and 27 feet effective depth.

The top chords, purlins and jack-rafters are yellow pine.

The struts are each composed of four angles, with square end bearing against top chord, and pin connections with tension members, all of which are square bars with loopeyes reamed to fit pins within $\frac{1}{4}$ inch.

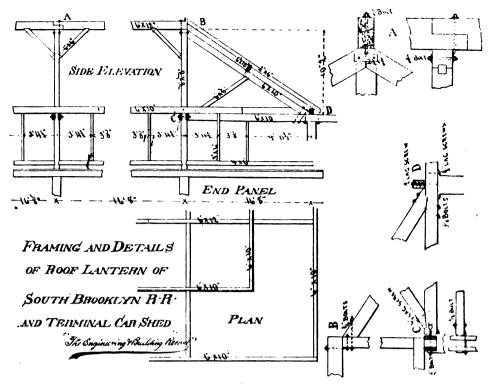

The only cast iron employed is in the corbel-brackets, peak-blocks and foot-pedestals, the latter resting at one end directly on stone wall caps, and at the other on expansion rollers. The connection of peak-casting to centre post of ventilator, the use of T-bolts for connections, and of twin planks for cross struts, together with other details of framing, are shown in the illustrations.

The roof is proportioned for a dead load of 40 pounds per square foot, and is considered so stiff in the purlin and rafter connections that lateral bracing in the end panels is omitted.

THE WATER-SUPPLY OF TOKYO, JAPAN.* By YBIJI NAKAJIMA, C. E., Imperial University, Tokyo, Japan.

Tokyo, or formerly called Yedo, is the present capital of Japan, and is the largest city in the empire. On the south it is bounded by the sea, and on the north and west there are many hill ranges. The heart of the city is traversed by many transportation canals. Its total area is 15,279 acres, or 23.87 square miles—a trifle larger than Manhattan Island. The total length of the streets is about 477 miles and they are, in general, very narrow. Most buildings in the business part are two stories high. The population of the city proper is 1,210,000, or 72.7 persons

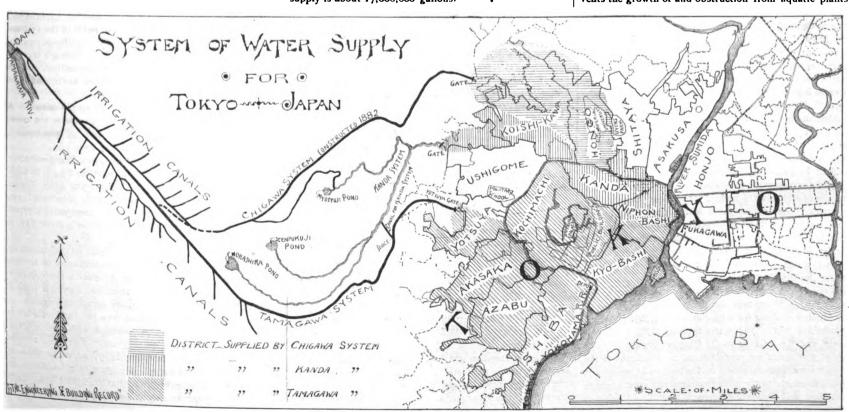

per acre.
"When Iyeyas, one of the most famous Shogun, decided to make Tokyo his headquarters, it was but a small town.

But his policy was to have all the nobility under his eye, so he ordered them all to reside in Tokyo, and this caused a very rapid increase in the population, as may be understood when it is remembered that some had armed followers to the number of 1,000, and each follower had his family." The water obtained was in general very bad, and in many places it contained salts and was not fitted for drinking purposes at all. Also in some parts the supply occasionally failed. Consequently, as the population increased, the necessity for water-supply was greatly felt, and the following works were consequently carried out, which, without material change, have supplied Tokyo until today.

In 1620 (though some say a little later), one of the Shogun ordered a man who had lived a long while in the neighborhood of Tokyo to consider the question of water-supply for the city. He proposed and constructed what is now commonly called the Kanda system. The three ponds—namely, that of Euokashira, Zenpukuji, and Myo-syoji—are the principal sources of this system, and a part of the water of the Tamagawa canal, which will be described further on, helps them. The respective heights of these sources are 147.5. 150.5, 137.5, and 129.6 feet above the sea. The waters from these four sources are combined in one canal and are distributed through a part of the city by various wooden pipes. This system supplies the wards of Koishi-kawa, Kanda, and part of Niphon-bashi. Its daily supply is about 17,000,000 gallons.

The other is called the Tamagawa system, and is more important than the one already described. The Shogun noticed the insufficiency of the then existing system, and, in 1651, he ordered a nobleman to consider its extension, or, more properly, the introduction of a new supply. It is said that accordingly two farmers who were well acquainted with the surrounding country were appointed to make surveys and report. It is also said that at that time there were no levels, and almost no surveying instruments of any description at all. However, somehow or other, they made the survey, and recommended drawing the water from the Tamagawa River. The plan was adopted, and the work was begun in April, 1652, and completed in November of the same year. They built a dam across the river so as to turn the water into the canal The height of water surface of the canal near the dam is 404 feet above the sea. The total length of the open canal from the dam to the Yotsuya gate, Tokyo, is 26.6 miles. There are two gates close by the dam and an overflow between them. From the dam for about 0.7 of a mile the width of the canal is about 30 feet, and the width of the remaining portion decreases from 24 to 18 feet. "The canal was skillfully placed along the plain which extends from the dam to Tokyo, so that no high embankments or deep excavations were needed. The velocity of the water is rather great, but it is quite uniform from one end of the canal to the other. The high velocity is beneficial, because it prevents the growth of and obstruction from aquatic plants,

Digitized by Google

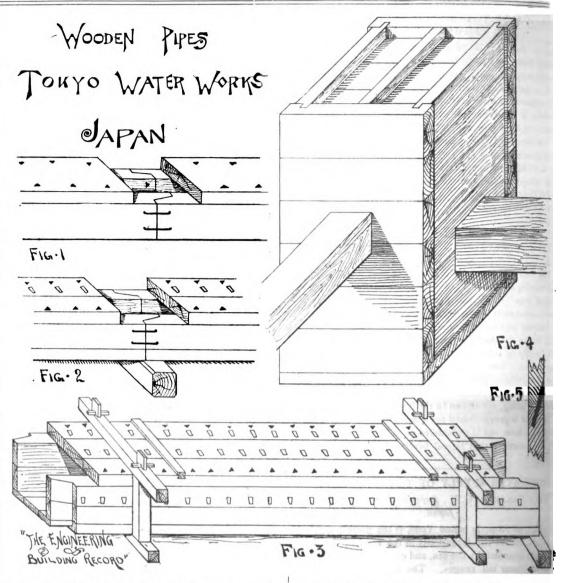

^{*}The materials for this description were furnished to the author mostly by Mr. R. Hara, C. E., in the Department of Public Works of Tokyo City, and considerable is quoted by permission from Prof. W. S. Chaplin's paper read before the New England Water-Works Association.

and the injury to the banks is less than would be expected, as the earth here hardens under the action of water." This canal serves also for irrigating the lands along the line. There are also several mills. The gate at Yotsuya regulates the water flow to Tokyo, and the extra water is drawn off by a waste-pipe. The daily supply by this system is about 24,000,000 gallons. This supplies the following wards—namely, Akasaka, part of Yotsuya, Azabu, Kochi-machi, Shiba, Kyo-bashi, and part of Niphon-bashi, as shown on the map. The total number of the people depending upon these two systems is about 400,000.

There is another, called the Chigawa system, which supplies a part of the wards of Koishi-kawa and Hongo. The daily supply is 1,400,000 gallons. It was reconstructed a few years ago.

Besides the above three systems, there had been introduced three or four other systems at various times, but none of them were successful on account of excessive cost of maintenance and all had been abandoned.

The distribution pipes are generally of wood; in dry places Retinispora Obtusa is used, and in wet grounds pine is used for pipes. There are many forms of wooden pipes in use. When the internal diameter is much less than 6 inches, a round timber with a circular hole through is used. When the pipes are a little larger, then a square timber is hollowed out so that its section looks like a U, and the top is covered with a plank which is spiked on (Fig. 1). The joints are well calked with a fibrous bark so as to prevent leakage. The connections between the ends of adjoining pipes are formed by chamfering the end of one pipe and enlarging the interior of the end of the next and driving the first into the second (Fig. 1). The pipe of this form is used when the side of the interior hole is less than six inches. In larger pipes the section is either square or rectangular, laid on the broad side (Fig. 2). The thickness of the planks forming the sides is from 21/3 to 6 inches. When these pipes are subjected to a considerable pressure, they are braced by frames of square timbers, as shown in Fig. 3. The largest wooden pipe in use is 3 feet in height by 41/2 feet in width, and the smallest one is 31/4 x 31/4 inches. The largest stone conduit is 5 feet in height by 6 feet in width, and the smallest one 1'6"x1'6". The total length of the wooden pipes now in use is 533,790 feet, or 101.1 miles, of which 290,470 feet belongs to the Tamagawa system, 221,210 feet to that of Kanda, and the balance to the Chigawa system. The total length of the stone conduit is 24,625 feet, of which 12,070 feet belongs the Tamagawa system and the balance to that of Kanda. The depth of the distribution-pipes is from 4 to 18 feet below the surface of the ground. The wooden pipes last from 10 to 20 years, according to the conditions of the soil. The distribution pipes of the three systems are not connected at all, though in some parts they come close together. Whenever there is an abrupt change in level, or there is a branch pipe, a square box is used, as shown in Fig. 4, whose sides vary from 21/2 feet to 6 feet, according to the sizes of the pipes. There are a great variety of the forms of these boxes, according to the locality, the head, etc. In some parts boxes are put simply for inspecting the flow and the quality of water. They may, to some degree, serve to make the flow in the pipes uniform. "The water is not carried from the mains into the houses, but is delivered into wells, which are usually on one side of the streets." Commonly, the connection of the well to the distribution-pipe is made by inserting one end of a 2-inch pipe about 3 feet long to the side of the distributionpipe and the other end to a square wooden box I foot 21/4 inches wide and I foot high, the thickness of which is about 21/3 inches. The connection of this box to the well is made commonly by a wooden pipe, the diameter of which is 21/3 inches. The wells are generally lined with wooden planks 5 or 6 inches wide and 2 inches thick fastened together by several bamboo bands in a cylindrical form. The height of each of these wooden cylinders is about 6 or 8 feet and their diameter varies from 3 to 4 feet. The depth of the wells depends upon that of the distribution-pipes near by. The top of the cylinder projects about three feet above the surface of the ground so as to prevent the danger of falling in. The total number of these walls now in use is 7,765, of which 2,935 belong to the Tamagawa system, 3,704 to that of Kanda, and the balance to the Chigawa system. "The ends of the mains are carried down to the banks of the canals, rivers, and the shore of the bay, and the water is allowed to escape freely, thus reducing the great pressure in the pipes and preventing injury to them." In this way

a great deal of water is wasted, though the exact amount is not known.

Total impurities	3 - 542

Chemical examinations have shown that the water is contaminated in the distribution, for samples taken from the conduits showed no pollution, while those taken from the wells in the lower part of the city were decidedly bad, as shown in the analyses. These analyses show also that the water of the Tamagawa is much superior to that of Kanda.

"Several theories have been advanced to account for the contamination. One is, that as the pipes are usually below the level of the ground-water, though the head is greater inside the pipes, there is a continual diffusion of the impurities in the ground-water through the wood into the pipes. Another and more probable hypothesis is that, owing to the constantly changing level of the water in the wells which arises mostly from the small size of the pipes which connect the mains with the wells, the impure water from the ground makes its way through the leaky linings into the wells, and that the water thus polluted is carried at times back into the mains." In another experiment, water was taken out from the different parts of the systems on the same day; and the analysis of these different waters showed that the further the water flows through the distribution-pipes the greater is the contamination, and in the thickly-settled places the impurities are found to be more than in the thinly inhabited portions.

The water-rate for one well is \$4.50 per annum. A fountain-rate is double, and a waterfall-rate is ten times that amount. The average annual cost of maintenance for the three years (1883-84-85) is \$27,800.

Nearly all the people of the Fukagawa Ward and about one-fifth of those of the Honjō, altogether 89,450 in number, use water brought daily by boats from some distant rivers or from the outlets of the already mentioned systems. The quantity conveyed daily by these boats is 77,200 gallons. The daily cost of transportation is about \$45, of about \$16,425 per annum.

In the places where the above systems do not extend the people use the water of the common wells and of artesian wells. The total number now in use in the capital is 33,952. In general, the water from the common wells is much inferior to that of the already mentioned systems.

As the water of these systems has no head and as in many places it can hardly be obtained with convenience, the losses due to fire are quite great. The area covered by the buildings burnt in 1883 is 37 acres, in 1884 26 acres, and in 1885 32 acres. Nearly all the buildings are only one or two stories high, so that the losses due to these fires is not so great as might be supposed. It may be

fairly estimated that that losses from [buildings burned in these years are \$669,000, \$473,000 and \$585,000 respectively.

The following table shows the areas, population, den sity, and death-rates of differents wards:

Name of ward.	Area in acres.	Population.	Persons per acre.	Death-rate per 1,000 in 1885.	Death rate in 1886 (cholera prevailing.)
Kochi-machi. Kanda Nphn-bashi. Kyobashi. Shiba. Yotsuya. Azabu. Akasaka. Ushigome. Koishi-Kawa. Hongo. Shitaya. Asakusa.	1,638 724 686, 876 1,524 381 914 1,105 1,372 953 838 953 1,067	51,305 123,241 153,996 170,816 111,681 30,733 40,814 25,526 43,550 40,840 62,205 78,462 110,043 85,868 72,278	73.3 80.7 44.0 23.1 36.9 29.7 65.3 93.6	20.1 25.8 25.7 22.7 26.0 22.5 20.3 23.5 24.7 25.0 24.6 25.4 29.3 26.8	25.0 42.2 37.8 25.5 31.9 26.4 22.9 23.3(?) 25.3 31.2 34.1 22.0(?) 45.1 30.0 37.8

24.96 31.94 Wards marked (?) omitted in obtaining average death-rate for

From the above table we see that the death-rate is generally great where the water is bad.

About two hundred and fifty years ago very little was done toward systematic water-supply even in London, and the water works of Tokyo were quite large for that period. In fact, up to that time there had been no such extensive water-works constructed in the world except at Rome. However, gigantic as it may have appeared at the time of its construction, it cannot be compared in many respects with the present systems in America and Europe, and, therefore, it will, no doubt, be replaced by some better system in a few years.

[The scale on the map is correct only for the city of Tokyo; the conduits have been shortened nearly one-half for convenience of representation. The Tamagawa and Chigawa systems are shown in solid black lines merely to distinguish them from the earlier or Kanda system. The ramifications of the distributing-pipes through the city have been omitted as unnecessary and confusing on so small a scale.

The Japanese names in the city area are those of the different wards whose boundaries are shown by the irregular polygonal lines.

In Figs. I and 2 of the details the joint covers have been left off to show the construction of the joints. They are simply pieces of plank of the same thickness as the rest of the top and secured with spikes and clamps. The small black triangles are heads of iron spikes, and the somewhat larger four-sided figures show the ends of wooden pins driven obliquely through the joints of adjacent planks to fasten them together, as shown in Fig. 5.]

STATEMENT OF THE CEMENT INDUSTRY.

THE following is the statement prepared by those intrusted in the cement industry in the United States, alluded to elsewhere in this issue:

In the present tariff the duty is 20 per cent. ad valo-

In the proposed tariff cement is on the free list.

neither under the doctrine of admitting free "such raw materials as enter into American manufacture," nor under the doctrine of admitting free such articles "as will not interfere with American industry" can the placing of cement on the free list be sustained.

Cement is not a raw material; it is quarried, burnt, ground.

ground.

Cement enters into no other manufacture as a raw

material.

Cement is nearly 90 per cent. labor, and labor that costs several times as much in this country as in Europe.

Neither importers nor European manufacturers ask its admission free; and in point of fact the price in Europe to dealers for American shipment is 18 to 25 cents less than for the same cement for European consumption, just about the amount of the duty; so that putting cement on the free list would enable the European makers to raise their price half the amount of the duty, and still control the American market by reducing prices only a part of the duty taken off.

THE CEMENT INDUSTRY.

The manufacture of cement is not a local industry. It is national. Works exist in Maine, Connecticut, New York, Pennsylvania, Ohio, Maryland, Virginia, Washing-

ton, Oregon, Alabama, Colorado, Texas, California. Illinois, Wisconsin, West Virginia, Kentucky, Indiana and Michigan. It stands seventh on the list of non-metallic products of the United States. It ranks just below lime tallic products of the United States. It ranks just below lime and salt. It employs a capital \$8,000,000, has an output of over 5,000,000 barrels per annum and gives work to about 12,000 laborers. The largest works are in New York State where nearly 3,000,000 barrels are made, and 8,000 men employed; in Kentucky, where nearly 1,000,000 barrels are made and 1,500 men employed; and in Pennsylvania, where nearly 400,000 barrels are made and 600 men are employed.

MANUFACTURE AND CLASSIFICATION OF CEMENTS.

"Roman" cement is a natural rock, quarried, burnt in

kilns and ground.
"Portland" cer "cement is an artificial cement made by mixing chalk and clay, or limestone and clay, in varying proportions, grinding this to powder, making a brick or ball out of this moistened powder, and after calcining at high heat, this artificially-made new stone, by grinding

the resultant clinkers to powder.

The "Roman" corresponds substantially to the Rosendale, Louisville, and the majority of American

cements.

The "Portland" corresponds to the American "Portland and the this grade of cement The "Portland" corresponds to the American land." It has been claimed that this grade of cement cannot be made in this country for want of material. After fifteen years of experimenting, and after a loss running into millions, this statement has been controverted, and for five years past American "Portland" cements, "of a quality equal to any imported," and made in Pennsylvania, in Ohio, in New York, in Indiana, and in Texas, have been used on Government work (Vide Reports Engineer-Commissioner District of Columbia for 1883, 1884, 1886) and other public work, with parties concerns. 1884, 1885) and other public work, with entire success, and in competition with foreign cements. The Eads Jetties are built with American Portland cement (Vide Jetties are built with American Portland cement (Vide Captain Eads' Report on Mississippi Jetties); and the London and Southwestern Railroad of England actually, after a test, bought American Portland for one of its bridges (Engineeeing News, Vol. 1887). This cement must sell at a lower price than the imported, because of the established reputation of the older foreign brands; but with the abundance of limestone and clay in this country American manufacture will develop, and its product become established also come established also.

STATISTICS OF MANUFACTURE.

From the "Mineral Resources of the United States," United States Geological Survey, 1885, the following figures are given of the production of cement made from natural rock in the United States, from 1882 to 1885:

Production of Cement from Natural Rock in the United States from 1882 to 1885.

YEARS.	Bbls. of 300 lbs.	Averege price per bbl	Total value.
1882	3,165,000	\$ 1 10	\$3,481,500
τ883	4,100,000	1 00	4,100,000
1884	3,900,000	90	3,510,000
1885	4,000,000	90 80	3,200,000

In reference to American Portland the following estimates are made in the same work:

Estimated Production of American Portland from 1882 to 1885 :

YEARS.	Barrels of 400 lbs.	Average price per bbl	Total value.
1882	85,000	\$2.25	\$191,250
1883	90,000	2.15	193,500
1884	000,000	2.10	210,000
1885	150,000	1.05	202,500

The total production of all kinds of cement according to the same authority:

Total Production of all Kinds of Cement in the United States from 1882 to 1885:

Years.	Barrels.	Value.
1882	3,250,000	\$3.672,750
1883	4,190,000	4,293.500
1884	4,000,000	3,720,000
1885	4,150,000	3,492,500

From leading trade authorities it has been ascertained that the output of natural cement has increased to 5,000,000 barrels in 1887, with an average price of 75 cents; and the Portland cement industry has not appreciably increased, though prices have gone down as low as \$1.85.

IMPORTATIONS OF CEMENT.

From reports of Bureau of Statistics the following are the imports of cement of all kinds into the United States for the past ten years:

Imports of Cement:

Years ending June 30.	Bbls. of 400 lbs.	Value.
1878	187.000 221,000 337.793 472.864 582,623 578.141 645,197	\$204,42° 205,074 373,601 440,025 675,587 817,346 820,008 906,581 722,579

* Estimate of Geological Survey.

CONCLUSIONS FROM THE FIGURES.

The American manufacture has remained practically stationary since 1883, actually decreasing in 1885, and increasing slightly to 1887. The price fell, however, each year so that the 4,150,000 barrels of 1885 netted less to the makers than the 3,250,000 barrels of 1882, and the ,000,000 of 1887, barely as much as the smaller output

On the other hand, the imports of foreign cement have increased tenfold since 1878, and in the period since 1882 have actually trebled.

In the last-named period the invoice price has fallen from \$1.77 in 1884 to \$1.01 in 1887, owing to taking duty off of barrel.

THE CAUSE OF HEAVY IMPORTS AND CHECKED PRO-DUCTION.

Three causes have led to the increase of imports and checked home production.

First—Low ocean freights.

Second—A practical reduction of the duty nearly one-half in 1885, by the decision of the Secretary of the

half in 1885, by the decision of the Secretary of the Treasury, relieving the foreign article from duty on the barrel and on foreign inland transportation to tide-water. Third—The higher wages paid American labor. On the first point it may be stated as a fact that the freight from Europe to nearly all tide-water points in the United States and to many lake points is less than the rates from American cement works to similar points. The reason for this is that cement comes from Europe as ballast

On the second point the figures of imports above given show a reduction of 75 cents in invoice value of cement imported from the year 1884 to 1887. This is due to the taking off the duty on the barrel, and has actually, by an executive act, without action of Congress, reduced the duty for ar to a cents per bere level. duty from 35 to 20 cents per barrel.

On the third point, in order to compete with the foreign

maker, there remains no other possibility of reducing cost except by reducing wages of labor, as the constant reduction necessary to keep a foothold since 1882 has exhausted all other margins and means, a number of failures having proven this fact. The labor is at least 50 per cent. less

COMPARATIVE LABOR FIGURES.

Cement is nearly all labor.

In the United States:

Quarrying rep	resen	its40 j	er cent
Burning	**		**
Grinding	**	6	• 6
Moving, etc.,	"	5	**
Packing	**	3	**
Coal and coke	e, sta	ves and heading, all the	
product of	labo	r represents27	"
Makin	g of l	abor 87	4.

This labor represents on an average for-

Quarrymen	\$1.50 to	\$2.00	per day
Laborers	1.30 to	1.50	**
Millers	2.00 to	2.50	••
Millwrights	2.50 to	3.00	44
Engineers	2.00 to	2.50	**
Coopers	r ro to	2.00	• •

All the labor is that of men.

In Europe.

Both men and women are employed in cement-works. The wages paid per day as gathered from investigation made in the European cement works and from Consular reports of 1884 are as follows:

	France.	Germany.	Belgium.	England.
Miners	\$0.87	\$0.52 .65	\$0.60 .881/s	\$0.52
Women Miliers	.48 to .87	.05	.88%	1.00
Millwrights	1.121/2		.831/2	1.16
Laborers	.76	.60	.66	. 78
Women Laborers	. 381/2	.24	.57	
Engineers	. 97	·73 .66	1.03	1.10
Coopers	.93	.66	.86	1.13

AMERICAN MALE VERSUS GERMAN FEMALE LABOR.

From U. S. Consular reports, Ex. Doc., 48th Cong., 464, one German Portland cement manufactory in

Silesia employed in 1884, according to its pay-roll, in its whole works:

3 workmen.at 36 cents per day.

A total daily pay-roll of \$33.72.

An American works of same number of hands employs according to its books :

2 engineeis.at \$2.00 30 coopers... .at \$1.74 4 millersat 2.50 2 millwrights....at 3.00 51 laborers at 1.30 50 quarrymen. at 1.75

A total daily pay-roll of \$226.30.

A daily difference in favor of German manufacturer and against American manufacturer of \$192.50 in labor alone. CONCLUSION.

Clearly, under these facts, the duty on cement should be retained under that clause of the Democratic platform of

1884, which says:
Necessary reduction in taxation can and must be effected without depriving American labor of the ability to successfully compete with foreign labor, and without imposing lower rates of duty than will be ample to cover any increased cost of production which may exist in con-sequence of the higher rate of wages prevailing in this country

CONGRESSIONAL BATH-ROOMS

CLEANLINESS, LUXURY, AND INSPECTION FOR THE NA-TION'S LAWMAKERS.

(From the Washington Star.)

THE bath accommodations of the House are a luxury that brings to the mind of back county constituents fairy visions of Oriental grandeur. Away down in the depths of the Capitol, down still yet below the basement, the marble tanks of tempered water into which the members plunge are located. When the elevator bumps against the plunge are located. bottom and can go down no further there are three steps with a brass rail on each side, and then you are in a little square room almost as warm as a steam bakery. A door leads into a short passage betwen the heavy foundations. Here the air is warmer than in the room. Suddenly it Here the air is warmer than in the room. Suddenly it turns at right angles into another short passage, where the thermometer registers still higher. Another turn and another thermometric jump, and there are the bath-rooms. The plural applies to the big walnut cabinets with blind doors which stand in a row along the wall. There are nine of these, and in each is a large tank or bath-tub, which can be filled with hot or cold or tepid water in a very few minutes. These are all in a narrow L-shaped room, which is presided over by a big colored man and his assistant. The cabinets or baths are about the size of assistant. The cabinets, or baths, are about the size of an ordinary hotel bed-room, and the tubs are big enough for the largest sized statesman to wallow about in with ease and comfort. Tom Reed, and Barnes, of Georgia, test their capacity more than any other members, but they even can roll over and flounder about in one of the marble tanks with as much ease as they could perform the same evolutions anywhere.

Some of the tubs are simply iron, nicely painted, but the newer ones are made of marble and each looks like a great sarcophagus. Three ordinary men might get in one of them without much crowding. The marble sides are as slippery as glass and as warm as the flesh that touches them. Thermometers are hung in each bath and on the walls in the passage. The temperature is kept always the same, and a member might promenade for three hours in nothing but his epidermis without danger of cold. It was here that Mr. Reagan struggled with a tight undershirt on the occasion of his famous bath while the vote on the

Morr son bill was being taken.

The temperature is just at a point where the least ex ertion would bring on a profuse perspiration, and but little rubbing in the bath is sufficient to bring a ruddy glow. Members come up in the elevator from these regions with the hair curling about their temples and their cheeks as pink as a baby's.

Some of the older members take a bath as the last step Some of the older members take a bath as the last step in their preparation for making a speech. They write the speech, commit it to memory, take a bath and then deliver it. If a member has the rheumatism or a cold, or for any other reason feels the necessity of being par-boiled, there is a Russian steam-bath at the end of the bath-room to which he resorts. It is a little close room furnished with a wooden bench and a coil of steam-pipes that cover the walls of the compartment. When the door shuts there can't much heat get out, and the thermometer naturally runs up into the big combinations. A member lies on the bench. into the big combinations. A member lies on the bench, the door is shut and the steam is turned on. He is then in about as hot a place as he is likely to enter in this life. He gets enough of this in a little while, and he has to be cooled off gradually by being plunged first into a tub of hot water, into cooler water, then cooler and cooler, until he gets back to the temperature of ordinary mortals. It takes about

an hour or an hour and a half's cooling before he ventures out into the colder atmosphere of the house; and it is best

for him to walk rapidly on his way home.

Members of Congress can bathe here any day, provided not more than a hundred select the same day : but on Saturday none but members can enter. On other days employees of the House, or men who have been given tickets ployees of the House, or men who have been given tickets by members, may bathe. On Friday business is most brisk, and the swashing of the water may be heard from early morning until the place is closed in the evening. It is hard to tell how many people are bathed on this day, but ordinarily a hundred is as many as can be handled "in hours." After an all-night session the capacity of the rooms is strained. Members have all their toilet made here except their barbering. The air smells moist with steam, and is fragrant with perfume and scented soaps. The very finest toilet furnishings are used. The "black man of the bath" will rub you down and perform all the services of the bath. services of the bath.

Besides this he has proper instruments for the purpose, and he will trim off the corns and keep the feet in order. When a new member is elected from a country district it generally takes "a right smart while" to get his feet in condition. They require much care and attention. But this man keeps all the Congressional feet in order without regard to size or previous condition.

THE DRAINAGE OF THE CITY HALL BUILD-ING AT ALBANY

WE saw a newspaper item alleging serious defects in the drainage of the Albany City Hall building built a few years since. We wrote to City Engineer Andrews regarding the matter, and have received the following reply:

ALBANY, N. Y., March 8, 1888.

SIR: In response to your request of the 7th inst., I will state that the origin of the article enclosed by you, which appeared in all the papers here, was as follows

One of my assistants imagined that he detected a smell of sewage in this office, which is on the ground floor, and, at my suggestion, he asked one of the inspectors of the Board of Health to apply the peppermint test. This was done by pouring a quantity of peppermint and water into a wash-bowl in the third story. In a few minutes the offices were filled with a very strong odor of peppermint. I then called upon the Street Commissioner, who is a plumber, and did the plumbing work (but did not lay the tile drains) of the building, to aid in an examination. We discovered that the immediate cause of the smell noticed was due to defects in tile pipes serving to drain the area boxes. One of these pipes had a hole knocked in it, and a very strong smell was evident at the hole; another of these tile pipes delivered a strong peppermint odor outside of the building into the area box, from whence it was immediately drawn into a window designed to supply fresh air to the building, a fan with steam coil being provided for the purpose, but not now used.

Until these defects are remedied it will be useless to test for other leaks.

The steam (return) pipes are badly rusted and leaky in places, and these are now being repaired. There seems to be a leak also in the water-pipes, or in the elevator pipes, as a constant stream of water runs through the cellar walls and over the floor. The roof of the building needs immediate and extensive repairs, as there are many leaks and much damage is being done.

A difficulty seems to exist in making small repairs when needed, for the building being in charge of County Supervisors as well as of city officials, it is very difficult to get the requisite appropriations. This is merely one of the many instances where there is no one responsible head, and where every one's business is no one's business. The defects arise from neglect mainly. As a sanitary engineer, I am most alarmed about the defective drains, and would ascribe the many headaches and small illnesses of frequent occurrence to this cause principally.

I do not wish to convey the impression that any others than my assistants and myself are alarmed, for such does not seem to be the case. The people of Albany are so used to defective drains and unventilated sewers that the matters I have referred to do not seem very alarming to them, excepting the evident damage to the externally beautiful building. Very truly yours,

HORACE ANDREWS, City Engineer.

CUP VERSUS WIPED JOINTS.

NEW YORK, March 14, 1888.

SIR: I have read with interest the discussion on the cup and wiped joint between Messrs. Kirk and Billings in your issue of March 10, and I must coincide with Mr. Bil-lings in his views. Having had twenty-eight years' experience as a journeyman and superintendent in the plumb-ing trade, I find that a cup joint, if properly made, will

stand the test of expansion in hot-water pipes better than a wiped joint, as the solder can be used on a cup joint a wiped finer and hotter than in wiping. While I have great deal finer and hotter than in wiping. While I hav seen many wiped joints stretch and crack in the middle I have no recollection of a cup joint cracking in the middle. We, as plumbers, object to the cup joint, because it don't look as well as a wiped joint, and it indicates no mechanical skill, and besides, if improperly made, it is useless.

Respectfully yours,

J. B. PATERSON.

845 EAST 164TH STREET, New York, March 10, 1888.

SIR: I thought that your correspondents in advocating the merits of the "wiped" and "cup" joints left the question without the clear line of demarkation which seems to tion without the clear line of demarkation which seems to me to define the limits of usefulness of the two joints. All of the lead solders melt at a lower temperature than lead. Generally speaking, the botter the solder is made without melting the pipe to injury the better the joint. The wiped joint is made by heating the solder to a semifluid state, when it is molded about the joint. The heat has not been great enough to make it athers. has not been great enough to make it adhere very firmly has not been great enough to make it adhere very him to the lead pipe, and it forms a metallic wrapping which shrinks tight about the pipe and resists low pressures. The ease with which it is made, even in inconvenient positions where it would be impossible to make a cup joint successfully, recommends it for all plumbing work at low pressures and justifies the waste of solder.

Any one who has had to do with joints in lead pipe at

pressures exceeding 100 pounds, and ranging from this to 400 pounds, will know how utterly worthless this joint is at such pressures. It is not necessary to make the pipe thin at the joint for the cup joint. If properly made the solder is literally melted into the lead pipe and on to the brass or copper fittings, making the joint, though some-times unsightly, still the only satisfactory one for use under high pressure, or when the conditions of tempera ture vary greatly. Yours truly, O. F. Nichols.

NEW YORK, March 15, 1888.

SIR: With reference to the discussion on cup and wiped joints between Messrs. Billings and Kirk in your issue of March to, it is my opinion that the cup joint naturally weakens the pipe by expanding it to admit another pipe of equal size, but if a smaller pipe be entered in a large one equal size, but it a smaller pipe be chicked in a swaller which requires no opening the joint will be as strong as

any part of the pipe.

In cases of frozen water-pipe that I have seen they invariably burst at the open end of a cup joint, but I never

wariably burst at the open end of a cup joint, but I neve knew a wiped joint to burst.

Mr. Billings makes a good argument in a bad cause, but is mistaken in saying that a wiped joint is a butt joint. This is not the case; one pipe enters the other the same as in a cup joint.

as in a cup joint.

A lead pipe can be no stronger than its weakest point: expanding weakens it, and if it be argued that it is still strong enough after expanding, there must be a great waste of material in making the rest of the pipe so much heavier. Therefore a wiped joint is cheapest on account of avoiding this waste.

Some years ago my attention was called to a device for cold-welding two lead pipes over a corrugated iron ferrule, which was inserted into the expanded ends and the

rule, which was inserted into the expanded ends and the pipes molded down over the corrugations and finished to a perfectly smooth joint. The same argument here used concerning cup joints was effectively used against it.

Basin-cock couplings and all small brass couplings are generally cupped in, but the pipe is usually large enough to admit the end of the coupling without expanding.

I consider a wiped joint the cheapest and best, and when properly made it is the strongest part of the pipe. A good wiped joint is also very surely made, and an inexperienced workman is least likely to make a poor joint with one since the more time he takes the more complete. with one, since the more time he takes the m MICHAEL SEXTON. the amalgamation.

HEATING SURFACE REQUIRED TO HEAT WATER IN TANK

NEW YORK, January 13, 1888.

SIR: Will you kindly inform us how many square feet of heating surface in a tank will be required to raise 21,000 gallons of water from 160° to 320° in ten hours. using steam at 80 pounds pressure, and oblige

[To warm 21,000 gallons in ten hours through the range of 160°, between 160° and 320°, is the equivalent of warm ing 17,125 pounds of water in an hour through the same number of degrees, or 2,740,000 heat units, and it calls for the condensation of 3,009 pounds weight of steam at 80 pounds pressure to water at the same temperature.

This steam must pass into the coil at a difference of something less that 5 pounds pressure-in other words, 1 pressure must be maintained in the coil of something over 75 pounds pressure if the water is to be made 320° Fab. This determines the minimum diameter of the pipe that supplies the coil; and with a volume of about 5 cubic feet to the pound weight, and a volocity of, say, 600 feet per second, it will require a pipe of fust about one square inch of area in cross-section to pass the steam required at 80 pounds.

Digitized by Google

It must be remembered, however, that this is a very short pipe-a nipple only-and that if the pipe has any considerable length, not less than a 11/4 or 11/2-inch pipe will pass this amount. This is the size that is required to keep the tank hot when it is drawn from regularly-or, in other words, to keep the pot boiling.

A different condition, however, exists when steam is turned into a cold tank, or, rather, a coil in a cold tank, and in such a case the pipe must be large enough in diameter to pass the steam in a very much greater volume, as the pressure cannot be maintained until the water becomes very hot.

It might be well to remember, also, that the velocity will vary under this condition, as condensation takes place so rapidly in the coil, so that the increase of volume may be 5 to I, or nearly so, as the pressure reduces. It is well in practice, therefore, to consider only the increase in volume, which will make the pipe five times the area of a 1-inch pipe, or something greater than a 2-inch pipesay the next commercial size-21/2-inch. This, remember, is for a very short pipe, with no elbows, and that practically you will require a 3-inch pipe.

The coil throughout would be well to be of the same diameter, if it is a continuous spiral or return bend. If a header coil, it may be made of 1-inch pipes, with 3-inch headers.

For the surface of this coil there are no very complete data. While there is a great difference of temperature between the steam and the water, a comparatively small coil will do-about 35 feet lineal of 3½ pipe. To keep the water at 320° Fah., however, with steam only 2° or 3° hotter, presumably four times as much coil will not prove more than necessary, and if we were called upon to plan such an apparatus we would so provide that it would be an easy matter to add to the length of the coil.]

PNEUMATIC TUBES WANTED.

PENNSYLVANIA COMPANY, CHIEF ENGINEER'S OFFICE PITTSBURG, PA., March 9, 1888.

SIR: We are looking up the matter of pneumatic tubes for a large office building. Can you give me the names of any parties who make a specialty of this business, and could you refer me to your paper for a description of any of these devices which are in use for the transmission of messages from one part of a building to another, or

from one building to another building through tubes?
Yours truly,
THOMAS RODD,
P. A. Engineer.

[An illustrated description of the Pneumatic Service in the Equitable Building, New York, appeared in our issue of November 12, 1887, page 680. Our readers can doubtless suggest the names of parties making a specialty of this work.]

RECORD OF PRESSURE ON WATER-MAINS IN UNITED STATES.

New York, March 10, 1888.

SIR: Will you kindly let me know if there is a book published giving the pressure on the water-mains in different towns and cities in the United States? The idea is to find out those towns in which the pressure on the water-mains is too high for domestic purposes, and where they would therefore likely need pressure-regulating valves. Answer at your earliest convenience and oblige,

Yours respectfully,

TIMOTHY KIELEY.

[We know of no book that gives this data, but we believe manufacturers of water-motors have collected it for their private use. Maybe our readers know of available data.]

STEEL VERSUS WROUGHT IRON FOR BUILD-ING PURPOSES

BOSTON, January 31, 1888.

BOSTON, January 31, 1888.

SIR: Might I ask an opinion from your paper in regard to the use of steel for building purposes in place of wrought iron? I am engaged in the planning of a large structure involving the use of many heavy iron or steel beams, and some trusses of rather exceptional spans. In view of the impracticability in this special case of making careful tests of each piece of metal before it leaves the shop, is it safe to simply specify steel beams of given weights and brands and figure the dimensions of the members of the trusses? In other words, can the appearance of steel be trusted as an indication of its reliability for building purposes?

Yours very truly, ARCHITECT.

[Our correspondent really asks two questions: First,

[Our correspondent really asks two questions: First, as to the comparative values of steel and wrought iron for structural purposes, and second, as to the importance of

inspecting and testing such structural material before delivery at the site of erection.

As regards the comparative merits of the two metals. we may say that for ordinary purposes there is very little choice between good grades of each as supplied by reputable manufacturers.

Iron has been longer made and is better understood, and can be obtained with certainty of good quality from more people, but first-class structural steel, as made by those who have had the requisite experience in its manufacture, is a most excellent material, and we should be inclined, if able to inspect it properly, to give it the prefrence for almost all structural work.

The two metals cost about the same per pound, and as steel is about 30 per cent. stronger, and the same factors of safety are admissible for each, the same dead load can be supported with equal safety and with less expense by the use of steel. As their moduli of elasticity are also about the same, the lighter steel beam, though of equal strength, will deflect more than iron under the safe load of each.

Consequently, if the admissible deflection is limited, there is no economy in the use of steel, unless the span is so great that the weight of the structure itself becomes a large fraction of the total load, in which case the saving of weight due to the greater strength of steel may make the deflection even less than that of an iron structure of the same strength, in which case the advantage is every way in favor of steel.

As regards testing, while we will not say that good material cannot be obtained with certainty and in any quantity from reputable makers, we should not advise placing any dependence upon so doing.

The material, whether steel or iron, should, for all structures of any magnitude or importance, be thoroughly inspected and tested as soon as rolled, and its behavior and treatment should be carefully watched at every step from that point on until it is finally and satisfactorily placed in the structure.

Too much stress cannot be laid on the importance of early inspection for the interest not only of the manufacturer, but of his customer as well, for not only can imperfections be much more readily detected before the work is assembled, but a flaw for which a single bar would be unhesitatingly condemned is apt to be looked at very differently when the condemned bar would have to be cut out of a finished member. Even if the bar is cut out and replaced the member is apt to be more or less injured in the operation.

If the job is not large enough to require all the time of one inspector, a cheaper way would probably be to employ one of those engineers who make a business of such work. and who, by long experience and systematic methods, are able to exercise an efficient oversight of several jobs at once at the same mill or sometimes even at different mills.

In conclusion, we may say to our correspondent that it is never customary to test each piece of metal, or even a large percentage of them, only a sufficient number being selected for test to secure a satisfactory knowledge of the material. Every piece, however, should be carefully inspected, and the architect who should depend merely on appearances, and presumably the appearance of finished work, could be by no means certain that he was even getting steel at all.

The general question of the comparative value of iron and steel for structural purposes is altogether too large to be satisfactorily discussed in this brief comment, and we should be glad to publish the views of those of our readers who can speak from experience.]

ADDRESS WANTED.

OFFICE OF THE Spring Hill Water Company, Seattle, Wash. T., March 1, 1888.

SIR: Please give me the name and address of parties manufacturing the Deacon meter, Bell's waterphone, and Church's indicator, mentioned on page 35 of your book, Water-Waste Prevention.

Yours respectfully. E. SHEPARD, Manager.

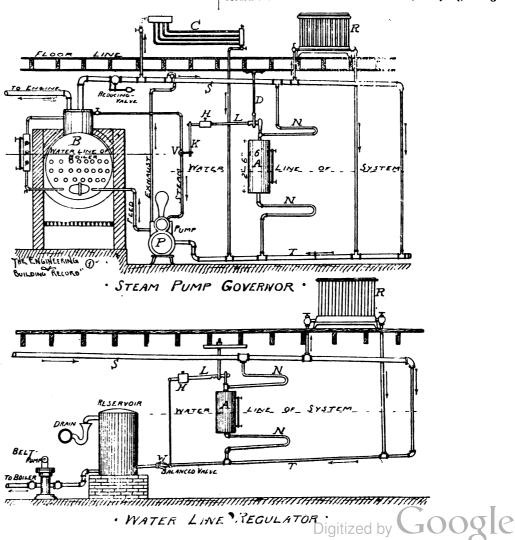

[The representative of the Deacon meter in the United States is S. A. Strang, 30 Pine Street, New York. We have not the address of the other parties. Possibly our readers can furnish it.]

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patenties, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any ofter of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

PUMP-GOVERNOR AND WATER-REGULATOR.

THE device which we illustrate herewith is designed to maintain a uniform height of water in the return-pipes of a steam-heating apparatus. This is accomplished either by controlling the action of the pump, if one is used to return the condensed water to the boiler, or by regulating

the outflow of the condensed water from the return pipes. Its action will be readily understood by reference to the illustrations. It consists primarily of a tank A suspended from the short end of a lever L, to the long end of which is connected the arm of the throttle-valve V of the pump or of the outflow-valve W on the return-water main.

This tank is connected to the return-water system by flexible pipes N N, which permit some vertical movement.

When there is an excess of return water its additional weight in the tank causes the tank to preponderate and raises the long end of the lever, which by suitable connection opens the throttle-valve of the pump, which then pumps out the condensed water until the tank is so far lightened that the counter-balance weight on the lever preponderates and by its descent shuts off the steam again.

Its operation in controlling the outflow-valve is precisely similar and will be readily understood from the above description.

The height of the water-line can be kept at any point within the range of the tank by adjusting the position of the counterweight on the lever or by shifting the position of the lever on its fulcrum by means of the notches on its under side or both.

The device may be used to control the height of any sort of fluid in reservoirs and under any pressure by regulating either the inflow or the outflow or both. If not under pressure only the lower connecting pipe N will be necessary. If attached to a steam-boiler it can be used as a feed-water regulator.

Mr. P. Gormly, 155 North Tenth Street, Philadelphia, manufactures this apparatus.

The patentee is Mr. H. W. Brinckerhoff, of 41 Jefferson Avenue, Brooklyn, N. Y.

BROOKLYN BRIDGE TERMINAL PLANS.

MESSRS. WALTER KATTE, Julius W. Adams, and Joseph Crawford, Board of Experts selected by the bridge trustees about a year ago to report on the different schemes submitted to secure better terminal facilities at the New York end of the Brooklyn Bridge, have made a report recommending as the best of all those submitted to them the plan presented by Mr. A. M. Wellington, Mem. Am. Soc. C. E.

Briefly stated, Mr. Wellington's plan, certain features of which are patented, contemplates the following:

To spread the two cable tracks a little at each end, and connect them by a horseshoe curve of ninety feet radius extending nearly to the street line of Park Row.

To enclose under one roof the entire terminal horseshoe thus formed. A station similar in essentials to be erected To run trains of eighteen cars (less, of course, until all

are needed) into this station, which, when stopped, shall completely fill the stations in horseshoe form, with head and rear cars opposite each other.

and rear cars opposite each other.

Entrance to train to be from inside platform only; exit to the outside platform only. The cars to have entrance and exit doors arranged in a peculiar way to facilitate quick loading and unloading on either the curved or arranged to the curved or straight track.

The extreme dimensions of the proposed building of horseshoe form are 434 feet long by 288 feet wide.

The roadways are carried within the building in covered

The roadways are carried within the building in covered ways twenty feet wide, as now. This enables the toll-gates to be under cover, and utilizes the space above the roadways as additional platform space for the upper tracks, where it is most likely to be needed.

The building is widened slightly at the easterly end, so as to obtain some desirable platform space and bring its side parallel with Frankfort Street. The entire small triangle of buildings be ween the bridge on the north, and Frankfort Street on the south must practibe acquired

The station is to terminate at the west end in a large The station is to terminate at the west end in a large rotunda, which is the principal feature of the building. The rotunda floor is separated from the loading or outgoing platform, and this fence is continued parallel to the track along the entire 900 feet of track within the building. In this fence are placed eighteen or more ticket wickets approximately opposite to the central entrance door of each car, the windows for sale of tickets being at some interior point. sale of tickets being at some interior point.

By these arrangements the entrance to the outgoing platform is from the side at all points instead of from the

THE NEW YORK ARCHITECTURAL LEAGUE ON THE GRANT MONUMENT COMPETITION

On Thursday, the 15th inst., a Committee of the Architectural League consisting of Messrs. Warren R. Briggs, E. H. Kendall, Henry J. Hardenberg, F. A. Wright, Clarence S. Luce, and the President of the League, Mr. John Beverley Robinson, presented the following memorial, as ordered by the League at its last meeting, to Ex-Governor Alonzo B. Cornell, Chairman of the Executive Committee of the Grant Monument Association:

To Alonzo B. Cornell, Chairman, and the members of the Execu-tive Committee of the Grant Memorial Association:

tive Committee of the Grant Memorial Association:

The Architectural League of New York herewith enters protest against the terms of your circular invitation to competitors for the Giant Monument bearing date January 26, 1888.

In its opinion many of the conditions as therein set forth are, by eason of their indefiniteness and ill-judged nature, such as will not titract designers of repute, and it would more specifically call your attention to the following sections of your circular.

(1) To Section 2, in which the proposed cost of the monument is not stated with that assuredness and authority that will place competitors upon equal terms, the amount to be expended being prac-

(1) To Section 2, in which the proposed cost of the monument is not stated with that assuredness and authority that will place competitors upon equal terms, the amount to be expended being practically left to the judgment of each.

(2) To Sections 5, 6, and 8, which permit designs to be submitted at different scales, one-quarter and one-cighth inch to the foot, in different mediums, line and "washed" or brush-made drawings, and in different materials, drawings or models.

To put competitors upon an equal footing, there should be but one scale to which designs should be made, and but one manner in which they should be exhibited, and to this one scale and one manner all should be bound. It has been found that a scale of one-cighth or one-sixteenth inch to one foot is sufficiently large to afford opportunity for the exercise of the most critical judgment and pure line drawings, in pen and ink, the most fair media of representation.

The precise nature and quality of sculpture should not be and is not now to be considered, its purpose and general intent being as well shown by drawings as by models.

(3) To Section 17, which, not he opinion of your memorialists, is the most faulty of the provisions. To request competitives to underbid each other in the price of their services is not the way to secure the best talent.

In conclusion, the Architectural League of New York has entered

most faulty of the provisional each other in the price of their services is not the way to secure the best talent.

In conclusion, the Architectural League of New York has entered this protest wholly and only with the desire to point out to your committee the faults in your circular which may render null your efforts; and to urge upon you the advisability of so amending your conditions that the best result may be reached in the best, most expeditious, and most fair manner.

In pursuance of the latter desire it presents for your consideration a copy of the Instructions to competitors for the Indiana State Soldiers' and Saitors' Monument, which it considers a model in completeness and fairness, and which competition has been brought to a most satisfactory and successful conclusion.

ENGINEERS' CLUB OF PHILADELPHIA.

THE business meeting of this club was held March 3, 1888, President Joseph M. Wilson in the chair; 34 members and 3 visitors present.

Rules to facilitate the discussion of papers, as formulated by the Publication Committee, were submitted by the Secretary, discussed, completed as to limit of time of submission to Publication Committee, and as to number of copies to be furnished to author, and, on motion of the Secretary, adopted.

The following were elected:

Active Members-Messrs. James G. Davidson, Edwin S. Crawley, Theodore Kolischer, James B. Best, Frederick Stamm, William D. Janney, Gustav Bottiger, R. I. D. Ashbridge, John Baptist Nau, S. Pemberton Hutchinson, and Joseph D. Potts. Associate Member-John Gordon

Mr. Morris P. Janney described an electric water-level indicator for steam boilers, exhibiting a specimen arranged so as to work as when in actual operation.

ENGINEERS' CLUB OF ST. LOUIS.

THE club met March 7, 1888, President Holman in the chair, W. H. Bryan, Secretary; twenty-nine members and five visitors present.

The report of the committee on the Waddell pamphlet The report of the committee on the Waddell pamphlet on "Highway Bridges" was taken up. After a general discussion, participated in by Professor Johnson, Colonel Moore, Professor Engler, Messrs. Seddon, Bouton, Wheeler, and others, the following substitute was adopted:

"Kesolved, That the Engineers' Club of St. Louis do not day it advisable to endorse any individual coefficients."

deem it advisable to endorse any individual specifications."

The secretary read a letter from Samuel J. Randall,

acknowledging receipt of the club's resolutions on self-

registering rain-gauges in signal-service stations.

The president formally announced the death of Fredappointed a committee to draft resolutions. Professor Potter, late president of the club, having been elected to the presidency of the American Institute of Mining Engineers. neers, it was voted to tender a complimentary banquet at such time and place as would suit his and the club's convenience.

Professor Gale then read a paper on "Transmission of Professor (ale then read a paper on "Transmission of Power by Belting," giving the results of some recent experiments; also a formula for calculating the width of belt for a given power. An empirical formula, which had been found correct up to 5,000 feet belt speed per minute, was given. Results of tests of various kinds of belts on iron and lagged pulleys were also given. Samples of the belts tested were shown.

ENGINEERS' CLUB OF KANSAS CITY.

A REGULAR meeting was held in the club room March 5, 7:45 P. M., T. F. Winne in the chair, and Kenneth Allen, Secretary, ten members and seven visitors being present.

A letter to the Committee of National Public Works from Mr. John Eisenmann, Secretary of the Council, requesting action to be taken by the club was read, also one from E. L. Corthell, Esq, President, thanking the Committee Council their liberal subscription to defray expenses of the Council.

The report to the Council on the Cullom Bill by the Kansas City Committee was read, and a report by the same committee to the club, in which it was recom mended that the club pass resolutions to endorse the said bill, and that they co-operate with the other societies in promoting it.

The report was adopted, and the resolutions endorsing it, which were read at the previous regular meeting, were

The club also, on motion of Mr. Kiersted, passed resolutions urging national appropriation for placing self-registering rain-gauges in all parts of the country, to record rainfall, as recommended by the Chief Signal

PERSONAL.

COLONEL G. W. M. MORSE, the inventor of the Morse cartridge and breech-loading gun, died at his home in Washington, March 8.

It is reported that M. Felix de Lagarde, engineer and Chief of the Second Division of the Panama Canal, died in Panama on February 27.

C. A. SEDORSTADE, C. E., of Philadelphia, Pa., has taken charge of the construction of the Simpson dry-dock at the Norfolk Navy Yard under the direction of Civil Engineer M. T. Endicott, U. S. N.

CAPTAIN SMITH S. LEACH, of the Engineer Corps of the Army, will succeed Captain Eugene Griffin, under the Engineer Commissioner of the District of Columbia. Captain Leach is a member of the Mississippi River Commission.

MESSRS. CHARLES D. CRANE and Charles Barkhausen, for many years with E. T. Mix & Co., have opened an office on Wisconsin Street, Milwaukee, and will do a general business as architects. Mr. Crane has superintended the erection of many of the large buildings erected by Mix & Co. during recent years.

CAPTAIN ROBERT W. HUNT, who recently resigned as General Superintendent of the Troy Steel and Iron Company, has established a bureau of inspection, tests, and consultation, under the firm name of Robert W Hunt & Co., with principal office in Chicago and branch offices in Pittsburg and New York. He has also become a member of the firm of G. W. G. Ferris & Co., civil engineers and inspectors of iron and steel, in Pittsburg, Pa.

MR. HENRY M. CONGDON, architect, of New York, has been selected to furnish the plans for Grace Cathedral, to be erected at Topeka, Kan., at a cost of \$100,000.

ARCHITECTURAL COMPETITIONS.

COURT-HOUSE COMPETITION, MINNEAPO--The committee has employed Architect W. Boyington, of Chicago, as expert to advise them regarding the merits of the different designs received for the new court-house and city hall. List of competitors noticed in our issue of February 25.

MISCELLANEOUS.

ALBANY, N. Y .- The Governor has signed the bill appropriating \$185,000 for a new asylum for insane criminals at Matteawan.

CHIPPEWA FALLS. WIS - Fifteen acres have been presented by Donald McDonald to Chippewa Falls. Wis, for a public park. Work is to be commenced on it soon.

BROOKLYN, N. Y.—The steeple of the Classon Avenue Presbyterian Church was destroyed by the recent storm and will have to

WATER, SEWERAGE, ETC.

WATER, SEWERAGE, ETC.

New York CITY.—The Municipal Council of Callao, Peru, invite sealed proposals for supplying the port with water-works and construction of drains to improve the hygiene of the place. Full particulars and conditions can be obtained at this Consulate, No. 39 Broad Street. The bids will be opened in Callao, June 26, 1888.

This reported that the civil authorities of

It is reported that the civil authorities of Brussels, Belgium, have offered prizes for plans for a municipal water-works system.

ALBANY, N. Y .- At a recent meeting of ALBANY, N. Y.—At a recent meeting of the board of old and new water commissioners the plans for locating the three 5.000,000 gallons each pumps at the driven well flats, and conducting the mains through the fields, as proposed by Engineer Fteley, of New York, to whom the matter was referred, were adopted, to whom the matter was referred, were adopted. to whom the matter was referred, were adopted, with certain reservations. The three months' test of the driven wells by the Messrs. Andrews, contractors, had been delayed somewhat by increasing the supply required by one-half, or to 15,000,000 gallons. At the expiration of the time set the three engines ordered by the old commission will have been expiration of the time set the three engines ordered by the old commission will have been ready to be erected, and provided the trial has ready to be effected, and provided the trial has been satisfactory, the work of constructing buildings and effecting the engines and pumps will be proceeded with immediately. The new commission proposed to add an additional engineering commission proposed to add an additional engine and pump of 5,000,000 gallons capacity to the three of like capacity ordered by the old board to the plant on the flats, but after discussion it was thought best to hold off until the test was completed. It was also recommended that in the event of the water in the mended that in the event of the water in the driven-wells being found inexhaustible, the engine on Montgomery and Quackenbush Streets, now used in sending Hudson River water to the reservoir, be remodeled and placed on the flats at an estimated cost of \$20,000 to \$30,000.

WACO, TEX.-It is reported that the City Council has been endeavoring for the past two years to get the Waco Water Company to accept a contract which that body considered equitable and just, one that would give the equitable and just, one that would give the city ample protection against fire, but failing to do this the Council at its last meeting passed a resolution ordering that cisterns be built over the city for protection for use when the present contract with the Waco Water Company expires on the 6th of July next. A meeting of a number of the largest taxpayers in the city was held March 9, and resolutions were passed condemning the city results. were passed condemning the cistern system, and a committee was appointed to confer with council, and if it was found that no just con-ract could be made with the Waco Water company, that the Council be advised to issue conds and build its own works.

HUNTINGTON, PA.—A water company has even formed here and it is reported that works vill be built this summer.

HUGOTON, KAN. — Our correspondent vrites: "This place will vote \$6,000 bonds on larch 16 for water-works and general imtovements for the city. Our city intends to ut in a good system which will cost some 50,000."

ATCHISON, KAN.—Mr. Fred. Giddings, ity Engineer, writes: "The Council have stered into contract with Messrs. Rosewater Christie, of Omaha, Neb., to design a sysm of sewerage for the city. The preliminary vels have been taken and they are now enged in platting the city and putting on ontours."

HARPER, KAN.—It is reported that the wn authorities have refused to accept the aler-works constructed for it by Mr. John J. Hill

GLENS FALLS, N. Y.—Reports say that new ater-mains are to be laid here, also that ten iles of extensions will be constructed.

NEW LONDON, WIS.—Reports say that a ater-works system will be erected here.

PARIS, Ky.—The water-works question was before the City Council again, and sealed was before the City Council again, and sealed proposals received and opened from the Davenport Company, of Charleston, W. Va., who propose to furnish 65 fire-plugs at \$2,500 per year rental; Thompson, of Bradford, Pa., 75 plugs at \$2,500, and Cosby & Glenn, New York, 55 plugs at \$3,750. A committee was appointed by the Council to take the proposition under advicement. tion under advisement.

ONEIDA, N. Y.—The sewer question continues to occupy the attention of the citizens of this place. Emil Kuichling, of Rochester, N. Y., has considered the plans submitted by Engineer Randoll and has suggested some changes in the systems proposed. Mr. Kuichling's estimate of the cost is \$93,000. The committee will have a formal report from him and will submit it to a publ c meeting. Engineer W. F. Randall will co-operate with Mr. Kuichling making the new plan.

JOLIET, ILL.—After seven years of litigation between this city and the Water-Works Company over the valuation of the latter's plant, which the city is to purchase, the question has been left to a board of arbitrators, who will meet in Chicago April 19.

STONINGTON, COSN.—The Mystic Valley Water Company has made a proposition to supply this place with a water-supply for fire purposes and for the people. The water is to be obtained from a reservoir to be established, with 2,000,000 gallons capacity, and also to place 42 hydrants throughout the streets. The matter is to be settled at a meeting to be held at a later date.

COLUMBUS, O .- At a recent meeting of the general committee appointed to secure from the Legislature the right to use the Columbus feeder or canal for an intercepting sewer, and to secure permission to issue bonds for the building of said sewer, the sub-committee appointed to draft bills reported two bills, the first to authorize the city of Columbus to borrow money to pay for the building of an intercepting sewer, and the second authorizing the city to enter into and occupy a part of the Columbus feeder and Ohio Canal, for sewerage and street purposes. Mr. Marble, the City Engineer, stated that there are two routes that each be used, one in and one out of the that can be used, one in and one out of the freeder, but that it would be a saving of \$200,000 to the city to build the sewer in the canal. The health of 90,000 people and the removal of a burden from the State was thought to be sufficient cause for the State to give up the feeder, and it settled that the abandonment of the canal to the four-mile lock should be asked. It was decided to ask the right to issue \$500 ooo worth of bonds and to proceed with the work as soon as possible.

Avon, N. Y.—Proposals will be received by the Board of Water Commissioners of the village of Avon, N. Y., until 12 o'clock M. of March 29, 1888, for the material and labor required to construct water-works for the village.

SALISBURY, MD.—Dr. L. S. Bell, Secretary Salisbury Water Company, writes as follows: "Our company has been incorporated with \$50,000 capital stock. We propose laying about three miles of pipe, and will put in 500,000-gallon pumping-engines, stand-pipe 12x100 feet."

MORRISONVILLE, ILL.—Reports say that the people of this place have decided for a system of water-works to cost \$5,000.

BEATRICE, NEB.—It is reported that the date for the election to decide for or against water works for this place is to be March 20, It is proposed to purchase a Jewell waterpurifying plant to cost \$10,000.

MORRISONVILLE, ILL.—Mr. W. E. Forbes writes us: "The proposed water-works of our village are to cost between \$5,000 and \$7,000, to be wooden tank and substructure 60 feet high, 1,150-barrel wooden tank, four firedrants, iron pipe, engine-pressure. Works to be built as soon as contract can be let. Bids will be received all this month. Specifications will be sent to all parties that want to figure on

ALLEGHENY, PA .- The Allegheny Water Committee has decided to purchase two 5,000,000 pumping engines to take the place of the old ones, which are to be sold.

CASSOPOLIS. MICH.—It is reported that a stand-pipe will be erected here.

UHRICHSVILLE, O .- Reports say that a water works plant is to be established here.

SCHWENKSVII.LE, PA .- Reports say that a water-works will be established in this place.

PALMYRA, N. Y.—James Bourne, Jr., Town Clerk, writes us: "There is nothing being done here in relation to the establishment of water-works."

BRADDOCK, PA .- A. S. Brubaker writes us: "No steps have as yet been taken to improve our water-works."

BALLSTON, N. Y .- It is said that extensive improvements are to be made to the water-

TECUMSEH, NEB.—Bids for the construction of a system of water-works at this place after plans by A. Richardson & Co., of Lincoln, Neb., will be opened March 29, 1888.

BRIDGES.

THE Wabasha Bridge and Ferry Co., of Wabasha, Minn., has been incorporated. The object is to build and operate a bridge across the Mississippi at Wabasha. The capital stock is \$20,000. The first board of directors is composed of J. Buisson and others.

IT is reported that Bay County, Mich., will spend some \$58,000 on stone roads and \$75,-000 for bridges, as result of recent elections.

NEW YORK CITY .- The Board of Estimate and Apportionment has authorized the issue of \$250,000 for the completion of the new bridge over the Harlem River now in course of con-

INDEPENDENCE, Mo.—The County Commissioners will build an iron bridge, 165 feet span, at Big Blue, Mo. Address P. H. Grinter, County Surveyor.

HARTFORD, CONN.-It is reported that the New York, Providence and Boston Railroad Company has decided upon the plans for the great railroad bridge across the Thames River from New London to Groton. The bridge will begin on the west bank at a point some distance above the city of New London, where the river is somewhat narrower than it is at the ferry. An attorney for the railroad company is now purchasing land for the approaches to the bridge, and it is reported that the work will begin this season.

GAINESVILLE, ALA. — Our correspondent writes as follows: "An appropriation has been made by the court of County Commissioners of Sumter Co., Ala., to build a bridge across Noxubee River, near Gainesville, but, as it is a navigable stream permission from as it is a navigable stream, permission from the Government will have to be obtained, or an act of Congress condemning said stream as a navigable one, before the bridge can be erected."

MINNEAPOLIS, MINN—Bids were opened on March 7 by the Council Committee on Roads and Bridges for the stone substructure and the superstructure of the bridge to be built on Lyndale Avenue over the railroad tracks. Six bids were received for the stone, of which the Minnesota Stone Company, of this city, is the lowest bidder. Eight bids for the super-structure were received, varying from \$19.515 to \$24,056. The lowest is from the Canton Bridge Co; but before the committee can recommend any bid the plan submitted by the bidders must be examined to see if they come up to the specifications furnished by the City Engineer. Following are the totals of the

Bids for stone-Baxter & Sons, \$6,703.07; Minnesota Stone Company, \$6,185.65; Thos. Daley, \$6,868.68; George McMillan & Co., \$6,596.10; Ring & Tobin, \$6,876.34; Douglas & Co., \$6,504.22.

For the superstructure— Canton Bridge

Company (two bids), \$19,515, \$20,608; King Iron Bridge Company, \$20,393; Sheffler Bridge Company, \$22,246; A. Y. Bayne & Bridge Company, \$22,240; A. Y. Bayne & Co., \$24,056; Milwaukee Bridge Company, \$23,069.24; Kansas City Bridge Company, \$23,750; Smith Bridge Company, \$21,000; C. P. Jones, \$21,736.23.

RAILROADS CANALS ETC.

MASON CITY, IOWA.—The contract for building 170 miles extension of the Chicago, Milwaukee, and St. Paul, from Chamberlain, Dak., through the Black Hills, has been awarded to Major Allen.

WILMINGTON N C -This city has voted WILMINGTON, N. C.—This city has voice to subscribe \$150,000 to secure the extension of the Cape Fear and Yadkin Valley Railroad from Favetteville to Wilmington. Work will of the Cape Fear and Vadkin Valley Railroad from Fayetteville to Wilmington. Work will begin at once and it is expected that the road will be running into Wilmington by the first day of January next. At the same time \$100,000 was voted in aid of the Wilmington, Winslow and East Carolina Railroad, which is now being built frem New Berne to Wilmington.

THE Arizona Central Railroad was incorporated recently at Phænix, Ariz, to build lines from Phoenix to Prescott, aggregating 400 miles. The capital stock is \$7.500,000.

STREET-WORK AND PAVING.

SAVANNAH, GA.—Matthew Hayes, of Jack-sonville, Florida, is to get the contract to pave New Houston Street, between Whittaker and Drayton Streets, with cypress blocks, which he guarantees free from sap, at \$1.20 per square yard—85 cents to be paid when the paving is completed and 35 cents at the end of ten years if the paving is durable.

GAS AND ELECTRIC-LIGHTING.

LOWVILLE. N. Y., March 9.—A special meeting of the Board of Trustees was held March 8, at which time the resolution previously adopted in relation to electric lights was annulled, and the following adopted: "Resolved, that whereas the Lowville Electric Light and Power Company (limited) have offered to make a contract with the village of offered to make a contract with the village of Lowville to light the streets of said village for a term of one year with the American system of electric arc lighting, with 21 arc lights of 2,000 standard candle power, (same as the sample lights in operation on the streets at the present time), to be kept burning every night from dark until midnight, for not less than 112 nights and 265 nights if necessary for 312 nights, and 365 nights if necessary, for the price of \$1.200 for 20 lights, and one light to be maintained free; said lights to be lo-cated by the Board of Trustees; that it is to the interest of said village to make such contract, and that the sum of \$1,200 be raised by tax upon the taxable property of the viliage for the purpose of making such contract for lighting said streets by said system for one year." The matter will be voted upon at the annual charter election March 20.

CANAJOHARIE, N. Y .- The electric light question is being agitated here.

RICHFIELD SPRINGS, N. Y.—It is reported that an electric-light plant will be established

LEOMINSTER, MASS. -- An electric-light company has been organized here with E. A. Bushington as president.

WABASH, IND.— The Wabash Electric-Light Company has offered to light the city. 130 lights are to be furnished at an annual cost of \$3,200. It is thought that the offer will be accepted.

FORT SMITH, ARK.—At a recent meeting of the Board of Public Affairs the following ordi-nance was passed: The Fort Smith Gas Light Co. shall furnish the city 100 additional lamps for the remainder of the time its original contract has to run at \$27.50 per 1,000 cubic feet per annum; the sixty-three lamps now in use per annum; the sixty-three lamps now in use shall remain at the present price. \$30 each, per year; that after May I consumers shall be furnished gas at a price not exceeding \$2.50 per I,000 feet; that the Ioo additional lamps shall be put up by May I; that by November I it will increase the capacity of its works so as to make them sufficient to supply a city of 25,000 population. The lamps are to be lighted every night when the moon is not actually shining. The Board of Public Affairs is authorized to make such a contract with the company which will be given ten days in which to sign it.

BIDS OPENED

PITTSBURG, PA.—Messrs. Riter & Conley, of this city, have the contract for constructing the iron buildings for the tube-works at Find-

GREENBUSH, N. Y .- The following bids for material to be used in the construction of sewers were opened March 8:

The following were the successful bidders in the different sections for construction: Section 4, Adam Miller, Saratoga, N. Y., \$10-350.50; Section 5, Adam Miller, Saratoga, \$11.327; Section 6, Adam Miller, Saratoga, \$10.658.50.

PHILADELPHIA.—Bids were opened by the Board of Port Wardens for dredging docks. The American Dredging Company offered to do the work for forty-three cents per cubic vard, and to place the material upon land, or for twenty-seven cents the dredged material to be deposited in the river behind dykes. The bids were rejected as excessive, and the matter ordered to be readvertised.

BROOKLYN, L. I.—The following proposals were opened March 6 for constructing sewers in Map O, Drainage District No. 37, Subdivision No. 29: John G. Bogert, 48-inch brick sewer, per running foot, \$4; 36-inch brick sewer, \$3.25; 30-inch brick sewer, \$3; 15-inch cement-pipe, \$1.25; 12-inch cement-pipe, 95c.; each maphole. complete. \$34: each street hasin manhole, complete, \$34; each street basin, complete, \$05. Daniel J. Creen, 48 inch brick sewer, per running foot, \$3.25; 36-inch brick sewer, \$3.25; 30-inch brick sewer, \$3.25; 15-inch cement-pipe, \$1.30; 12-inch cement-pipe. oc.; each manhole, complete, \$33; each street basin, complete, \$98. James F. Gillen, 48-inch brick sewer, per running foot, \$5; 36-inch brick sewer, \$3.80; 30-inch brick sewer, \$3.15; 15-inch cement-pipe, \$1; 12-inch cement-pipe, 95c.; each manhole complete, \$33; each street basin, complete, \$100.

MILWAUKEE, WIS .- The following bids were opened March 6, 1888, to construct and erect the engine foundation, engine pit, pump-wheel foundation, gate wells, manhole, and a section of the flushing conduit for the Milwaukee River flushing tunnel pumping works on the beach of Lake Michigan, opposite the foot of Dane place, in the First Ward of the city of Milwauke: W. T. Casgrain & Co., \$23,275; J. H. Kearney, \$18,325: Wm. Forrestal, \$17,975. The contract let to Wm-

Boston.—The City Engineer, on March 14, received the following proposals for rebuilding the sea-wall on the Roxbury Canal: H. H. Pike & Co., \$9,697; Collins & Ham, \$9,369.50; H. W. Phillips, \$8,263.50; McInnis & Parker, \$7,528.50; Boynton Bros. \$6,349; C. T. Denz & Co., \$6,065; T. A. Power of the Construction Construction Rowe, \$5,784.50; Metropolitan Construction Co., \$5,735; Charles H. Edwards, \$5,427.50. The contract was not awarded.

The Boston Water Board on March 12 received the following bids for a wrought-iron tank on Breed's Island for the high-service supply in East Boston: Whittier Machine Co., Boston, \$2,696; Samuel & Molloy, Lowell, \$3,213; Tippett & Wood, Phillipsburg, N. J., \$3,275; Ryan & McDonald, Waterloo, N. Y.. \$4,350; Riter & Conley, Pittsburg, Pa., \$3,885; James Russell & Sons, South Boston, \$3,195; Cunningham Iron Works, Charleston, \$2,800; George Miles, South Boston, \$2,420; H. L. Robinson, East Boston, \$2,779; Edward Kendail, Cambridge, \$2,625; E. Hodge & Co., East Boston, \$2,496 Atlantic Works, East Boston, \$2,975; King Iron Bridge Co., Cleveland, O., \$3,728. The contract was awarded to George

GOVERNMENT WORK.

CHICAGO, ILL.—The following tids for tie rods, etc., for repairs to attic story of Custom House were opened March 5 by the Super-vising Architect of the Treasury Department:

Joseph Downey, \$6,983; Hollingsworth & Coughlin, \$9,975; William Mansan, \$9,975; E. F. Gobel, \$9,335; E. R. Brainerd, \$10,887.

TERRE HAUTE, IND.—The following bids for material, tools, and labor for plumbing and for material, tools, and labor for plumbing and gas fitting for the Post Office were opened March 2 by the Supervising Architect:

D. W. Watson & Son, \$3,379: A. J. Gallagher, \$2,674.50; J. F. Dalton, \$2,670; Crook,

Horner & Co., \$2,825.

SAN ANTONIO, TEX.—The following bids for erecting and enclosing superstructure in masonry, iron, carpentry, and roof work of Court-House opened March 6 by the Supervis-ing Architect of the Treasury Department: Dumesneil & Bro., \$125,600; McCarthy & Baldwin, \$104,354.50; George W. Corbett, \$125,000; Branden & Andison, \$97,350; Samuel W. Swift, \$98,000; Boettler & Sindahl, \$125,000; Branden & Andison, \$97,350; Samuel W. Swift, \$98,000; Boettler & Sindahl, \$125,000; Panby & Dielman, \$111,000; Gus Wilke, \$105,000; W. S. Pleasants, \$116,000; P. T. Shields, \$105,300; John O'Connor, \$176,287; F. H. Mickey & Sons, \$116,300.

THE following bids for an electric fire-alarm call and patrol system were opened in the Treasury Building, Washington, D. C.,

John R. Galloway, Washington, D. C., \$3,200

J. N. Burket, Washington, D. C., \$2,-

The Electric Fire-Alarm Co., Evart, Mich., \$4,343.

Pierce & Jones, New York, \$3,000. Royce & Mareau, Washington, D. C., \$1,-

MANCHESTER, N. H .- The following bids for iron beams and terra cotta arches for sec-ond and attic floors of the Post Office were opened March 5 by the Supervising Architect

the Treasury Department: Sargeant & Sullivan, \$7,000; Head & Dowst,

PROPOSALS.

(Continued from page viii.)

STEAM FIRE ENGINES.—Proposals are wanted to New York City, until March 28, for furnishing two econd size steam fire engines with boilers of the "La France's improved nest tube" pattern. Address the Board of Commissioners of the Fire Department, Nos. 57 and 159 East Sixty-seventh Street.

RESERVOIR—Proposals are wanted at Columbia, S. C., until March 26, for the construction of a reservoir, according to specifications. Address William J. Catheart, City Cierk and Treasurer.

ROCHESTER, N. Y.—The Genesee Valley Club will erect a \$40,000 club-house from plans made by Messrs. Fuller & Wheeler, Architects, of Albany. N. Y.

BRICK SCHOOL-HOUSES.—Proposals are wanted at Pittsburg, Pa., until April 4, for the erection of two brick school buildings. Address James N. Campbell, architect, Room 814, Penn Building, No. 708 Penn Avenue, as above.

HOISTING ENGINES.—Proposals are wanted at Zanesville, O., until April 2, for furnishing and delivering three boisting engines for use on the improvement of the Musking run River. Address Lieut. L. H. Beach, Corps of Engineers, as above.

IRON DRIFT BOLTS.—Proposals are wanted at Zanesville, O., until April 2, for furnishing, etc., 60,000 pounds of iron drift bolts. Address Lieut, L. H. Beach, Corps of Engireers, as above.

WROUGHT - IRON WORK. — Proposals are wanted at Zanesville, O., until April 2, for furnishing and delivering thirty-eight sets of wrou ht iron anchorages for locks on the Mussingum River. Address Lieut. L. H. Beach, Corps of Engineers, as above.

STEAM-HEATING, ETC.—Proposals are wanted at Louisville, Kv., no date specified, for furnishing the sewer pipes, plantering, inon work, steam heating, boilers, plumbing, wire work, and water service, including pumps, etc., for the West Tennessee Hospital for Insane. Separate proposals will be received for each class of work. Address McDonald Brothers, architects, as above.

ELECTRIC-LIGHT PLANT.— Proposals are wanted at Jackson, O. until March 21, for an electric-light plant, to include 30 arc and 600 incandescent lights, 90-power engine and boilers. Address the Mayer.

SHOPS.—Proposals are wanted at Decatur, Ala., until March 24, for the erection of new shops for the United States Rolling Stock Co. Address the com-

PUBLIC LIGHTING.—Proposals are wanted at New York City, until March 26, for furnishing the gas or other illuminating material, and for furnishing, operating and maintaining electric lamps for lighting the streets, parks, and public p aces of the city of New York, for the period of one year, commencing on May 1, 1888, and ending on April 30, 1889. Address the Department of Public Works.

ARMORY.—Proposals are wanted at New York City, until March 20, for furnishing materials and performing the work in the erection of an armory building on the block bounded by the Boulevard, Ninth Avenue, Sixty-seventh and Sixty-seighth Streets. Address the Secretary of the Armory Board, Staats Zeitung Building, as above.

FIRE HOSE.—Proposals are wanted at New York Cito, until March 28, for furnishing 10,00 feet of 2½-inch balanced woven-cotton jacket rubber-lined hose with standard couplings attached. Address the Board of Commissioners, Fire Department, 157 and 159 East Sixty-seventh Street.

BUILDING.—Proposals are wanted at McPherson, Kan., until April 11, for the erection of the north wing of the county poor house, according to specifications, Address W. A. Morris, County Clerk.

BUILDING. -Proposals are wanted at Abilene Kan, until March 30, for the erection of a county high school building, for Dickinson County. Address W. H. Roe, Secretary, County High School Trustees, as

PLUMBING.—Proposals are wanted at New York City until March 27 or plumbing two water-closet towers at Bellevue Hospital. Address the Depart-ment of Charities and Correction, as above.

PAVING.—Proposals are wanted at Chattanooga, Tenn., until March 19 for paving certain streets with Trinidad asphalt street pavement. Addr sa Robert Hooke, Superintendent of Public Works.

FIRE HOSE.—Proposals are wanted at New York City, unti! March 28, for furnishing 20,000 feet of 23/4-inch circular woven-cotton, rubber-lined hose, with standard couplings attached. Address the Board of Commissioners, 157 and 159 East Sixty-seventh Street.

MASONRY.—Proposals are wanted at New York City, until March 20, for furnishing materials and performing masonry-work in the erection of an armory building on the block bounded by the Boulevard, Ninth Avenue, Sixty-seventh and Sixty-ei, hith Streets. Address the Secretary of the Armory Board, Staats Zeitung Building, as above.

Zeitung Building, as above.

SUBMARINE TELEGRAPH CABLES.— Proposals will be received, until 12 o'clock noon, the rôth day of April, for furnishing, delive.ing, and laying four nautical miles of submarine telegraph cable across the mouth of the Columbia River, Ore; a'so, until 22 o'clock noon, the 17th day of April, for furnishing, delivaring, and laying eight nautical miles of submarine telegraph cable for Martha's Vineyard, Mass For further information address A. W. Greely, Chief Signal Officer, Washington, D. C.

PILES, STONE, ETC.—Proposals will be received until 12 o'clock noon, March 31, for furnishing and delivering the following articles for use in improving the Mississippi River below St. Louis, Mo.: Piles, stone, manila and sisal rope, oakum, wire, noils, spikes, screw bolts, and iron. For further information address A. M. Miller, Major Corps of Engineers, St. Louis, Mo.

Louis, Mo.

IRUN-WORK.—Proposals are wanted at New York City, until March 29, for furnishing materials and performing iron-work in the erection of an armory building on the block bounded by the Boulevard, Ninth Avenue, Sixty-seventh and Sixty-eighth Streets. Address the Secretary of the Armory Board, Staats Zeitung Building, as above.

PLUMBING AND GAS-FITTING. — Proposals are wanted at New York City, until March 20, for furnishing materials and performing plumbing and gastiting work in the erection of an armory building on the block bounded by the Boulevard, Ninth Avenue, Sixty seventh and Sixty-eighth Streets. Address the Secretary of the Armory Board, Staats Zeitung Building, as above.

STEAM HEATING "AND VENTILATING.—
Proposals are was ted at New York City, until March
20, for furnishing materials and performing the steam
heating and ventilating work in the erection of an
armory building on the block bounded by the Boulevard, Ninth Avenue, Sixty-seventh and Sixty-eighth
Streets. Address the Secretary of the Armory Board,
Staats Zeitung Euilding, as above.

WATER WORKS,—Proposa's are wanted at Salisbury, Md., for a complete system of water works. No date specified. Address L. S. B-11.

PROPOSALS.

PUMPING ENGINE.—Proposals are wasted a Yonkers, N. Y., until March 20, for a 2,000,000 Extension, and boiler. Address Rudow Extensive, President Board of Water Commissione, above

A VIADUCT ROAD IN THE LATE SNOW-STORM.

THE only transportation line within a radius of at least 100 miles from the New York City Hall which did not succumb even for a few hours to the blizzard of March 12 and suspend the running of trains was the Suburban Rapid Transit Railroad. During the afternoon of Monday the headway of the trains was increased from six to about ten to fifteen minutes, but on Tuesday morning the traffic on this line was as frequent as usual, trains running at five and six minute intervals, when all other travel was completely blocked by the snow. The other elevated railroads soon recovered and resumed by degrees their regular trips, but the surface roads took several days to get into running order.

The Suburban Road had the advantage, to be sure, of having a route but little more than two miles long, but the true reason of its superiority was that it possesses a structure which is strong enough to bear the strain of locomotives powerful enough to overcome the obstacle of snow on the tracks. The other New York and Brooklyn elevated roads have not the strength of structure nor the efficiency of motive power to draw full trains against the resistance offered by the snow which drifted in between the timber guard-rails, and trains which had once started from the terminals could not be moved by the engines nor could they be lightened by dropping some of the cars, because there was no place in the streets to deposit the superfluous cars. Consequently, the absurd spectacle was pre-sented of miles of streets occupied by trains of crowded cars on elevated trestle held immovable by little gutters full of snow. But the 28-ton engines of the Suburban kept running regularly to and fro on its substantial viaduct, mostly on its own purchased right-ofway, the cars loaded with passengers, while half a mile away hundreds of people were snowbound in the cars of the Harlem and Hudson River Railroads in deep cuttings and in the sunken way through Harlem, and thousands were stored away in the elevated railroad cars in the avenues of the city, unable to get forward, backward or downward. While the character of the structure and of the rolling stock had much to do with this result, they would not have been so effective without the activity and energy displayed by Mr. E. B. Wetmore, the Superintendent of the Suburban Road, who was as untiring as he was judicious in his management of affairs under the trying conditions.

HE PROPOSED NATIONAL BUREAU OF HARBORS AND WATERWAYS.

THERE has been for some time more or less agitation by certain engineers in favor of placing civil engineers in charge of Government work connected with the improvement of rivers and harbors, and the idea has always been a popular one with many in the profession. When, therefore, the bill known as the Cullom-Breckinridge bill was introduced in Congress we published it and opened our columns for a discussion of its different clauses, with a view to drawing out opinions for and against the measure. We entertained views at the time regarding the practicability of it, but refrained from expressing them, as we desired to elicit the fullest discussion both from those in favor of the bill and from those who thought it would fail to accomplish the results anticipated. We have received a

large number of letters in response to invitations for an expression of opinion. The majority, however, were not written for publication. Many of the writers made suggestions, others expressed indifference, and others, while expressing sympathy with any movement intended to benefit the profession, claimed to be too busy to investigate the matter sufficiently to give an intelligent opinion.

We publish elsewhere two more letters on this subject, and, for the present, at least, think we have surrendered all the space to this subject that the general interest in it will justify. We must, therefore, refer those who wish to read the arguments of the authors of the measure to a publication, which is just issued by the Council of Engineering Societies on National Public Works at Chicago.

We have been urged by the promoters of this bill to discuss it editorially and to express our "candid views" on the subject.

Briefly, then, the practical question, as it appears to us to-day, is, "Will the cause of river and harbor improvement in the United States be benefited if the change contemplated in this bill is made at this time, in view of the changeable character of Congress and the effect of political influences?" The establishment of a bureau employing about six hundred engineers, requiring something like a million and a quarter of dollars annually for salaries, may be a pleasant prospect for engineers who want positions, but we very much fear that ultimately every member of that corps would be taxed to maintain a lobby in Washington to secure the annual appropriation for their salaries, besides appropriations for work to keep them employed, and experience would lead to the belief that the result of all this would be that the control of the bureau would drift into the hands of wire-pullers and politicians. The opponents of river and harbor improvements would, moreover, receive a strong re-enforcement in the way of arguments against the propriety of appropriations for internal improvements, since they would be able to point to the existence of such a lobby, and urge that the recommendations of the engineers were influenced by their desire to secure work in order to retain their positions. Such a charge cannot now be made against the recommendations of the army engineers, because it is universally known that their pay is in no way contingent on the passage of a river and harbor appropriation bill, they being paid as army officers whether assigned to engineering work or not. It is for this reason that their recommendations have had more weight with Congressional committees than would the opinions of the same number of men in civil life in all respects their equals.

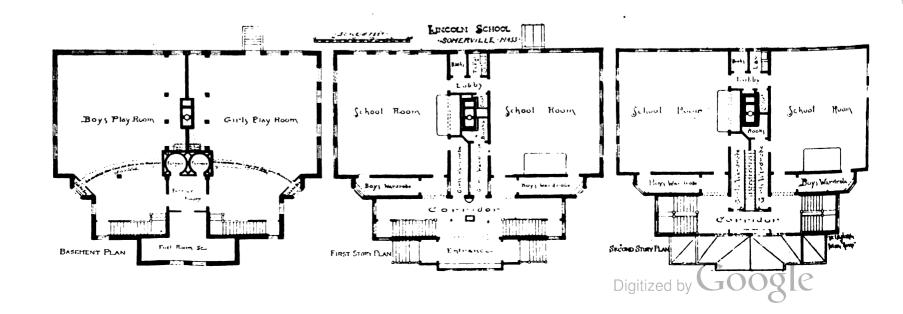

There are two features of this problem that have always appealed strongly to us: First, the question of intermittent appropriations by Congress, which method results in so much injurious delay and ultimate unnecessary expense in the execution of work; and second, the fact that faithful and capable civil engineers employed on Government work have no chance for promotion to independent charge of work and consequently little opportunity for making professional reputation.

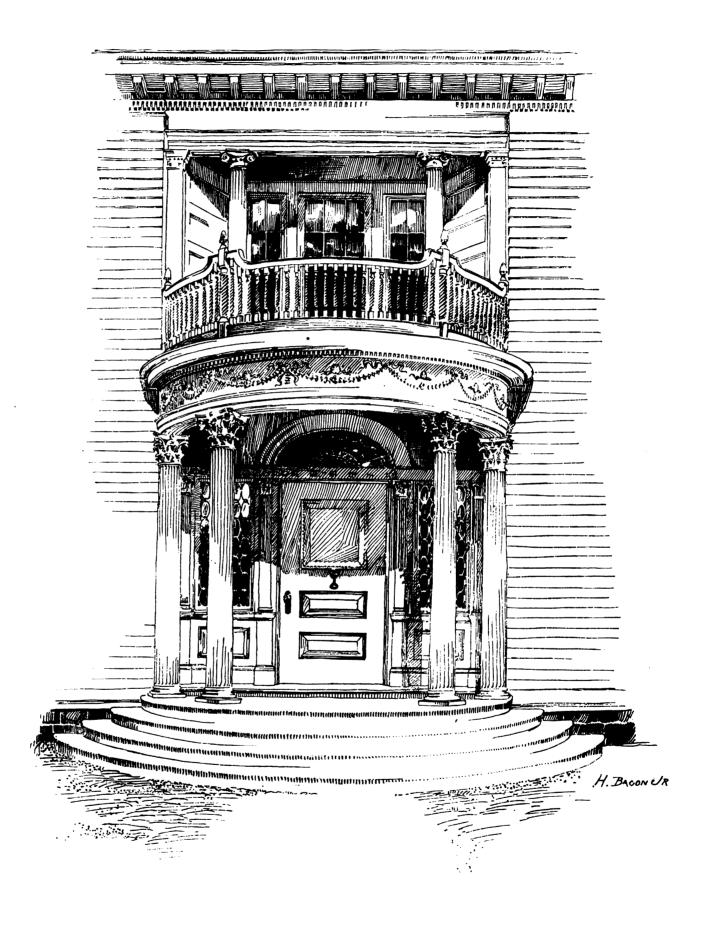

Section 14 of the Cullom bill seeks to deal with this evil of intermittent appropriations, but we fail to see how one Congress can control a subsequent one. Appropriation bills in this

PORCH OF RESIDENCE OF MR. THORPE, CAMBRIDGE, MASS.

LONGFELLOW & HARLOW, ARCHITECTS.

country are passed or withheld too often from considerations of political expediency—i. e., a Republican legislative body is not apt to appropriate money, if it can avoid it, that a Democratic administration will have the spending of —and this would be especially true when money was to be spent by a civil bureau. Consequently, for a time, at least, appropriations for public work in this country are not likely to be made in

any but an intermittent manner.

With regard to the status of civil engineers now employed in subordinate positions on Government work, there is an act of Congress that has authorized the appointment of several civil engineers of high grade to independent charge of work. It would seem to us practicable even at this time to arrange for the appointment of an additional number of those higher grade officers, to be taken entirely from those who are or may be in Government employ as civil engineers, pay to correspond with similar grades in the army, and vacancies as they occur to be filled from the civil engineers employed on Government work, all to be under the Chief of Engineers and attached to the present organization.

This would give the opportunity for promotion, now withheld, and independent reputation which every professional man so much prizes. A provision somewhat on the lines here indicated it carried out would remove to a large extent from the minds of civil engineers generally what they regard as a real grievance and would offer inducements to men of capacity to remain in the civil corps of the service.

We believe when the influential men in Congress are consulted on this question the friends of this measure will learn that the Government considers it to its interest at this time to avail itself of the services of the army engineers. As the country becomes older, the public more enlightened, and legislative bodies more rational, the example of older countries in providing a special department for the execution of public works may be followed with better results than it would be possible to secure under existing conditions.

THE CAR-STOVE AGAIN.

DURING the recent storm, when the New York Central trains, like those on every other line running out of New York, were stuck for several days in snow banks and locomotives were detached, the steam heat from the locomotives of course could not be relied upon for car-heating. President Depew is reported to have stated that that circumstance demonstrated that in this country we would have to rely upon the car-stove for car heating. That remark being quoted seems to have met with the very genera protest that it deserves. It is entirely practicable for railroad companies to provide in each car a stove to be used only when a train is disabled and steam from the locomotive cannot be obtained.

It is worthy of remark in this connection that George Gould, who was on the wrecked Florida train last week, in the interviews reported, stated that as soon as he extricated himself and wife from the debris and saw the mass of crushed and mangled people in the destroyed cars, his first thought was that the train would catch fire and many of them be burned. The passenger cars which were at the head of the train, doubtless in that climate contained no fires, and, from the reports, we believe steps were taken to immediately put out the fires in the Pullman sleepers.

George Gould will some day probably be the owner, as his father is now, of many miles of railway. It is to be hoped he will always remember that experience when he has to consider the methods of heating railway trains on the roads that he has the control of.

A BILL has been introduced into the House of Commons under the title of the Architects', Engineers', and Surveyors' Registration Bill, and purporting to be the petition of the Members of the Royal Institute of British Architects, and drafted by the "Architects', Engineers', and Surveyors' Registration Act Committee." The fact that the Royal Institute of British Architects is not connected with the movement, and has moreover issued a notice by its secretaries to its members asking them not to sign any forms in connection with the movement, does not augur well for the success of its second reading.

CANALS AND INLAND NAVIGATION.

IT is the intention of the Society of Arts of London to hold a conference in May next on the subject of canals and inland navigation. In the year 1885 an international conference on this subject was held at Brussels, and in the following year there was one at Vienna. The third meeting is to be this year at Frankfort. It is not, however, proposed that the Society of Arts Conference should be of an international character, as naturally the canals of this country are not in any way dependent on, or connected with, those of other countries. Amongst the subjects set down for discussion are included the history of canals in Great Britain, the engineering of canals, the present condition of canal navigation, with suggestions for its improvement, the connection between canals and railways, tariffs, cost of carriage, etc. It is also proposed to include in the proceedings some account of the canal systems of foreign countries, and the committee have already been promised several papers on this head. Further information as to details of the arrangements may be obtained from the Secretary of the Society of Arts.

ANOTHER CHANNEL BRIDGE PROJECT.

FRENCH engineers are said to be projecting plans and estimates for a bridge between France and England with termini at Cran-aux-Oeufs, south of Cape Grisnez, and at Solkestone, thus crossing not at the narrowest, but at the shallowest part of the channel. The piers are to be of beton, and the superstructure, at an elevation of 40m. (131.24 feet), of iron from the Creusot Works, whose engineers are said to be the designers.

Admiral Cloué, late Minister of Marne, and M. Heredia, Minister of Public Works, are said to support the scheme and to be seeking English assistance for it.

FIRE-PROOF THEATRE DECORATIONS.

THE many different processes in use for rendering curtains, etc., incombustible are said to be, without exception, unsatisfactory and imperfect, the fire-proofing material with which they are saturated either disappearing or losing its efficacy after a time.

The Chronique Industrielle states that M. E. Tepper, of Berlin, has invented a process by which it is possible to paint decorations on an absolutely incombustible iron wire cloth, the meshes of which are about 0.04 inches square. It is covered by a mechanical process with a yellow plaster that is incombustible and insoluble in water.

This coating is very liquid when applied, but afterward takes the consistency of firm clay. It receives paint readily and can be rolled upon poles about two inches in diameter without injury. The weight of the prepared material is less than a pound and a half per square yard, and the price does not exceed that of decorations made incombustible by impregnation.

PULMONARY EXHALATIONS.

MM. BROWN SEQUARD and d'Arsonval have been examining the air expired by men and animals, and find by analysis that there is always present: First, an insignificant quantity of ammonia; second, very small quantity of organic matter, which, if not already putrefied in the pulmonary passages, has a strong tendency to decay rapidly even at a low temperature; third, if confined it is also harmful on account of the carbonic acid which it contains to the dangerous amount of more than I per cent.

The Chronique Industrielle says that experiments made n rabbits to determine the effect of aqueous injections charged with the poisonous principle, produced by the pulmonary mucous, showed that the human lungs, as well as those of dogs and rabbits, in a healthy condition, produce a very energetic poison that is continually diffused by the exhaled air, and that it is extremely probable, if not certain, that it is this poisonous agent that renders confined air so dangerous to animal life.

According to experiments mentioned in Indian Engineering the tensile strength of a wet rope is only one third that of the sam; rope when dry, and a rope saturated with grease or soap is weaker still, as the lubricant permits the fibres to slip with greater facility. Hemp rope contracts strongly on being wet, and a dry rope twenty-five feet long will shorten to twenty-four feet on being wet.

CINCINNATI WATER-SUPPLY.

THE Board of Expert Engineers employed by the city Cincinnati have completed their investigations, and or Chemnat have completed their investigations, and made a preliminary report in shape of replies to the several propositions submitted for the new system of water-supply. The board consisted of Henry Flad, of St. Louis; Charles Hermancy, Louisvil'e; Alphonse Fteley, New York; Charles B. Brush, Hoboken, N. J., and Dewitt C. Cregier, Chicago.

"The questions and our answers thereto may be briefly

stated as follows

No. 1. Is the location of the present intake on the Ohio River a proper one? Answer. No.
"No 2. Is it practicable and advisable to enlarge and

improve the present pumping-station? Answer. It is not.

No. 3. Is it practicable and desirable to supply Cincinnati with wholesome water from a system of driven

wells? Answer. No.

''No. 4. What source of supply do you recommend?

Answer. The water should be taken from the Ohio River above the Little Miami River, and from an inlet tower or

pier placed on the northern or right bank of the river.

"No. 5. What location do you recommend for the pumping-station? Answer. This question cannot be fully answered until further examinations and surveys have been made. We recommend that a competent engineer should be selected at once to proceed with this work. The necessity for such action will become apparent to you when we state, as we do, that, in our opinion, the plan of constructing a storage reservoir on the Markley farm is impracticable for reasons which will hereafter be fully given.

"No. 6. What method of clarifoction if any description is a superscription."

"No. 6. What method of clarification, if any, do you recommend? Answer: No definite plan can be recommended at present, but we believe it advisable that the engineer selected for making the surveys and examinations above referred to should also be intrusted with the duty of instituting a series of experiments on the applicability of the different methods now in use for clarifying the water by settling and filtering, and that this should be done on a scale sufficiently large to admit of its serving as a guide a scale sufficiently large to admit of its serving as a guide in arriving at an intelligent conclusion, both as to the practicability and cost of the process. We may, in our full report, definitely indicate the nature and extent of the experiments which we consider necessary.

"Besides the questions answered above several others have been submitted verbally by members of your Com-

have been submitted verbally by members of your Com-

mission. To these questions we reply as follows:
"It would be unsafe to rely on a single line of supplymain under any circumstances. The supply-main should be of cast iron. We consider the use of a supply-main of cast iron sixty-two inches in diameter as not warranted by practical experience. The main supply-pipes, where laid in embankment, should be placed at a safe distance apart. We beg leave to call your attention to the fact that surveys may be made, within a month or two, sufficient, if properly directed, to determine the general system to be adopted; and that, therefore, the construction of new works will not be materially delayed. Early relief may in this way be received by the city if the necessary means for

rnis way be received by the city if the necessary means for prosecuting the work are promptly obtained.

"There are several feasible methods of utilizing the water taken from the intake, located, as above proposed, beyond the mouth of the Little Miami River, for supply-

ing the city.

The one that is most practicable can be easily determined as soon as the surveys have been made and the

plans prepared.

"It is not practicable to obtain from the Dayton bar a permanent supply of water for Cincinnati.

"In conclusion we deem it pertinent to say that from every point of view we cannot too strongly urge prompt action in the pressing and very important matter of an increased and improved water-supply for the city of Cincinnation.

nati.
"While, for the reasons above stated, we are not prepared to submit an estimate, we are inclined to believe that the cost of any system of supply which we may be prepared to recommend will not exceed \$6,000,000."

OUR ARCHITECTURAL ILLUSTRATIONS. PORCH OF RESIDENCE OF MR. THORPE, CAMBRIDGE, MASS.-LONGFELLOW & HARLOW, BOSTON, ARCHITECTS.

THE LINCOLN SCHOOL, SOMERVILLE, MASS. -GEORGE F. LORING, BOSTON ARCHITECT.

THIS school building, situated at Somerville, Mass. is wooden frame, brick underpinning, hard pine floor-joists, and slate roof. It is finished in pine, natural, in-side blinds with pockets, maple floors, concreted play-rooms. The ventilation is by means of galvanized-iron ducts to brick shaft in centre; the vent spaces are large enough to admit a man through iron doors in basement; all heating is by register eight feet from floor, and ventilation by two registers in each room, one near floor, another eight feet from floor; all heating and ventilating ducts are eight feet from floor; all heating and ventilating ducts are in inside walls and the results are very satisfactory by using top vent in summer and bottom vent in winter. The heating is by hot air, two furnaces, one for first floor and one for second floor, run separately or with common heating chamber. In summer time the ventilating shaft is heated by gas jets.

The cost was \$12,000. The architect was George F.

Loring, of Boston.

CEMENT MORTARS FOR USE IN PUBLIC WORK.*

THE primary duty required of mortar, whatever may be THE primary duty required of mortar, whatever may be its quality, is to connect or unite the bricks or stones used in the structure, and to adhere closely to the surfaces of the individual blocks or fragments, thus binding or cementing them together into a single coherent mass, just as separate pieces of wood are joined or united by the aid of glue. The quantity used need be only large enough to thoroughly coat every piece of stone or brick, and to completely fill out all of the intersties between them. It is a common practice among masons in this city and elsewhere to fill the larger interstices, which always occur in the rear to fill the larger interstices, which always occur in the rear of the face stones of a wall, with small fragments of stones laid in dry and promiscuously, and then to smear some mortar over the top of the mass, in order to hide the improper workmanship. This practice is exceedingly reprehensible. Every intelligent and skillful workman knows that to produce sound and durable masonry, mortar should first be deposited freely in these spaces and the fragments of stone imbedded therein, after which the process may be repeated until each space is full. In many cases concrete

repeated until each space is full. In many cases concrete is used by engineers for this purpose, and rammed into place, in order to prevent the carelessness just described. In modern practice, for rubble or other masonry, where strength is of more consequence than appearance, full beds and joints are generally considered to be better than thin ones. In such work from one-third to one-fifth of the entire volume of the masonry is occupied by mortar, depending upon the manner in which the stones are dressed and laid, and also upon the skill of the mechanic. Greater skill is needed to properly build a rough or uncoursed and laid, and also upon the skill of the mechanic. Greater skill is needed to properly build a rough or uncoursed rubble wall than one wherein the stones have been nicely dressed; but, on the other hand, a greater strength is required for the binding material, or mortar, since the beneficial effect of the interlocking of the stones and the distribution of strains by large blocks at regular intervals is greatly diminished in rubble masonry constructed with small stones. In such cases the quality of the mortar and the workmanship become of the utmost importance.

Obviously, if the stones are small and irregular, the

masonry must be regarded only as a mass of concrete, in which each fragment of stone is to be cemented or joined more or less firmly to the adjacent fragments by means of the mortar; and in such cases something more than mere hardness after the lapse of a certain time will be demanded of the mortar or binding material. Its capacity for adhering to the surfaces of the stones or brick, as well as its cohesion, are then brought into consideration, in order to prevent any displacement of small blocks or fragments of stone, etc., distributed more or less densely throughout the mass. On the other hand, if the blocks of stone are relatively large and regular in form, the mortar under such conditions is subjected essentially to compression alone, and its properties of hardening, or indurating, need only be taken into account

In many kinds of public works, however, such as the side walls of large sewers, bridge abutments, retaining walls, etc., likewise the concrete foundation for asphalt pavements which are quickly opened to traffic, the stresses to which the masonry is subjected within a comparatively short time after completion are not only simple pressures, as above described, but lateral or oblique forces of more or less intensity, also act upon the mass, and tend to destroy it by causing the slipping of one stone or course over the the next one below, the overturning of a portion, or the displacement of any component part of the structure in general. It is manifest, therefore, that in work of such character the mortar must necessarily be of a better quality than where it is called upon to resist simple pressure alone and the measure of the strength, durability, and safety of the structure becomes in fact the measure of the strength of the mortar in binding together the individual pieces into a coherent mass.

Theoretically, the best wall or masonry structure is one Theoretically, the best wall or masonry structure is one in which the cementing material is just as strong as the brick or stone joined together. It, therefore, becomes necessary to know something of the actual strength of the mortar, both with respect to cohesion and adhesion, during the first few days after its preparation and use in the structure, in which period it may be subjected to severe lateral stresses, and sometimes even to much greater stresses than will probably be brought to bear upon the masonry at any subsequent time. Little bear upon the masonry at any subsequent time. Little attention seems to have been given to this subject by experimenters and authors, since it is tacitly assumed on all sides that no improper strains shall be allowed to act upon the fresh masonry. This important assumption cannot, however, always be realized in municipal work, since the public convenience frequently demands the completion and straining of a masonry structure much earlier than the dimensions or quality of workmanship adopted would seem to warrant; and when, in such an event, the structure is not seriously injured or deformed, the circumstances may generally be regarded as a happy accident, rather than as the outcome of wise forethought on the part of either designer or builder. To assist somewhat in arriving at a fair measure of the strength of hydraulic mortars at different periods of time, as well as the proper composition of the same, the statistics given in tables Nos. 2 and 3, hereunto appended, have been compiled from a great variety of sources, and attention thereto is herewith invited. The record of mortar tests made with American to warrant; and when, in such an event, the structure is The record of mortar tests made with American natural cements is not very extensive, and particularly is this the case with reference to tests for adhesion to the

various kinds of stone used for building. Tests of mortar made with Portland cement and other cements have, therefore, been included both in order to submit the subject in a more complete manner, and to point out the fact that more attention to the composition of the cement mor-tars used in public work in this city may profitably be be-

Strange and anomalous as it may seem, most of the cement tests made in this country and England are carried out for the purpose of ascertaining the tensile strength of neat or pure cements, although such material is rarely, if ever, used in masonry without the admixture of some sand. In Europe, on the other hand, the practice was established about ten years, both by manufacturers and engineers, to determine the value of a cement by testing it when mixed with sand into mortar, the usual proportions of the mixture being three volumes of sand to one volume of cement. It is obvious that the latter practice is preferable since thereby a knowledge of the strength and properties of the

binding material actually used in the work will be gained, and furthermore, because no valid inference as to the co-hesion of a mortar can be drawn from a statement of the tensile strength of the neat cement. Tests of this kind should, therefore, be made with cement mortar, mixed in the same proportions as contemplated in the work itself, and also with the same sand if practicable, inasmuch as the quality of the latter exerts a marked influence upon the resulting strength of the mortar. In general it may be said that the greater the proportion of sand in the mortar tested the more accurately can the actual cementing quality the cement be indicated.

The secret of good masonry lies in having the mortar strong or thick and the bricks or stones wetted.

In regard to the proper amount of water to be used in tempering a cement mortar, it may be said that this will depend upon the quality and quantity of the sand, as also From the numerous and upon the quality of the cement. From the numerous and careful experiments with Portland and Rosendale cements.

^{*}Abstract of a report by the Executive Board of the City of Rochester, N. V., prepared by Emil Kuichling, M. Am. Soc. C. E.

made a few years ago by Mr. Eliot C. Clarke, C. E., and made a tew years ago by Mr. Enot C. Clarke, C. E., and published in the Transactions of the American Society of Civil Engineers for April, 1885, the inference was drawn company to the American cements required. Civil Engineers for April, 1885, the inference was drawn that "as a rule, American cements require more water than Portland, fine ground more than coarse, and quick-setting more than slow-setting cements." For experimental setting more than slow-setting cements." For experimental purposes in the laboratory, the amount of water added by Mr. Clarke to the dry mixture of sand and cement was usually about one-fourth the weight of the Portland, and one-third of the weight of the American cement contained in the batch: but these amounts were increased or discipline one-third of the work in the batch; but these amounts were increased or diminin the batch; but these amounts were increased or diminished somewhat in order to obtain mortars of uniform consistency. Mr. Clarke adds, that in mixing mortars on the sistency. Mr. Clarke adds, that in mixing mortars on the sistency of public works, and particularly for concrete works, site of public works, and particularly for concrete works, much larger quantities of water than are used by him for testing purposes are commonly added by workmen in order to render the labor of mixing and spreading less difficult, but that the result of this procedure is always a more of to render the labor of mixing and spreading less difficult, but that the result of this procedure is always a more or less great loss of strength. For the standard tests of cement mortars by European engineers the rules prescribe one part by weight of cement, three parts by weight of normal sand and four-tenths of a part by weight of clean, test water.

Portland cement acquires its strength more quickly than Rosendale. Both cements, but especially the Rosenthan Kosendare. Both cements, but especially the Kosendale, harden more and more slowly as the proportion of sand mixed with them increases; and whereas neat sand mixed with them increases; and whereas neat cement and rich mortars attain nearly their ultimate strength in six months, or less, weak mortars continue to harden for a year or more." It has also been found that after a period of about a year, weak mortars often lose in strength or tenacity what they may gain in hardness, from the fact of their becoming more brittle. Specimens from the fact of their becoming more brittle. Specimens of such mortar two years or more old break very irregularly. Mortars less than one month old are relatively weak, and hence the advantage of waiting as long as possible before loading masonry structures. Portland cement mortars are especially useful in cases where the masonry is necessarily subjected to severe strains within so short a period as one week. Specimens

period as one week.

The standard of tensile strength required by German engineers of Portland cement mortar, prepared by mixing one unit of weight of cement with three like units of norone unit of weight of cement with three like units of normal sand, and four-tenths of such a unit of clean, fresh water, and tested after an exposure of one day in air, and twenty-seven days in water, was formerly 114 pounds per square inch. A few years ago the standard for a slow-setting cement was raised to 142 pounds, and at the present time it has been further raised to 227 pounds. For quick-setting Portland cements somewhat inferior strengths than the latter are expected after the same period of time. In the construction of the French harbor works at Calais and Boulogne, Mr. F. Guillain, C.E., in a recent report on the tests of the Portland cement used there states that the minimum tensile strengths specithere states that the minimum tensile strengths specified for tests with neat cement were as follows: 282

pounds per square inch after seven days, 498 pounds after twenty-eight days, and 640 pounds after eighty-four days. According to eminent English authorities, Portland cement, tested neat, should give a tensile strength of at least 200 pounds per square inch after seven days' immersion in water; and when tested with an admixture of three parts of sand to one of cement, its strength should be about parts of sand to one of cement its strength should be about 112 pounds per square inch after one day in air and twenty-seven in water. For use in public work where other than compressive strains act upon the structure, it should not be mixed with sand in smaller proportions than one part of cement to three of sand. Natural or "Roman" ements, when tested neat, usually exhibit tensile strength after seven days in water. Such cements should not have a greater admixture of sand than in the proportion of one to one, in all structures subjected early to the action of the structure of the subjected that is the subj lateral forces. They also develop their greatest strength when freshly burnt and finely ground.

RAPID RAILWAY EMBANKMENT CONSTRUCTION.*

THE object of this paper is not to give you information upon new engineering topics, but to describe the methods adopted in performing a certain given amount of work in a brief period of time. The difficulties that have been overcome in the work about to be described were more from a shortness of time than from any other cause. The a brief period of time. The difficulties that have been overcome in the work about to be described were more from a shortness of time than from any other cause. The work is located in the city of St. Louis, namely, on Hall Street, between North Market and Bremen Avenue. A franchise was granted to a certain railway corporation in this city to build its railway tracks over and upon certain portions of various streets and wharves in the city of St. Louis, which, among other things, required that the railroad company should "fill Hall Street forty feet wide to the established grade within one year" from the date of the approval or the ordinance granting the franchise. Certain difficulties were in the way, and were not removed until all the time mentioned in the ordinance had expired excepting twenty days. The amount of work required to be done to comply with the terms of the ordinance and save its being forfeited—namely, that of filling IIall Street forty feet wide to the established grade from North Market Street to Bremen Avenue, involved the building of an embankment about a mile and a quarter in length, requiring about 97,500 cubic yards of material. All of this material had to be obtained from points outside of the limits of the streets, it being an embankment the whole distance.

A ad by Isaac A. Smith before the Engineers' Club of St. Louis, and published in the Journal of the Association of Engineering

^aR ad by Isaac A. Smith before the Engineers' Club of St. Lou's, and published in the Journal of the Association of Engineering Societies.

Two borrowing pits were secured near the centre of the work, with an average haul from the borrowing pits to work, with an average half from the borrowing pits to the place of deposit in the road of about 1,300 feet. These borrowing pits were composed wholly of silt, and situated upon the west bank of the Mississippi River. The first work performed was that of building a road from the borrowing pits to the embankment. This was done by cut-ting down the willows which grew over the borrowing pit, and between it and the street upon which the embankment was to be constructed, and laying them crosswise of the road and putting dirt upon them to hold them down, the road of course being simply a temporary one for use dur-ing the time of construction. After clearing all of the logs, stumps and other debris from the surface of the pits, which required two days, on the morning of the third day the work of constructing the embankment began. horse wagons were placed in service for each pit, one hundred and twenty in all. opened in each pit of sufficient width to load twenty wagons at one time, and seven men were detailed for each wagon, making 140 men, exclusive of a foreman in each pit. After the wagons were loaded they were driven straight forward, without turning, to another road already constructed, and, following this road, conveyed their load to the place of deposit. When the wagon reached the place of deposit, or dump, as we call it, it was driven on the dump to a place designated by the dumpman. If by any accident or fault of the driver or horses the load was stopped short of the point designated it was at once unloaded, for the orders were strict against per-mitting teams to pull a second time on a load after it was stopped on the soft dump. The wagon, after being unloaded, proceeded over the forward end of the dump to the road in the pit. A ticket-boy, provided with a sufficient number of tickets, all alike, handed one to the driver of the wagon as he passed going to the pit. Drivers were required to exhibit forty of those tickets for a day's work. The tickets were returned to the time-keeper every even-Each wagon was numbered, and each shoveler and dumper was numbered. Men and teams were known only by their numbers. Their numbers appeared upon the time-book instead of their names. The object in doing this was to prevent a multiplication of similar names. which is often a source of serious error in keeping time on large works. There was one walking foreman in each on large works. pit, whose business it was to preserve order among the men and direct where the wagons were to be loaded. The men were not allowed to speak to each other, neither were they allowed to smoke or drink. Teamsters were not allowed to leave their seat upon the wagon. Men were employed, who carried water and watered the horses when they needed it. Ice water was carried to the men when it was needed. If a man was derelict in his duties, or was falling behind in the performance of what was expected of him, the foreman would warn him first that he must do better. If a second warning was necessary it came in the shape of a discharge, the foreman being provided with a pad of blank discharges requiring a very small amount of writing, one of which he made out and handed to the dissmall amount of charged employee, who conveyed it to the time-keeper, and from the time keeper he received a check on the treasurer for his money, his number being preserved after he was discharged, and a remark made opposite the number in the time-keeper's book stating the cause of his discharge. If the cause was not through any fault of his own, if it was from sickness of himself or family, or from any cause that he could not control, there was no objection to his being re-employed; but if his discharge was occasioned by laziness, desire to drink, or any fault of his own, he was not re-employed. Each pit foreman was provided with a staff eight feet long. Three feet and three inches from the end of this staff was a notch cut in it. There was also a notch cut twenty inches from the end. The length of the staff indicated the required length of the wagons. The first notch mentioned—namely, the one three feet and three inches from the end, was the required width of the wagons, and the twenty-inch notch was the required to enter the pits that did not comply exactly with these dimensions. The wages paid to teamsters was \$4 per day; to walking foremen, \$2.50 per day; time-keeper, \$2.50 per day; dumpmen and shovelers, \$1.50 per day; ticket boys, \$1

The second pit was operated precisely as has been described for the first one. The embankment had been properly staked out by the engineers, slope stakes with the fills marked upon them at frequent intervals, and skilled dumpmen were secured where it was possible to do so. The work from these two pits proceeded in this manner until the 97,500 cubic yards of material had been deposited in the embankment. However, all of the material required for the embankment did not come from these pits. There were some cellars being dug in the vicinity and some street reconstruction; from both of these sources some material was obtained, it being hauled to the dump by the conwas obtained, it being hauled to the dump by the contractors for these respective works. A separate system was observed for this character of work. The teamsters were each given a ticket for a load. The tickets were printed and were numbered serially, and each of them contained the autograph signature of the chief engineer. This was done to prevent counterfeiting. These tickets were redeemed at the office of the company in quantities exceeding ten, and ten cents apiece was paid for them generally. The wagons which conveved this outside material to dump were of different sizes. Some of them would contain more were of different sizes. Some of them would contain more than a yard and some less. In sixteen days from the time the work began it was finished forty teet wide to the estab-lished grade; that is to say, within a period of sixteen

days 97,500 cubic yards of material was deposited in Hall Street between North Market and Bremen Avenue embankment was about ten feet high and forty feet wide on top. It is usually the case that where work of this character has to be *rushed*, or done within a given period of time, that little or no attention is given to the cost of the work, but in this instance the cost was a very important matter, and every point was closely watched so as to secure a minimum price per cubic yard for this embankment. Before the company concluded to do the work itself a number of prominent contractors were requested, after visiting the premises, to make bids for doing the work, accompanied, of course, by a guarantee that it would be done within the time required—namely, twenty days. No contractor would give that kind of guarantee, and the lowest price to be obtained from any of the contractors for this work, without a guarantee, was 35 cents per cubic yard. The actual cost of doing the work in the manner described was eighteen and fifty-eight hundredths cents per cubic yard, which was but little more than one-half of what it would have cost had it been let to the lowest bidder for The weather, during the time the work continued, was very mild and pleasant, conducive to the largest results in a given period. The character of the material conveyed from the borrowing pits to the embankment was such that it required no picking or plowing, but could be readily shoveled, being silt deposit from the river. Care was taken in the pits to see that the surface of the ground was taken off evenly, consequently loaded wagons very rarely "stalled" in the pit, or got in each other's way. However, an extra team was kept in each pit to help loaded wagons if there was any tendency to stall on help loaded wagons if there was any tendency to stall on the part of the horses attached to the loaded wagon. Not more than one pair of horses was required, however, to over twenty teams. The utmost harmony prevailed among the men; no talking was permitted, as I have before remarked, and at noon hour the men were required to take their lunch as near as possible to the scene of their operation. Work began at half past six in the morning, ended at half past five in the evening, and one hour for feeding at noon, which left ten working hours.

ing hours.

Several eminent local engineers, knowing the extent of the work, gave it as their opinion that it could not be done in the limited time, and the writer confesses that he was of the same mind; but there was no alternative but to try; and favored with fine weather, excellent materials, and thorough organization, the task was accomplished within the allotted time.

PROPOSED NATIONAL BUREAU OF HARBORS AND WATERWAYS.

> DEPARTMENT OF ENGINEERING. COLLEGE OF NEW JERSEY, PRINCETON, N. J., March 7, 1888.

SIR: Whatever may be said of the details of the Cullom bill, its general purpose seems to be a wise one—viz., to secure for the Government the advantages which may naturally be expected from separating the improvement and maintenance of harbors and waterways from other na-

and maintenance of harbors and waterways from other national works and placing it under a separate bureau on the footing of a distinct and important speciality, to be conducted by a carefully organized corps of specialists.

The general scheme is an attractive one, but its value to the country at large will depend greatly upon the adjustment of its details, and upon the fidelity with which the spirit of its provisions is carried out. I shall have time to notice only a few of the points contained in the measure.

An important feature of this bill is the provision for retaining in the new organization the services of as large a portion as may be practicable of the United States Engineer Corps, the purpose evidently being to profit by the skill and experience which these officers have acquired in the management of just such works as the bill contem plates, and to infuse into the new organization the careful and orderly methods of transacting business which are characteristic of the army. In my opinion the bill might have gone a step further in the same direction with great have gone a step further in the same direction with great advantage, by requiring that, in the initial organization of the new corps, the chief engineer, the associate chiefs and the department engineers should be army engineers of large experience in harbor and river works, the other officers being appointed as provided for in the bill. The earlier transactions of the new corps might thus be rendered perhaps more harmonious and, certainly, less tentative in character; while the rules and regulations of tentative in character; while the rules and regulations of the old organization, so far as they may be applicable to a mixed board of military and civil engineers, could go into operation at once, and could continue in force until expe-rience shall have demonstrated the necessity for alterations. In making this suggestion, I do not mean to imply that the professional attainments of our civil engineers, within the professional attainments of our civil engineers, within or outside of their particular specialties, or their general intelligence, enterprise or faithfulness is to be rated lower than that of military engineers. Such an implication would not be warranted by the progress of civil engineering in this country. But it is a fact, I believe, that many of the older members of the engineer corps of the army are experienced in conducting harbor and river improvements in a degree which from the very nature of the existing in a degree which, from the very nature of the existing organization, must have been beyond the reach of civilian employees, though through no fault of their own. The number of civil engineers who have been brought in contact with the work of harbors and waterways in a much higher capacity than that of assistant must be extremely

small—I can think of only one. Would not the appointment of civilians to the higher offices of the new corps be therefore somewhat in the nature of an experiment, and might it not be wiser to proceed more cautiously than the bill contemplates in committing the higher duties of the corps to persons who, however high their other qualifications may be, may have only a theoretical knowledge of the routine of the business? The retirement of higher officers will in due time open opportunities to all members

of the corps to advance to higher positions.

Personally, I look with gratification, not with indifference, on the provision for the immediate appointment of civil engineers to nearly one-half of the principal offices of the new organization; but in making the preceding suggestions, I am aiming to look at the matter from a business point of view, and solely in the interest of the Government, for whose benefit alone, I take it, the bill has been pre-

If the suggestions here offered were incorporated in the bill a special commission for the formulation of rules and regulations and for the nomination of officers would be unnecessary. The regulations would then naturally be drawn up by the chief and his associates, while the same officers, if at all worthy in point of character and professional attainments to hold their positions, would, in my estimation, be quite as likely to make judicious nominations of subordinates as the special commission provided for in the bill. Moreover, they would, in all probability, be better acquainted than an outside commission could be with the necessary qualifications of appointees. The employment of a special board on rules and credentials has the flavor of civil service reform, and would be a very desirable step in organizing a bureau for conducting entirely new work. But the commission in question seems to me to be a superfluity, in view of the fact that the improvement of harbors and waterways has been carried on by the army engineers during the past fifty years on good business principles, so far as these were within their control, and, considering all the circumstances, with a very fair degree of success.

fair degree of success.

The closing provision of Section 15 supplies the necessary authority for filling vacancies in the grades of first and second assistants by the appointment of new men whenever an emergency may arise in the service rendering such action necessary. But the language of that provision admits of too liberal an interpretation. It apparently sanctions the reservation of one-third of the vacancies occurring in the above grades annually for the benefit of outside applicants, regardless of the claims of meritorious officers for promotion to these vacant positions. The law should first provide for the promotion of all officers who are really deserving, and only after that should it contemplate the throwing open of the vacancies that may be left unfilled to the competition of applicants for admission to the corps. I apprehend that the clause, as it stands, may prove to be "an entering wedge." It will tempt those who may have friends or political adherents desiring appointments as first or second assistants to use their influence for opening every year a full third of the vacancies in those grades to outside candidates without regard to the possibility that there might be in the service deserving officers yet unpromoted. This clause also apparently excludes from reappointment all former officers of the corps who, having once resigned their position, and having received an honorable dismissal, may apply tor readmission. The discrimination can be avoided by striking out the word formerly from the phrase "not formerly members of the corps."

The just regulation of promotions is a troublesome matter, and I have no doubt that the framers of the bill have given the subject much thought. Yet it does not appear to me that seniority alone should determine the advancement of the higher officers. Mr. Hering has stated very fully and clearly the arguments against it, and I cannot add to their force. But I may say that the duties of the higher officers in any organizations are not of so intangible a nature as to preclude the possibility of judging the mannet in which they are performed; that the performance of the duties of department and division engineers will admit of comparison almost, if not quite, as readily as the work of officers of lower grades; that under a proper system of observation, such, for example, as exists on some railroads, the quality of each man's work, his general efficiency, and, consequently, his fitness for being intrusted with higher duties, can be determined with great exactness; and, therefore, that there appears to be no good reason why the recommendation of the advisory board should not be made a condition for the promotion of department and division engineers. The promotion of associate chiefs could be made by the President on the recommendation of the Secretary of War, who naturally would be in possession of all the necessary intormation on which to base such recommendations.

to base such recommendations.

I think no argument is needed to show that almost any rule that may be adopted for regulating the retirement of officers from active duty will at first operate unequally in a new organization. A limit of age will probably prove, in the long run, to be a fairer basis for retirement than any other.

any other.

The bill is lacking in provisions for dealing with officers who may have become disabled while in the service; also, for ridding the corps of untrustworthy members.

In conclusion, I desire to say that the bill indicates to my mind a purpose on the part of the National Government to deal with public works on broad and advanced principles; that in the execution of such a purpose it deserves, in my estimation, warm encouragement from all quarters; that, while I have criticised some of the details

of the bill, there are many others which I heartily approve of; and, finally, that I regard the measure generally as a very important move in the right direction.

Very respectfully, your obedient servant,

CHAS. MCMILLAN.

———

ROCHESTER, N. Y., March 10, 1888.

SIR: I have read with much interest both the bill and the discussion thus far in relation to the establishment of a Bureau of Harbors and Waterways, and I desire to add my mite to the support of the bill in general. The idea underlying it is the tardy recognition by the Government that engineering and scientific ability does exist outside of the graduates of West Point, and to this extent, at least, it should be looked upon as a step in the right direction. There are doubtless few earnest engineers in civil life who have not suffered more or less from just the lack of such recognition. The bill should, therefore, pass, even though all of its provisions may not be exactly in accord with our individual opinions. Much will depend upon the commission provided for by Section 12, and upon the character of the men who shall determine what the standard of a mission into the corps shall be. If this be made high enough then promotion by seniority will perpans bethe only practicable manner of filling recognities.

the character of the men who shall determine what the standard of a mission into the corps shall be. If this be made high enough then promotion by seniority will perhaps be the only practicable manner of filling vacancies.

It is very difficult to criticize a measure of this kind fairly without a thorough knowledge of the system adopted in the past. Traditions are always strong and may be respected, to a certain degree, provided that their influence is, on the whole, good. The generous rivalry between the army and the civil engineers, which will doubtless result as soon as the corps is once rationally organized, cannot fail to be beneficial, and to redound ultimately to the greater glory of a profession which, in our country, does not enjoy the general respect that is accorded to it in other lands. In the absence of anything better, let us accordingly look upon this measure with favor, and thereby secure some degree of recognition for the educational facilities and the natural talent which our country affords.

Yours very truly, EMIL Kuchling.

SELF-BURNING BRICKS.

THE following is an extract from a letter which appeared in the Peterborough Advertiser: "At Peterborough there are a number of brick-works, and the lower the clay for making bricks is obtained the less coal it takes to burn the bricks. After getting some few feet down the clay contains natural fuel, and the deeper the clay is dug the more natural fuel it contains. When the bricks made from the lower clay (which is really a shale) are being burnt, they throw out a gas which can be clearly seen burning in the kiln between the bricks. The coal bili is so much reduced since the lower shales have been made into bricks that they can be sold cheaper than anywhere else in England."

MASONRY BRIDGES OF LARGE SPAN.

ACCORDING to Professor E. Dietrich, of Berlin, in the London Engineering, there are only fifty-seven bridges of brick or stone existing having a span greater than 131 feet. Forty of these have spans lying between 131 and 164 feet, ten having spans of from 164 and 200 feet. three of from 200 to 230 feet, and one only, the Cabin John Bridge, near Washington, exceeds this limit, and has a span of 237 feet. Thirty of these are road and twenty-two are railway bridges; one carries a canal, another a conduit, and three are not classified. Fourteen of them date from before the commencement of the present century, twenty-two were built between the years 1800 and and 1860, five between 1860 and 1870, six between 1870 and 1880, and since then ten have been erected. In twenty-two of the bridges the rise lies between half and one-third of the span, in eighteen between one-third and one-fourth the span, in ten between one-fourth and onefifth the span, and in six between one-fifth and one-eighth the span. One bridge only, a road bridge in Turin, has a flatter arch than given by the smallest of the above ratios, and in this case the rise is 0.122 of the span. The radius at the crown lies in fitteen cases between 66 and 98 feet, in eight between 98 and 131 feet, in eleven between 131 and 164 feet, and in three cases between 164 feet and 187 feet 81/2 inches, the latter being the radius at the crown of the Devil's Bridge at Bevizzo, Italy. The ratio of the arch at the crown to its radius at the same point is in thirty bridges between one-tenth and one-twentieth, in ten between one-twentieth and one-thirtieth, and in eight between one-thirtieth and one thirty-fifth. In all the railway bridges this ratio lies between one-twentieth and onethirtieth, the smaller fractions being solely confined to road bridges. Twenty-seven of the bridges are situated in France, thirteen in Ita'y, ten in England, two in Austria, two in Spain, and one each in Germany, Switzerland, and the United States.

NEWARK'S WATER-SUPPLY.

THE Water Commissioners of Newark, N. J., have mace arrangements to ask the Common Council for \$450,000 to build a new storage reservoir and to increase the pumping facilities.

Superintendent George R. Gray of the Aqueduct Board says: "The city has at present the receiving reservoir, with a capacity of 14,000,000 gallons; the Chatham Street reservoir, which holds about 15,000,000 gallons; the Branch Brook reservoir, capacity 4,000,000 gallons, and the South Orange Avenue reservoir, with a capacity of 8,000,000. This makes a total of about 40,000,000 gel. lons, all of which would not be available, for when the quantity is reduced the pressure is too light to furnish the supply. The daily drain upon these reservoirs is from 17,000,000 to 20,000,000 gallons. On the basis of the lower figure the supply is scarcely sufficient to furnish the city with water for two days. Consequently the pumpmust be kept always at work, and should an accident oc. cur the city would have to depend upon the reservoir sup. ply, good for less than two days. It is proposed to spend \$150,000 in building a reservoir on the Branch Brook site. one which will hold 155,000,000 gallons, and it will be necessary also to increase the pumping facilities at Char. ham Street. This will require \$35,000 more. The remainder of the money is required for extensions, and new supply mains are needed which will cost \$165,000. The safety of the city demands instant action, for the consumption of water is constantly increasing."

The total expense is calculated to be \$450,000, but it will probably be at least half a million. The site selected for a new reservoir is the place from which the original water-supply of the city was taken. It lies along the bark of the Morris Canal, between Orange Street and Bloomfield Avenue, and was originally a natural lake nearly half a mile in length.

THE NEW TAY BRIDGE.

THE new Tay Bridge, successor to the most unfortunate piece of bridge work which British engineering annals record, was opened for general traffic on 20th June last, just five years after its commencement. The London Engineer gives the following description of this important work:

The bridge is only 23 feet less than two miles in length. or 10,527 feet. It comprises in all 86 spans, five of which are brick-work, the remainder of girder-work. Seventythree of the piers have cylinder bases, 49 of which are wrought iron, and 24 of cast iron. The piers, with wrought-iron bases, are on the straight part of the bridge. and from low water to high water are built of blue brick cylinders filled with concrete. At high water they are joined by strong connecting pieces, surmounted by octagonal wrought-iron plate pier superstructure, joined at the top by plate-work in arch form. The piers with cast-iron bases are carried up in cast iron to the connecting piece, on which the wrought-iron superstructure is erected. The girders are of wrought iron, and the maximum headway above high water is 77 feet. The total weight of wrought iron used is 19.337 tons, cast iron, 2,470 tons, and steel in flooring, 3,540 tons; or a total of 25,347 tons. Of brick-work 25,700 cubic yards were used, and of cement concrete, 37,000 cubic yards. In testing the viaduct 16 heavy locomotives were used, weighing 955 tons. The engineers for the work were Messrs. W. H. Barlow & Son. MM. I. C. E., and the contractors Messrs. Arrol & Co.. Glasgow, Mr. F. S. Kelsey, M. I. C. E., being the resident engineer.

A FRENCH VIEW OF AMERICAN TRAIN SERVICE.

M. ROEDERER, in the Annales des Ponts et Chausses, etplains the American system of train dispatching and commends it as excellent and productive of good results, but considers it the outgrowth of special conditions and requirements here, and does not advise its adoption in Europe, where, he states, the percentage of deaths and wounds from railroad accidents is only about one-fourth of what it is in this country.

THE President has approved the joint resolution directing the Secretary of the Interior by means of the Director of the Geological Survey to investigate the practicability of constructing reservoirs for the storage of water in the arid regions of the United States.

STATE SANITARY INSPECTION OF SUMMER RESORTS PROPOSED IN RHODE ISLAND.

THE Rhode Island State Board of Health make the following report and recommendation to the Legislature:

The occurrence at the Conanicut Park Hotel in Jamestown, in July, 1887, of a large number of cases of sickness, a considerable proportion of which were of great severity, and attended with fatal results in a few instances, was the occasion of early attention on the part of the State Board of Health.

The premises were visited by the secretary upon notice of the sickness there. It had been ascertained that the sickness had probably resulted from the leakage of a sewerpipe, which was the conduit of the washings of the water-closets, said leakage being in close proximity to a well under the cellar floor, and said well having been the sole supply of water for the hotel for drinking and culinary purposes.

Inquiries as to the system of drainage, location of waterpipes and connection with drains, material used, time when put in and when last examined, number and location of cisterns for washing purposes and outlets of the same, the care of outside privies, etc., elicited statements of such discrepancy as to create a belief that no person had a full knowledge of the premises and all its appurtenances.

Following the events which had occurred at the hotel there were various idle and contradictory rumors in circulation which at the best could only perplex rather than enlighten the public mind.

Under the circumstances it seemed proper that the Board should not only officially examine the premises at the Park, but also give a public hearing, so that all parties might have an opportunity of stating facts known to them, and give such individual opinions or interpretations as they believed were correct, as to the connection of the events that had transpired with the condition of the premises, and as to the responsibility therefor.

The first examination and hearing was on the 31st day of August and the second on the 14th of September, 1887.

The testimony taken at these hearings was quite voluminous, covering III pages of type-writing. The Board feel assured that it would be too tedious for the General Assembly to attend to the reading of this mass of testimony in ordinary session, and do not deem it expedient to have the whole of the same printed, inasmuch as the pertinent facts elicited, covering the questions at issue before the general public, can be stated in a greatly abridged and more concise form as follows:

On the part of the owners of the premises it was stated that "the company had not attempted to minimise the enormity of the events that had occurred: that when it appeared that the sewer was broken it was evident where the wrong was; that they felt the humiliation and sorrow of the circumstances as keenly as possible, but knew that their grief could not assuage the harm that had been done; that they did not ask that anything be covered up or any favor shown; that they believed the sewer was all right; had been in use thirteen years, the original having been put in on specification of the architects, and what were believed to be first-class plumbers employed; that they depended on the experts for good work; did not know all the details of the water and drain connections; had been informed that there would be trouble from the privies outside some future day; had contemplated putting in waterclosets in the house and discarding privies entirely and rearranging the whole plan of drainage, but had not the available means."

On the part of the lessee it was stated that he had occupied the premises several years, did not know of any defect in the drainage until 1880 a bad odor came up through the cellar and laundry floors; the floor was taken up and a waste-pipe from the laundry tubs was found broken; this was mended and the odor diminished; that he had never been satisfied with the water-supply; that he had talked with the agent several times about it, and that it was well understood that in the spring of 1887 new and ample water-supply would be furnished and the drainage

entirely overhauled; that he came about the 1st of June, nothing unusual about the water was discovered until the 9th of July. On the 10th the pump from the well was tied up and no water taken from it afterwards; the sickness of the boarders, however, continued to increase in number and severity, and they began to leave, and by July 23 all were gone. On the 23d the cause was definitely determined.

The testimony of practical plumbers was to the effect:

That the old plumbing was bad work, materials bad, joints badly cemented, sewer of vitrified pipe running through the wall, broken both sides of wall and at a joint three lengths from the soil-pipe; traps of water-closets plugged in the iron soil-pipe with wood; overflow-pipe from a cistern had entered the soil-pipe and sewer without a trap, but had been plugged.

Believe the well was polluted by sewage from the leaking sewer or drain pipe.

Dr. Jernigan, of Boston, testified substantially:

That from the testimony of others, and from personal knowledge of certain unsanitary conditions, he was positive that the sickness was caused very largely, if not wholly, by the use of polluted well-water, and that the pollution of said well-water was caused by the inflowing of sewage from a broken drain-pipe or sewer.

From the examinations made and the evidence presented at the public hearings, the Board came to the following conclusions:

That the sickness at the Conanicut Park Hotel was caused by the pollution of the well-water which had been in use.

That said pollution was caused by leakage from a broken sewer-pipe.

That the said sewer-pipe was of brittle material and that the connecting joints were cemented by material that had become brittle and crumbly.

That the sewer pipe had been in use thirteen years and had not been inspected during that time.

That the sewer-pipe was broken both sides of the wall through or under which it emerged from beneath the building, and that said breakage had probably been in existence to some extent for several years.

That there had been foul smells in the cellar beneath which the sewer-pipe was laid and in the laundry adjoining during the year 1886, and upon examination a drain-pipe from the laundry tubs running to the sewer was found broken several feet from the connection with the sewers. The broken drain-pipe was mended and no further examination made.

That the connection of the drain-pipe with the sewer was very loose and had probably allowed the leakage of wash-water when flushed for a number of years.

The Board is further of the opinion that there had been an almost entire and inexcusable lack of proper knowledge on the part of the owners of the quality or condition of the main sewer and the arrangement and condition of the soil and water pipes, and of their dangerous relation to the well.

That there had been on the part of the owners a culpable neglect of proper inspection and supervision from year to year of the drainage, water-supply, and other sanitary requirements of a summer hotel.

And further, that there are other summer hotels and boarding-houses in the Stare in which and around which the sanitary conditions are such that disastrous events, like those which occurred at Conanicut Park Hotel, may ensue to a greater or less extent in any or every year indefinitely.

The Board, therefore, would recommend such legislation as will, as far as possible, secure a thorough sanitary examination of all premises that are opened to the public for the accommodation of summer boarders, and thereby furnish healthful homes to seekers after recreation and health, rather than unsanitary traps to catch confiding visitors, and promote disease instead of health, and respectfully submit the accompanying act therefor:

SECTION I. The State Board of Health shall cause an examination of such buildings and premises connected therewith as may be opened in this State for the board and lodgment of summer visitors or summer patrons and furnishing accommodations for ten or more such persons at one and the same time. Such examination shall be made under the direction and supervision of the said Board and by employees under its appointment and at such times as the said Board shall deem necessary.

SEC. 2. The said employees or sanitary examiners so appointed shall ascertain the source and sufficiency of the water-supply and the quality of the water, the methods of removal of waste water, slops, excreta, house refuse, gar-

bage and all putrescible matter of whatever kind, the ventilation available, the means of preventing and modes of safe escape in case of fire, and such other conditions, as per schedule furnished, as the said State Board of Health shall require. The said examiners shall receive for such service such compensation per diem as the said Board shall deem just and reasonable.

SEC. 3. Upon the receipt of the report of such examinations the State Board of Health shall authorize the Secretary of said Board to issue a certificate certifying to the sanitary and other conditions of the examined premises in accordance with the examiner's report, and said certificate shall be placed by the managing occupant of such premises in a safe and conspicuous place where it may be easily seen and read by all persons visiting said premises, and the said managing occupant upon the destruction or defacing of such certificate shall immediately procure another of the same character, to be placed in a like conspicuous position.

SEC. 4. Every person opening a hotel or other building for the purposes set forthin Section 1 of this chapter, who has not previously requested or obtained an examination of said premises in compliance with the provisions of this chapter, shall be fined not less than \$50 nor more than \$500; or imprisoned not less than thirty days nor more than three years.

SEC. 5. The sum of \$1,500, or so much thereof as may be needed, is hereby appropriated for the purpose of enforcing the provisions of this act, and any bills for service or expense incurred in such enforcement, when certified by the Chairman of the State Board of Health and approved by the Governor, shall be paid from the State Treasury upon order of the State Auditor.

SEC. 6. All acts and parts of acts inconsistent herewith are hereby repealed, and this act shall have effect from and after its passage.

THE HISTORY AND ART OF RAISING WATER.

A Lecture before the Plumbing Class of the New York
Trade Schools.

A LECTURE was delivered before the plumbing class of the New York Trade School March 15, by Mr. Thomas J. Rider, Superintendent of the Delamater Iron Works, who briefly outlined the development of the art of water-raising from the earliest times until our own day, and explained some of the special and fundamental principles and devices.

Mr. Rider traced the progress of this art (which he believed so important as to be a fair indication of civilization) from its probable beginning in the use of a gourd dipper. From the gourd the first artificial vessels for raising and carrying water were modeled; then, as wells were dug of increasing depth that became inaccessible from the surface of the ground, inclined planes were made to descend to the water-level, and when these became too long or steep, spiral stairs were built in the well itself.

Where the stairs were not used a vessel was probably lowered by a cord, and from this germ the "chain of pots" was evolved that still exists in a slightly modified form as a chain pump.

The cord with a single vessel was soon provided with a pulley, and then another vessel or bucket was attached to the other end. This was the first machine used for raising water, and was very soon supplemented by a windlass. The well sweep was also introduced and still performs effective service under suitable conditions.

Increasing demands for water, especially for irrigation, led to the invention of pumps, which may be divided into two classes—lifting pumps that work by suction alone, and those that also force the water above their own levels.

The surface of all water sustains an atmospheric pressure of about 15 pounds per square inch (increasing rapidly with its distance below and decreasing slowly with its distance above sea-level). If this pressure be removed from a certain portion, as is done in the barrel of a suction pump, the water is unbalanced and the pressure on the remainder will force it up there until the height of the column is such that its weight equals the pressure on its base. This height is theoretically a little more than 32 feet at sea-level; in ordinary practice about 20 feet is attained, 25 feet is considered as high as practicable, and 30 feet as the absolute working limit.

The ordinary cistern or pitcher-pump has a metallic barrel with a tightly fitting sucker or bucket in it, and there are valves in the foot of the barrel and bucket. Raising the bucket removes some of the air-pressure from the water below, which flows up through the foot-valve into the barrel of the pump. When the bucket is depressed its valve opens and allows it to descend through the water in the barrel; again raising the bucket lifts the water already in the barrel and sucks in more under the bucket, and so on for every stroke. This pump is called single-acting

all the work being done by the up stroke of the bucket piston. If the pump is far above the water the first strokes will draw air only from the pipe, gradually lifting the water towards the barrel, which it will enter and then be continuously discharged. If the pump be placed above the limiting height of suction, water can only be raised to that height in the pipe and will remain there, further pumping being useless.

The bucket of this pump is usually made of two pieces of metal, with a cup-shaped leather packing between. The bucket-valve is metal, ground to fit. The foot-valve is soft leather, working like a hinge, and is loaded to close it tightly. A stem on the bucket-valve and lever on the foot-valve open them while the bucket is at the lowest part of its stroke and insures the drainage of the water from the pump when not in use.

This pump becomes a single-acting force-pump by the addition of an air-tight cap, through which the pump-rod works in a stuffing-box, and a discharge-valve which is placed above the bucket, and is a counterpart of the foot-valve. The water raised by the bucket is forced into the discharge pipe through this valve, which closes and prevents its return to the barrel when the bucket descends. The next up-stroke of the bucket forces more water through the discharge-valve, raising the level in the discharge-pipe, and so on until it rises to the required height and reaches the outlet, when the discharge will correspond to the strokes of the bucket.

Force-pumps are generally made double-acting— $i.\ e.$, to throw the water at each stroke. The bucket is replaced by a solid piston, four valves are required, and the footvalve is called a suction-valve. A common single-acting force-pump, used for pumping against heavy pressures, feeding boilers, etc., has the bucket replaced by a solid plunger passing full sized through the stuffing-box and loosely fitting the barrel. This pump cannot raise the water far by suction.

The bucket-plunger pump is like the single-acting bucket force-pump, except that the pump-rod is so large as to occupy just one-half the volume of the barrel, so that on the downward stroke of the bucket the water occupying the whole space of the barrel flows through the bucket-valve, and having only half room enough above it one-half is forced out through the discharge-valve, and the remainder being forced out on the up-stroke keeps up a constant discharge and makes the pump single-acting in suction and double in discharge. This is of great advantage for a long or crooked discharge-pipe and this pump is much used for artesian wells and other places. Besides the above, which are the principal forms, many other pumps are now made.

Rotary pumps of whatever pattern have parts which correspond in use to the foot-valve, bucket, cylinder, and discharge-valve, and are extensively made, but not in such numbers as the reciprocating pumps. Usually they are more delicate than straight-motion pumps, but often have the advantage of occupying little space and discharging a continual flow of water at a high speed.

There are three essential elements of the power required to raise water—viz., the weight lifted, the distance to which it is lifted, and the time it takes to lift it. A strong man, working to his full capacity, is able to raise 4,000 pounds one foot high in one minute; 33,000 pounds raised one foot in one minute is the standard horse-power. A gallon of water weighs 8½ pounds, and a man working at his maximum capacity could raise 300 gallons 100 feet high in one hour, provided there were no losses from friction; but these losses are so great in practice, that frequently the water raised represents only one-third or less of the power developed. One great source of loss is in the considerable speed at which water is frequently delivered.

As civilization has advanced, the power for raising water has been succesively furnished by manual labor and animal labor, and steam, gas and hot-air engines. We have large pumping-engines raising millions of gallons of water daily, and we have the smallest steam-pumps, but all may be classified either as simple or duplex pumps.

The direct-acting steam-pump differs from a steam-engine in having no crank or fly-wheel, and no part makes a revolution. The steam-cylinder is at one end of the apparatus and the water-cylinder at the other, and the steam is admitted alternately to the opposite sides of the piston; the inlet and outlet valves of the steam-cylinder are generally automatically worked by the steam itself, and

these small engines are usually efficient, and more used in this country, at least, than all other kinds together.

In the duplex steam-pump two pumps are combined so that the piston of one controls the steam-valve of the other.

These small engines are very popular, and are unequaled where there is enough pumping to require steam-power. Their valve motion is simple and positive, and the speed of discharge is practically constant.

Where steam-power or skilled attendance is inadmissible, gas pumping-engines may be used. These derive their power from the explosion of a certain mixture of air and illuminating gas, which is injected in the cylinder, and drives the piston. Continued action is maintained by a heavy fly-wheel, which sustains it from one impulse to the next, which may be one, two, or three revolutions apart. The chief advantages of these engines are the ease and rapidity of starting and absence of dust, ashes, etc., but they are apt to get out of order easily, and require a constant uniform quality of gas.

Hot-air pumping-engines are very simple, perfectly safe, and their care requires no skill and little attention.

Some points should be especially considered regarding the pumping of water for domestic use. With a singleacting pump, particularly if run fast, every pulsation is sure to be heard.

If we place an air-chamber on the pipe at every upward stroke the water enters the bottom and compresses the air in the upper part; when the piston descends the air expands and forces the water out in a comparatively steady stream without the shocks otherwise caused. Frequently more than one air-chamber is necessary on a long discharge pipe.

A similar chamber, called a vacuum-chamber, although it should be filled with air, is often used on the suction-pipe for the same purpose as on the discharge-pipe.

The air-chamber sometimes becomes filled with water and must then be resupplied with air, which is generally easily accomplished by opening a pet-cock and allowing some air to be pumped with the water. A pet-cock should never be soldered to the top of an air-chamber, for it is impossible to make it tight and the air escapes through it.

If a cock is necessary to draw water out of an air-chamber place it in the lower part and make it large enough and there will be no difficulty.

Fresh water contains a large amount of free air which generally supplies the air and vacuum chambers of a pump, but in pumping water over and over from one tank to another, as in some hydraulic elevators, this air becomes eliminated. The water is slightly warmed by friction, loses the air as it leaves the pipe entering the tank, and becomes as solid and unyielding as a bar of iron, making it generally difficult to keep a pump running smoothly at such service.

The larger the pipe the easier it is to pump a given quantity of water through it in a given time, because the friction is less than for a smaller pipe.

The power required depends on the size of the piston and the height to which the water is forced. Elbows, particularly those of 90°, should be avoided when possible, and the size of the pipe be made such as to give a speed of five or six feet per minute to the water. When there is danger of an insufficient water-supply, a reservoir should be introduced between the street-main and the suction-pipe. This reservoir should be as near the pump as possible and a large pipe may often be neatly and advantageously used for the purpose.

Mr. Rider concluded his remarks by the explanation of a hot-air pumping-engine which was exhibited in the class-

CUP VERSUS WIPED JOINTS.

105 BLEEKER STREET, TORONTO, March 14, 1888.

SIR: I have noted Mr. Billings' reply to my letter. I have no records of any tests as to the relative strength of the joints in question.

the joints in question.

Like Mr. Billings, I have to rely on my experience (some 14 years) as the basis of any opinions I may have in this connection. One has only to compare the two joints to see that the wiped joint is superior in every respect. Granted that the bond of the lead to the brass to be perfect, and not subjected to changes of temperature as is the case with hot-water pipes, there is still in the cup joint the weakness caused by opening the pipe to allow the insertion of the tail piece or coupling, which would be further aggravated in the connection of lead pipe with lead pipe; again, in the event of it being necessary to bend the pipe close to the coupling or solder-nipple the tendency would be to strain the pipe at its weakest point, which is the

shoulder formed by opening the pipe at C; D shows a wiped joint similarly treated. The lap feature may be added to the wiped joint as shown at A, held and strengthened by a "perfect cement." B shows an ordinary wper joint. Now, I think that Mr. Billings and most of yet readers will concede superiority for the wiped joint as to strength

Now let us consider its durability under changes of temperature, such as occur in hot-water pipes. In my experience I have never seen a wiped joint opened at the edges as Mr. Billings describes. I have, however, seen joints melted off on water-back connections where in a water-famine the water in the boiler was below the side coupling. This was evidently caused by steam generated in the water-back, probably superheated, and as wiping solder melts at 475° and fine solder, such as is used for making cup joints, will melt at 360°, it will be seen that in this case the advantage is with the wiped joint. The lead may sometimes crack at the edges of a joint which mighs be attributed to two causes: (1) the crowding together of joints on hot-water pipes, not allowing sufficient room for expansion between them; (2) the pernicious practice some young plumbers have of trimming their joints on the edges, leaving a cut in the lead, which by the constant expansion and contraction gradually opens. With regard to the unequal expansion of the solder, the lead, and the brass, I find that under a change of temperature from 40 (cold water) to 212° (boiling water) lead will expand I in 368; wiping solder will expand I in 482; and from this it is shown that the inequality of expansion is principally between the lead and the brass. The expansion of the lead and wiping solder is more equal than would be the case with fine solder containing, as it does, more tin, which is less expansive.

Let us now consider the effect that such changes of temperature would have on the cup joint. As the lead expands the tendency will be for the weakest portion of it to give way, the frequent repetition of which must cause a fracture at that point.

I entirely agree with Mr. Billings as to "cheapness properly understood" being good argument, which, I take it, means "the best is the cheapest"; and as the wipedjoint is the best, it is, therefore, the cheapest.

Respectfully yours, BENJAMIN KIRK.

PHILADELPHIA MASTER PLUMBERS' ASSOCIATION.

THE Master Plumbers' Association met March 9. After the transaction of routine business, Mr. John E. Eyanson called the attention of the association to the fact that the testing of soil-pipes by either peppermint, pressure (water or air), or smoke was being agitated in the newspapers, and he thought it proper for the association to examite the several tests and report which, in its judgment, is the proper one for the plumbers of Philadelphia to adopt.

On motion the subject was referred to the Sanitary Committee, with instructions to invite the entire association when the experiments are made.

The Sanitary Committee propose meeting this week and without delay attend to the work which the association has assigned to it.

HOW MANY GALLONS IN A CYLINDRICAL TANK.

JOHN F. WARD'S rule for the number of U. S. gallons of 231 cubic inches contained in a cylindrical vessel is to multiply the square of the diameter in feet by the length or height in feet and divide by 0.17. This will be found to be a very close approximation, its error being less than that due to ordinary changes of temperature. If only a rough approximation is desired, say within two per cent. it will be sufficient to multiply by 6 instead of dividing by 0.17.

A NOVEL BOILER-FEEDER.

If an open tank be placed on top of a steam-boiler with a short connection closed by a stop-cock communicating with the steam-space, and the tank be filled with cold water and the stop-cock opened. the water will rush into the boiler no matter what the steam-pressure may be inside

This statement we have recently seen in some publication whose name we cannot now recall.

The explanation would seem to be that the steam in contact with the cold water is so instantaneously condensed that it has no time to exert any pressure against it, and hence cannot oppose its entrance.

The water really surrounds itself with a vacuum or vacuous film into which it rushes as into an exhausted receiver. The principle is very much the same as that of the injector.

We should warn our readers to use great caution in repeating this interesting experiment, as 'the rapid fall of pressure in the boiler due to the sudden condensation of so much steam is liable to cause violent and even dangerous ebullition.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

HOT-WATER HEATER.

MESSRS. RICHARDSON & BOYNTON Co., 232 Water Street, New York, are just placing on the market a new hot-water heater, which is herewith illustrated. The cut clearly indicates the principle of construction.

It is made in sections, the flame passing upwards through the hot-water tubes, which are staggered. The connections between each section is alternately front and

rear. The water entering the lower section must pass through each one above before entering the house system. Plates are placed partially over the three centre openings in the top section, immediately below the smoke outlet, for the purpose of diverting the products of combustion and retaining the heat. The grate is the same as is used on the hot-air furnaces made by this firm.

ENGINEERS' SOCIETY OF WESTERN PENN-SYLVANIA.

AT a regular monthly meeting of the Engineers' Society of Western Pennsylvania, held at the rooms of the society, March 20, Professor J. A. Brashear acted as Chairman and Captain A. E. Hunt as Secretary. Three new members were admitted. Mr. J. F. Bray, being present, opened the discussion on his paper on the "Welding of Steel Tubes," which was read at the January meeting, but on which discussion was postponed until he could be present.

Mr. Bray brought with him a large number of samples showing what could be done with the steel from which the tubes were made. He stated that the making of steel tubes was not a new industry, as lap-welded tubes have been made for the past twenty years. But as they always had been made of a high grade of steel, a fine article, the price interfered with their use. He had at first objected to the use of steel, believing it unsuited for the purpose, but his experience had shown him that the steel they were using was far better than iron. They had yet to receive a complaint. complaint.

There was no trick or flux in the matter of welding.

Moreover, the steel stands more heat than iron, more abuse in the furnace, and will not waste as much.

He exhibited samples of steel pipe that had been frozen six times and thawed out, and there was no sign of a burst. Iron pipe, tested in the same manner, had split to pieces

As to bending, his experience was to the effect that steel bent better than iron. In the matter of threading, the smaller pipe are threaded at a higher speed than iron, from smaller pipe are threaded at a higher speed than iron, from 20 to 22 feet per minute, while on the larger sizes we taper down to 12 to 14 feet per minute. The very best material is used for dies, lubricating well with the best lard oil. In the matter of cost of repairs to dies the difference has been noted between the steel and iron pipe. He believed a better thread could be cut on steel than on iron pipe. Mr. Barnes stated that he could not be persuaded that the success obtained in the welding was not due to expertness or skill in the manipulator.

Mr. Bray replied that a number of the samples exhibited had been formed by a boy of 17 or 18 who certainly was not an expert.

was not an expert.

Mr. Metcalf stated than when boiler-tubes were first made crucible steel was employed, which was very expensive. Then the steel suitable for the purpose was gauged by the carbon, which was about .25 per cent., the steel being as free from impurities as it could be made. He still thought, in spite of what had been shown, that there

is a distinction between the manner in which steel welds and that in which iron welds. When separated the iron and that in which iron welds. When separated the iron is shown torn out in fibres, and then interlacing, while steel, when possible to separate it in the weld, always shows a smooth surface, so that seriously the expression "stuck together," as employed by Mr. Bray, was more appropriate and more expressive of the actual condition as applied to steel than the term "welding." Steel does not weld in the sense that iron welds, where the fibres inter-

/ Mr. Koch spoke of his experience in England where, on more than one occasion, when plates came out too narrow or too short, they had welded them to the proper dimensions. This had been done, too, in the case of shafts, and he knew of cases now where these materials had been and he knew of cases now where these materials had been and are now being employed on Atlantic steamers. That, so far as quality was concerned, any kind of steel could be welded. He exhibited a sample of Clapp-Griffith steel pipe tied into a knot, and stated that equally as good results could be obtained with open hearth or Bessemer. That in his experience they had welded every kind of steel, from .02 to 1½ per cent. manganese, and from .05 to .60 per cent. carbon.

Captain Hunt then gave the results of two analyses of the steel used by Mr. Bray in making the tubes, one by him-

steel used by Mr. Bray in making the tubes, one by him-self, the other by Mr. Wood, chemist of Carnegie, Phipp & Co., which were:

	Hunt,	Wood.
Carbon. Mar gauese. Phosphorus Sulphur. Sulphur.	.05 .38 .105 .059	.06 .36 .09 .074 Not taken

The material has a tensile strength of 55,000 to 60,000 pounds, an elastic limit of one-half the ultimate, an elongation of 25 per cent. in 8 inches, and a reduction of area

of 50 per cent.

The discussion then closed to hear the reading of a paper by Professor F. C. Blake on "The Electrolytical Separation of Gold and Silver."

The paper was an interesting one, though quite technical.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

AT a regular meeting March 21, Treasurer George S. Green presiding, the secretary read a paper by Edward Prince, Mem. Am. Soc. C. E., upon a 30-inch wooden conduit designed and constructed for the Quincy, Ill., Water-Works

The conduit connected the iron water-pipe on shore at the pumping-station with the point of supply at a crib I,480 feet away in the Mississippi River, and was built in three sections of 540, 548, and 400 feet each, towed out to position, launched, then connected, ballasted, and sunk

to position.

The secretary was requested to ask Mr. Prince for fur-The secretary was requested to ask Mr. Prince for further data than was embodied in the very brief description. It was thought that in some parts of the Mississippi the current would scour underneath the conduit and soon let it down many feet, effectually protecting it from navigation, ice, etc, and inquiry was made whether the increased length that would be required for the elongation of the

conduit had been provided for.

A circular communication on "Increasing the Durability of Timber," from the Forestry Division of the U.S. Department of Agriculture, was also read. The cause of decay, comparative durability of different kinds of wood, time for felling, and subsequent treatment were briefly explained. plained.

A paper by Mr. Emil Kuichling, M. Am. Soc. C. E., giving some data translated from the Deustche Baug Zeitung concerning surface drainage and flow in sewers. The paper was presented in the discussion of Mr. McMath's recent paper, and an earnest request was made for the recording and publication of further observations; these, Mr. Rudolph Hering stated, to be now in progress both in Washington, Philadelphia, and New York, where carefully measured areas have been selected and provided with automatically registering rain-gauges and the sewers with a system of velocity-floats for recording the velocity at different depths of flow.

ferent depths of flow.

The secretary announced the death on the 15th inst. of Squire Whipple, Hon. M. Am. Soc. C. E. Mr. Theodoie Cooper spoke of Mr. Whipple's able professional career, that was founded on natural ability and earnest work, unaided by special preparation or early technical education. He developed the theory and practice of iron bridge building and just attained the simplicity of design and effectiveness of construction that permits an exact mathematical calculation of strains in every member and reduces the structure to the skeleton of the strain diagram. He wrote, printed, and published the first book on bridge building that pre ents the accurate and practical principles building that pre ents the accurate and practical principles on which our present practice is founded, and he was essentially the "father of bridge building."

It was moved, seconded, and carried that the president

be authorized to appoint a committee to prepare a memoir of Mr. Whipple for publication. Mr. L. L. Buck suggested that the memoir contain a sac-simile of the origina edition of Mr. Whipple's book and an illustration of the model truss, now in the society's possession, by which the fundamental propositions were just demonstrated, suggestion was referred to the committee.

BOSTON SOCIETY OF CIVIL ENGINEERS.

THE annual meeting of the Boston Society Civil Engineers was held March 21 in the parlors of Young's Hotel. neers was held March 21 in the parlors of Young's Hotel. After listening to the annual reports of the governing and the special committees, balloting was had for election of officers for the coming year, with the following results:

President, D. Fitz Gerald; Vice-President, F. P. Stearns; Secretary, S. E. Tinkham; Treasurer, Henry Manley; Librarian, H. D. Woods.

After transacting some other business matters, the meeting adjourned to the large dining-hall to partake of the annual dinner.

annual dinner.

There were present as guests of the society: Messrs.
J. J. R. Croes, Vice-President American Soc. C. E.; George
G. Crocker, Chairman Mass. R. R. Commissioners; E.
P. Fisk, Chairman Legislative Com. on Drainage; Joseph
A. Wilson, President of Engineers' Club of Philadelphia;
H. M. Howe, Vice-President Am. Inst. Mining Engineers:
A. V. Abbott, Chief Engineer National Superheated
Water Co.; J. N. Louder, President New England R. R.
Club; E. R. Jones, late Superintendent Eastern Division
B. W.W.; M. L. Holman, President St. Louis Engineers'
Club. Besides these there were 18 other guests and 77 Club. Besides these there were 18 other guests and 77 members present.

After partaking of the viands prepared for them the company were favored by speeches from Messrs. Croes, Crocker, Fisk, Wilson, Howe, Holman, Louder, Fitz Gerald, F. P. Stearns, Clemens Hershel.

MAGNESIA IN PORTLAND CEMENT.

23 LIBERTY STREET, NEW YORK,) March 12, 1888.

SIR: In your last issue you quote from the London Engineer regarding expansion of Portland cement after setting, which is due to an excessive quantity of magnesia, and I have for some time insisted that engineers should and thave the insisted that engineers should not depend exclusively on the tensile strength of cement at seven days' age, but should consider its analysis at the same time and reject all cement that contains over one and one-half per cent. of magnesia as dangerous to use in concrete construction.

Analyses of different Portland cements showed that "Gibb's" was peculiarly free from magnesia, the highest percentage present being .79, and the lowest .46, giving a mean of .62.

Chemical analysis is of great importance since the intro-duction of slag cement sold as Portland, and to the use of it is now attributed the failure of several concrete works.

A simple test for slag cement is to place upon a clean silver coin a thin layer of cement, dropping thereon a small quantity of dilute sulphuric acid (one acid to seven water), and afterwards rinsing with water. If the cement is genuine Portland the treatment will only slightly affect the color of the silver; if there has been adulteration with slag a dark brown stein will be produced white class. slag a dark brown stain will be produced, whiist slag cement turns the silver almost black.

Yours truly, HOWARD FLEMING.

AN ADDRESS WANTED.

WALTHAM, MASS., March 14, 1888.

SIR: Will you please inform us, if it will not inconvenience you too much, who makes W. Scarborough's trap and where a letter would reach him, and has he obtained a patent on it? It is illustrated in W. Paul Gerhard's book on "Drainage and Sewerage."

KNAPP & KIRWIN

KNAPP & KIRWIN.

[Referred to our readers.]

HOW WILL DAMMING THE NIAGARA RIVER AFFECT LAKE ERIE?

MAYOR'S OFFICE, VERMILLION, O., March 10, 1888.

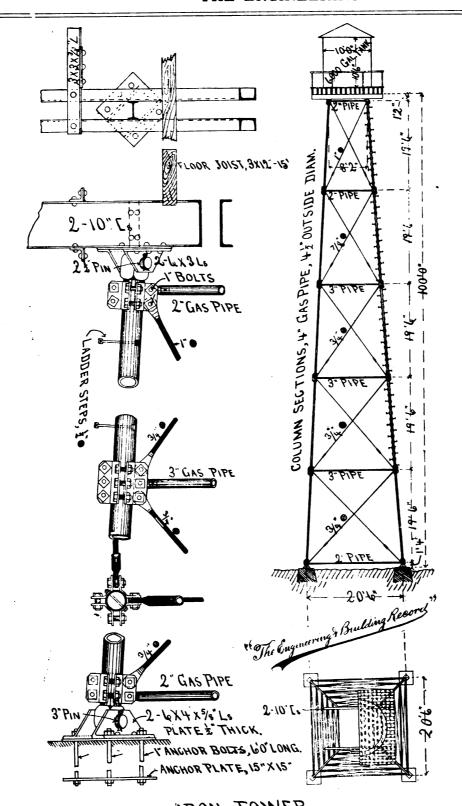

SIR: If a breakwater should be built across the Niagara River at Buffalo of sufficient height to raise the water four feet at the port of Buffalo, would the same or nearly the same rise take place the whole length of Lake Erie?

Please give me your opinion and oblige,

B. S. HORTON.

[The only cause of the flow of water in streams is a difference of surface level, to which, or better to the slope of the surface, the velocity of the flow always bears a certain proportion, other things being equal. The only cause that retards the flow due to a difference of level is the resistance due to the friction of the stream in its bed, which will obviously be proportionately greater as the stream is shallower. Hence, the velocity of a stream will be proportional both to its slope and to its depth, and if the velocity of a stream is decreased, either its slope or its depth or both must have been reduced, and if one of these factors has been increased while the velocity is reduced, then the other must have been reduced in still greater proportion.

Lake Erie baving a current through it and being of approximately uniform width, is practically a portion of a stream and subject to the laws above stated. Since its depth is great and the velocity of its current very small, it follows that its slope must be very sign, that its level practically level. If, therefore, its level be raised four Digitized by follows that its slope must be very slight, that in fact it is

TRON TOWER ELEVATING 6,000 GAL, WATER TANK. BUILT FOR GEORGE DULLING, SAN ANTONW, TEX. AND DESIGNED BY THE DETROIT BRIDGE AND IRON WORKS.

feet at its outlet by a dam at that point the level of the whole lake will practically be raised the same amount. Since, however, the amount of water flowing through it will not be changed, it follows that the velocity of the current will be reduced in the proportion that its crosssection has been increased by the additional depth.

But, as above stated, if the velocity is reduced while the depth is unaltered or increased, then the difference of level or slope of the surface must have been reduced as well, consequently the level of the upper end of the lake will be raised something less than four feet, but as the lake was practically level before, the decrease in the difference of level will be an almost imperceptible quantity, perhaps too small to be detected by the most careful leveling. We may therefore expect a dam to raise the lake-level with practical uniformity at all points.

Winds blowing lengthwise of the lake often make a difference of several feet in the level of the water at its ends, and on one occasion, just after a strong westerly wind had raised the water at the eastern end and thus forced out an unusual amount through the Niagara River, a strong

easterly wind set in, forcing the balance to the head of the lake and lowering the water at the outlet to the bed of the river, which, of course, stopped its flow, so that for some hours it was possible to walk across just above the Falls, and several persons did so.]

WATER-TANK TOWER OF WROUGHT-IRON PIPE.

For elevating a small private water-tank to a considerable height, this tower presents a simple and inexpensive design. The pipe struts and columns are joined by wroughtiron sectional clamps, which with the turned end plugs make light, but strong connections. All the diagonal rods have forged heads for pin connections, and are adjusted by sleeve-nuts on upset screw ends.

The structure presents a minimum surface for resistance to wind, and is anchored at each column foot to the masonry foundation.

This tower, now in use in San Antonio, Tex., was designed and built last year by the Detroit Bridge and Iron Works.

THE ARTHUR KILL BRIDGE.

A MEETING of the Board of Army Engineers, appointed by the Secretary of War, was held during the past week to hear testimony in regard to the proposed Kill-Von-Kull bridge, between Staten Island and New Jersey. The Board consisted of Col. T. L. Casey, Lieut. Col. H. M. Robert, Lieut.-Col. P. C. Hains, Major W. R. King and Capt. Edward Maguire.

Capt. Edward Maguire.

Ex-Senator Sewell in behalf of the Pennsylvania Railroad Co. stated that the Arthur Kill was one of the chief waterways on the coast. The point at which the bridge is being constructed is only 700 feet wide, and the annual tonnage aggregates 10,000,000 tons. He declared that the opposition was simply to protect navigation. The towing rate from Amboy to New York Bay did cost about 5 cents a ton, but owing to the obstructions in the channel since work on the bridge was begun the rate has been increased to seven cents. This means \$420,000 annually, and falls on the railroads that are obliged to use the waterway. Chief Engineer Richards, of the Pennsylvania Railroad, submitted a map of the Arthur Kill and statistics to show how towing had been hampered. He suggested that the bridge should be not less than 70 feet above high water and consist of a single span. Senator Chase, who is superintendent of the single span. Senator Chase, who is superintendent of the towing interests of the Pennsylvania Railroad, gave it as his opinion that the bridge pier is an obstruction to navi-

An affidavit by Robert H. Sayre, Second Vice-President of the company, stated that Perth Amboy is now the main coal and freight terminus of the company, which has expended over \$2,000,000 on it, and the coal and freight moved annually over the waterway is about 2,250,000 tons. If the bridge is built as proposed he would deem it his duty to advise the company to cease further development of Perth Amboy and endeavor to secure some other location for its business.

Mr. H. Haley, of the Brotherhood of Steamboat Pilots, said that the organization had adopted resolutions favorable to the plan. Mr. Haley said the trouble was that the large tows sent through the Kill by the rivals of the Balting town sent through the sent thro more and Ohio practically monopolize the stream to the detriment of private tows, and are a nuisance.

Colonel Casey announced that the board would report

to the War Department.

GEORGE W. CASS.

GEORGE W. CASS.

GEORGE W. CASS, who was generally known as "General Cass," died in New York on March 21.

Mr. Cass was born in Muskingum County, O., in 1810.

His father was a brother of General Lewis Cass. He was graduated from the West Point Military Academy with the class of 1832. He served on the North-westem frontier, and resigned from the army in October, 1836.

He was appointed by President Jackson as one of the engineers to construct the great national road, and was engaged in that work until it was completed through the States of Maryland, Penmsylvania, and Virginia. In the course of this enterprise he constructed the first cast-irod bridge ever built in the United States over Dunlap's Creek, a tributary of the Monongahela River. A company was then organized for the improvement of the channel of the Monongahela. He became the engineer and after may discouragements the enterprise was carried to a successfunl issue in 1844. In 1849 he established the Adams Express across the mountains from Baltimore, effected the consolidation of all the company's large that the restablished the Restablished the Restablished the Cass of St. Levis and south to Rich. lished the Adams Express across the mountains from Baltimore, effected the consolidation of all the company's lines between Boston and St. Louis and south to Richmond in 1854, and was rewarded in the following year by being elected first president of the united company. Though elected president of the Ohio and Pennsylvania Railroad in 1856, he continued to direct the affairs of the Adams Express until 1857. In the same year he became president of the Pittsburg, Fort Wayne and Chicago Railroad, which office he held for twenty-six years.

THE following changes are ordered in the stations of officers of the engineer corps: Maj. L. C. Overman will relieve Maj. S. M. Mansfield as engineer of the Tenth Light-House district, who will then relieve Capt. D. W. Lockwood; Capt. Lockwood will then proceed to West Point to assume the duties of instructor of practical military engineering and as commanding officer of Company E. battalion of engineers, relieving Capt. P. M. Prick, who will go to the office of the chief of engineers at Washington; Capt. W. L. Marshall will relieve Maj. Thomas H. Handbury as engineer officer of the division of the Missouri, and the latter will proceed to Portland, Ore., relieving Capt. C. F. Powell as engineer of the Thirteenth lieving Capt. C. F. Powell as engineer of the Thirteenth Light-House district; Capt. Powell will then take station at Memphis, Tenn., relieving Capt. W. T. Rossell.

CITY ENGINEER ROBINSON, of La Crosse, Wis., has resigned his office and will go to Chicago.

DOMINGO J. CARTAYA, a civil engineer employed by the Nicaragua Canal Company, died at San Juan del Norte on March 14.

EDWARD D. BOLTON, C. E., for many years in the employ of E. D. Bouditch, C. E., of Boston, has become a member of the firm of T. William Harris & Co., engineers and contractors of New York neers and contractors, of New York.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

THE MAINTENANCE AND OPERA-TION OF WATER-WORKS BY PRIVATE CORPORATIONS.

PRIVATE CORPORATIONS.

Under this title Messrs. A. H. Howland and George A. Ellis, Civil Engineers, 71 Equitable Building, Boston, Mass., have produced a pamphlet describing a series of blank books which they have published intended for use by private water companies in keeping their accounts. Included in this pamphlet are suggestions regarding the method of keeping water-works accounts. We presume the pamphlet is intended for gratuitous distribution. It will be suggestive to water-works officials.

ARCHITECTURAL COMPETITIONS. STONE LAKE, IOWA.—Plans are wanted here until April 1 for a court-house. Address J. W. Warren.

For works for which proposals are requested see also the "Proposal Column," pages i-vii-viii-260.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

NOT JOHN W. HILL, M. E., OF CINCINNATI. MR. JOHN W. HILL, M. E., of Cincinnati, is not the John W. Hill referred to in this item published last

week:

"Harper, Kan.—It is reported that the town authorities have refused to accept the water-works constructed for it by Mr. John W. Hill."

South Framingham, Mass.—Concerning the reported water-works project here, we have received the following communication from Frank E. Hemenway, Town Cierk: "The water-works have been in operation some three years. They are operated by an incorporated company called 'The Framingham Water Co., Willis M. Ranney, President.

CLYDE, N. Y.—The water-works project here is explained by E. W. Sherman, the Town Clerk, in the following communication to us: "No action has been taken in relation to water-works in this village. There have been parties here from Buffalo and also from Water-town, but the retiring Trustees did not feel like taking any action, and the newly elected ones, I hardly think, would favor the project. There seems to be but a few who are favorable to it on account of the heavy tax it would saddle upon the village."

KEYPORT, N. J.—Concerning the report that water-works were to be established here, we have received the following letter from Town Clerk C. H. Cook: "A man, representing a New York party, was in town a short time ago agitating the question of water-works, but nothing has been done in the matter."

CENTREVILLE, MD.—Our correspondent here sends us the following communication: "A bill has passed both Houses of the Maryland Legislature empowering the people to vote on the question whether the Town Commissioners shall issue bonds to the amount of \$20,000 for the construction of water-works. The bill has not yet been signed by the Governor, but there is no doubt but what it will. The election will take place April 2, when three new commissioners will be elected."

STONINGTON, CONN.—The people of this place decided, at a recent meeting, to accept the offer made by the Mystic Valley Water Company to supply the place with water for fire protection and private use. The terms of the contract state that the company is to furnish the borough with a water service from forty-two hydrants, to be located under the direction of a committee representing the borough, said hydrants to be supplied from a reservoir to be constructed with a capacity of 2.000,000 gallons, the fall to be not less than to feet. Mains will also be laid throughout the different parts of the place, and families will be supplied from the same source. The construction of the system is to begin at once

COLUMBUS, O.—The bill authorizing the Governor to appoint a commission of five with power to provide Cincinnati with a new water-supply at a cost not exceeding six million dollars has been unanimously recommended for passage by the committee of the legislature to whom it was referred. If the recommendations of the expert commission, elsewhere reported in this issue, are carried out, a large sum for iron pipe will be expended.

GUVANDOTTE, W. Va.—Traverse E. Stout, attorneyat-law, sends the following communication concerning
the water-works project here: "In theimatter of the
water-works at this place I will say that the plant will
be built and operated in connection with the Huntingalready in successful operation. The total cost of the
two plants will be in the neighborhood of \$300.000.
The American Water-Works and Guarantee Company
will build the plant, being the same company that built
the plant in Huntington."

Cassopolis, Mich.—Concerning the reports that the water-works here were to be improved, we have received the following communication from William Jones, the village clerk: "There is no contemplated improvements this season that I am aware of; however, there is a new board of trustees just l-cted which may do something in that line, as there is need of it."

WATERLOO, N. Y.—Concerning a published report that water-works were to be established here, Ichn P. Walsh, the town clerk, writes us as follows: "We have water works in Waterloo; we have had them about two years."

years."

Hot Springs, Ark.—A. N. Sill, Superintendent of the water-works at this place, writes us as follows: "We are about to move our present pumping plant to a new building and water-supply about one and a half miles from the city to what is known as "Big Chalybeate Springs," and have contracted with the Knowles Steam-Pump Company for 1.500,000 gallon duplex compound condensing engines, boilers for the present plant, laying new mains, and other necessary improvements."

JACKSON, MISS.—It is reported that a water-works company has been organized here.

company has been organized here.

Bentonville, Ark.—Mayor W. S. Floyd, of this city, writes us, under date of March 16, as follows: "We are going to establish water-works in this city. We have a proposition pending before the Council, but it will not be accepted. When we can look further into the matter, and when we receive a proposition that the city can accept we will establish the same; and in all probability the city will build its own works if we can buy material and make a suitable contract for construction of the same."

Hugo, Kan.—Our correspondent writes as follows: "The water-works bonds carried on the 9th inst. for \$6,000. We have a committee Fast making examinations of the water-works systems now in use, and will take no action until their return."

SCHWENKSVILLE, PA.—We are in receipt of the following communication from Irvin H. Bardman, the Town Clerk of this place: "The only movement in regards to water-works was the tongue movement (talk)."

Dalton, Ga.—We have received the following communication from John Black, Esq., of the Water Committee, under date of March 15:
"We first complied with the act of our Legislature in regard to any city issuing bonds. We have plans and specifications made, and are now considering offers for the complete construction of our system, and we hope to close contract with some reliable concern so as work will be ein by first of May. Will hold matter open yet for thirty days and longer if we are not satisfied with any bids we may receive."

MYSTIC VALLEY, CONN.—The voters of the Mystic Valley Fire District decided at public meeting, held March 15, to contract with the Mystic Valley Water Company for forty-seven hydrants, located at convenient points in the village, at an annual rental of \$1,680. The other details of the contract are similar to the one made by the same company with the Borough of Stonington, Conn. S. H. Buckley is at the head of a committee appointed to look after the work of construction, which is to begin at once.

MILWAUKEE, WIS.—The sum of \$80,000 was appro-priated at the last meeting of the Common Council for the Milwaukee River flushing-tunnel.

New London, Wis.—C. F. Dickinson, the Town Clerk, explains the water-works project here as follows: "We have taken no decisive steps as yet regarding water-works; are merely considering the matter, and awaiting the action of Common Council."

PANA, ILL.—Our correspondent writes as follows concerning the water-works project here: "There has been no official action here in regard to water-works, but a great amount of talk is being had in regard to putting in a system."

GRAFTON, W. VA.—Concerning the water-works project here John J. Gilligan, the Town Clerk, sends us the following communication, dated March 21: "Plans and estimates have been made by direction of the Council, the intention being to submit the question to the people at a special election some time during the summer. There is more than a probability that the town will have water-works inside of a year."

PINEVILLE, Ky.—Concerning the water-works project here our corresponder writes as follows: "Application has been made to the Legislature now in session for a charter. It will probably be granted and company organized this spring."

MANKATO, MINN.—A proposition to issue \$20,0 bonds to extend water-mains and establish a pumpin station also will be submitted at the spring election.

ORLEANS, NEB-It is stated that the people of this place have selected April 3 to decide the question of a \$10,000 system of water-works at the polls.

MOUNDSVILLE, W. VA.—Reports say that a water-orks system is to be established here.

MONTROSE, COL.—Some time in April the people of this place will decide for or against a \$50,000 system of water-works.

LLANO, TEX.—Reports say that a system of water-rorks will be established here by Fort Worth capital-

STAUNTON, ILL.—A contract has been drawn up by the Water-Works Committee of the Village Board of Trustees with the owners of the water-works site, whereby the Board can go to work clearing the land and making other arrangements about building the water reservoir, which will be done in the near future.

CLEVELAND, TRNN.—Reports state that water-works re to be established here, and that details can be had

OLDTOWN, ME.—It is reported that this place is to have water-works and that A. O. Brown can furnish details.

Monmouth, Ill. —A system of water-works, to cost \$48,000, is to be erected here.

JACKSON, MISS.—Reports say that water-works will be established here.

WALLULAH, WASH. T.—It is reported that water-works will be established here.

PADUCAH, Ky.—The water-works company here has een incorporated.

HARRODSBURG, Ky.—The Harrodsburg Water Company has been incorporated.

PARIS, Ky.—The Paris Water Company has been incorporated.

CENTRAL CITY, Ky.—Water-works have been incorporated here.

Owatonna, Minn.—The city has voted to build water-works.

MASBURY PARK, N. J.—Our correspondent writes as follows: "The borough will make some extensions to its plant this spring."

NRW BEDFORD, MASS.—New water-mains, to cost \$20,000, will be added to the water-works system here.

GLOVESVILLE, N. Y.—Address the Water Commissioners for details of a water-works system for this place, to cost \$100,000.

CHADRON, NEB.—It is reported that the proposed water-works system for this place will include several

CAMDEN, ARK. - The Camden Water-Works Company has been incorporated with S. Q. Sevier as president.

TULLAHOMA, TENN.—George W. Davidson is interested in a proposed water-works system for this place.

ested in a proposed water-works system for this place.

CUBRO, TEX.—John O. French is at the head of a project to supply this place with water from Guadaloupe River.

WATER - WORKS. — See our Proposal Column for information regarding water-works and water-works supplies at the following places: Salisbury, Md., Yonkers, N.Y., Ottawa, Kan., Welland, Ont., Hoboken, N.J., Whitewater, Wis., Nebraska, Neb., Waterbury, Conn., Newport, Ky., San Buenaventura, Cal., Tecumsch, Neb., Jersey City, N. J., Greensburg, Ind., Dalton, Ga., Louisville, Ky.

BRIDGES.

INDIANAPOLIS, IND.—The Marion County Commissioners will erect a 175-foot iron bridge over the White River, near North Indianapolis, and ask for proposals for the work. See our proposal column for details.

DENVER, Col.—It is reported that this city will expend \$150,000 in building viaducts over the railroad tracks during the present season.

ST. PAUL, MINN.—The Committee on Streets has passed a resolution providing for the building of the Wabasha Street bridge, according to the City Engineer's plans, providing that some feasible plan could be derived for raising the necessary funds. The amount required to build the bridge according to the approved

BRIDGE PLANS.—Plans for three iron railroad bridges re wanted at Los Angeles, Cal., until April 3. Ade-ress John H. Quinton, Chief Engmeer, San Gabrie alley Rapid Transit Railway Co., 55 and 57 Baker

I.EBANON, CONN.—Press dispatches say that breaking of a dam here on the 20th inst, destroye bridges besides doing considerable other damage, dam was connected with the Exeter reservoir.

MILFORD, DEL.—It is reported that a large iron bridge is to be erected here, and that John D. Norris, of Georgeton, Pa., can furnish details.

HAMILTON, O.—The County Commissioners will place a bridge over the Miami River, to cost \$30,000

BRIDGES.—See our Proposal Column for information regarding bridge construction at the following places: Indianapolis, Ind.: Atchison, Kan.; Los Angeles, Cal.; Minneapolis, Minn.

RAILROADS, CANALS, ETC.

LITTLE ROCK, ARK.—The City Electric Street Railway Company has one mile of its line about completed and another well under way. Another mile and three-quarters will be let in a few days. The contract for the West Markham Telford Macadam district has been awarded to the Arkansas Industrial Company.

GRAND RAPIDS, MICH.—The Valley City Street and Cable Railway Company, of this city, has received a franchise allowing them the use of several miles of streets in which to construct and equip a cable or horse railway, a greater part of which will probably be a cable line. Address Valley City Street and Cable Railway Company, Grand Rapids, Michigan.

PINEVILLE, Ky.—Our correspondent writes; "A street railroad will be organized here, and built as soon as the charter passes through the Legislature."

Orange, N. J.—The tracks of the Orange and Newark Horse Car Company are to be extended to West Orange.

CAMBRIDGE, MASS.—The West End Street Railway omnany has decided to use the cable system and per-Company has decided to use the cable system and permission has already been granted from the Board of Aldermen for the construction of the road.

Owosso, Mich.—The city of Corunna, the township of Caledonia, and the Owosso Council have granted the right to the Port Huron Electric Railway and the Detroit Electrical Company jointly to construct an electric railway between the cities of Owosso and Corunna. According to the terms of the grant the work of building the road must be begun within 90 days

the work of building the road must be begun within 90 days.

Brockton, Mass.—The East Side Street Railway Co., of Brockton, has organized with a capital of \$45,000 and will build 4½ miles of road the coming season. It is probable that a careful investigation of horse power versus electric motor as a propelling force will be made. E. L. Brown has been appointed engineer to the corporation.

WASHINGTON, D. C.—The sum of \$17,500 has been appropriated for placing an electric-light plant in the north wing of the capitol.

Sloux City, Iowa.—Articles of incorporation are to be filed here for an elevated railroad, with a cash capital of \$1,000,000. A. S. Garretson is one of the incorporators.

GAS AND ELECTRIC-LIGHTING.

WAHPETON, DAK.—H. W. Turner, of St. Paul, has been granted twenty-one years' franchise to light the city with electricity. He will furnish ten 200-candle lights at \$1,800 a year.

CONWAY, ARK.—It is reported that an electric-light plant will be established here.

CANANDAIGUA, N. Y.—The Canandaigua Electric-Light Company has been incorporated; capital, \$50.-000. Alexander Grieve and others, incorporators.

EUREKA, KAN.—The Eureka Electric-Light and Power Company has been incorporated; capital, \$25,000. A. S. Van de Mark and others, incorpo-

Winchester, Tenn.—It is reported that an Edison electric-lighting plant is to be established here, with a capacity of 200 lights, and that Girton & Smith can furnish details.

JACKSON, MISS.—Reports say that an electric-light ompany has been organized here.

CLEVELAND, TENN.—It is reported that J. H. Craic-niles can furnish details of a project for gas-works

TERRELL, TEX.—According to reports an electric-light plant is to be established here, with Mr. Cook at

JACKSON, MISS.—It is stated that an electric-light plant will be established here. The Board of Trade is said to be in charge.

SHELBYVILLE, TENN.—It is stated that an incandescent plant is to be added to the arc system here.

ASHTON, DAK.—The Ashton Gas and Fuel Company will incorporate. Capital stock, \$100,000. The company will work the natural gas well here.

MASON, MICH.—The question of establishing an electric-light plant is again being agitated here.

WEST NEWTON, PA .- A new gas company has been organized here and will establish works at once.

Orange, Mass.—It is reported that this place has appropriated \$1,500 for an electric-lighting system.

BROOKLYN, N. Y.—Another application has been made to the Aldermen by the Edison Electric Illuminating Company to lay its conduits and wires in the streets. It was referred to the Lamps and Gas Committee.

THE Georgia Portable Water-Gas Company, A Ga. Capital, \$20,000. W. S. Crane, and othe corporators.

ROCHESTER, MINN.—The Rochester Light and Fuel Company has been incorporated; capital stock, \$100,-000; incorporators, F. F. Walker, of Dubuque, Iowa; Thomas Hennessey and William O'Mulcahy, of Grand Forks, Dak.

RICHMOND, VA.—The Virginia Electric Light and ower Co., of this city, will put in an additional

DAVENPORT, Ky.—The People's Light Company has een incorporated here.

KEY WEST, FLA.-This place is to be lighted by electricity.

BIDS OPENED.

Grand Rapids, Mich.—The following bids for pump for water department were received by Board of Public Works, March 17: Eagle Iron Works, Detroit, Mich., \$5.584.75; Butterworth & Lowe, Grand Rapids, \$8,447; Adolph Leitelt, Grand Rapids, \$0,185. The contract was awarded to the Eagle Iron Works.

Tract was awarded to the Eagle Iron Works.

MINNEAPOLIS, MINN.—Bids for the substructure of the \$40,000 Lyndale Avenue Bridge have been opened as follows: Baxter & Sons, \$6,708.07; Minnesota Stone Company, \$6,185.65; M. Daley, \$6,868.68; George McMullen, \$6,596.10; Ring & Tobin, \$7,870.34; Douglas & Co., \$6,504.22.

Bids on the superstructure were: Canton Wrought-Iron Bridge Company, \$20,635; Canton Wrought-Iron Bridge Company, \$20,635; Canton Wrought-Iron Bridge Company, \$20,83; King Bridge Company, Cleveland, \$20,303; A. G. Bayne & Co., \$4.056; Scheffler Bridge Company, Milwaukee \$23,070.24; Kansas City Bridge Company, \$23,750; Smith Bridge Company, Toledo, \$21,000; Jones Bridge Company, Chicago, \$21,536.23.

MILWAUKER, WIS.—The following hids for furnish.

MILWAUKEE, WIS.—The following bids for furnishing a water-gate for the Milwaukee River flushing tunnel were opened March 16: Edward P. Allis & Co., \$1,625; Gardiner Campbell & Son, \$1,450.

Stock; Gardiner Campbell & Son, \$1,450.

COLUMBIA, O.—The following bids for brick and cement were opened by the State House Commission, March 16: Cement, per barrel—Fleming & Devereaux, Charleston, \$1.68; C. O. Brown & Bro., Columbia, \$1.78; Lorick & Lowrance, Columbia, \$7.85; J. M. Mayhew, Columbia, \$2. Brick, per 1,000—C. A. Guignard, Lexington, \$10, delivered by April 15; T. W. Stanland, Summerville, \$10. The contract for furnishing the cement was awarded to Lorick & Lowrance, and the brick contract to T. W. Stanland.

NEW YORK CITY.—The following was the only bid submitted for furnishing a steam-elevator at the Charity Hospital, at Blackwell's Island, opened March 16 by the Department of Charities and Correction: Joseph Moore, New York, \$2,825.

Minneapolis, Minn.—The Committee on Roads and Bridges has awarded the contract for the superstructure of the new bridge over the railroad tracks on Lyndale Avenue to the Canton Wrought Iron Bridge Co. at \$79,575. The substructure work was awarded to the Minnesota Stone Co. at \$6,799.75.

Digitized by GOOGLE

New York Cive.—Bids were opened by the Department of Docks, March 12, as follows: For turnshing 856 pieces of granite for bulkhead or river wall, consisting of 201 headers and 465 stretchers, containing about 18,200 cubic feet in all. The b ds were: Guidet & Co., \$1.45 per cubic foot; J. Goss, Jr., \$1.03 per cubic foot.

ST. Louis, Mo.—The following b.ds were opened by lenry Flad, President of the Board of Public Improvements, March 13:

For furnishing 670 tons of 36-inch cast iron wasteipe, A, B, and C—Addyston Pipe and Steel Co., \$19,30; Dennis Long & Co., \$19,262.50; Shickle, Harrison: Howard Iron Co., \$17,051.50; R. D. Wood & Co., 20.066.50.

\$20.066.50.

For 35 tons of special castings—Addvston Pipe and Steel Co., \$2,635; Dennis Long & Co., \$2,555; St. Louis Iron and Machine Co., \$7,380; Schickle, Harrison & Howard Iron Co., \$2,026.50; R. D. Wood & Co.,

son & Howard Iron Co., was the St. Louis Iron and For one 36-inch check-valve—St. Louis Iron and Machine Works, \$1,038.90; Fulton Iron Works, \$1,245.

For one 36-inch check-valve—St. Louis Iron and Machine Works, \$1,036.90; Fulton Iron Works, \$1,245.

Bufffalo.N.Y.—The following bids for pipe, valves, pavi.g., and other materials were opened March 20 by the Water Commissioners:

Cast-iron ppe and special castings: Donaldson & Duncan, Lake Shore Foundry, Detrcit Pipe and Foundry Co., Addyston Pipe and Sieel Co., Shickle, Harrison & Howard Iron Co., &t. Louis, Mo., submitted bids which were declared informal as they furnished no bonds; Warner, Wood & Co., 4 inch, \$2,05.6 inch, \$30.95; Mellert Foundry and Machine Co., Phillipsburg, Pa., 4 inch, \$2,24.6 inch, \$28.60, to inch, \$28.20, io inch, \$28.20, io inch, \$28.20, io inch, \$28.20, io inch, \$27.80, io ii ch, \$27.90, 20 inch, \$27.80, io ii ch, \$27.90, 20 inch, \$28.20, io inch, \$28.20 io ii ch, \$27.90, 20 inch, \$27.80, io ii ch, \$27.90, 20 inch, \$27.80, io ii ch, \$27.90, 20 inch, \$27.80, io ii ch, \$27.90, 20 inch, \$27.80, io ii ch, \$27.90, 20 inch, \$28.20 for all siz; s. stipulating to deliver on streets where wanted. In consideration of the cost of transportation from cars, estimated at \$1 per ton, the bid of the Buffalo Company was accepted.

Valves: I. S. Carson & Co., Philadelphia, Pa., informal; Eddy Valve Co., Waterford, N. THE MASSACHUSETTS INVESTIGA-TIONS ON WATER-SUPPLY.

WE have several times called attention to the systematic investigations upon water-supplies and upon methods of dealing with town sewage to prevent pollution of streams which are being carried on under the direction of the State Board of Health of Massachusetts. The report which has just been issued by this board, under date of January, 1888, upon water-supply and sewerage, confirms the opinion we have expressed that this work will probably be of great interest and practical value. The second part of this report is that which gives the results of the examinations of the waters of the Taunton, Charles, Blackstone and Merrimack Rivers, for each of which tables are given showing for seven months the results of systematic analyses of 1,509 samples of their waters, together with studies of the physical peculiarities of and of the animal and vegetable organisms present in them.

The board is very properly cautious in drawing conclusions from these tables, remarking that they cover only part of the year, and that, as the past summer was one of unusual rainfall, the waters of this period cannot be considered

The data of the tables relate to color, free ammonia, albuminoid ammonia, nitrogen as nitrates, turbidity, total solids, loss on ignition, fixed solids, and chlorine, and from these it is easy to trace, on broad lines, the progressive pollution of the stream upon which large towns are situated, the oxidation of the albuminoid ammonia into nitrates, and the effects of dilution by large tributaries. The importance of chlorine determination as evidence of sewage contamination is well shown by these tables.

The third part of the report relates to the purification of sewage by applying it to land, and more especially to the results obtained at the sewage experimental station at Lawrence. At this place a large number of experiments on the filtration of water and of sewage through various soils and combinations of soils have been made. For this purpose there were used ten circular tanks, each six feet deep, sixteen feet eight inches in diameter inside, and seventeen feet four inches at the top, sunk in the ground and under-drained into a section of a flume, where the effluent could be collected and examined. These tanks were filled to a depth of five feet with various materials-for example, in one was placed clean, white sand, in another peat, in a third garden loam, in a fourth clay and sand, etc. About two-thirds of an acre of filtering grounds were also used for the experiments upon sewage.

The results of these are very interesting, but cannot be summarized here, and every water engineer must consult the original tables. We can only say that the fine sand filter showed improvement in the filtered water the longer it was used. The final results with 1,000 gallons of the water supplied to the city of Lawrence flowing daily through the tank were complete removal of color, reduction of the organic matter to four-tenths, of the free ammonia to one-twelfth, of the albuminoid ammonia to one-sixth, and of the nitrates to three-quarters of the amounts in the applied water, while the chlorine remained unchanged.

This tank also gave a clear, colorless effluent with sewage applied at the rate of from 136 to

272 gallons per day, but the experiment had not continued long enough at the date of this report to permit of any definite conclusions.

While we think that the board underestimates the amount and precision of existing knowledge on this subject when they say that "at present no one can tell in regard to any area that may be selected the character of the effluent that will result from the application of sewage in large or small quantity, nor the effect of our winters, nor of long storms upon the efficiency of the bed, nor the proper intervals for application,' nevertheless true that the results of European experiments are not wholly applicable to our soils and climate; that there is need for careful trial and observation upon these points, and that the State Board of Health of Massachusetts is acting with its usual wisdom in attempting to make these trials.

The report of the engineer of the board refers mainly to filter-galleries for water-supply, and upon this we will comment hereafter.

THE COST OF MELTING SNOW.

AFTER the recent blizzard in New York and vicinity, Mayor Hewitt advised the use of steam to melt the obstructive snow-drifts, and many persons tried it with more or less success, running temporary pipes from their boilers into the snow-banks or into large boxes into which the snow was shovelled.

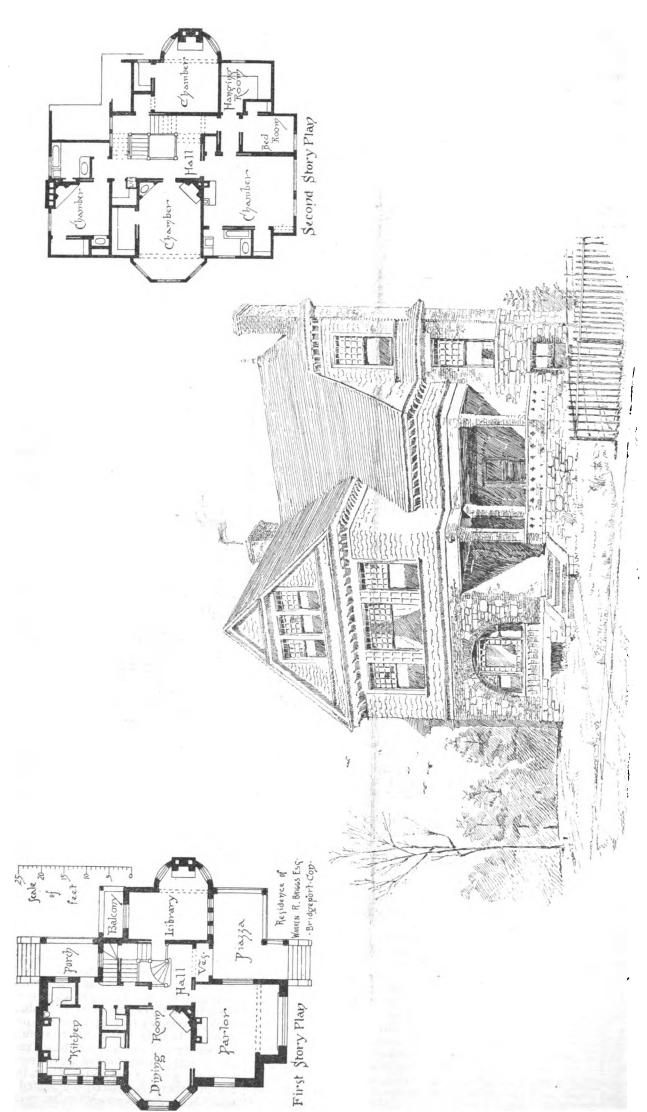

The emergency justified even such an expensive expedient, but lest any one should imagine that this method of removing snow should be generally adopted, we would remind them that to melt a pound of snow or ice takes as much heat as would raise the same weight of water from the ordinary temperature of 70 degrees to the boiling point.

Removing snow by melting in various ways has been frequently proposed, and in Volume IV. of this journal an apparatus was described, said to have been used in London, in which the snow was thrown down the sewer manholes, and there melted on iron plates kept hot by gas-jets. We then pointed out the impracticability of the plan, and Mr. E. S. Philbrick, M. Am. Soc. C. E., showed in our columns that to melt by gas the snow from a mile of ordinary street after a fall equal to three inches of rain, about equal to that of the blizzard, would require the consumption of about 100 tons of gas coal, provided all the heat was utilized; practically, it would take a great deal more. In another column we reprint the portion of Mr. Philbrick's communication referring to the consumption of fuel required.

A TEST OF SOIL RESISTANCE.

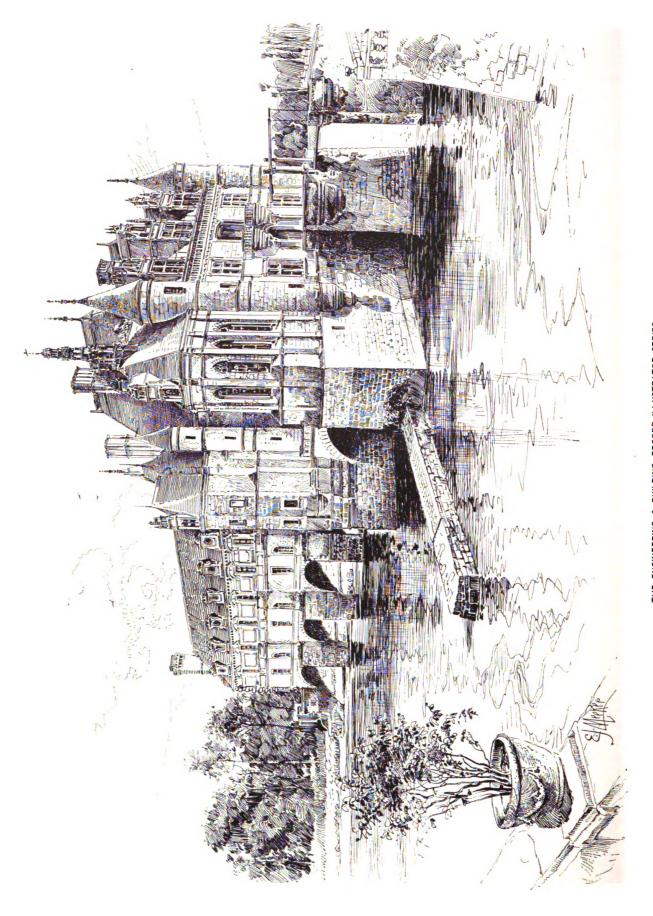

A NOTE in the Chronique Industrielle mentions some experiments that, though meagre, are interesting and would be more valuable if accompanied by any data concerning the condition and character of the soil. The experiments were made in the Champ-de-Mars to obtain the information necessary to proportion the foundations about to be built there. On a carefully leveled surface were placed four cast bases, each o.5om. (1.64 feet) square, located at the corners of a square of 3.5m. (11.48 feet). Upon these bases a T-iron frame was placed and loaded with iron bars. Settlement commenced after twelve hours, under a load of 64,074 kilos (141,282 pounds). The load was then gradually increased until it

RESIDENCE OF WARREN R. BRIGGS, ARCHITECT, BRIDGEPORT, CONN.

CHATEAU DE CHENONCEAUX, FRANCE.

reached 80,000 kilos (176,376 pounds) and was then left for the night. In the morning a settlement of 0.26 to 0.29m. (0.85 to 0.95 feet) was noted, and the load was increased to 93,400 kilos (205.947 pounds). The soil was considered capable of sustaining 60,000 kilos per square metre (12,288 pounds per square foot).

It would be well if similar experiments were made on the resistance of all soils on which it is proposed to place important buildings and the foundations designed in accordance with the results.

A record of such experiments and the settlement observed in the buildings after erection would soon become a very valuable guide in proportioning foundations about which there is usually an amount of guesswork that would not be tolerated in any other though much less important part of the structure, and that is certainly not creditable to engineering science or skill.

CHARLES LATIMER.

ALL who knew him will learn with sorrow that Charles Latimer died Sunday, the 25th inst., at his home in Cleveland, of apoplexy.

Mr. Latimer was a graduate of the U. S. Naval Academy at Annapolis, and was connected with the navy for thirteen years. In 1854 he entered an engineering party on the Mobile and Ohio Railroad, and was connected with that road till the outbreak of the war, during a part of which he was an engineer in the military service, returning to the Mobile and Ohio at the close of the war. After some experience on various roads he entered the service of the Atlantic and Great Western—now the New York, Pennsylvania and Ohio Railroad—in 1874, with which, as chief and consulting engineer, he was connected till the time of his death.

As the chief engineer of "a finished road," which during nearly all his connection with it was virtually bankrupt, Mr. Latimer had to struggle with a heavy traffic over an unballasted road, which at times could not even afford a fair complement of track hands; but he had so thoroughly imbued his men with the religion of track supervision that it is related that on the occasion of a reduction of both force and pay the men voluntarily worked overhours to keep the track in good repair.

Mr. Latimer brought to all problems great industry and a rare degree of religious enthusiasm. He believed he possessed the power of locating underground-water by the aid of a forked witch-hazel stick, and, it is said, was uniformly successful in his attempt to do so.

In addition to his conviction of the inconvenience of the metric units in practical use, and of the absurdity of English-speaking people, who expect their language to dominate the earth, adopting the measures of what he considered a decreasing and non-mechanical people, he had a firm conviction that the English inch was derived from and virtually identical with the unit of measurement employed in the construction of the great pyramid, to which he ascribed a Divine origin, associating at the same time infidelity of the French revolution with the metric section of measures.

Mr. Latimer was elected a member of the American seight of Civil Engineers in 1876, and was one of the nders and for some time president of the International stitute for the Preservation of Weights and Measures.

THE COST OF MELTING SNOW.

THE following is a portion of a communication dated ril 1, 1881, and received from Mr. E. S. Philbrick, M. em. Am. Soc. C. E., which we have referred to editorially.

After alluding to the various devices for melting snow artificial heat, he goes on to say:

Their absurdity becomes evident when we look into the ctual quantity of heat required, and the amount of fuel eeded to supply it. In the latitude of Boston, many 5 Towstorms bring an accession of snow equivalent to two three inches of rain. If we call it only two inches, the quantity falling on a single mile of street sixty feet in idth, besides what is brought from back yards and slides from roofs, would be 3,294,720 pounds, or over 1,600 tons. It is well known, though perhaps not so well appreciated by all your readers, that ice or snow cannot be melted without supplying to it 142° of heat, on Tahrenheit's scale; that is to say, as much heat as would be required to raise the same water after the thawing from

32° to 174°, or within 38° of the boiling point. This 142° of heat is absorbed by the water in the process of thawing, without any increase of its temperature, for the ice-water is just as cold, as shown by the thermometer, as the ice or snow itself. The only apparent effect of this accession of heat is in the fluid condition of the water, which before was solid.

It was proposed, in the article above referred to, to get rid of the snow in the streets by shoveling it into the sewer manholes, where it was to be thawed by gas-burners. Suppose a force of men and teams to be employed adequate to dump the 1,600 tons of snow per mile of streets into the manholes, how much gas would be required to thaw it by the heat evolved in its combustion?

The combustion of a cubic foot of street ordinary gas evolves about 760 heat-units. Although it is not practicable to utilize in melting the snow nearly all the heat so produced, a good deal of which will, in spite of us, escape into space, we will, for the sake of the argument, suppose it to be all saved and used. The snow from a mile of street would then require for its melting at least

$$\frac{3,294.720x142}{700} = 668,357$$

feet of gas. I will leave it for your readers to determine how many gas-burners, consuming four feet per hour each, would be needed to deliver and burn this amount within such a period as would be considered reasonable for removing the snow, and how many manholes of the ordinary size and style would be required within the mile to give room for these burners. The coal required to produce this quantity of gas is easily estimated. Modern gas-works turn out about 5 % feet per pound of coal, so that it would need about 64 tons of coal to thaw in this way the snow from a mile of length of street. Possibly the parties who devised this system would find themselves, before finishing the job, in a similar position to that described by Swift where the Lilliputians undertook to provide for the bodily wants of their visitor, Captain Gulliver. They would certainly find that gas is but a poor substitute for sunshine in more ways than one.

PROPOSAL OF PHILADELPHIA TO BUY GAS.

BOTH branches of the Philadelphia City Council have passed an ordinance authorizing and directing the Mayor of the city to advertise for proposals and enter into a contract for the furnishing by private parties of 3,000,000 cubic feet of illuminating gas each day. The gas to be manufactured at the works of the contractor, and furnished at the holders of the city for distribution through the city mains without any additional cost to the city than the contract bid, which is limited by the ordinance to be not more than fifty cents for 1,000 feet. The city to have the right to purchase plant and right to manufacture at any future period.

This ordinance is in consequence of the many complaints of the bad character of the gas turnished by the city works, and which was claimed by the Director of Public Works to be owing to the incapacity of the works to produce gas sufficient for the demand.

A PLAN TO UTILIZE NIAGARA'S POWER.

MR. WILLIAM GOLDING, a civil engineer of New Orleans, proposes the following plan to utilize in the city of Buffalo the power stored in the decending waters of the Niagara River, which has been estimated to be equal to 6,000,000 horse-power.

His plan is to run a tunnel from the Niagara River below the Falls to and along beneath the water front of Buffalo. This tunnel is to be of suitable inclination and dimensions to act as a tail race for any number of turbines or other water-motors which may be supplied directly from the waters of the lake.

The available head would be about 200 feet and the total length of the tunnel about 23 miles.

OBJECTION TO WATER-MOTORS IN ST. PAUL.

Some water-motors have for some time been in use in St. Paul, and, according to the *Pioneer Press* of that city, an effort has been made by certain people for their general introduction to operate elevators and other machinery, claiming that it is part of the business of the Water Department to furnish water for motive purposes and trying to influence the Chamber of Commerce to support their claims.

Mr. John Caulfield, Secretary of the Water Board, who has carefully studied the question, emphatically declared, when interviewed on the point, that under existing circumstances the general introduction of water-motors through the city would be detrimental to the service and in some respects dangerous, as the capacity of the water-works is not sufficient to supply any great number of motors and at the same time maintain the pressure needed

for efficient fire-service. He referred also to the experience of the Water Department of Rochester, N.Y., where, after a brief experience with water-motors, it was found necessary to prevent any more of them being used, as they made too great a draught on the limited water-supply to permit adequate service to the city.

"PURGING" PORTLAND CEMENT.

THE aqueduct to convey the waters of Vyrnwy Lake to Liverpool is a little over sixty-eight miles in length, consisting mainly of tunnels, through which a supply of 40,000,000 of gallons per day may be passed without filling them. A large part of the aqueduct has been completed, and nearly the whole can be finished by the autumn of this year. As so much has been heard of Portland cement failures during the past year, and as so much cement concrete, constructed under remarkably stringent supervision, and after searching tests, has been used in the Vyrnwy dam, it is worth noting that George F. Deacon, the Chief Engineer, is of opinion that these results would not occur with thoroughly purged cement. He says that, as is well known, fresh Portland cement is unfit for use. on account of the large quantity of uncombined lime it contains. If molded in this condition, the lime slakes while the cement is setting, and often breaks it up completely. To avoid this the cement must be thoroughly purged—that is, exposed to the atmosphere for a considerable time. By this means the lime is slaked to a sufficient extent to prevent any failure of the work from subsequent slaking. This action diminishes as the purging becomes more complete; but even in the best Portland cements after exposure to the air for an indefinite time, there is rarely a diminution, though there is sometimes an increase of strength if allowed to stand fifteen or twenty minute, between the process of mixing and placing in situ. In the opinion of the London Engineer it is difficult to ascribe any cause for this, except on the hypothesis that even in the best purged cement there remain minute points of compression, scattered throughout the mass, and produced by minute particles of lime which are slaked on the application of water. Whether or not this be the true explanation, the facts are indisputable, and have an important bearing upon many works in concrete. The methods of cooling or "purging" cement on the Vyrnwy works are new and efficient, and the thermometer is employed from time to time to detect any rise of temperature on the application of water to the cement. When this is systematically done no cement unsafe from the presence of free lime need be used. There is no doubt that the demand for a cement with high strength, and quick setting, has led manufacturers of Portland cement to over-lime them. Such cements are certainly not so safe to use, and it is a question whether ultimately they are as strong. The introduction of free lime in any quantity into Portland cement mortar at once reduces its strength to about that of ordinary cements, and highly-limed Portland cements are much more subject to what is called "blowing" after setting.

THE CALCULATION OF BRICK-WORK.

ORDINARY bricks are about 8 inches in length and, with the mortar joint, about half that in width, so that each brick on the flat will give a horizontal surface of about 32 square inches, or 41/2 bricks will cover a square foot. As ordinarily laid there are o courses to every 24 inches, or 41/2 to the foot. Four and a half courses with 41/2 bricks to the course gives 201/2 bricks to the cubic foot. Waste. cutting, and closer joints will easily require an allowance of 21 bricks per cubic foot, which will be found a very convenient figure for estimating the number of bricks required for a wall of a given size and thickness, as it thus becomes unnecessary to find the cubic contents of the wall. but merely to multiply its face area or the product of its length and height in feet by ? of its thickness in inches, which, as the thickness is always some multiple of 4 inches, is a very simple process.

For instance, a 20-inch wall 40 feet long by 30 feet high has a face area of 1,200 square feet, and as it is 5 times 4 inches in thickness it will require 5 times 7, or 35 bricks per square foot of face, or 42,000 bricks altogether.

OUR ARCHITECTURAL ILLUSTRATIONS.
CHATEAU DE CHENONCEAUX, FRANCE.

RESIDENCE OF WARREN R. BRIGGS, ARCHITECT, BRIDGEPORT, CONN.

EXCESS OF MATERIAL IN A WOODEN BRIDGE.

A STRIKING illustration of the excess of material used in many old timber structures, and the utter disregard of proportion displayed in their design, is seen in the case of a bridge over Black River, at Watertown, N. Y., which was built forty or fifty years ago and sustained the constant and increasing traffic of a large trading and manufacturing town until its recent removal.

The channel was divided by a centre pier into two 79-foot openings, over which the bridge was built in continuous spans of the Towne truss type, constructed throughout of 12-inch yellow pine plank 31/2 inches thick, connected with 2-inch oak pins at every intersection. There were six planks in each chord, and two in each of the diagonal members, which were three feet six inches c. to c. horizontally. There were two trusses fifteen feet six inches deep and eighteen feet apart, seated in the usual manner on timber sills on the pier and abutment masonry.

There was a double web system in each truss, and each chord was made in three parts of two planks each, the centre part being placed between the two web systems, outside of which again came the two other parts. In the cross-section, the web members are not shown in section, to avoid confusion on so small a scale. There are 8x8-inch diagonal braces in the planes of the top and bottom chords, and the structure, though unpainted, was covered by a roof not shown in the illustrations.

An unusually severe flood brought down heavy drift and damaged and finally destroyed the centre pier. Fortu-

would be less than 1,400 pounds per square inch, or about one-seventh of the breaking strain.

The strains in the web members are not so readily estimated and there is more uncertainty as to the value of their attachments, but there is evidently a much greater excess of material in them than there is in the chords. which, indeed, they must have considerably assisted, for it is obvious that the web system alone without any chords would much more than support itself.

No doubt this excessive amount of material was used ignorantly and as a matter of convenience, as ordinarily a 150-foot span without any centre pier would have been built with about the same quantity and arrangement of timber, and the bottom chord most likely wastefully spliced, but in any light, the fact that the clumsy old bridge safely did quadruple duty is very refreshing in these days when so many structures are so slenderly proportioned.

NEW LONDON SEWER ASSESSMENT DECISION.

THE important sewerage work recently executed at New London, Conn., by the Board of Sewer Commissioners, under the immediate charge of their engineer, Mr. W. H. Richards, with Mr. Rudolph Hering as Consulting Engineer, has been the occasion of some litigation on the part of those who objected to the assessments levied in connection therewith, and the decision just rendered by Chief Justice John D. Park and Judge Elisha Carpenter as arbitrators, confirming the assessments and vindicating the character of the work, will be of interest to our

objection. From the evidence before us, after having wit. nessed the practical operation of the sewer, we are satisfied that all sewage matter will be easily disposed of and with reasonable dispatch unless obstructed from other causes.

We come now to the specific objections stated in the appeal—reasons of appeal: (1.) That after the assessment were completed the board did not give reasonable notice to the appellants.

(2.) The second reason of appeal is: "Said board in assessing said alleged benefits are governed by a rule estab-lished by them of assessing benefits strictly and solely in proportion to the width and superficial area of the several lots fronting said sewer."

The rule adopted by the board, with the approval of the

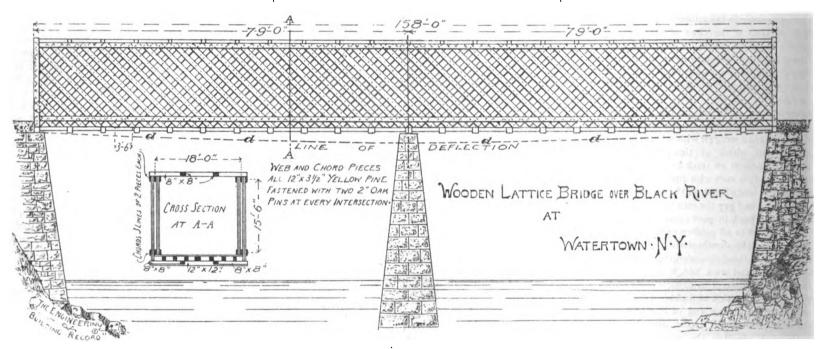

Common Council, was to assess fifty cents per foot street frontage, and seven mills per square foot area of land benefited not extending more than 100 feet from street line, with certain modifications in corner lots and in verying, ularly shaped lots. In the application of this rule no regard was had to the relative value of the different lots, nor to the value of the buildings or other improvements thereon. This, it is claimed, is an unjust and unreasonable rule, and therefore an illegal one.

It must be borne in mind that this is not an ordinary

ax, which, in theory, is a percentage of what a man has, but is a proceeding to recover from proprietors of land some portion of the benefits conferred upon such land by a public improvement for the purpose of defraying the expense of such improvement. It has not been made to appear that the benefits conferred, or the costs of constructing the sewer bear any proportion to the rules. structing the sewer, bear any proportion to the value of land or the value of the improvement thereon.

The following considerations will aid us in estimating

approximately the benefits of a public sewer. place we must premise that in a place like New London a sewer or a system of sewers is a necessity. Individuals

nately the seats on the abutments were ample, and allowed the trusses to pull forward enough to correspond to the deflection of about eighteen inches, which was all the apparent injury caused by the loss of the pier. Considerable alarm was felt, however, by the citizens, who considered the structure very dangerous and closed the entrances, until reassured by the safe passage of a carriage whose driver insisted on crossing. After this the barriers were removed and the usual traffic resumed, the double roadway being often entirely covered with loaded wagons. After a considerable time a trestle bent was placed under the centre of the span, and the bridge blocked up on it to the old level, and eventually the structure was replaced by an iron bridge.

The trusses contained about 37,000 feet of timber, b. m. and together with the rest of the timber, roof, etc., weighed about 200,000 pounds.

Assuming a uniform live load of 75 pounds per square foot of floor (which was probably never attained throughout), the gross load would be about 390,000 pounds, and the maximum chord strain when supported by the centre pier would have been 120,000 pounds, if no allowance were made for continuity.

Allowing 1,000 pounds per square inch as a safe working strain for timber, this would require a net section of 120 square inches, while allowing a loss of one-sixth for splices, and of one-sixth more for pin-holes, the net chord section is 350 square inches, or nearly three times as much as necessary. Even with the centre pier gone and the chord strains quadrupled the strain per square inch of net section

readers, and, we believe, will constitute a valuable precedent for similar cases in the future.

Its more important points are as follows:

The system adopted is excepted to in several particulars.

First.—The outlet is objected to. At present there is but one. The trunk or intercepting sewer already constructed is designed to carry off the sewage from the greater portion of the town. The discharge is into the harbor near the centre of the town. The objection is that there should have been several outlets instead of one. If the sewage was to be discharged into the water in large quantities at or near the shore it might be very objectionable. But the plan contemplates a discharge in the channel several hundred feet from the dock, where there is a strong current which will immediately convey the offensive matter into the sound.

This objection is not well taken.

Second.—That the plan devised does not provide for the drainage of cellars nor the discharge of surface water. So far as the latter is concerned it is obvious that if it had provided for it the sewer must have been much larger, consequently more expensive. But it was unnecessary; the town is on the hillside, so that it is rapidly and efficiently drained with little artificial aid. Moreover, this objection, so far as it exists, is not peculiar to the appellants. It is common to all.

In respect to cellars. They can in nearly all cases be easily and properly drained upon the surface. As the

water is comparatively pure, we see no particular objection

-The next objection is that there is not sufficient fall, it being for a part of the distance but one foot in

This question is mainly one of engineering, and we are satisfied that all was done that well could be to obviate the

cannot, either alone or in combination with others, conduct their own sewage matter to the harbor or coves. Sanitary reasons forbid it. The experiment has been tried by some of the appellants and the result is an intolerable nuisance. desspools may be allowed to some extent in the suburbe but they are objectionable, and in the thickly settled por tions of the town are wholly inadmissible. Assuming, then that a sewer is absolutely necessary, and that each individual may choose between the use of a public sewer and constructing a private one, it then becomes a question of comparative expense.

How much will it cost a man to procure a right of way

and construct a sewer that will discharge its contents into deep water? And how much expense will it be from year to year to keep it in repair? The idea readily suggests itself to the mind that there might be a large saving by

several combining and using one sewer.

That is undoubtedly so; and every business man would at once follow the suggestion to the logical conclusion that one sewer or system of sewers for the accommodation of all would be cheapest and best for all concerned. Obviall would be cheapest and best for all concerned. Obviously no one of these appellants could procure sewerage facilities for the sum assessed against him to say nothing of the expense of repairs from year to year. These suggestions ought to be sufficient to satisfy every intelligent man, not only that a public sewer properly constructed, and permanently cared for, is cheaper and better than any other but also that it benefits property to an amount largely in excess of the cost. largely in excess of the cost.

The benefit, however, is not in proportion to its value.

but is a given sum irrespective of its previous value or of the value of the improvements thereon added to the real worth of the land. It matters not whether the land is improved or unimproved. That is a matter that cannot well be taken into consideration. A lot is occupied to-day; tomorrow a fire may sweep away the buildings and the owner will have no present use for a sewer. A lot is vacant now.

but at any time a building may be constructed thereon and a sewer become a necessity. In either case the sewer is an improvement that adds so much to the value of the land in market. Temporary considerations do not affect the value of the land as such and ought not to affect the amount of benefits assessed. Moreover, the cost of constructing a sewer is not affected by the use or non-use of the laud. It costs as much to construct a sewer for vacant land as for land covered with buildings.

The cost depends in some measure upon its length, and

The cost depends in some measure upon its length, and its length has some relation to the aggregate of land fronting thereon. The benefit conferred is largely in proportion to the quantity of land as shown by its superficial area. On the whole the rule seems to be a just and reasonable one; and it is not claimed that it was unfairly or partially administered. All in similar circumstances fared alike.

The third reason of appeal—that the assessments were exorbitant—the fourth that the lots were not specially benefited, the fifth, that the benefits assessed to the appellants were proportionally greater than those assessed

benefied, the fifth, that the benefits assessed to the appellants were proportionally greater than those assessed to others—are not found true.

The sixth reason of appeal is that the construction of the sewer is of no benefit to the appellants. To sustain this allegation some of the appellants show that they have private sewers into the harbor and coves of the city. In Clapp 25. Hartford, the court held that such facilities should be considered. That would be conclusive were it not for the fact that the circumstances are materially changed. Such private sewers in these cases are nuisances and should be abated. As such they are prohibited by the statute, and the city has the power to compel every man to sewer into the public sewer. To giving the city such power in the case of nuisances there can be no legal or constitutional objections; and that too without compensation. If the sewers were unobjectionable it would present a different question. One of the appellants discharges his sewer into the dock; that is only less objectionable, still it is prohibited, and we think properly so.

One of the appellants complains that there is no fall between the bottom of the curbstone in front of his land and the the too of the saver: the difference however is a clight.

One of the appellants complains that there is no fall between the bottom of the curbstone in front of his land and the top of the sewer; the difference, however, is so slight that the objection is easily obviated in either one of two ways, by having a lower discharge into the sewer, or it desirable that it should be at the top, the sewage from the closets and sinks can be at a higher level than the curbstone, in which case the depression under the curbstone will occasion no inconvenience, but on the contrary will operate as sion no inconvenience, but on the contrary will operate as

Others of the appellants have cesspools. Probably most of the inhabitants of the town had some such facilities. They are a poor substitute at best for a good sewer; and much inconvenience and more or less danger are to be apprehended from their use; when it is further considered that the board has power by the express provisions of the ninth section of the act to compel all persons to connect with the sewer, the cesspools become in effect of no consequence.

One of the appellants is blind, and he claims exemption from assessment by the general statute exempting from taxation to a certain extent the property of the blind. This is not such a tax as the legislature in providing for exemption contemplated. We are constrained, therefore, to hold that the assessment is not illegal on that ground.

CEMENT MORTARS FOR USE IN PUBLIC WORK.*

No. II.

(Continued from page 253.) ADHESION OF MORTARS.

In the foregoing the subject of the tensile strength, In the foregoing the subject of the tensile strength, tenacity or cohesion of cement mortars has been considered, but another equally important quality, namely their adhesion to the bricks or stones, which are to be cemented together, must also be taken into account. On this particular point altogether too much appears to be taken on simple faith, since the records of experiments bearing directly thereupon is vastly smaller than in the case of cohesion. It is commonly assumed that after the lanse of cohesion. It is commonly assumed that after the lapse of a moderate time the adhesive and cohesive strength of cement mortars are about equal, and that in old work the former exceeds the latter. Modern experiments, however, fail to establish the truth of this assumption, and indicate rather that the adhesion of such mortars to bricks or stones is much less than the tensile strength during the first few months; also that the relation between the first few months; also that the relation between the adhesive and cohesive strengths of both neat cements and mixtures with sand are very obscure. It has been found that the adhesion of mortars to bricks or stone varies greatly among the different kinds of these materials, and particularly with their porosity; it also varies with the quality of the cement, the character, grain and quantity of the sand, the amount of water used in tempering, the amount of moisture in the stone or brick, and the age of the mortar. Some cements which exhibit high tensile strength, give Some cements which exhibit high tensile strength, give low values for adhesion, and conversely, cements which are apparently poor when tested for cohesion, show excellent adhesive qualities. Quick-setting cements are usually found to give greater adhesive strength than slow-setting ones, while in the case of cohesion the opposite is generally true. Under these circumstances, therefore, it is manifest that a test, at various stages of age, of the adhesive properties of a binding material like cement mortar should be regarded as a very important one, in the case of masonry structures which must soon after completion be subjected to other than compressive strains, and it is to be regretted that so comparatively little information respecting such

*Abstract of a report by the Executive Board of the City of Rochester, N. Y., prepared by Emil Kuichling, M. Am. Soc. C. E.

tests with cements and mortars as made at the present time, is available.

The authorities with reference to the strength of mortars

usually quoted by the compilers of modern manuals on engineering subjects, can fairly be considered as somewhat out of date, as many of them experimented in the early part of the present century with limes, mixtures and methods of preparation different from those now in common use on public work; and hence the measures of strength given by these experimenters may reasonably be regarded as varying more or less from what is to be expected of the binding material used in structures now in process of erection. In view of the fact, however, that but few others relating to adhesion are accessible, they are herewith submitted.

herewith submitted.

According to Rondelet, the adhesion of common lime mortar to stone and brick after one year is greater than its cohesion, and after six months it is about 15 pounds per square inch for compact limestone, and 33 pounds for brick. Plaster of Paris, or gypsum, he rates as having a tensile strength of 76 pounds per square inch, and an adhesion of about 50 pounds, which latter, however, diminishes greatly with age

sion of about 50 pounds, which latter, however, diminishes greatly with age.

Gen. Pasley gives about 140 pounds per square inch as the average adhesion of Portland cement to bricks. Vicat takes the adhesion as equal to the tensile strength of the cementing material, giving the following values thereof in pounds per square inch, one year after mixture: Good hydraulic mortar, 140 pounds; ordinary hydraulic mortar, 85 pounds; good common (quicklime) mortar, 51 pounds; inferior common mortar, 21 pounds.

As M. Vicat states that the best proportions of mixture are 2.4 measures of sand to one of quicklime, and 1.8 measures of sand to one of good hydraulic lime, it may be inferred that his tests were made with such mortar.

inferred that his tests were made with such mortar.

For a hydraulic mortar made of equal parts of cement and sand, Mallet, in 1829, found an adhesion of about 70 pounds per square inch when kept in air, and of about 99 pounds when kept under water, both for considerable

periods of time.

In 1832, Mr. J. White made some experiments with blocks of brick masonry, using a hydraulic mortar composed of lime, puzzolana and sand, and found that the cohesive strength of the entire mass, after one month, was about 5 pounds per square inch, and after nine months, about 8 pounds.

In 1858, Mr. Robertson, an English engineer, carried put a large number of experiments on the adhesion of both cement and common mortar to bricks, and found that in cement and common mortar to bricks, and found that in the case of cement, such adhesion at the end of one week after mixture varied from 23 pounds to 15 pounds per square inch, according as the cement was quick-setting or slow-setting, and after four weeks, from 30 pounds to 50 pounds per square inch, under the same circumstances. With common mortar, well ground and six months after mixture the adhesion was found to range from to pounds. mixture, the adhesion was found to range from 40 pounds to 18 pounds per square inch, depending upon the quality of the brick, the hardest and densest giving the higher values, and the softer and more porous varieties the lower ones. The inferior results obtained with the soft brick are ascribed to the water in the mortar being absorbed by the bricks and consequently not being available for the process of crystallization.

process of crystallization.

A few years later, Gen. Q. A. Gilmore, U. S. A., conducted an extensive series of tests of limes, cements, and mortars, in the course of which the adhesion of cement mortar to bricks and granite, after 29 days and 320 days, was determined. Rosendale cement, mixed with various proportions of sand, was here used, with the result that the adhesion was found to vary with the quantity of sand in the mixture, and to be considerbly less than the cohesive strength of the mortar at the same age. The figures /thus derived are all given in Table No. 2, hereunto appended, but it may be remarked that after 29 days, the adhesion of mortar made of equal parts of cement and sand was only about 16 pounds per square inch to bricks and adhesion of mortar made of equal parts of cement and sand was only about 16 pounds per square inch to bricks and 21 pounds to finely cut granite, and when mixed in the proportion of two parts of sand to one part of cement the adhesion was only 12 pounds, whereas the tensile strength of similarly prepared Rosendale cement mortars, four weeks old, will be found to be much greater. The twentynine days' test was made with great care, with mortar of the consistency ordinarily used for brick masonry, and the bricks having first been properly wetted and afterwards moistened every alternate day. In the cases where the mortar was allowed to set for 320 days, the materials remained exposed to the air in a room without further attention, and upon being torn apart the adhesion to the bricks, mained exposed to the air in a room without further attention, and upon being torn apart the adhesion to the bricks, the cohesion or tenacity of the mortar, and the cohesion of the bricks themselves, were all found to be about the same, or about 68 pounds per square inch, when the cement was used neat or pure; further, when equal parts of cement and sand were used the cohesion and adhesion were each about 40 pounds, and when two parts of sand to one part of cement were used the cohesion and adhesion fell to 24 pounds per square inch.

Many experiments on the adhesion of Portland cement mortar to various qualities of brick were also made between 1802 and 1870, by Mr. John Grant, C. E., for the Metropolitan Board of Works, and with particular reference to the construction of the large intercepting sewers of London. In these tests the cement was used neat, and

of London. In these tests the cement was used neat, and also after being mixed with an equal volume of sand, the latter being the proportions used in the work. After the mortars had attained an age of twelve months the bricks were torn apart and the adhesion was found to range from 40 lbs. to 126 lbs. per square inch with neat cement, and from 29 lbs. to 83 lbs. per square inch with equal

parts of sand and cement, depending upon the quality of of the bricks and whether the pieces had been kept in air or in water. Here again it is found that the adhesion is far less than the tensile strength of similar Portland cement mortar of the same age.

In 1873 a number of tests of the adhesive strength of mortars made of Bonn and Perlmoos Portland cements, and also of Perlmoos hydraulic lime, all mixed with clean and relatively fine river-sand, were made by Prof. Bauschinger, at the Royal Testing Laboratory of Munich. The substances cemented together were common bricks, arranged in pairs, which were torn apart after from six to sixteen weeks. The adhesion ranged from 69 lbs, to 13 lbs. per square inch, depending upon the quality of the cement and the amount of sand used, and was far less than the tensile strength of the mortar of the same age, nor was the tensile strength of the mortar of the same age, nor was any definite relation found to exist between the two series

A similar set of experiments with the Bromberg hy-draulic lime was carried out in the winter of 1882 3, at the A similar set of experiments with the Bromberg hydraulic lime was carried out in the winter of 1882 3. at the Royal Testing Laboratory at Berlin, by Dr. Böhme. The mortar was made with standard quartz sand, in varying proportions and applied to common bricks, the joints being torn apart after one, four, and thirteen weeks respectively. At the same times the tensile strengths of the mortars were separately tested. The results obtained showed the adhesion to range from 42 lbs. to 13 lbs. per square inch, according to age and quantity of sand, the higher value being obtained after ninety days, with neat cement or mortar with equal parts of cement and sand, and the lower one after one week, with mortar made in the proportions of one part of eement to four parts of sand. Further, by comparing the tensile and adhesive strengths at the same ages, it was found that the former was about ten times greater than the latter at all times when the mortar consisted of one part of cement to three or four parts of standard sand; also from six to eight times greater, both when the cement was used neat and when the mortar was mixed with one part of cement to one or two parts of the same sand. These results are of great interest, inasmuch as they indicate a definite relation between the two tests, thus leading to the inference of the one from a knowledge of the other.

Other interesting experiments on the adhesion of cement mortars to brick-work were made last year by Prof. Warn

one from a knowledge of the other.

Other interesting experiments on the adhesion of cement mortars to brick-work were made last year by Prof. Warren, of Sidney University, New South Wales. Portland cement and three different qualities of sand were used, with results, after seven days, ranging from 117 lbs. to 9 lbs. per square inch, according to the kind and amount of sand, and after twenty-eight days, from 146 lbs. to 14 lbs. per square inch. The highest values were almost invariably obtained when crushed sandstone was used in making the mortar, and the lowest when river-sand was used. The tensile strength tested neat was 607 lbs. per square inch, after seven days, and 740 lbs. after twenty-eight days.

rhe most recent experiments on the adhesion of cements The most recent experiments on the adhesion of cements to a variety of different substances used in the construction of public works are those made by Mr. Isaac J. Mann, C. E., and submitted in 1883 to the Institution of Civil Engineers. Mr. Mann urges that as the principal function of cement in masonry structures is to produce adherence or a binding together of the loose or disconnected material, its value should be estimated by its adhesive strength, after a certain lapse of time, rather than by its cohesion, which latter is always considerably greater. In his experiments, however, he uses neat cement only, and his experiments, however, he uses neat cement only, applied in a very thin layer between two blocks of the material to be cemented together. For estimating the relative adhesive strengths of different brands of cements, the latter, after being properly tempered neat, is placed between two small strips of sawed limestone or ground plate-glass and allowed to set for specified periods of time, after which the force required to tear them as under is duly after which the force required to tear them asunder is duly measured. The average of a number of tests thus made with neat Portland cement on limestone showed an adwith near Portland cement on limestone showed an adhesion of 65 lbs. per square inch after seven days, and of 99 lbs. after twenty-eight days; the tensile strength of briquettes made and tested in the usual manner being about 430 lbs. in both cases. For chiselled granite and common brick, after seven days, the adhesions were 78 lbs. and 19 lbs. per square inch respectively. It was also found that the roughness or smoothness of the cemented surfaces did not affect the adhesive strength as much as had been use not affect the adhesive strength as much as had been sup-posed, but it varied with the quality of the substances to which the cement was applied. The adhesion was better to very hard surfaces, such as granite and ground plate-glass, than to softer material like common bricks.

glass, than to softer material like common bricks.

With regard to the shearing strength of cement mortar, or its resistance to the sliding of one stone or course over the one next below, but little in the way of direct experiments has been published. Rondelet states that for common lime mortar, six months old, this shearing strength is only about 5 lbs. per square inch. Boistard's experiments with mortar made in the proportions of two parts of sand to one of lime, placed between two blocks of roughly dressed limestone and then allowed to dry for 16 days, gave a shearing strength ranging from o lbs. to 15 lbs. gave a shearing strength ranging from 9 lbs. to 15 lbs. per square inch, according as the area of the bed increased from sixteen to sixty-four square inches; with a mortar made of one part lime and two parts cement, on the other hand, he found, under the same conditions, a shearing strength of only about 5 lbs. per square inch, on the average.

In recent times, elaborate experiments to ascertain the shearing strenth of mortar, both in the joints of brick-work and separate blocks, have been made by Prof. Bauschinger, of Munich. The results are too numerous for a verbal

Digitized by GOGIC

description and they are accordingly given in Table No. 3, hereunto appended. None of the values obtained are very large, ranging after ninety days from 70 lbs. to 7 lbs. per square inch on brick-work with mortar mixed in the proportion of three parts of relatively fine river-sand to one of cement or lime. The shearing strength of cubes of mortar also appears to be considerably greater than that of the comparatively thin joints in brick-work, and to be influenced by the quality of the sand.

As in the case of adhesion, no exact relation between the tensile and the shearing strengths of mortar placed in

As in the case of adhesion, no exact relation between the tensile and the shearing strengths of mortar placed in brick-work can yet be deduced, owing to the lack of sufficient data; but on the other hand, the experiments show that the shearing strength of blocks or cubes of mortar is about twenty per cent. greater than the tensile strength under the same circumstances.

The method of testing cement mortars for their adhesion to building materials is accordingly one of great practical importance, and which should commend itself to the favorable notice of those who have the opportunity to make such experiments; for while the test of cements and mortars for tensile strength is of great service in forming estimates of their value, we have the strength in the forming estimates of their value, we have the strength in the strength in the strength in the strength in the strength is of great service in the strength in the strength is of great service in the strength in the forming estimates of their value, yet it cannot be denied that their adhesive properties actually limit and concition the cohesive strength of the mass of masonry itself, bethe conesive strength of the mass of masonry itself, because in any section through or parallel to the courses or beds of the brick or stone work, the aggregate area of the surfaces affected by the adhesion of the mortar will generally be far in excess of that affected by its cohesion. If we conceive the stones or bricks removed from a wall without disturbing the mortar or binding material, the without disturbing the mortar or binding material, the latter will form the sides of a series of cells, more or less regular in shape, depending upon the form of the blocks conceived to be taken out; and the strength of these sides in the structure will differ according as they represent the adhesion or the cohesion of the mortar. For example, in the case of a vertical wall, whose upper portion is over-thrown by a lateral force or pressure of any kind, the failure occurs either by rupturing the adhesion in the beds and the conesion of the side joints, or by the rupture of the mortar in the beds alone. The latter course, however, is improbable, since the cohesion of cement mortars is always much greater than their adhesion, as shown in the foregoing; and hence, in estimating the resistance of the wall to overturning, it becomes necessary to fix values for both the cohesive and adhesive strength of the mortar at the time when the structure is first exposed to the action of the lateral force or pressure, and also to ascertain the relative areas of beds and side joints in the assumed section of rupture. In good brick work the aggregate area of the side joints, in any section parallel to the beds, will amount to about one-seventh of the total area of such section; and in stone-work it will vary from about one-third to one-eighth, according to the quality of the dressing and laying: hence it follows that the adhesive strength of the mortar will, in a case like the above, be called into action for much the greater portion of the entire sectional area of the wall, while its tensile strength will apply only to the small remainder. In fresh work, therefore, the strength of the cement mortar will govern that of the whole mass, and a knowledge of its tensile strength becomes eminently useful only as it can be considered a correct index of its adhesive strength to the materials which are to be bound together. The experiments heretofore made, however, indicate that the relation between the cohesion and adhesion of a cement mortar is still obscure; and until further investigations have been carried out in this direction, it will become advisable to remain on the safe side by specifying and using mortars richer in cement, instead of im-perilling the durability of the work with mortars containing relatively large admixtures of sand. In problems of the nature now under consideration, where the data necessary to a complete demonstration are indefinite or uncertain, and where the efficient supervision of the work during construction is of paramount importance, it has always been regarded as perfectly legitimate for the engineer to adopt such a course and to provide for the greatest possible, as well as the greatest probable, stress which may reasonably be expected to act upon the masonry; and hence, under such circumstances, the specification of mormeagre in cement becomes unjustifiable and of doubtful economy.

. (To be continued.)

THE ACTION OF BOSTON WATER ON CERTAIN SORTS OF SERVICE PIPE.*

ALTHOUGH galvanized pipe is used to a considerable extent for distributing soft water, and although the general nature of the action of water upon zinc is known, there are very few results of quantitative analysis accessible which show the amount of zinc actually taken up by the water under the circumstances of ordinary practice. We have recently made some experiments in this direction.

tion.

The principle on which the so-called "galvanizing" process rests is that, under ordinary circumstances, zinc is slightly electro-positive to iron, and if the two metals in intimate contact are simultaneously immersed in water the zinc will be acted upon rather than the iron. This principle is only partially realized in practice. As long as the zinc coating is perfect the iron is protected, but if the zinc coating be imperfect, or if it be removed, as it is liable to be in coupling pipes together, then the iron is acted upon

*This paper was prepared by the late William Ripley Nichols, member of the Boston Society of Civil Engineers, and L. K. Russell. It was read before the society by Prof. L. K. Norton and published in the Journal of the Association of Engineering Societies.

as well and compounds of zinc as well as of iron are formed and carried fofward with the water, or form a sediment which gradually chokes up the pipe. One of us has already stated elsewhere, as the result of experience, that it will usually be found possible to detect zinc in water which has passed through any considerable length of zinced pipe, and has expressed the opinion that with most waters which are used for water-supply the amount of zinc in suspension—generally a hydrocarbonate—and in solution (in whatever form) is too inconsiderable to form the basis of a sanitary objection to the use of the pipe.

objection to the use of the pipe.

In our recent experiments we employed a length of about thirty-nine feet of half-inch galvanized pipe connected with the water service of the building in such a way that the water in the pipe could at any time be displaced by fresh water without allowing air to enter. Usually for a test an amount of water was drawn off equal to or slightly greater than the capacity of the pipe.

than the capacity of the pipe.

The experiments were continued during a period of three months. We found zinc in solution and in suspension, in not widely varying amounts, whenever water stood in the pipes from seven to seventy hours.

in the pipes from seven to seventy hours.

Water standing several days in the pipe contained no greater proportion of zinc in solution, though that in suspension was increased, and at the end of the three months the quantity of zinc found was only slightly less than at the beginning.

the beginning.

The water contained in solution 0.3 to 0.6 parts of zinc per 100,000 and in suspension 1.5 to 2 parts per 100,000, or 0.3 grain per gallon in solution, and 1.0 grain per gallon in suspension. No zinc was found in water with the regular flow, but when the rate was decreased to about one quart per hour, 0.9 parts per 100,000 of zinc in solution and suspension was found.

The inevitable inference to be drawn from these results is that the zinc coating is slowly but continuously dissolved, and it becomes a question of interest to consider the length of time the coating will last. Some experiments on the thickness of the zinc coating and the depth to which it penetrates the iron were made.

Some rods of wrought iron about six inches long were carefully centered and turned off by a lathe for about four inches of their length. The diameters of these were measured with a micrometer screw caliper measuring to one one-thousandth of an inch. The rods were now treated exactly as iron pipe is galvanized—i. e., by dipping the iron previously cleaned by immersion in muriatic acid, into a bath of melted zinc, with frequent additions of salmoniac, the centering being preserved by filling the holes with putty, which was afterwards easily dug out. The increase in thickness was noted. The rods were turned down by this amount, the turnings collected and analyzed for zinc and iron. Other turnings followed of varying thickness which were also analyzed.

zinc and iron. Other turnings followed of varying thickness which were also analyzed.

The results are given in the following table. The measurements show the thickness of the consecutive layers removed:

No. of rod.	No. of consecutive turning.	Diameter before galvanizing. In inches	Diameter after galvanzing. In inches	Thickness of turning.	Per cent. Iron.	Per cent. Zinc.
1	1 2 3 1 2 3 1 2 3	.901 .901 .901 .901 .901 .901 .901	.905	.002 .0035 .002 .003 .003 .0025 .002 .0025	2.19 93.31 96.04 1.87 65.24 1 70 02.03 87.09	97.08 4.33 .98 96.42 33.18 tr. 97.20 33.95 13.23

This table shows the increase in thickness due to galvanizing to be a ring of two one-thousands of an inch thick and that zinc does penetrate slightly into the iron, forming an allow

ing an alloy.

It will be seen that at the rate of wear indicated in the first series of experiments the coating of zinc would not last many months.

The zinc coating is not an even layer over the whole surface, but is thinner in places. This was made evident by experiment as follows: On immersing one of the galvanized rods or a piece of pipe in water, points of iron rust appeared at irregular intervals. In the water drawn from the pipe as above described some iron was always found with the zinc.

Some experiments were also made to ascertain the composition of the insoluble precipitate formed by the action of water on zinc. A quantity of chemically pure zinc was placed in a large flask and covered with filtered Cochituate water. The precipitate formed was collected from time to time, and was dried over sulphuric acid, and the water was renewed; one portion contained

ZnO 73.68 H₂O 16.90 CO₂ 10.02

Another portion dried longer gave

H₂O 10.98 CO₂ 10.58 100.00 This composition nearly corresponds to 5H₂O,2CO₂. 8ZnO. This zinc hydrocarbonate differs somewhat from those investigated by Rose and v. Pettenkoffer.*

At the same time as the foregoing experiments, tests were made of a pipe protected by a coating of lead, tin and antimony (in the proportion of about 80-12-8 in the sample examined) instead of zinc. The pipe is called kalamein.

Our experiments show that the coating on our sample is not evenly laid on, the spots of iron showing as referred to in the case of the galvanized pipe. Our experiments extended over nearly a month, and the amount of lead and tin in the water drawn from the pipe was not appreciably diminished at the end of the time.

read and the first water drawn from the pipe was not appreciably diminished at the end of the time.

We also arranged brass pipe in the manner described for the galvanized, except that the two ends were connected so as to enable us to heat the lower part and keep up a circulation of water through the pipe, and to ascertain what metals, if any, went into solution. Zinc and copper were found in small quantities, but constantly present.

As a further evidence of chemical action, the dissolved oxygen in samples of water which had remained in contact with the pipes for fifteen hours was determined by Schutzenberger's method, fully aerated Cochituate being taken as a standard, and the tests being made for several days in succession.

Freshly drawn and fully aerated Cochituate gave per cents, of dissolved oxygen as follows:

Kind of Pipe. Common iron pipe, from faucet in the laborator hours' contact	Dissolved Oxygen, ry, after 15
Brass pipe	
Galvanized pipe	
Kalameined pipe	0.06

COPPER PIPES MADE BY ELECTROLYSIS. THE recent accident to the steam-pipe of the steamship

Elbe lends a special interest to the electrolytic process for the manufacture of copper now being practiced by Mr. W. Elmore at Cockermouth. The London Engineer says that by this method such an article as a steam-pipe can be produced without weld or joint, and having a tensile strength from 50 to 100 per cent. in excess of first-class brazed pipes. Further, this result can be attained with the use of a very inferior quality of copper, and at a cost which will enable the electrolytically-made article to compete in the market with the customary varieties. Of course there is nothing new in depositing copper in a tubular form, but hitherto such metal has been too brittle to render it reliable for use in circumstances under which it is exposed to great stress. For copying engraved plates, and for the rollers of calico-printing machines, deposited copper has been used with great success, and when it has been thrown down very slowly it has been possible to produce very satisfactory qualities of metal for these purposes. The novelty introduced by Mr. Elmore, however. lies in breaking down the crystals almost immediately they are formed, and pressing them out into a fibrous form, in which they are interlaced and matted together. To this end the iron core or mandrel on which the metal is deposited is kept constantly rotating in the bath, and an agate burnisher is slowly moved backwards and forwards lengthwise of the cylinder, as if to cut a screwthread upon it. The speeds are so arranged that a layer of copper seven-thousandths of an inch thick is deposited between each reciprocation of the burnisher. When the required thickness has been attained the mandrel is lifted out of the bath and placed in a vessel supplied with superheated steam. In a few moments the expansion of the copper detaches it from the iron, and the shell can be stripped off. Pieces cut from such tubes have been submitted to breaking tests by Messrs. Kirkaldy & Co., Professor Kennedy, and Professor Unwin, and have broken at strains varying from 27 tons to 41 tons per square inch, with an extension varying from 5 per cent. to 7½ per cent. in a length of ten inches. The metal can be worked under the hammer most easily, and can be drawn, bent. or compressed without annealing and without any tendency to crack. Specimens poished and submitted to the microscope show that the electrolytic metal has a perfectly compact and homogeneous structure, while drawn copper is a honeycombed mass of crystals, only connected together at points. The success which has attended the experimental stage of Mr. Elmore's process encourages the belief that absolute security from burst copper steampipes can be secured in the future, and that we are on the eve of being supplied with a greatly improved quality of copper for all purposes.

DOMESTIC ENGINEERING, ETC., EQUITABLE LIFE INSURANCE BUILD-ING, NEW YORK CITY. No. VIII.*

> (Continued from page 711, Vol. XVI.) PLUMBING DETAILS.

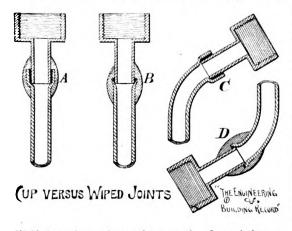

WE this week conclude our descriptions of the plumbing in the Equitable Building with an account of the justcompleted bath-room in the Lawyers' Club apartments. The bath-room, adjacent to the dressing-room (see Fig. 1), contains three tub and shower baths and one needle-bath, each in a separate marble-paneled alcove (see Fig. 2). The bath-room is well lighted by external windows opposite the interior ones shown in the illustration. The floor is laid with Italian marble tiles. The wainscot is Italian marble, about seven feet high. The cornice and window trim is of grained oak and the ceiling frescoed in colors.

The tubs are porcelain, resting on carved marble feet, and capped at the upper edge with a marble rim, molded outside and beveled inside, as per sketch, Fig. 2. All the fixtures and visible metal work (except the polished brass door-hinges) are silver plated, and the pipes are led behind the wainscot paneling; this paneling was not at first contemplated and its adoption necessitated the vent to the bath-trap to pass under the paneling and connect behind it with the main vent-pipe. The waste-pipe trap is accessible through a handhole in the floor, covered by the convex silver-plated cap, shown in the illustration at the foot of the tub.

In addition to the regular plumbing-work described in this and previous issues, the plumber, Mr. W. H. Quick, has fitted up a novelty in the way of a dish-washing machine. which we illustrate in our "Novelty Column" elsewhere

CUP VERSUS WIPED JOINTS.

THE following illustration should have accompanied Mr.

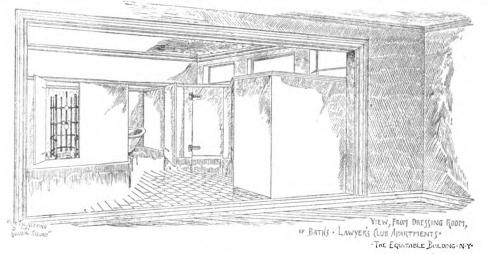

Kirk's letter in our issue of last week. Its omission was through inadvertence.

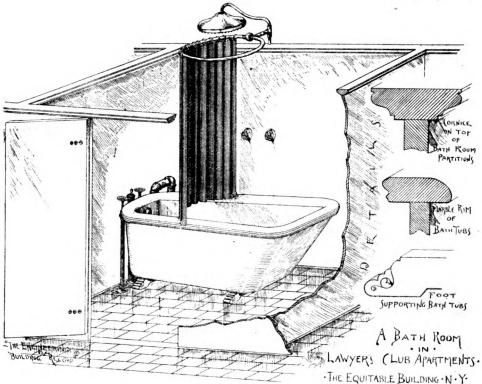

BILLINGS, MONT., March 17, 1888.

BILLINGS, MONT., March 17, 1888.

SIR: I have read with considerable interest the correspondence between Mr. Kirk and William R. Billings as to the merits of cup joints versus wiped joints. I agree with Mr. Kirk, and will always stick to the wiped joint. I, like every other plumber, will naturally stay by the latter joint (providing he can make one). But, aside from this, I think the wiped joint is the best in all cases, which I will try to demonstrate by the assistance of the enclosed cuts. Figure I represents a piece of lead pipe and a solder nipple fastened together by a cup joint. In opening the lead pipe to receive the nipple it is necessary to cup or flange the end of the pipe. This leaves the pipe (after joint is made) below the end of solder nipple about one-half its original thickness, and nothing on the outside of pipe at this point to protect it against internal pressure,

* No. I. of these articles, containing the first installment of Sketches of Plumbing, appeared in our issue of October 8, 1887; No. II., General Description of Building and Plant, October 15; No. III., Details of Pumps and Boilers, October 22; No. IV., Smoke-Stack and Passenger-Elevator Water-Supply, October 29; No. V., The Elevators, November 5; No. VI., Pneumatic System, November 12; No. VII., Steam-Heating, November 10.

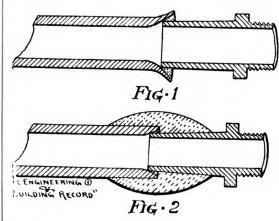

while in a wiped joint, if prepared and made properly, making a rough estimate, I would say there is three times the strength of the lead pipe, which any one can see by reference to Fig. 2.

the strength of the lead pipe, which any one can see by reference to Fig. 2.

In regard to a wiped joint's giving out under different temperatures of water, I would state that they never do, except under an extreme high temperature. I agree with Mr. Billings that the giving out is caused indirectly by expansion, but directly by the mode in which joint is prepared before wiping. As an example we will suppose a joint is wiped over Fig. I. The pipe being plugged leaves a projection all around

same, and when a joint is wiped over the pipe the solder fills the cup as well as covering pipe. Now, what I claim is this, that the cup or flange pulls the joint apart during the operation of expansion. On the other hand, if a pipe is prepared like Fig. 2—that is, tapped out with a tapbore instead of being plugged out with a turn-pin—I claim that there will be no resistance to the lead pipe and joint will not break. What I draw my conclusion from is this: that nine times out of ten when I have found joints broken from the effects of extreme heat I have always noticed that they were parted in the centre.

A cup joint may do in some cases, but on a hot-water pipe it would never work; for this reason, when the solder expands it forces the lead cup out before it (the lead) has

had a chance to get warm, and when solder contracts again it leaves the cup part of joint larger than it originally was intended to be, and this expansion and contraction will soon work a cup joint loose.

Hoping more of your readers will give their views on this point, I am yours respectfully, GEORGE SOULE.

NEW HAVEN, March 21, 1888.

New Haven, March 21, 1888.

Sir: In your issue of March 17 on wiped and cup joints, Mr. J. B. Patterson says he has seen wiped joints stretch and crack in the middle where a cup joint will not. In the first place, a cup joint has no middle to crack in, and he nor any other man ever saw a wiped joint that was properly prepared and wiped crack or stretch. A joint that the pipes are prepared right and wiped even with fine solder will last as long as the pipe it is wiped on. He may have seen a joint crack where there was a piece of iron or brass wiped into the lead. But if he ever noticed he will find that it was the tinning that was eaten off the brass or iron, which in time will eat through the joint. I think that what Mr. M. Sexton says is right, and I think he has had as much experience as Mr. J. B. Patterson.

Yours respectfully, T. A. JARRETT.

INSTRUCTION IN LEAD-BURNING.

APPLETON, Wis., March 26, 1888.

SIR: I am a subscriber to your paper and would be glad to get a little instruction from some one of our pracglad to get a little instruction from some one of our practical lead burners in regard to burning upright seams, as I find it a rather difficult job to do. I have a machine for that work and can burn the flat seams satisfactorily, but the upright seams are what bother me. Any information in regard to the same would be thankfully received.

Yours truly, H. N., Plumber.

[Referred to our readers.]

MACHINE FOR DRILLING CEMENT PIPE WANTED.

CEDAR RAPIDS, IA., March 24, 1888.

SIR: Will you kindly inform me through your most valuable paper next week if there is a machine of any kind made for boring holes in cement pipe instead of cutting with a chisel and hammer, as we are having great trouble here with the pipe breaking up. If you know of any machine or any other way to cut in for connections please let me know.

COATING OF SOIL-PIPES—NEED OF TRAP-VENTS.

BROCKVILLE, ONT., March 8, 1888.

SIR: Would you kindly give space for the following

queries in your paper t

First—In the latest plumbing rules for the city of New

First—In the latest plumbing rules for the city of New York, why are soil-pipes to be uncoated?

Second—Where main soil-pipe passes unobstructed through roof should water-closet trap be vented where closet is the highest fixture, or should it be vented if there are no closets above it? If so, why?

Third—Some boards of health consider that the longer the branch pipe or waste from any fixture (except a water-closet) the less need of a vent to trap of such fixture. Others consider that the shorter said pipe the less need of a vent. Which is correct, and why?

need of a vent. Which is correct, and why?

Fourth—In the hotels and business houses of our city water-closets are in the basement with unvented traps. The fixtures in stories above basement are wash-bowls sinks, etc., with an occasional water-closet. Should a Should all traps in these cases be vented?

aps in these cases be vented r

By commenting on above you will greatly oblige,

Vours truly. New Subscriber.

First-The amended rules required that pipes should not be coated, because experience showed that sand holes and defects in the pipe were concealed by the tar coating.

Second-The necessity for it depends on the circumtances in each case.

Third-The vent is needed in either case.

Fourth-In new work traps should be so placed that they may all be vented. In old work there may be special instances where a compromise in the shape of a deep seal trap without special vent would be the most practicable thing to adopt. Traps are vented not only to prevent syphonage, but to permit a circulation of air through the branch waste-pipes, and thus through the drainage system of a house.

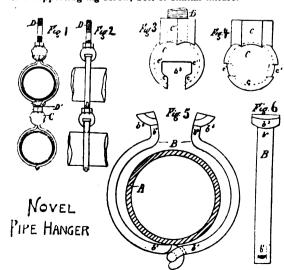

So much space has been taken up in the earlier issues of this journal in discussing this question, that we must refer our correspondent to these articles, especially "Report of Tests," by E. S. Philbrick and E. W. Bowditch, to the National Board of Health, Vol. VI., pages 264 to 267, and Glenn Brown, in issue of December 11, Vol. XVI. "Plumbing and House Drainage Problems" also discusses this matter. Any of these volumes are obtainable of the Book Department of THE ENGINEERING AND BUILDING RECORD.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, oeing governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

PIPE-HANGER.

A DEVICE recently invented and patented by Harry Trask, of Trask & Carmichael, 80 Centre Street, New York City, for suspending pipe so as to admit of easy adjustment and free movement in any direction, consists essentially of a yoke connected by a ball and socket joint to a supporting lag-screw, bolt or similar fixture.

The lag-screw D (Figs. 1, 2, 3) is driven in the ceiling or other support, and the hollow sphere C is screwed on to it by the threaded lug C'.

B B (Figs. 5 and 6) are interlocking arms of the pipe yoke and have a hooked shoulder b^3 with a spherical

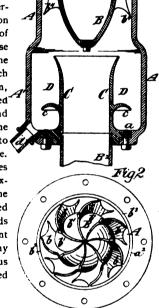

bearing surface to fit the inside of C. The yoke arms B B (Figs. 5 and 6) may be hooked together around the pipe A, and their necks and shoulders b4 and b8 inserted through the T-shaped slot cc' c' c in C, then lowering them until the shoulders b8 b8 bear on their seats cc on the concave interior surface of C will lock the yoke and permit oscillations of the enclosed pipe.

By making the lower ends b' b' (Fig. 5) of the yoke segments B hook into an auxiliary lug D' (Figs. 1 and 2), a duplicate yoke and joint may be provided for a second line of pipe, and so on, extending the system as far as

STEAM AND WATER SEPARATOR.

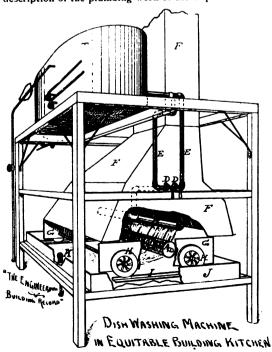

THE operation of this device, recently patented by J. Joseph De Rycke, of New York City, is clearly shown by reference to the accompanying illustration.

The steam enters at the top of the separator, and as it passes downwird is given a rotary motion by the spiral ribs on the central core. The centrifugal force generated by this rotation throws the particles of entrained water or grease to the outer wall of the separator down which they flow to the bottom, where they are carried off by the drain-pipe and either returned to the boiler or discharged into some suitable receptacle. The steam escapes through the dry pipe extending up from the bottom and the curved flange which surrounds it is intended to prevent the splashing up of any fluid which might thus again become mixed with the steam.

DISH-WASHING MACHINE.

THE novel device for washing dishes referred to in our description of the plumbing work of the Equitable Build-

ing elsewhere in this issue, consists, as shown in accompanying illustration, of a wooden frame, supporting on top the hot-water tank T, underneath which, enclosed by the galvanized iron hood F, is the spray-tube B. The tank, T, is double, the hot water in one side being pure and in the other containing a quantity of soda in solution. The pipes E E lead from these respective divisions of the tank, either of which can be connected at will by valves D or D with the pipe B, whose lower side is perforated so as to eject a solid sheet of water, which escapes at considerable pressure and plays upon the dishes in the frame A. These plates, etc., are placed edgewise in separate cross-racks in skeleton cylindrical frames, two of which are set inside the larger similar frame or cage A A.

The car G G has galvanized iron sides, but no ends or bottom, and travels, with grooved wheels H H, on the rails I I. It can be moved from beneath F, and receives two of the frames A A, which, after being rolled back under the spray, are revolved by cranks attached to the gudgeons at the ends opposite to that shown in the illus. tration.

The track I is laid on the bottom of the galvanized iron pan J, which catches the water and discharges it through basket strainer K.

The soda water is first turned on and removes the grease, etc., from the dishes, which are then rinsed by a jet of pure water, which is so hot as to quickly evaporate and make further drying unnecessary.

The machine is claimed to reduce breakages and do the work of ten persons.

It is invented and patented by J. Haskins, Chicago, Ill., and is one of the first that has been put in use.

A LONG STEAM-GAUGE PIPE.

MR. WFLLS, superintendent for Gillis & Geoghegan, recently had occasion to place a steam-gauge 100 feet hori. zontally and 20 feet vertically above the main steam-pipe whose pressure it was desired to register. The connection was made with a half-inch pipe, but the gauge would not stand within nine pounds of the pressure in the main, which was 12 pounds per square inch.

A separate pipe was run back from the gauge, making a circuit, and the difference of pressure then fell to two pounds.

The great difference at first observed was probably due to a column of condensed water in the vertical part of the dead end.

DEFECTIVE CIRCULATION IN A STEAM-HEATING APPARATUS.

WE learn from Mr. E. E. Magovern of an interesting case of defective circulation in a high-pressure steamheating apparatus located in a large office building.

Steam was brought into the building at a pressure of 60 pounds, and taken to a horizontal steam-main fire inches in diameter in the top of the building, from which 21/2-inch supply-pipes descended to a 4-inch return main in the basement.

Each radiator had a single 3/2-inch connection to the supply-pipe for both steam and return.

One supply-pipe about in the centre of the building had on it but 16 square feet of surface; the others had a much larger quantity-in some cases 300 or 400 square feet

When steam was turned on it pretty much all went through the pipe supplying the least surface, so that the other radiators got little or nothing.

Probably the difficulty could have been remedied by equalizing the amount of surface supplied by the different pipes; but as that could not conveniently be done, the expedient was adopted of putting a trap at the foot of each supply-pipe to return the condensed water into the 4-inch main, which had the desired effect of securing a uniform circulation.

WELDING BY THE ELECTRIC ARC.

A METHOD of welding by electricity, devised by Mr. Nicholas von Benardos, of St. Petersburg, has recently attracted considerable attention on the Continent, and possesses several features which render it quite distinct from the various processes of fusing and reducing by means of the electric current or the electric arc, proposed from time to time by Siemens, Cowles, Elihu Thomson, Wallner, and others.

Mr. von Benardos works directly with the electric arc produced between a carbon pencil as one terminal, and the metal to be treated as the other terminal. This has been suggested and tried before. But the carbon was made the negative pole, as it was feared that otherwise the consumption would be embarrassingly rapid. Hence the metal became the positive pole—that is to say, it became exposed to energetic oxidation-and a great deal of the trouble experienced by other experimenters arose from this circumstance. In the Benardos process, the carbon forms the positive terminal; it is, of course, quickly consumed, but can easily be replaced; on the other hand there is a favorable reducing action going on in the fused metal. The great importance of this modification can easily be tested by changing the poles, when the work soon becomes enveloped in a dense cloud of oxidized products. The intense heat of the arc melts even the most refractory metals almost instantaneously; but the action is purely local, like that of the blow-pipe, and only those parts upon which the arc plays directly are attacked, the adjoining portions undergoing little change; and the fused mass solidifies and cools very quickly. In the Benardos process the material requires little or no preparation. Even a pretty thick layer of oxide will be reduced and drop off, while smaller quantities of oxides unite to form a slag with the sandy clay frequently added as a flux. This slag prevents the oxidation of the metals whilst cooling. No other fluxes are required. The operations can also be carried on under water, although the gases and steam generated cause trouble. One of the chief advantages claimed for the new system appears to be that the arc is brought to the work. Size is hence a question of secondary importance, and unwieldy pieces may be dealt with. A fortunate accident occurred last summer at the emery works of Messrs. Struve, of St. Petersburg, which directed general attention to this process. The works have a vertical boiler with heaters, some of which had become leaky, and the works were practically at a stand-still. The consulting engineer declared that the repairs would be rather expensive, and might occupy three weeks' time. Mr. von Benardos inspected the boiler and offered to repair the heaters that very day. The boiler was put on a truck, taken to his works, treated electrically on the truck and wheeled back, all in three hours. Another case is reported by Professor Ruhlmann. A cast-iron fly-wheel of more than five tons weight had been broken into several pieces whilst being taken down from the truck. The pieces were fused together within a few hours, and the following day the flywheel was in place and at work.

The operation is as follows: The carbon pencil is allowed to touch for a fraction of a second, and is taken off again immediately, so that between the plates and the carbon pencil an arc of a few milimetres length is formed. The iron melts like wax: the molten metal hissing and evaporating distinctly.

The carbon-holder resembles a pair of scissors, and its construction permits of a quick replacement of the carbon pencil. The diameters of these carbons vary greatly. For more delicate work, fine pencils of only one-sixteenth of an inch are required; whilst boiler plates are welded together by means of thick carbon rods of up to 2½ inches in diameter. The carbon is pointed before using it.

One of the most important applications of the new process is for welding plates of all thicknesses. For the very finest sheets of one millimetre and less, the Electro-Hephaestos Company prefer, with commendable impartiality, a modification of the Elihu Thomson process, although their own process is sometimes equally good. But all stronger plates up to several centimetres thickness are subjected to the rrc.

To effect this with ordinary plates the edges are feathered and pressed together. The furrows are filled with little pieces of the same material, and the arc is then applied whilst fresh pieces are added until the furrow is completely filled with the molten mass. The plates are immediately afterwards finished under the hammer. In making iron welds the small pieces for filling are always of wrought

iron. With iron, a flux of clay sand is recommended, with copper, borax, or sal-ammoniac.

If two iron bars are to be joined end to end, the one bar is roughly centered in a lathe, and the other pressed against it; the body of the lathe is connected with the negative pole. A few momentary touches with the carbon will make the two bars stick together sufficiently so that they move as one piece with the lathe. Whilst the lathe is turned slowly, the welding is effected by the addition of material in small quantities at a time. To join two telegraph-wires the ends are bent, a little iron ring is pushed over the hooks, and the whole fused into a sort of button; the resulting joint leaves nothing to be desired as to conductivity and breaking strength, and the whole operation can be accomplished with a few cells, and in two minutes for 4-millimetre wires.

The intense heat of the arc supplies alloys which are hardly known under other circumstances, so that iron and copper, tin, zinc, lead, steel, cast iron and steel, wrought iron and steel, aluminium and platinum, etc., can be united. This promises important progress in the working of metals. Professor Ruhlmann has exhibited specimens of iron plate welded to red copper, iron plated with tin, and iron plated with lead. In such cases there is probably at the junction of two metals a layer of alloy. Chemical manufacturers would be thankful for cheap copper retorts coated inside with platinum, or iron vessels coated with lead. Professor Ruhlmann saw at St. Petersburg a number of copper tubes soldered into a cast-iron plate, and this iron plate coated with copper several millimetres thickness.

If the metals can be joined by the electric arc, they can also be separated by the same means. For instance, holes can be made if the metal is permitted to flow off. To pierce a hole one inch in diameter through two plates of ½-inch thickness takes about four minutes.

Iron and steel undergo little chemical change under this treatment.

The tensile strength tests of electrically-made joints yielded most satisfactory results. Two pieces of rolled charcoal iron, joined electrically, showed a breaking strength of 28.5 kilogrammes per square millimetre (18 tons per square inch), the iron itself giving 32 kilogrammes; the elongation was 9 per cent. In another instance 93 per cent. of the initial tensile strength was observed. A plate riveted electrically rent finally outside the riveting line.

The "Electro-Hephaestos" of St. Petersburg has taken up these inventions, and in Russia the processes have been introduced at the well-known works of Messrs. Struve. For Austria and France, Baron Rothschild has acquired licenses, and works have been started at Creil. A Dresden company is about to create works at Berlin. For further information we refer our readers to an extended and fully illustrated article on the subject in the London Engineering of January 27, taken from the articles of Professor Ruhlmann in the Zeitschrift des Vereins Deutscher Ingenieure, and the Electrotechnische Zeitschrift.

FLAMAND OR "FLEMISH" TUBES.

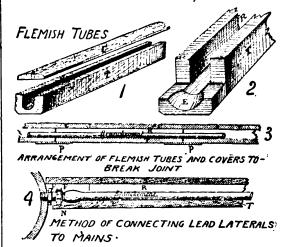

UNDER this title Le Genie Civil describes some of the methods that have been employed in France for the protection of small underground pipes and conduits. It says:

"Since metallic laterals placed underground are exposed to many causes of deterioration, the great extent to which pipes are being laid to day for the distribution of water, gas, and compressed or rarefied air, and as conduits for telegraph, telephone, and other electric wires, forces upon us the importance of giving to these the best possible protection. Gas pipes require more care in laying and maintenance than any of the others.

Cast-iron, wrought-iron, and lead pipes are used for the above purposes. Placed in the subsoil of cities and subjected to the incessant action of moisture, of oxidizing agents, of vibrations, of caving in, of settlement, and of all the movements of the earth due to the passage of vehicles on the surface, and to the excavation and refilling necessitated by the use of the streets, these pipes last for only a comparatively limited period whose duration depends entirely on the more or less efficient protection given them. This deterioration to which they are exposed is to be feared, not only on account of the repairs, or the replacement of the pipe which it causes, but also on account of the leakage which it occasions—leakage always prejudicial and often dangerous.

The use of cast-iron pipes is sensibly diminishing. They can be obtained only in short lengths, which increase the number of joints and consequent leakage, and are more expensive. They are relatively fragile and brittle, and it is difficult to manufacture them of the small diameter required for gas laterals.

Laterals of wrought iron, on the contrary, are much employed. They are strong, easily laid, and keep their shape well. These tubes can be obtained of considerable lengths and the number of joints is thus reduced. It is true, however, that these tubes oxidize very easily and that their destruction by rust is rapid, so that their average durability is but from three to eight years, according to the character of the earth in which they are laid.

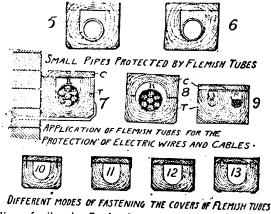

As to lead pipes, which have the advantage of requiring no intermediate joints, of not oxidizing and of being very little influenced by chemical agents, of being laid more easily and more rapidly, and so less expensively, it must be remembered also that their malleability constitutes a drawback to their employment in the subsoil, for they can be deformed, flattened, or broken by pressure or settlement of the earth, or by the stroke of the pick of the laborer.

Various modes of protection have been employed.

For wrought-iron tubes several methods have been used, such as coating by the Bower-Barff process, intended to protect the iron tubes from oxidation or from injury by chemical agents; but these processes are of no avail against physical agents of deterioration and against deformation or rupture.

In order to obtain this latter protection, whatever may be the kind of tubes employed, the laterals are placed in wooden casings of a square or triangular section made of strips of wood coated or impregnated with tar from 12 to 15 mm. thick, nailed together, and with a cover secured by clasps. The space is then filled with melted tar mixed with sawdust or sand. Sometimes for the wooden cases are substituted earthenware or light cast-iron tubes which are filled with an insulating mixture. Mr. Alexandre Léon, ironmaster in the Landes, struck with the resources which the cultivation of timber in this region and in that of the Gironde afford, and with the facilities which the new

lines of railroads offer for its transportation, proposes to substitute for these protecting casings special wooden tubes, to which he has given the name of "Flemish" tubes.

The manufacture of these tubes is conducted at the works of St. Isidore, near Lesparre (Gironde), the forest of Flamand furnishing the wood. New and original forms have been made to insure rigidity of the conduits. Their preservation is secured by the injection of creosote, and rigidity obtained by means of strips placed under the lower joints and by breaking joints between the upper and lower parts when putting together.

The section of these Flemish tubes can be varied according to the use for which they are intended.

As to the covers, they are either nailed on the edges of the tube, or else fixed on by means of hooks or iron wire. Small groves can be made on the surfaces of contact, which are filled with melted pitch when putting on the covers. Tightness, especially for electric cables, is insured by a layer of melted pitch or tar placed on the surfaces of contact.

The advantages of these tubes as protectors are the following:

They prevent injury from shocks and exterior pressure, as well as from settlement of the earth. By reason of their solidity, and of their construction of one piece, they preserve the metal from all oxidation and deformation, and their durability adds greatly to their value; finally they act in the same way as a tight pavement in regard to the leakage of gas, as has been proven by different gas companies that use these tubes, notably the gas company of Bordeaux.

They can also be employed for the protection of electric wires or cables placed in the subsoil instead of the cast-iron tubes now employed.'

DESCRIPTION OF ILLUSTRATIONS.

In Figs. 1 and 2, T is the "Flemish" tube, C the cover, R the groove, and E the recess for the union and solder joint in case lead pipe is used. Figure 4 is a section of the same thing, but showing also the lead lateral in place and its connection to the main. Figure 3 is a section of the continuation of the same lateral and enclosing tube breaking joint with its cover, and resting on splice-plates. Figure 5 is a transverse section of the same arrangement. Figure 6 shows an iron pipe in "Flemish" tube, with groove filled with melted pitch mixed with sand or sawdust. Figure 7 shows a "Flemish" tube enclosing electric cables affixed to the wall of a tunnel, gallery or sewer. Figures 8 and 9 show the same thing underground, Fig.

OTHER MODES OF PROTECTING SMALL PIPES

o being arranged for a double electric conduit. Figures 10. 11. 12, and 13 need no explanation and are of interest mainly as illustrating the superfluous minuteness with which the matter has been treated. In fact, in view of what has been done in the subways of New York, illustrated and described in our issue of January 14, we do not expect that this article will add very much of value to the subject. It is chiefly interesting as showing different methods of doing and describing such work, but in the matter of subways proper—that is, of subterranean conduits large enough to contain sewers, pipes, and wires, and to afford ready access for repairs or replacement-we might very profitably study what the French have done. Figures 14 to 19 show other modes of protecting small pipes. In Fig. 14 the casing is made of boards. In Fig. 15 the pipe is laid on a board and surrounded with puddled clay. In Fig. 16 it is enclosed in an earthenware tube, and in Figs. 17 and 18 the casing of boards is filled with melted pitch. In Fig. 19 the casing is of thin cast iron and filled in the same way.

A BRIDGE ON A YOYAGE.

The iron truss bridge over the Chicago River at Wells Street was, on the 26th inst., successfully floated on scows from that point to Dearborn Street, where it will remain. The structure, denuded of flooring and other wood-work, weighed about ninety tons. The work was done under the personal supervision of Mr. C. L. Strobel, M. Am. Soc. C. E., Consulting Engineer of the Keystone Bridge Company.

A PATENT DECISION.

THE United States Circuit Court for the district of New York, Judge Wheeler, has given a decision in favor of the Babcock & Wilcox Co. against the Pioneer Iron Works for infringement of their patent in building the "Zell" boilers.

STEAM-HEATING FOR DWELLINGS IN 1810 IN CONNECTICUT.

BRIDGEPORT, CONN., March 28, 1888.

SIR: In looking over some papers to-day, I found the inclosed clipping from the Bridgeport Evening Standard of July 27, 1887. It gives an account, as you will see, of what is claimed to be the first job of steam-heating ever done in this country. The work was done in Fairfield, a small town to the south-east of Bridgeport, and knowing that you were interested in all matters of this kind, I thought it would be a good idea to let you know that Connecticut in this, as well as in other things, is always at the top.

Trusting you may find it of interest, I remain,

Respectfully yours,

ALFRED HOPKINS.

The following is the clipping for which we are indebted to Mr. Hopkins:

(From the Bridgeport Standard.)

"In response to a request from those interested in the matter, we reproduce in full the letter on Steam-Heating, an extract from which was recently given in the Standard:
"HARTFORD, Sept. 16th, 1819.
"Roger M. Sherman, Esq., Fairfield:
"DR SIR:—Yours of the 14th Inst. lies before me with the contents noted. You anticipate warming yr Dwelling-House with Steam, and desire of me a particular account of the Machinery necessary to the object. I shall be happy to give you all the information I possess on the subject; but at present decline doing it by writing, under the belief that it would not be done to yr satisfaction or my own; that it would not be done to yr satisfaction or my own; even if accompanied with Diagrams. Could I see you, Sir, I have no doubt it w'd be in my power to give you more information in an hour, than would be possible with the pen, in two or three days. If, however, you have not business to call you hither, and still wish me to give a written description of the Machinery, please to signify it, and it shall be done. It is perhaps proper for me here to state that my object in making the experiment last winter, was, simply, to test the principle, whether Steam can be advantageously used for heating rooms or not, and am satisfied it can, under some if not all circumstances. My Boiler was not of a kind, or set in a manner to show the economy with which the thing may be done—but a boiler. that it would not be done to yr satisfaction or my own conomy with which the thing may be done, -but a boiler afterwards was constructed for a different application of steam, which I think w'd clearly show that it is economical. The most successful experiments with which I am acquainted, have been made in England, within a year or two, and apparently with great approbation. The difference of climate I think should be taken into consideration; may be questioned whether it will answer as well in a climate so cold as ours, as in theirs; my experiments have not been such as to satisfy me entirely of the facts; but should say any desirable temperature may be obtained, and kept up, even in our climate. If I am correct in my position, there cannot be a question but the advantages of using Steam for warming Rooms are so great as to demand its immediate introduction to the exclusion of all other methods. I am Sir Very Respectfully Yours, etc.,

" LORENZO BULL."

By the above letter it will be seen that Mr. Bull had tried the experiment of heating a room by steam the win-ter before the date of this letter, or probably as early as 1818, and that, a year before, successful experiments in the same line had been tried in England. We know that James Watt, the English philosopher, had warmed his own study by steam many years before this date, but the matter had been looked upon as a mere whim and not as of general application or utility. We presume that the above recorded case is the first in this State if not in the country.'

ENGINEERS' CLUB OF ST. LOUIS.

AT the meeting March 21 there were thirty-two mem-Chairman pro tem., William H. Bryan, Secretary. William S. Henry and John B. Myers were elected members. Mr. S. F. Burnet then read a paper on "Cements and Mortar." He gave some practical hints on mixing and using same; also, how specifications should read and tests be made. He exhibited specimens and gave results of tests. Some information on sand, water, and lime was given. The damaging effects of freezing were shown.

The secretary then read a short paper by E. L. Corthell in review of one by Robert Moore on "Interoceanic Ship Transfer," read before the club March 2, 1887. The criticisms of Mr. Moore on the floating pontoon, the wheel load, comparative economy and capacity of carriage were reviewed to show the practicability of the design. Mr. Moore replied at some length, answering the points brought up, which he claimed did not change the material aspect of the problem. Prof. Johnson called attention to some bars of iron which had been broken in a testing machine bars of iron which had been broken in a testing machine after having been strained beyond their elastic limit and then allowed to rest. The results were: After a rest of one day an increase of strength of 16 per cent, was shown; seven days, 22 per cent.; sixteen days, 26 per cent.

Mr. Bruner called attention to a remarkable case of filtering water through an ordinary brick wall. Prof.

filtering water through an ordinary brick wall. Prof. Nipher reported the results of some experiments on leakage of gases through brick walls.

MICHIGAN BRICK AND TILE ASSOCIATION.

At the eighth annual meeting recently held at Lansing, Prof. R. C. Carpenter, of Ann Arbor, read a paper on "Steam-Drying." C. B. Williams, of Bay City, read a paper on "The Dry Clay Process of Brick-Making."

THE MORRIS CANAL BILL APPROVED.

THE bill permitting the Lehigh Valley Railroad, as owners of the Morris Canal, to surrender its charter and thus be freed from its obligation to furnish facilities for transportation while retaining the right to sell its property, and especially its water, has, by the signature of Governor Green, become a law of the State of New Jersey.

It will be interesting to note what use the owners of the canal will make of their newly-acquired privileges.

The general impression appears to be that it gives them a practical monopoly of the sources of domestic watersupply in the northern part of the State.

A SEWERAGE SYSTEM FOR ATLANTA.

ATLANTA, GA., is having plans prepared for a system of sewerage by its City Engineer, Mr. R. M. Clayton, Mr. Rudolph Hering, of New York, being retained as Consulting Engineer.

HARBOR IMPROVEMENTS IN BUENOS AYRES

A DESCRIPTION is given in the Annales des Ponts et Chaussees for January of the plan of harbor improvement at Buenos Ayres so long delayed by political and finan. cial difficulties.

The Argentine Congress has approved Engineer Manero's plans, and voted \$10,000,000 for the construction of a new port, the work on which is already commenced, and will consist first of a canal 100m. (328 feet) wide and 6.4m. (21 feet) deep below low-water level, prolonging the Balisas River for the entrance of large ships; a basin of the same depth will be constructed for vessels remaining but a short time, and four other docks or basins also of the same depth whose quays will have a total length of 8 kilometres (26.2 feet); finally, a maritime basin of equal depth and 1,430m. (4,692 feet) long will be made. All the masonry will be of beton blocks. Separate storehouses will be built for imported and exported goods, which will occupy a total area of 1,000m. (3,280 feet) by 50m. (164 feet), and have a capacity of 315,000 cu. m. (10,963,900 cu. feet). All the quays will be provided with loading and unloading appliances, cranes, and der-

DISINTEGRATION OF BRICKS.

THE atmospheric influences producing disintegration of bricks, tiles, etc., are noted by the *Chronique Industrielle* as being much less active and destructive in a season of continuous humidity than during alternately wet and dry periods. Their action also is obviously affected by the chemical and physical composition of the bricks and their degree of burning. An excess of sand destroys cohesion, and calcareous matter is reduced in burning to lime, which will be slaked by exposure to moisture, and, by the expansion which follows, causes disintegration.

APRIL 10, it is said, has been fixed upon as the date of opening the Union Elevated Road in Brooklyn. The Kings County Road promises to be ready for travel in less than a month.

OBITUARY.

GEORGE F. HARRIS, a prominent railroad contractor, died March 18, at Clayton, Ala., aged 70 years. Thedeceased built the Great Western Railroad of Canada, in 1852, and a few years later invented a track-laying machine. Mr. Harris was at the head of the firm of George F. Harris, Son & Co.

SURGEON WILLIAM C. SPENCER, U. S. A., died at Fort Trumbull, March 22. The deceased was born in 1838, and entered the army in 1861.

PERSONAL.

W. W. OLNEY, C. E., has resigned his position as Principal Assistant Engineer of the Louisville and Nashville Railroad, and is in New York.

CITY ENGINEER SANFORD, of San Diego, Cal., is to visit many of the principal Eastern cities for the purpose of studying the different styles of pavements and street work in general; also the laying out of public parks, etc., with a view of applying his investigations to the interests

DESMOND FITZ GERALD, Superintendent of the Western Division of the Water-Works, has received the "Norman' medal of the American Society of Civil Engineers for the best paper read at a meeting of that body. This is the third time that the medal, which is only given to papers of a high standard of excellence, has been presented to an employee of the Boston City Engineers' Department.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

TRADE CATALOGUES.

THE Hydraulic Pressed Brick Co., of St. Louis, Mo., have issued an attractive catalogue illustrating the various products of their logue flustrating the various products of their works, including front bricks, molded and ornamental bricks, arches, and several pages of details of buildings, illustrating various combinations of special shaped brick.

ARCHITECTURAL COMPETITIONS.

TECUMSEH, NEB.—Plans are wanted here for a \$40,000 court-house, until April 3. Address J. L. Young, County Clerk.

Tipton, Ind.—Plans are wanted here for a county ail, to cost \$25,000. No date specified. Address the lipton County Commissioners, as above.

Kingston, Can.—Plans are wanted here for a new diffice for Chalmers Church, to cost \$25,000. No date

New York City.—Prof. Ware and the committee in harge of the architectural competition for plans for the new club-house which the Progress Club will erect it bixty-third Street and Fifth Avenue, have accepted the plans of Alfred Zucker & Co., of this city. The ottal expenditure including land, it is said, will exceed \$500,000 and the work of construction will begin at ince.

St. Paul, Minn.—Competitive plans for the new furner Hall have been considered, and the award has een made to Messrs. Gerloch & Haas.

for works for which proposals are requested see also the "Proposal Column," pages i-v11-v11-272-ix.

Persons who make any use of the information they nd in these columns we trust will not omit to mention the Engineering & Building Record as the source.

Jur readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

EAST LIVERPOOL, O.—The Sewer Commissioners of his city advertise for proposals for the construction f sewers in the Sewer District No. t. Cast-iron rater-pipe, special castings, rings and covers for flush-inks, inspection-pipes, manholes, cement, etc., are ranted. For details see our Proposal Column.

TULLAHOMA, TENN.— Our correspondent writes:
Our water-works company is not yet organized, but it sonly a question of a very short time until something i the kind is done, as better water facilities are an inspensable necessity in our rapidly growing town. The intention now is to organize and charter a private ompany, who will construct and operate the works nder such regulations as our muncipal authorities may reproper to enact."

Mt. Clemens, Mich.—Our correspondent writes: Our City Council have resolved to submit the proposition to the voters at spring election of raising \$50,000 y bonds for construction of water-works. It will probbly carry."

Wotpboro, N. H.—Concerning the water-works enject here, C. J. Frost, the Town Clerk, writes as ollows: "At the annual town meeting held March 7, 1888, it was voted to appoint a committee to make urveys and estimate the cost of establishing a water ystem in Wosfboro, and report at a meeting to be alied on or before May 20."

STAUNTON, ILL.—Concerning the reported water-rocks improvements here our correspondent writes as ollows: "The land has been purchased on which a section is to be built. Work will begin as soon as reather will permit."

BEATRICE, NBB.—We are in receipt of the following ommunication, dated March 20, from the Town Clerk this place: "Filter proposition was carried March 20 by 130 majority for a filter plant of a million galous capacity per day."

OBERLIN, KAN.—It is proposed to establish a system if water-works here. Bonds in the sum of \$30,000 will mobably be issued.

OVID, MICH.—A complete system of water-works is 0 be erected here. For details see our Proposal Col-

GREENPORT, N. Y.—A committee of citizens of this dace who have charge of introducing water have sent petition to the Board of Trustees recommending the franting of a franchise to a company composed of frooklyu capitalists.

Paso Robles, Cal.—The Paso Robles Water Comany has been incorporated here. Capital, \$20,000. M. Shackelford, and others, incorporators.

HUNTINGBURG, IND.—Our correspondent writes: "The Citizens' Gas and Water-Works Company, H. Rothert, President, has been incorporated with a capital of \$25,000. They intend building water-works, eservoir system, the coming summer. The source of supply is 2½ miles distant from the proposed reservoir, which is to be constructed on a hill just west of the ity."

ORLEANS, NEB.—Charles S. Simpson, Town Clerk, writes us: "We are contemplating putting in of waterworks and are awaiting plans and propositions from those who wish to take contract."

BUTTE, MONT. T.—A despatch to the San Francisco Chronicle says the City Council passed a resolution condemning the water-supply to the city by the S.lver Bow Water Company as impure and unfit for domestic use, and inviting proposals for furnishing a sufficient supply of good, pure, wholesome water at a reasonable rate. The Council agr esto give an exclusive franchise to any company which will relieve the present situation. County Physician Hoigh in a report to the Council upon the quality of the water furnished to the city, pronounced it "dangerous and damnable."

WATKINS, N. Y.—The committee appointed at a public meeting held several weeks ago to procure estimates and surveys for a system of water-works for this piace, called a meeting of taxpayers and others March 24, at which the report submitted by Mr. C. P. Bassett, C. E., of Newark, N. J., was considered The report estimated the cost of the water-works at \$48,000 and sewers \$22,000. After reading the proposed law which should be introduced in the Leeislature a vote was taken to send it to Albany for passage at once. The following are the commissioners named in the bill: Hon. Daniel Beach, F. Davis, Jr., and others.

Hon. Daniel Beach, F. Davis, Jr., and others.

WEST TROY, N. Y.—The Albany Journal says:

"The West Troy Water-Wo ks Company's plant has been purchased by the Green Island Water Company. The Green Island Company consists of Messrs. Moffet, Hodgkins & Clarke of Watertown. Their contract now gives them power to pump from their plant to be erected on the island through the mains of the West Troy Water Company. The main office of the company will be in Green Island. Gravei Island will be used for the filtering process and the pumping station will be in Green Island.

HALSTEAD, KAN.—It is reported that a system of water-works is contemplated for this place and that Mayor S. H. Tuco can furnish details.

GLOURRSVILLE, N. Y.—Our correspondent writes:
"We have decided to extend our present system (gravity) by the construction of a conduit about 7 miles in length to new source of supply, together with intake basins and smail reservoir, at an estimated cost of about \$100,000. No engineer engaged yet; expect to begin work as soon as weather will admit."

DETROIT, MICH.—The Sewer Committee of the Common Council has fixed the amount to be raised by bonds and otherwise, for constructing additional sewers, at \$282,446.75.

JERSKY CITY, N. J.—The date for receiving bids for new water-supply and for the filtration of the pres-nt supply has been changed from April 21 to April 9.

PARIS, Kv.—Our correspondent writes: "The contract for water-works has been let to W.E. Thompson, of Bradford, Penn, subject to ratification of voters of city. Election will be held April 14. It is the genera opinion it will be ratified."

MILFORD, N. H.—Our correspondent writes: "The town voted to accept and adopt a resolution instructing the Selectmen to invite proposals from more than one corporation or party for putting in water-works in this town and to make a thorough examination of the subject, get all the information possible by visiting other towns who had a system, and employ experts, and in such oth r ways as they may deem best before concluding a contract, and that said contract shall be concluded within 90 days."

CAMDRN, ARK.—The President of the Camden Water-Works Co. writes us: "We have filed articles of association. Authorized capital, \$10,000; subscribed capital, \$10,000. There is some detail work to be done yet before we can close contract for construction, such as obtaining privileges from the city, etc., etc. We contemplate commencing the construction not later than May next and hope to have same completed by August 1. We want estimates on 4,000 feet 8-inch main pipping, 2,000 feet side pipes, either 2 or 3 inch and fixtures, 18 fire-plugs and all necessary equipment to make a first-class system for a small city of 2,500 people. We want pump and main capacity sufficient to supply 10,000 people. We are not certain but that we will use 10-inch piping. Distance from low-water mark at pumphouse to highest point in the city 4,000 feet; difference in altitude 115 to 120 feet. Want a stream thrown perpendicular from point above mentioned 100 feet, by pressure direct from the pump. We want an estimate based upon first-class machinery and the latest and best machinery. Do not want anything shoddy, believing the best is the cheapest."

CAMDEN, N. J.—Among the improvements which are to be made to the water-works here will be the addition of a new stand-pipe, of iron, 89 feet in height, and 130 feet above tide-water. Bids will soon be wanted.

CENTRAL CITY, Ky.— Our correspondent writes; "The water-works have not yet materialized, though there is quite a lot of talk about building them this coming summer. A charter has been secured. Can't tell whether they will or not be built this year."

WATER-WORKS.—See our Proposal Column for information regarding water-works and water-works supplies at the following places: Cambridge, O.; East Liverpool, O.; Ovid, Mich.; Jackson, Miss.; Dover, N. H.; Newark, N. J.; New York City.

Nиоsно, Mo.—It is reported that water-works are ranted here and that J. E. Alexander can furnish

BRIDGES.

OTTAWA, CAN.—Application has been made for a charter to construct a bridge from Windsor or Sandwich to Detroit. The capital stock of the company, which is to be known as the Detroit River Winter Railway Bridge Company, is placed at \$500,000.

HERSEY, MICH.—An iron bridge is to be built by the County Commissioners.

BIG RAPIDS, MICH. — The County Commissioners have decided to place a bridge over the Muskegon River at this place. Address them for details.

ST. PAUL, MINN. — Our correspondent writes: "The Wabasha Street bridge across the Mississippi is to be enlarged at a considerable expense. Bids will be required."

Memphis.—A letter published in the Memphis Appeal has been addressed to Mr. D. P. Hadden, President of the Taxing Districts of Memphis, Tenn., by Mr. W. R. Harvey, a railroad contractor and bridge builder of that city, strongly urging that such additions be made to the contemplated double-track railway bridge over the Missis-ippi at that point, as will accommodate street-car and wagon traffic and foot passengers. The bridge is to be built by the Phemix Bridge Co., and a letter is enclosed from Mr. A. Bonzan, its Vice-President and Chief Engineer, stating that the proposed additions to the bridge and approaches be easily made at a cost of about \$475,000.

LEAVENWORTH, KAN.—County Clerk J. W. Niehaus wants bids for the construction of two bridges. See our Proposal Column.

Winston, N. C.—It is reported that the County Commissioners will build an iron bridge over Salem Creek, in Forsyth County. Address, for details, E. A. Conrad, at this place.

CAPE MAY CITY.—The Board of Freeholders of ape May County has ordered a new bridge erected wer Cape May Creek, between this city and West

Cape May.

NEWARK, N. J.—The Special Committee of the Essex County Board of Freeholders to examine into the necessity of a new bridge over the Passaic to connect the Twellth Ward of Newark and the town of Harristn, held a meeting March 28 and discussed the question of the exact location of the structure. At a meeting to be held next week it is expected that definite action will be taken, and steps toward surveys, etc., will be made.

Bridge.—See our Proposal Column for information regarding bridge construction at the following places: Lynchburg, Va.; Leavenworth, Kan.

RAILROADS, CANALS, ETC.

PITTSBURG, PA.—It is reported that the Pennsylvania Railroad management has decided to commence work on the projected improvements at Wals Station during the coming spring. Bids for the commencement of the work are being received by Chief Engineer Brown, at Philadelphia. The estimated cost of the work is \$1,000,000 and it is thought that it will take at least five years to complete the enterprise.

SING SING, N.Y.—The Ossining Railroad Company has organized to construct a road from this place to Whitson's Station. John V. Cockcroft is one of the directors.

New Brunswick, N. J.—A dispatch to the World says: The directors of the new karitan River Railroad heid a meeting in the Fuller Building, Jersey City, March 22, during which it was decided to begin building the road without delay between South Amboy and this city and Bound Brook. Contracts for iron and building were entered into with John Buttman and the Scranton Steel Company. The road will measure twenty miles and be bonded for \$30,000 per mile.

STREET-WORK AND PAVING.

Kansas City, Mo.—It is estimated that \$500,000 will be expended on street improvements here this

TOPPKA, KAN.—Estimates are being made by City Engineer for several thousand dollars' worth pavements to be laid during the present season.

GAS AND ELECTRIC-LIGHTING.

Annapolis, Md.—The Annapolis Electric Company has been incorporated here. Capital, \$100,000. George Wells, and others, incorporators.

MALDEN, MASS.—The Malden Electric Company has been incorporated here. Capital, \$20,000. John S. Bartlett, and others, incorporators.

Jackson, Mich.—At a recent meeting of the stockholders of the National Water, Gas and Fuel Company at Chicago the plant located in this city a year ago was decided upon as the most available place for the construction of model works for showing how gas can be made and used for domestic purposes. C. H. Evans, manager of the company, states that the work of constructing the new plant is under way, and that the company will make improvements to amount to \$250,000.

WEST SPRINGFIELD, MASS.—The Agawam Gas Company has been incorporated here, with J. R. Smith and others interested. Cash capita, \$50,000.

QUINCY, MASS.—The Quincy Electric Light and Power Company has been organized here, with a cash capital of \$25,000. G. A. Pattee is one of the directors.

WINCHESTER, MASS. - The Winchester Electric Light Company has been organized here, with a cash capital of \$10,000. James F. Dwinnell is at its head.

POMEROY, O.—It is reported that this place is to be ighted with electricity.

St. Johnsbury, Vt.—A company has been formed here with a capital of \$20,000 to establish an electric-light plant.

OBERLIN, KAN.—An electric-light plant is to be established here this spring.

MONTICELLO, ILL.—An electric-light system is to be established here. DULUIH, MINN.—The gas and water company will erect new and larger gas-works.

Navy: Babcock & Wilcox Co., New York, \$2,806; James P. Witherow, Pittsburg, Pa., \$16,800, or four boilers. \$16,550; Edward J. Moore, Philadelphia, Pa., \$20,000; George M. Newhall, Philadelphia, Pa., \$16,500; Abendroth & Root Manufacturing Co., New York, \$19,270. The three last named bids were informal.

WASHINGTON, D. C.—Synopsis of bids for Life Saving Station on coast of Long Island, opened March 21 by S. J. Kimball, General Superintendent, U. S. Life Saving Service: F. H. Smith, New York, \$5,830; R. A. Robbins, New York, \$5,480; J. H. Coster, Baltimore, \$5,993; Morris Jacob, \$7,650; H. A. Talbert, Barnegat, \$5,730.

LITTLE ROCK, ARK.—The contract for the construction of a sewerage system for the Little Rock Barracks was awarded March 23, by W. A. Simpson, First Lieutenant, Second Artillery, A. A. Q. M., to Davey Cloweh, of Little Rock, for \$3,704.

New York City.—The following was the only bid submitted March 29 for deepening the channel in Sheepshead Bay, opened by G. L. Gillespie, Lieut.—Col. of Engineers. The engineer's estimate called for about 18.000 cubic feet of dredging. Bidder, Michael H. Flannery, 50 cents per cubic foot.

MISCELLANEOUS.

ALLENTOWN, PA.—The Allentown Steam Heating and Power Company has been incorporated with a cash capital of \$50.000. James P. Baures, and others, are the incorporators.

WASHINGTON, D. C.—Press reports say that the Supervising Architect of the Treasury suggests that Congress appropriate \$200,000 for the preservation and repair of public buildings generally and appropriate specifically the following sums for the cities named:
Boston, \$28,000; Chicago, \$112,000; Cincinnati, \$64,000; New Orleans, \$169,099; New York, \$267,823; Philadelphia, \$134,608; San Francisco, \$40,000; St. Louis, \$64,1266. He adds, the reports state, that in case it is necessary to extend the Court-House and Post-Office in New York, additional land will have to be purchased, and for this purpose an additional appropriation of \$170,000 will be required.

Westungton, D. C.—The Sanata Committee on

propriation of \$170,000 will be required.

Washington, D. C.—The Senate Committee on Commerce has reported a bill to provide for the erection of numerous lighthouses on Lakes Superior, Huron, Erie, and Michigan. Following are some of the fog signals and lights provided for: Fog signal, Beaver Island, Lake Michigan, \$5,500; Mackinae Point, \$5,500; lighthouse, White Shoal, Lake Michigan, \$60,000; fog signal, Twin River Point, Lake Michigan, \$5,500; fog whistle, Lapointe, Ashland Harbor, Lake Superior, \$5,500; Point Iroquois, \$5,500; fog signal at Two Harbors, \$5,500; light on Devil's Island, Apostle group, \$15,000; range lights at Duluth, \$3,284.12.

The Nam Volt and Nam Lerson Power Company has

The New York and New Jersey Power Company has been incorporated, with a capital of \$3,000,000, for the purpose of manulacturing, seiling, and renting boilers and machinery for obtaining power and heat and tefrigeration under various letters patent. The Trustees are David Dunham Withers, J. Coleman Drayton, John G. McCullough, and others. The principal office is in New York.

PROPOSALS.

(Continued from page viii.

To Builders and Contractors.

PROPOSALS are wanted at Sayre, Bradford Co., Pa., until April 20, for the erection of a stone church and rectory. Plans and specifications may be seen at the Rectory, Sayre, and at the office of the architect, C. M. BURNS, JR., 717 Walnut Street, Philadelphia.

SAND.—Proposals are wanted at New York City, until April 11, tor furnishing 1,200 cubic yards of clean, sharp Cow Eay sand, suitable for road surfacing Address the Department of Public Works, as above.

CHURCH.—Proposals are wanted at Altoona, Pa., until April 7, for the erection of a brick church. Address G. W. Buck, President Trustees United Brethren Church, as above.

NORTH BILLERICA, MASS.—School bldg; cost \$15,000; o, M C Mitchell; a, J L Faxon, Boston; b, John H Fuller and Mr Green. The former does the stone work, and the latter the wood work.

NORTH ADAMS, MASS,—3-story br bldg, 1 story to be used as hall, other stories for tenements; 0, S P Thayer.

FI.AGGING.—Proposals are wanted at Brooklyn, N. Y., until April 2. for flagging certain streets. Address John P. Adams, Commissioner of the Department of City Works.

BUILDING.—Proposals are wanted at Wichita, Kan, no date specified, for the erection of a temple to cost \$100,000. Address the Secretary of the Masonic Fraternity.

SOLDIERS' HOME.—Proposals are wanted at Minnehaha, Minn, until April 24, for the erection of buildings for the Soldiers' Home. Address O. M. Sawyer, Sectetary Minnesota Soldiers' Home.

SEWERS. — Proposals are wanted at Bridgeport Conn., until April 12, for the construction of sewers in certain streets Bernard Keating, Clerk, Board of Public Works, as above.

TAPPING-COCKS.—Proposals are wanted at New York City, until April 11, for furnishing tapping-cocks and tapping cock boxes. Address the Department of Public Works, as above.

GRAVEL.—Proposals are wanted at New York City, until April 11, for furnishing 2,200 cubic yards of Roa Hook gravel suitable for road surfacing; also, 3,000 cubic yards of Roa Hook gravel bank screenings. Address the Department of Public Works, as above.

STOP-COCKS, HYDRANTS, ETC.—Proposals are wanted at New York City, until April 10, for furnishing and delivering stop-cocks, hydrants, wooden hydrant-boxes, and cast-iron stop-cock boxes. Address the Department of Public Works, as above.

PROPOSALS.

WATER-PIPE, ETC.—Proposals are wanted at New York City, until April 11, for furnishing cast-iron water-pipes, bianch-pipes, and special castings. Ad-dress the Department of Public Works, as above.

ENGINES.—Proposals are wanted at Washington, D. C., until April to, for five Armington and Sim's engines for the Navy Yard. Address James Fulton, Paymaster General, U. S. N., Navy Department.

LAYING WATER-MAINS.-Proposals are wanted at New York City, until April 11. for laying water-mains in Morris, Anthony, and Fifth Avenues, and in Ash, Berry, Bush, Buckhout, Twenty-second and One Hundred and Seventy-seventh Streets. Address the Department of Public Works, as above.

BRIDGE.—Proposals are wanted at Hamilton, O., until April 5, for the construction of an iron bridge over the Miami River, at Poasttown. Address the Butler County Commissioners, as above.

LIGHTING .- Proposals are wanted at Washington, D. C., until April 13, for manufacturing and placing in position, in complete working order, in the U.S. bnildings at Syracuse, N. Y.; Lynchburg, Va.; Council Bluffs, lowa, and Waco, Tex., certain combination gas and electric-light fixtures. Address C. S. Fairchild, Secretary of the Treasury.

For additional proposal notices see page ix.

SOME DETAILS

WATER-WORKS CONSTRUCTION

By W. R. BILLINGS,

Superintendent of Water-Works at Taunton, Mass. WITH

Illustrations from Sketches by the Author. INTRODUCTORY NOTE.

Some questions addressed to the Editor of The Engineering and Building Record and The Sanitary Engineer by persons in the employ of new water works indicated that a short series of practical articles on the Details of the structing a Water-Works Plant would be of value; and, at the suggestion of the Editor, the preparation of these papers was undertaken for the columns that journal. The task has been an easy and agreeable one, and now, in 3 more convenient form than is afforded by the columns of the paper, these miles of actual experience are offered to the water-works fraternity, with the belief that they may be of assistance to beginners and of some interest to all.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 19.

PUBLISHED EVERY SATURDAY.

NEW YORK, APRIL 7, 1888.

LONDON, APRIL 21, 1888.

SINGLE COPIES, TEN CENTS. IN AMERICA Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE.

THE ENGINEERING & BUILDING RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

OFFICE IN GREAT BRITAIN. 92 & 93 FLEET ST., LONDON

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

Hritish and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record (New York), and crossed —— & Co.

Continental subscriptions are also received by F. A. Brockhaus, Esq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses.

When a change of address is desired, both the old and new addresses should be given.

THE LIGHTING OF LIVING ROOMS.

THAT a healthy room is usually, if not always, a light room, and that there is some connection between darkness and disease, in addition to the fact that both words begin with the same letter, and that they therefore sound well together, is generally admitted.

When, however, we come to consider the principles or rules which either do or should guide the architect in his plans for either natural or artificial illumination, it will be found that they are rather empirical, and are not always or even frequently followed. M. Trélat's definition of a well-lighted room is, that it is one in which light has been introduced in sufficient quantity, and has been so distributed that objects in any part of it are clearly seen without special effort.

This is much too vague for either scientific or practical purposes. Must we require that a room shall be so light that one can in any part of it without trouble see clearly the eye of a fine cambric needle? That might be a proper requirement in a watch factory, but it is unnecessary to demand it in living rooms.

On the other hand, it seems probable that to keep a living room healthy it needs not only the diffused light of day, but the entrance of the direct rays of the sun-that is, we want sunning as well as lighting.

If we have an isolated house in this latitude, its east, west, and south sides will be well sunned, while its north side will not. For such a house the rules for window height and area, from a sanitary point of view, are that for rooms having windows upon but one side the area of the openings should be at least one-fourth or one-fifth of the area of the wall in which they are placed, and the distance from the window to the opposite wall should not be more than 11/2 times the height of the top of the window from the floor. If we consider houses in a city we have to take into consideration the shadows cast by other houses and the width of the street in its relation to the height of the houses upon it. The theoretical rule is that the height of buildings on a street should never exceed 11/2 times the width of the street.

Although, as stated above, the north side of the house is less sunned, yet north windows give a very agreeable light. They are preferred by those who work immediately in front of windows, as microscopists, draftsmen, etc., and are strongly recommended for the main source of lighting of school-rooms, though in this case they should always be supplemented by windows in the east or west walls. For bedrooms south windows are preferable.

In the lighting of school-rooms the chief

point as to direction is that the principal light should come from the left of the scholars, and that they should never face the light. So long as these rules are observed there cannot be too much light in a school-room, and there need be no fear about cross lights unless the room is to be used as a drawing school, and even then it is easy enough to cut off the light from one side.

In living rooms, and more especially in drawing-rooms and parlors, the full benefit of the windows is, as a rule not obtained. They are more or less obscured with curtains and draperies which are so arranged as to cut off precisely that part of the window which is most important for illuminating purposes—viz., the top. Careful housekeepers do not want sunlight in their

parlors, and, so long as this is the case, it is probable that they will not have it, sanitary reformers to the contrary notwithstanding.

In planning a dwelling, therefore, we should try to give the windows of the bedrooms such an aspect that they will receive the sunlight, and the same should be done for the room which is to be the chief sitting and living room, while the apartments of state can do very well without much natural illumination.

NEW YORK PAPERS ON RIVER AND HARBOR WORK.

It will be remembered that we published on February 11 a copy of a letter sent by Capt. Wm. H. Bixby, of the U. S. Engineer Corps, to the Wilmington Messenger, showing the great improve-ment effected in the inland navigation of the

Carolinas by a comparatively small expenditure.
In an unguarded moment Captain Bixby addressed a similar communication to the New York Sun, with the result of producing a violent explo-Whether that great central luminary felt affronted by the suggestion of enlightenment from any external source or was chagrined by the confessed suspicion that the same information had been given to other journals as well is not clear, but that Captain Bixby's letter was for some reason considered objectionable is very plain, for our esteemed contemporary straightway fell foul of it in most unamiable fashion, and after characterizing it as "a recitation of the stock arguments in favor of engineer work upon the unnavigable little streams of the country, and North and South Carolina in particular," and stigmatizing the Captain's figures as "untrustworthy," apparently for no better reason than because they showed a development of commerce amounting to \$12,950,000 annually as the result of a total expenditure of \$500,000, it proceeds to remind the unfortunate officer that it was "tolerably familiar with the subject while he was yet a cadet in the Military Academy.'

This ill-natured and uncalled-for attack called out an editorial from the Charleston News and Courier, in which it says: "The Sun wants to know what is this army officer driving at." "It is equally to the purpose to ask what is this newspaper driving at?" and makes the following further comments on the strictures of the Sun:

Surely there is no good reason why a digest of the information which has been presented to the War Department and to Congress should not be communicated to the newspapers in order that they may be in possession of the truth when they discuss the proposed appropriations in the River and Harbor bill.

"The Sun speaks very lightly of the 'creeks' of the South Atlantic States. It forgets, or is ignorant of the fact, that many of the so-called 'creeks' of the South Atlantic coast are either longer or broader or deeper, and carry more water, than many of the so-called 'rivers' of the New England and Middle States. The Sun should not measure our mighty creeks by the petty rivers with which it is familiar, and should remember, besides, that there is no attempt in the Carolinas to create waterways which have no existence. The work here is confined to improving the waterways which, in a more or less navigable condition, are here already.

"The Sun remarks that it would like to learn whether Captain Bixby 'regards it as a part of the duty of a captain of engineers to lobby for big appropriations by Congress for the creeks and sand-bars, or to undertake to educate the newspaper press of the country up to his

Digitized by GOGIC

views of the desirability of a policy of lavish expenditure.' This is not courteous or fair. No body of men in the United States are more independent of political considerations and political parties than the Engineer Corps of the United States Army. They have no personal interest in large appropriations or small appropriations. They hold their rank and draw their pay whether the rivers and harbors are improved or not. If there is an instance in which an engineer of the United States Army has been truthfully accused of jobbery or fraud, the News and Courier is wholly ignorant of the circumstance. To the engineer corps the public and the politicians can and do look with confidence for plain statements of unvarnished facts. They possess the confidence of the public, and it is not reasonable or just to deride one of the most capable officers of the corps for understanding his work, or to scold him for taking pride in its progress and performance."

It is unfortunate that a journal whose brilliancy is usually worthy of its name should have, on apparently such slight provocation, allowed its bile to get the better of its brains

The Sun, when it recently bewailed the neglect of Congress to act on the advice of the late Samuel J. Tilden to provide adequate coast defenses for our great cities, could have found a reason in the prejudice existing in Washington against any expenditure for our Eastern ports because of the persistent and indiscriminate opposition to appropriations for improvements in the West and South on the part of leading Eastern papers.

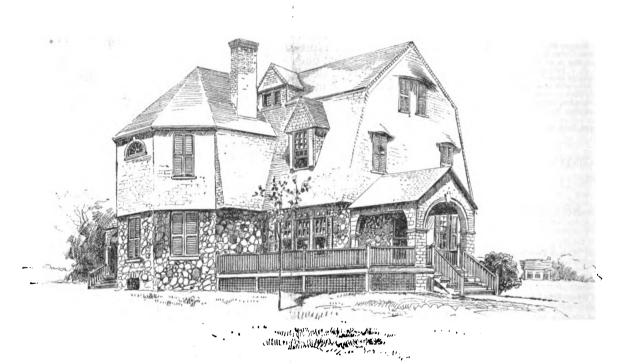

It is high time that the citizens of New York should be led by at least an intelligent self-interest to realize that we are one country, not an aggregation of antagonistic sections, and that no part of the nation can expect to derive the benefits that naturally belong to it that is not willing to do its full share in securing like benefits for all the rest.

into the present ones—in other words, their external fit.

Most of the designers have felt that the City Hall w_{ac} to be kept intact and was to mark the centre of a mass of building whose principal point of view was from the south, the Court-House being quite ignored.

Some of the designs, and these the most successful, show a feeling that some feature or features should rise at the back of the low central portion—the City Hall—and by their size and height connect the two high new wings and bind the whole into one composition. It should be remembered that the City Hall is, in the main, but two stories over a basement, while the new wings are six above the same

Perhaps the most successful, composition is that signed "Audaces Fortuna Juvat." In this the new wings are so arranged on the south front as to expose the whole of the City Hall. At the back of this building, and connected with the new wings by arcades, rises a great tower, presumably for records, some fifty feet square and perhaps four hundred feet high. The wings are so treated as

RESIDENCE OF MR. M'KIM, WORCESTER, MASS.-W. R. EMERSON, ARCHITECT.

and make such ill-tempered and uncalled-for There is, however, a possible statements. third reason for its conduct, which, unfortunately, is not confined to it, but is shared by many of the New York journals. It is briefly this: The improvements described and advocated by Captain Bixby are not in the immediate vicinity of New York, and, therefore, are to be opposed. This would be unfortunate enough as an exhibition of most unpatriotic sectional selfishness, utterly unworthy of those who claim to represent the thought of the chief city of the Western world, but unhappily it has serious consequences as well. We believe that it is largely due to the resentment naturally felt by those whose interests are thus constantly antagonized by the metropolitan press, and that means all the rest of the country, that it is so difficult to obtain adequate appropriations for New York harbors and waterways, and that the defenses of the metropolis are so ridiculously inadequate to the vast values they are supposed to protect.

OUR ARCHITECTURAL ILLUSTRATIONS. EXAMPLES OF MODERN FRENCH RESIDENCES.

RESIDENCE OF MR. M'KIM, WORCESTER, MASS.—W. R. EMBRSON, ARCHITECT.

THE COMPETITIVE DESINGS FOR THE PRO-POSED MUNICIPAL BUILDING FOR NEW YORK.

In a room adjacent to the Mayor's office in the Stewart Building the twenty designs received in competition for the new municipal building are now open to public inspection.

They are not well arranged for this purpose, being placed upon racks, with the drawings composing each set one over the other—a manner not conducive to their well being, as each set must be handled in examining the different sheets. We have had no opportunity for more than a hasty view of these designs, and that only with the purpose of determining with what degree of success the competitors have been able to fit the proposed buildings

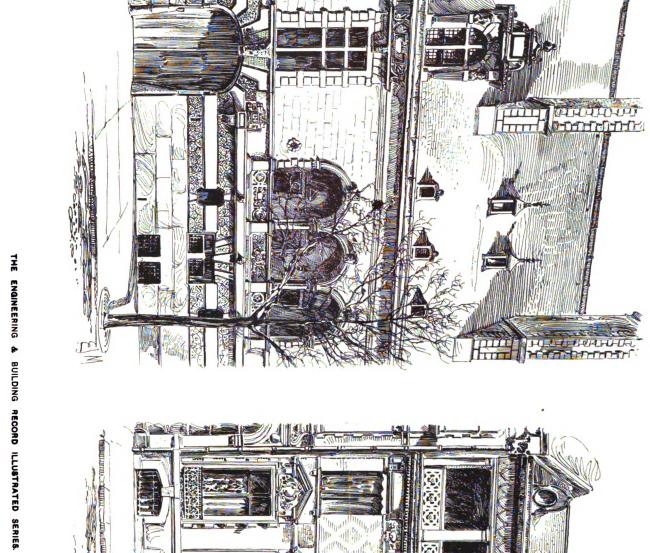

to recall the delicate refinement of the City Hall without continuing any great number of its features, with the exception of the cornices which mark its two stories. The flanking pavilions of the new wings are marked by pyramidal roofs which do not compose well with the strongly marked horizontality of the whole mass.

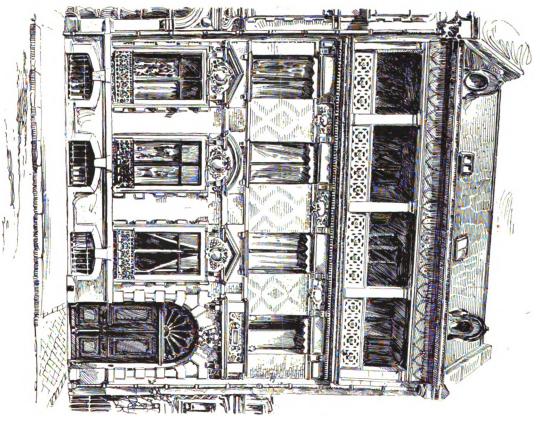

"Sans Peur" has attempted to reach the same result in his composition, but not with so much success, as he uses two towers, one at the back of each new wing. They are so far apart and the connecting mass of building is comparatively so low as not to bind his composition with the same degree of strength as in the design above mentioned. His treatment of the wings is more simple and self-restrained, and is quite in scale with the City Hall. His sky line is quiet to severity. His design may be criticised for its want of variety and plainness, but it is quite in keeping with what it is connected.

"Manhattan" No. 1 has not thought of the tower in his composition, but has given a plain, straightforward solution, well handled, well in scale, well disposed—though there is some unfortunate arrangement of windows in the upper stories.

Digitized by GOGIC

EXAMPLES OF MODERN FRENCH RESIDENCES.

"Manhattan" No. 2 has done fairly well, but has made the mistake of bringing his building more in the scale of the Court-House by the use of a colossal order.

This design has a peculiar resemblance to the Mutual Life Insurance Company's building.

"Three Interlacing Circles" has a carefully studied design very carefully drawn.

When these five designs have been considered, the last of even fair solutions of a difficult problem has been reached.

While none of them has solved it with success, they have each felt the extreme difficulty of it, and, by a bold self-restraint, have produced results which are at least praiseworthy.

In the second rank should come "New York," who has followed the original plan—as sent out by the commission—too closely, and, in consequence, has found great difficulty in roofing his retreating pavilions, and, when he has succeeded, produces a woeful result; "Harmonia Cum Utilitate," whose design belies the first part of his nom de plume, being open to the same criticism as "New York," and being, moreover, quite out of scale.

"Je Maintiendrai" and "Law and Order" add a third story to the City Hall, while the rest of the design gives them no excuse for such a liberty.

"Poietes"—whatever that may mean—and "Architect" have gone into eccentricities with Mansard roofs and things of that sort.

The rest of the designs taper off in a succession of atrocities; perhaps the worst being that by "Sans Peur, Sans Reproche," which is in the most wicked and abandoned French Renaissance, contemplating a steep roof on the City Hall and a composition of clock, fleche and flanking pavilions closely studied from the Hotel de Ville in Paris, but with domical roofs and other queer things.

"Albinus" runs the preceding hard for last place, but has used a nameless style which defies classification.

"Vitruvius," with his classical name, has ignored the City Hall, the Court-House, and Mr. Eidlitz's addition, and has gone in for Romanesque, and very bad Romanesque at that, while "Respice Finem" has followed his example.

There are also designs by "Leo," "Seven Circles," "Flower in Circle," and "Pro Bono Publico," none of which are as the last named.

An inspection of these drawings has shown very plainly how exceedingly difficult, from an artistic point of view, is this problem. The chief difficulty, as we have before pointed out, is in treating the great seven-story wings of the new buildings so as to be in harmony with the refinement and delicacy of the City Hall, and none of the designers have accomplished this without resulting monotony and tameness of effect. "Sans Peur"has, perhaps, made the nearest approach to it, but with the result that his composition, as a whole, lacks the strength and unity of that of "Audaces Fortuna Juvat."

The other designs placed in the first rank have some of the faults and some of the excellencies of those above named.

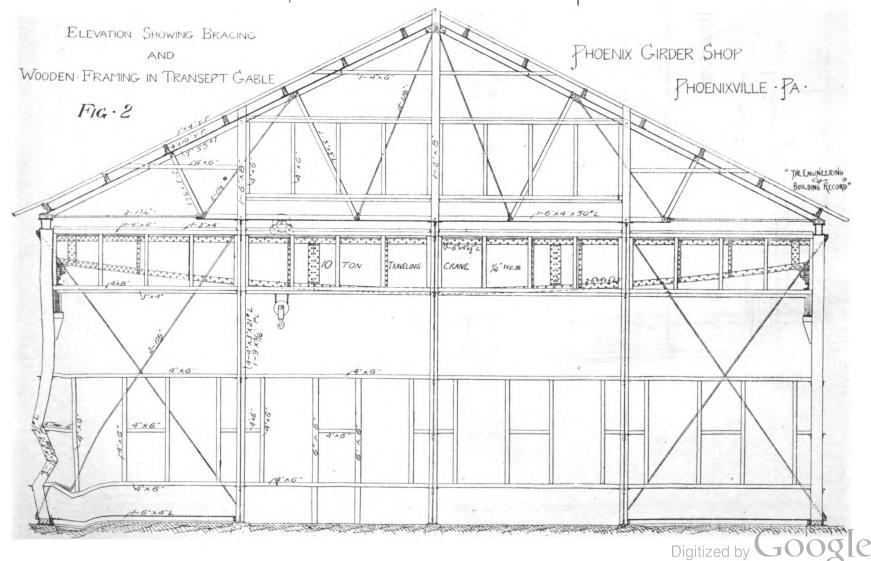

THE NEW GIRDER-SHOP OF THE PHŒNIX IRON COMPANY.

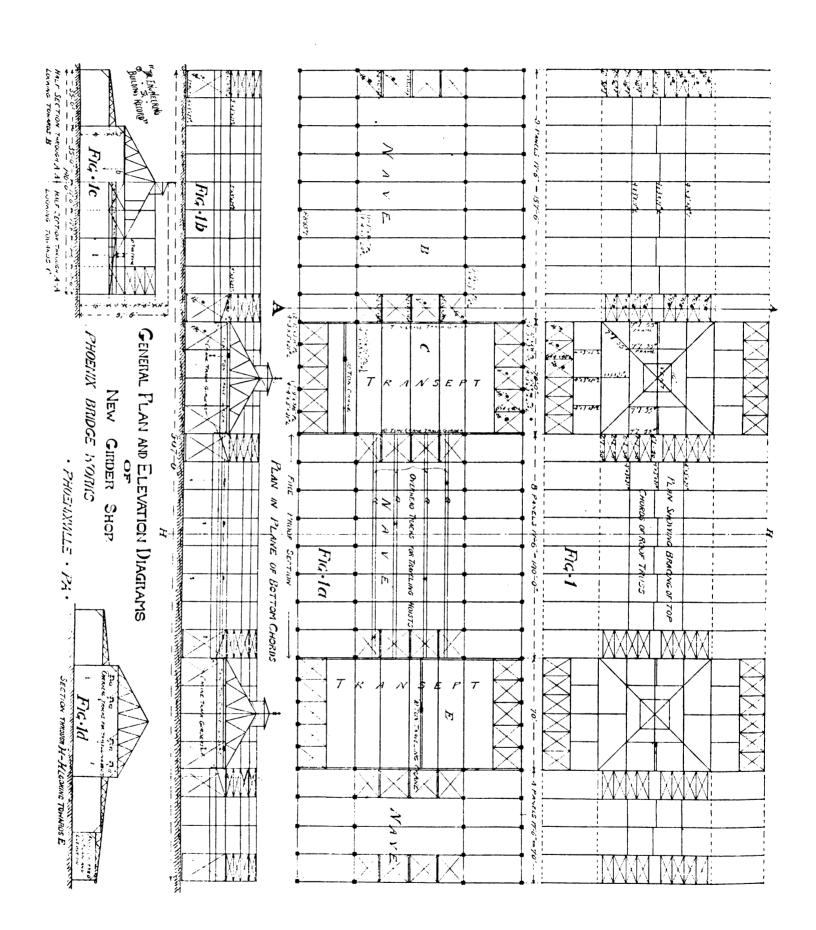

This building, intended, as its name implies, for the construction of all classes of structural work, except forged members, was built in 1887 by the Phœnix Iron Company, after the designs of the Phœnix Bridge Company's engineers. The present total dimensions of the main building are 140 feet width by over 500 feet long. An annex extending the whole length of the building on its south side is occupied by the engines, boilers, a smith shop for repair purposes, shop office, etc., but, as it is not an immediate part of the shop proper, is shown only in Fig. 1 d.

A central nave with 70-foot roof-trusses is crossed by two transepts 70 feet wide and 140 feet long and 140 feet apart. The nave is flanked on each side by an extension or wing, 35 feet wide, whose outer columns are in line with the transept gables and give the building a rectangular outline. The roof-trusses are spaced 17 feet 6 inches apart, and it is intended to add to the west end of the nave as occasion requires. The lower chords of the main roof trusses are made stiff enough to sustain transverse s'rains, and from them are suspended several trolley-tracks carrying hoists of from 5 to 15 tons capacity, some of which are shown at a a on the general plan and section. Various tools and heavy machinery suitable for the fabrication of the heaviest bridge work are conveniently located about the building. The trolly-tracks above mentioned are so placed as to serve the different machines with the least amount of labor. Each transept is spanned transversely by a traveling crane 70 feet in length which moves on tracks supported on plate-girders running along each of its sides. In this manner every point of each transept is completely commanded by a traveling crane arranged to hoist and handle in the most expeditious manner bridge members weighing from 10 to 18 tons. Five lines of railroad tracks run longitudinally through the nave and across the transepts and deliver material at any point in the building. The shop is abundantly lighted by numerous side lights in the walls of the wings, in the walls of the nave above the wings, and in the sides of the ventilator lantern or louvre. The walls are covered with corrugated iron and the roof with slate laid without sheathing on pine laths or nailingstrips, except in the braced panels on the outer side of each transept, where 21/4x11/2x1/4-inch angles are used, as shown in Figs. 6 and 7. This construction was designed to prevent the spread of fire, the metal roof insulating, as it were, the sections each side and dividing the building into three parts, the central one containing the two transepts and intermediate portion of nave, and the end ones comprising all the nave beyond the transepts. The roof of either of these divisions might, it is thought, be burned without the fire spreading across the adjacent fire-proof panel.

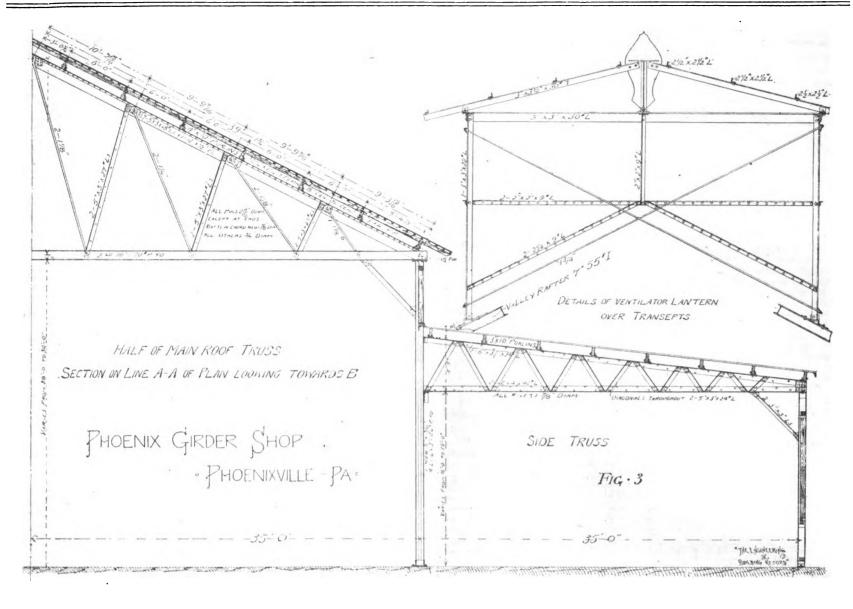

All roof-trusses are bolted firmly to columns with proper provison for expansion and contraction produced by changes of temperature. The whole building is rigidly held by systems of lateral bracing and heavy knee-braces against the severest wind pressure or the shocks and vibrations of the heavy shafting and machinery which it contains. In the erection of the building the columns were set up with small derricks and anchor-bolted. The rooftrusses were then assembled and connected at the feet of their respective columns, elevated into place and riveted or bolted in their final positions. The purlins and rafters were designed for a total load of 40 pounds per square foot. In addition to the wind, snow, and dead loads, those members of the roof and transept trusses which carry a live load of machinery and of bridge members in process of fabrication were designed for this additional duty. The main transept girders are proportioned to carry two 10-ton cranes each in any position not less than 10 feet apart. All iron-work is designed with working stresses from onefourth to one-fifth of its ultimate strength. The total weight of iron in the roof is a little more than 1,000,000 pounds.

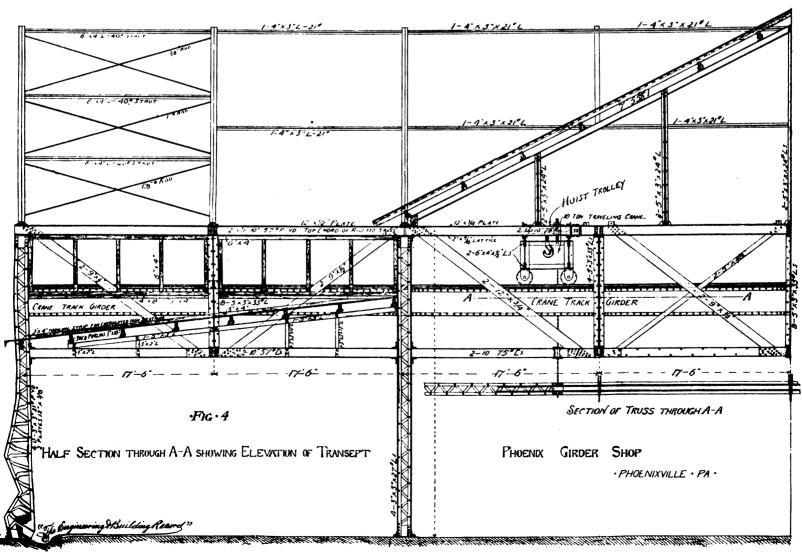

This building was specially designed to meet the demands of the heaviest long-span structural business of the Phoenix Bridge Co.

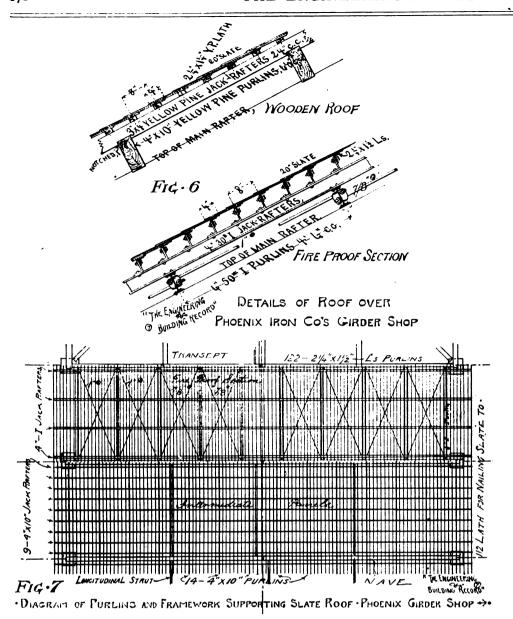

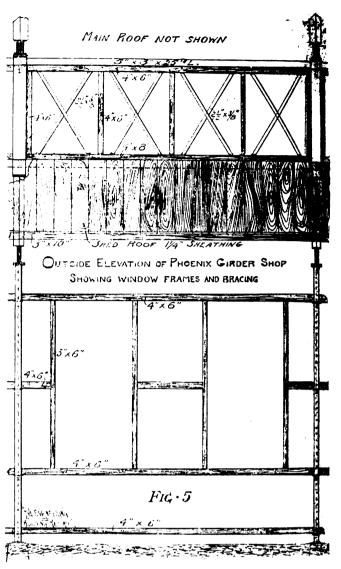

CHELSEA CITY ENGINEER'S REPORT.

THE report of Mr. William E. McClintock, City Engineer of Chelsea, Mass., for 1887 contains the following item of interest in regard to macadamizing highways. He says: "It has been our policy to take a section of the city and repair all bad places in walks and use about so much money each year.

"The principal feature for the year just past in this department is the addition of a complete new plant for macadamizing streets. This includes a 10x15 Farrell & Marsden stone-crusher, costing \$586; a 15-ton Aveling & Porter steam road-roller, costing \$5,000; a 20-horse power portable engine, costing \$822, and a platform and house at the crusher so arranged as to allow of delivering the stone at the jaws of the crusher so as to prevent the handling it over again. In arranging this platform we have taken advantage of the natural contour of the ledge and placed it about fifteen feet above the pit. The stone passes from the jaws of the crusher into a rotary screen, that is made to revolve by the same power that runs the crusher, and from here it falls through shoots that separate the broken stone into four different grades depending on the size. The bins are of sufficient capacity to hold two days' breaking without moving any stone. By this arrangement two men can easily feed the crusher and one man runs the engine, and this is all the expense for labor. The actual cost of breaking per ton was figured on 1.418 tons, the total amount broken, and is as follows:

	\$0.013
	0.016
	0.75
• • • • • • • • • • • • • • • • • • • •	0.194
	0.05
	· · · · · · · · · · · · · · · · · · ·

"If the cost of the platform be added to this it will amount to an additional \$0.267, or \$1.29 for the whole, which is about 30 cents less than it cost last year for the same work, and we now get first-class material against very poor stuff at that time.

"The steam road-roller, which to many was considered a luxury, is what will give us the very best results from our stone. With the old roller we could not roll the streets

that we repaired, as one roller and a pair of horses could not get over the ground fast enough. With the new roller we can lay a section of street down so that a seven-ton team with narrow tire makes no impression in it while passing over, and we can do this as tast as the street can be covered and still leave time for the same engineer to run the crusher for other work.

"The cost of rolling the past year is not a fair estimate of what it will cost, as many things are figured into rolling that will not occur again, as our outfit is now complete. There were rolled in the short time we worked about 6,275 square yards at an average cost of $4\frac{1}{3}$ cents per yard. The above figures will plainly show that the outlay on the outfit for macadamizing streets is not an experiment as far as the cost of the work is concerned."

Six thousand seven hundred and twenty-three lineal feet of new sewer of wood and Portland and Akron pipe from 6 to 18 inches in diameter was built at a total cost of \$9,135.27; the assessments for which per 1,000 square feet of property benefited varied from \$3.31 to \$9.65.

In preparing plans for the assessors it is necessary to look up a great many deeds in order to correctly locate the lots. These deeds are then entered in a deed indexbook which will save much time hereafter in looking up property.

Nearly all the drains, also, whether new or old, have been examined and located in the books kept for that purpose and indexed alphabetically by streets.

RAISING COLUMNS OF ST. ISAAC'S CATHE-DRAL, ST. PETERSBURG.

This operation, as described by Mr. R. L. Venables in the London Architect, was extremely interesting, from the size of the columns and the height at which they were placed, being the second tier or story of columns. Its base must be 130 or 140 feet from the ground. Each column is a solid block of granite, 42 feet high, and weighing 5,000 poods, or upwards of 80 tons (larger than the columns of the Panthéon, and both larger and better wrought than any column found in the ruins of Zenobia's capital). The columns on the ground tier, each of which is also a single stone, are 56 feet high, and weigh 11,000 poods each.

He says: "When I reached the platform to which the column was to be raised, I had below me a panorama of Petersburg, and the country around for many a mile, the most interesting part of the prospect being the Gulf of Finland, down which I could see as far as Cronstadt. From the platform down to the next stage, a depth of about 80 feet, was fixed a strong timber frame, covered with planks, so as to form a very steep inclined plane. At the bottom of the slide, when I first looked down, the column to be raised was lying horizontally on rollers; it was girthed round with very thick ropes drawn very tight, and padded underneath. Other ropes, or rather cables, secured to these girths, passed lengthways along the column, crossing each other over its lower end, and it was lashed to strong planks which lay under it, that the polish of the stone might not be injured in ascending the slide. Over the base on which the column was to stand was placed a high framework of strong timbers. The cables, twelve in number, attached to the column passed through blocks fixed in the frame, and, with the aid of one movable pulley to each, were drawn by twelve capstans, each manned by fourteen or sixteen men. There were two extra capstans for the purpose of guiding the lower end of the column when suspended in the air. Altogether, upwards of two hundred men were employed in the operation. When all was ready the capstans began to turn, and by degrees the column, instead of lying in a horizontal position, rested on the inclined plane, which was well greased, and began slowly to ascend, two men standing on its upper end, to be ready in case of the cables becoming entangled. The capstans were all numbered, and the superintendent at the top, by calling out sometimes to one gang, and sometimes to another, to move faster or slower. Kept all the ropes drawing equally. The column at length reached the top of the inclined plane, and it was then raised until it was hanging in the high wooden frame exactly over the base on which it was to stand. A c

THE interesting and important work on the "Railroad Suspension Bridge at Niagara," by L. L. Buck, M. Am. Soc. C. E., which was the subject of a paper before the American Society of Civil Engineers, is being described with illustrations, by our foreign contemporaries, London Engineering and Le Genie Civil.

1

STATION J OF THE NEW YORK STEAM CO.

WHEN, in 1881, the New York Steam Co. began its operations it proposed a very comprehensive scheme for supplying steam throughout Manhattan Island, and, with that object in view, selected and in most cases acquired convenient sites for steam stations throughout the city. These stations were to be designated alphabetically from the Battery north, and in most cases were located with a view to convenience of obtaining coal from the water-front. The site acquired for Station A at 17 Front Street has so far been used only as a storage-yard. Station B, though hardly more than half finished, yet, with its huge chimneys, amply dominates the block bounded by Greenwich, Cortlandt, Washington, and Dey Streets, which, with its annexes, it largely fills, and is a familiar landmark to those who cross the Jersey City ferries. This building is designed to accommodate on four floors 64 Babcock & Wilcox boilers of 250 horse-power each, a total of 16,000 horse-power, and to store 1,000 tons of coal on the fifth floor, which is 90 feet from the ground.

This building now contains 48 of its boilers, and though its facilities for storing and handling coal are yet incomplete, it supplies an aggregate of 12,000 horse-power to 1,000 customers in a district extending from Reade Street to the Produce Exchange and as far east as Pearl Street.

Steam at a pressure of 80 pounds is taken from the building in three mains of 11, 15, and 16 inches in diameter respectively, while provision has been made for a third main 30 inches in diameter. There are 5 miles of steam-mains from 6 to 16 inches in diameter, most of them over 11 inches, with a corresponding length of return mains from 4 to 6 inches in diameter, and several miles of service-pipes averaging three inches in diameter and some as large as 8 inches. The furthest point supplied is three-quarters of a mile from the station.

While a detailed description of this unique building,*
even in its unfinished state, would be of much interest, it

would, in view of the vastness and complication of the plant, be a very difficult and relatively unsatisfactory undertaking. We have therefore thought it wiser to describe Station J, located on Fifty-eighth Street, near Madison Avenue, which has the advantage of being a completed building, and, with the exception of blowers, contains practically all the details to be found in Station B, but perfected by the experience there acquired and simplified by the relative smallness of the plant.

Stations B and J, and a rudimentary one in the upper part of the city supplying the neighboring works of the Standard Gas Company, are the only ones which have thus far been put in operation.

Station J was located and designed primarily to heat the handsome residences to be found in its neighborhood, and while its boilers and pipes are well able to carry a pressure of 80 pounds they are usually run at half that

This building, as will be seen by reference to the accompanying plan, is arranged to accommodate fifteen Babcock & Wilcox boilers of 200 horse-power each, a total of 3,000 horse-power, of which only seven have been put in, their location being indicated by the grates A A. In the yet unoccupied stalls are shown the ash-hoppers G G, while the descending flues are shown at B B, and at C C are cleaning-doors giving access from the cellar to the spaces back of the bridge wells. The feed and blow-off pipes are shown at E E and F F respectively; the steam-pipes, being overhead, will be shown on a subsequent plan. The outlet of the coal-shutes from the overhead bins is shown at D D.

The methods of handling and storing coal and of getting out the ashes, together with the general arrangement of the various pipe-systems, will be described in subsequent issues when sufficient plans have been given to render such description intelligible.

PHILADELPHIA MASTER PLUMBERS' ASSO-CIATION AND TESTS OF HOUSE DRAINAGE.

(Special Correspondence.)

PHILADELPHIA, April 3, 1888.

One of the rules regulating the ventilation and drainage of dwelling houses in the city of Philadelphia requires that the soil-pipe shall be subjected to a test that will satisfy the inspectors of the Board of Health. No particular test or method of test has yet been adopted by the Board of Health as a universal standard, and the plumbers have been using numerous devices for the purpose; but the

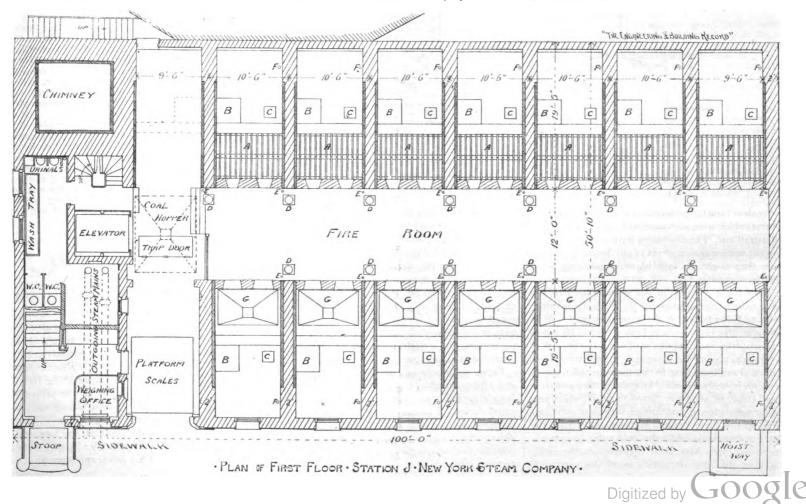

question of adopting a standard test which will be required by the rules of the board has been under consideration for some time, and the Master Plumbers' Association, at their last monthly meeting, directed the Sanitary Committee to prepare for and make such tests of the different appliances used as they saw fit, and report the most practicable and efficient method to the association.

The Sanitary Committee, on March 29, held a meeting, of which public tests of a number of appliances were made by both the smoke-pressure methods. They will prepare a report.

A COMMON-SENSE VIEW OF THE NECESSITY OF ENFORCING A PLUMBING ORDINANCE.

THE Burlington, Iowa, Free Press gives the following very sensible advice to its Health Committee:

"The plumbing ordinance was adopted by the city in compliance with a very distinct public demand and has been productive of very beneficial results. That if it is steadily enforced it will have a constant and valuable effect in the prevention of epidemics and promotion of the health of the city, we suppose no well-informed person can doubt. But, of course, to be of any service it must be squarely sustained and impartially enforced. It is just the kind of an ordinance that cannot be enforced by fits and starts. If one individual is allowed to disregard it, the next one will claim exemption, and the statute will soon be a dead letter. For these reasons many of our citizens have viewed with concern the failure of the Health Committee to sustain the Health Officer and the ordinance, in the matter of the plumbing of Barrows Block. All that the Health Officer asked was compliance with the ordinance. That requires that the soil-pipe within any building be of iron. Health Officer Linsley finding that this requirement had not been complied with, ordered the owners of the building to comply with it. The latter appealed to the Health Committee, and the majority of the committee practically relieved the owners from the order of the Health Officer. Now our plumbing ordinance is not a rigid one. It is far less rigid than the plumbing ordinances of many cities. It was not enacted for the benefit of plumbers, but for the benefit of the health of the city. It requires only what the best authorities on the subject regard as indispensable. It costs owners something, of course, to comply with its regulations, but faulty plumbing and the breeding of infection on their premises would in the end cost them far more, if this were not so. The health of the public is of more consequence than the private interest of any individual. It is the Health Officer's first duty to look out for the public health; and he should be supported squarely by the Health Committee, or his usefulness is at an end. If he is fit for his office, his orders shou

^{*} A general description of Station B and its contents, and also of the street-work of the New York Steam Company, was given in Vol. VII., Nos. 8 and 9, of this journal.

A LECTURE ON PLUMBING BEFORE THE NEW YORK TRADE SCHOOL.

WE have from time to time noted the progress and development of the trade school established and maintained in New York by Colonel R. T. Auchmuty, through whose courtesy and that of Mr. Edward Murphy, the instructor in plumbing, we are enabled to present a report of the last lecture delivered by the latter before the class in plumbing. This class has received during the winter practical instruction in the use of tools and handling of work, and have acquired some skill in workmanshin and made many specimen jobs at the benches in the class room. Mr. Murphy has also given them theoretical instructions in a series of lectures treating of drain and soil pipes, their trapping and ventilation, hot and cold supply pipes, boilers, tanks, pumps, fixtures, and of the different problems arising in practice, their best solution, and the mistakes commonly made, explaining the best practice and the principles involved

The course was divided into topics, of which the outline and diagrams were printed and furnished to the students injured or destroyed. This mistake does not often occur, but is sometimes made, especially with a range which has a long water-back, whose hot and cold pipes, H and C (sketch A), are not easily distinguished. Of course, the hot and cold pipes should be arranged as shown in dotted lines D F H and C R I. Care should always be taken to determine which of the water-back couplings is lowest and connect the cold-water pipe to it.

In Fig. 22 B is the boiler. W the water-back, I G R the hot-water supply to upper floors and R L E the circulation-pipe, which is a continuation of the supply-pipe, brought back to connect with cold pipe at E. The object of this circulation-pipe is to enable hot water to be drawn from faucets at a distance from the boiler without having to first draw off a large quantity of cold water, as would be the case in drawing at A or F, when all the water contained in the pipe between those points and I would have to be drawn before any hot could be obtained. By returning the pipe from R to L E constant circulation is obtained and all the water is hot, and only the cold water in the branch between A and R or F and G—a pint, perhaps—has to be

then be opened to drain boiler I, and both boilers will either be emptied together or O must be emptied first.

Figure 24 shows an arrangement that is frequent in Canada and in New Orleans and some other places.

Hot and cold water tanks, E and T respectively, are placed together in the upper story of the house and connected with a pipe having a regulating-valve V that lets water pass in only one direction, from T to E.

The cold water goes down B C to the water-back W. is heated, rises through H A, and is drawn off through D S for house-supply.

This saves the expense of a boiler and the room occupied by it near the range and has the advantage of being easily built by any plumber and carpenter.

(TO BE CONTINUED.)

SIXTH ANNUAL CONVENTION OF NATIONAL ASSOCIATION OF MASTER PLUMBERS OF THE UNITED STATES.

THE sixth annual convention of the National Association of Master Plumbers of the United States will be held in Boston this year on June 26, 27, and 28.

THE REGISTRATION OF PLUMBERS IN GREAT BRITAIN.

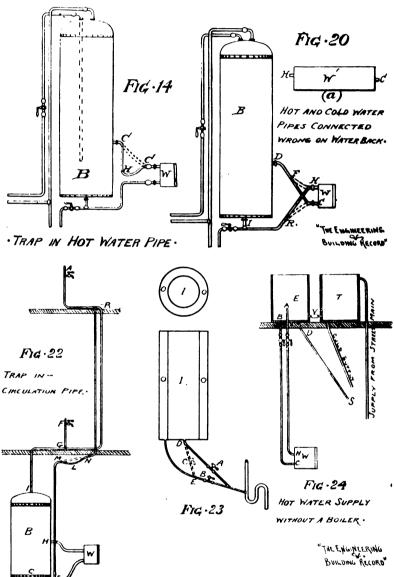

An influential meeting of citizens was held under the Presidency of Professor Sir Douglas Maclagan, to discuss the propriety of forming a district council for Edinburg and the east of Scotland, to act in concert with the London Plumbers' Company in furthering the scheme for a national system of registration. It was generally felt at the meeting that the object in view was a very important one, and that every effort should be put forth to insure its accomplishment. As the whole of the fraternity of plumbers had been canvassed in regard to the matter, and a opinion was unanimously in favor of the project, the meeting at once proceeded to elect the district council, consisting of about forty members, on which the master plumbers, the operative plumbers, and the general public are equally represented. The Council having been duly elected, it was further entrusted with powers to draw up rules for carrying on the movement. On the Council are several medical representatives, also a considerable contingent of leading architects and engineers, so that it is well balanced leading architects and engineers, so that it is well balanced in its constitution, and well adapted to exercise the important functions that are to be assigned to it.—Lancet.

THE TORONTO PLUMBING LAW.

A JOINT meeting of the Water-Works Committee and Local Board of Health was held to finally revise the plumbers' by-law before it is submitted to the Council. Alderman Boustead presided, and in addition to the members of the committees there were present Messrs. Wright and Burroughes, representing the master plumbers; Mayor Clarke, Medical Health Officer Canniff, and Assistant Engineer Maddough!

Engineer Macdougall.

A three hours' discussion took place, in which the Aldermen showed a great deal of interest in the different clause under discussion. Among the changes made were the following: As the American laws exclude all persons except Americans from receiving a plumber's license, it was decided that those to whom licenses are to be granted must be British subjects or Canadians by birth or naturalization. The clause requiring master plumbers to give two sureties in \$1,000 was altered to read \$500. The employer is to be held liable for all work done under his charge. All private drains are to be laid by the Engineer's Department between the sewer and the street-line before the housedrain is laid in order to get the proper levels. All the taps, etc., are to be stamped with the name of the plumber. All soil-pipes must be of iron instead of the glazed drainpipe formerly used. A certificate for work done is not to be issued for 30 days. All plumbing work is to be left open and uncovered until inspected and approved of by the proper inspector.

in a convenient form for preservation and reference during the lectures, which were accompanied by object and blackboard illustrations. The concluding lecture was devoted to pointing out some common errors in city-house plumbing and how they might be avoided, and explaining some desirable arrangements.

The following is a report of one of these lectures, the cuts being reduced reproductions of the illustrations used

In Fig. 14 B is a boiler, W the water-back, and C H C the hot-water pipe bent so as to form a trap at H, where steam accumulates and remains until it condenses, and is forced through, making the disagreeable hammering often complained of as threatening to tear the boiler off from its stand. This is easily remedied by making the pipe have a continual slope, as shown in dotted line. C C, which permits any accumulation to pass through without obstruction.

In Fig. 20 B is the boiler and W the water-back, H the hot-water connection, and C the cold-water connection, but the boiler-pipes have been connected to the wrong couplings, so that the circulation would be very much

drawn before it runs hot. The trouble in Fig. 22 is that any trap or sag, as at L, in the circulation-pipe will destroy the whole system, for the colder water arriving there on its return to the boiler will immediately settle and cannot be forced out by the lighter hot water. The pipe should be carried in the straight dotted line M N, and must be laid with a constant fall at all points and free from any sag or trap. The principle would be illustrated by pouring very fine bird-shot into the top of the pipe; if there is a continual downward slope, the shot would run through to the bottom, but a slight rise forming a depression would immediate.y choke up.

Figure 23 shows a double boiler, with inside cylinder I and outside cylinder O O, and the sediment-cocks A and B so arranged that either boiler may be independently emptied, and the danger arises that the inside one, I, may be carelessly emptied first, causing its certain collapse and destruction. This is prevented by changing pipe D A to position shown by dotted line D E connecting with pipe from outside boiler above its sediment-cock B, which must

Novelties.

COMBINATION COMPASSES.

La Semaine des Constructeurs notes a new drawing instrument as shown in the accompanying figure, which can be used, first, as an ordinary pair of compasses with legs a a; second, as proportional dividers by attaching the third leg b and its link c in the proper position; and third, as a pantagraph, by attaching a supporting pin at d, perpendicular to the plane of the legs, and to c, c and c respectively a fixed needle point, a tracing point, and a pencil.

ELECTRICAL TRANSMISSION OF POWER.

As an interesting instance of the transmission of power by electricity over long distances, that at the Phoenix Gold Mines in New Zealand may be referred to. The current Mines in New Zealand may be referred to. The current is generated by two No. 8 Brush machines, each capable of giving 20,000 watts, or 26 horse power; they are driven by Pelton water-wheels with a head of 180 feet. The current is conveyed to the motor about three miles distant, and back again, by a No. 8 B.W.G. copper wire (0.165 inch thick) nearly six miles long, supported on telegraph poles. The power lost in the line is only three horse-power. A Victoria motor is used, running at about 350 revolutions per minute; and the power is transmitted to the machinery by a belt the machinery by a belt

At Hatfield, on the Marquis of Salisbury's estate, the

River Lea is utilized to generate electricity which is transmitted to the house and over the estate for a variety of purposes. Two turbines are used—one to drive a forty horse-power Siemens alternating-current dynamo, for lighting the house; and the other to drive a sixteen horsepower Brush machine, for arc-lighting at night, and in the day for working the motors at the house and on the farm. Those at the house drive pumping and ice-making ma-chinery, and a twenty-four inch Blackman air propeller fixed in the roof for ventilating; on the farm the motors are used for elevating hay and corn sheaves to the tops of the stacks, for thrashing, for cutting rough grass with a chaff-cutting machine for ensilage in fields extending to a distance of two miles, for grinding corn, etc., to make fodder, and for other purposes. The motors have also been used for pile driving, for making coffer-dams where necessary in the river, and also for dredging the river and cleaning it of weeds. A Gramme motor, capable of raising 2,500 to 3,000 gallons per hour, pumps the town sewage into a tank at a height of thirty feet for irrigation. The conductors are carried overhead on poles about the farm, and underground in wooden troughs to the house.—

PAVEMENTS AND STREET RAILROADS.

No. XXIX.

(Continued from page 196.)

WOOD PAVEMENTS IN PARIS.

In continuation of the series of pavement articles that we have published in previous issues, we have prepared a description of the present standard practice of paving with wood and asphalt in Paris.

The regulations and specifications for the work are translated from the Annales des Ponts et Chaussees, and will follow this weeks' introductory description of the conditions and methods of work in 1883, when the first satisfactory trial of wooden blocks was made.

We abstract below the paper of M. A. Laurent, Ingenieur des Ponts et Chaussees, published in the Genie Civil

Numerous failures in the use of wooden pavements

on public roads had discredited them in Paris, but their rapid extension and success in other countries, particularly in London, under very heavy traffic, has compelled the attention of the municipal authorities.

A new study of this mode of surfacing was demanded, not only on account of the hindrance occasioned by the constant reballasting of the more-frequented macadamized public ways, and by their frequent renewals, with the attendant mud, dust and increased resistance to traction, and restriction of traffic, but also by the quantities of waste material stopping the drains and endangering public health. The problem of replacing these macadamized pavements in the great thoroughfares involved its effect upon the sewers.

The administration favorably received the proposals of the London wood pavement company, who have successively obtained the contracts for more and more important work. In 1881 they paved their first section on a small portion of the Boulevard Poissonpiere and the Rue Montmartre; in 1882, and early in 1883, all the roadway of the Avenue des Champs-Elysees, from the Place de la Concorde to and including the Rond-Point, had been relaid with wooden pavement, and the Municipal Council has now just accepted their proposition to pave a large portion of six of the most important boulevards, the company guaranteeing its work for a long period, and the city in turn permitting them great liberty in the execution of the work by English methods.

The process of the Improved Wood Pavement Company essentially consists in the construction, on a perfectly rigid foundation, of an impermeable surface of wooden paving blocks (pavés) thoroughly solidified. The resistance of the pavement to the action of the wheels depends almost entirely on the foundation, the wood being intended solely for a covering to protect this foundation, and to secure, by its elasticity and the perfect uniformity of its upper surface, the smoothest possible rolling of vehicles.

Rigidity of foundation, solidity of blocks, and impermeability of the surface are the three points this system aims to secure.

(I.) Foundation.—This consists of a bed of Portland cement beton 0.15 m. (6 inches) thick, with top coat of cement mortar about 0.01m. (3/8-inch) thick. The beton is thus proportioned: A mixture of about one-third sand and two-thirds gravel is put in a bottomless box containing half a cubic metre (0.65 cubic yards), and after the removal of the box 100 kilograms (220 pounds) of cement are emptied on the heap. This is in the proportion, by volume, of about one seventh as much cement as there is sand and gravel, since 1,400 kilos is the mean weight of a cutic metre of good Portland cement heaped loosely.

The sand was dredged from the bed of the Seine and the gravel taken from pits on the seashore. The cement was furnished by the manufactory of Demarle & Lonquety, of Boulogne-Sur-Mer.

The paving-blocks should have a uniform thickness and not be laid on the bed of beton until after it has set, in order to exactly preserve the curvature of the surface of the beton required for the convexity of the roadway. In the Avenue des Champs Elysees the convexity was 0.42m. (16½ inches) in a width of 27m. (87 feet 7 inches), which represents a mean transverse slope of a little more than 3 in 100. This convexity, though less than first proposed by the company, appears to be a little excessive, and it seems that for a road under satisfactory drainage conditions the convexity might be diminished; 0.42m. is only a mean convexity, for, on account of the small longitudinal slope of the avenue, the grade of the gutters is not parallel to the grade of the street, but presents a series of short slopes from the hydrants to the sewer openings, consequently the convexity varies from 0.39m. (151/4 inches) at the hydrants to 0.45m. (1734 inches) at the sewers.

To exactly regulate the surface of the beton a series of transverse profiles were defined by stakes leveled to the grade of the top of the bed. Along each profile a strip of stiff beton was laid. The top of this beton was carefully leveled and smoothed and received a guide rule, laid flat, whose thickness exactly corresponded with that of the beton coating. This series of rules thus formed a set of guides close together, between which it was easy, with large straight edges, to level the beton to the required surface The first leveling could never be more than approximate, the surface of the beton naturally remaining somewhat rough. The exact level required, as fixed by the tops of the rules, was secured by the top coat of cement-mortar

which filled the spaces between the pebbles and made an exact surface. This mortar was first composed of 200 kilos of cement to a cubic metre of sand (336 pounds to the cubic yard), but this proportion proving too small it was increased to 300 kilos. It was always mixed with a great excess of water so as to penetrate the interstices of

(2.) Paving.—The covering is formed of small uniform blocks of red Northern #r 0.15m. (6 inches) high, 0.22m. (83/4 inches) long, and 0.08m. (31/8 inches) wide. These are set close lengthwise, with joints, transverse to the street, of about one centimetre (3/8-inch). The blocks are sent, ready for use, from England, where they were cut from planks of the ordinary size, 0.08m, thick by 0.22m. wide. The third dimension, taken in the length of the plank, forms the height of the block, so that in position the fibres of the wood are placed upright. The blocks are superficially creosoted after being cut.

When the foundation has set, two or three days after being laid, the blocks are set by the pavers. Owing to the light weight of the blocks the work of paving is very rapid. Between crossings the blocks are set in rows perpendicular to the axis of the street, with their longitudinal joints staggered exactly half the length of a block. The methods used at crossings to avoid a continuous joint parallel to the traffic are analagous to those used in stone paving. Special precautions should be taken to insure exact spacing and regularity of the rows. Before commencing a new row, a strip whose thickness is exactly that of the required joint is set edgewise in contact with the last row and the paver has only to set the adjacent blocks in contact with it.

The blocks do not at first adhere to the foundation and are easily displaced after the removal of the strips, and to maintain them in place, as soon as the strips are taken out a small quantity of bitumen is poured in the ioints. This liquid material fills the small spaces that may exist under the blocks and partially fills the joints, and in solidifying effectually seals the blocks.

The joints are then filled by a thin grouting of neat Portland cement, distributed by the aid of a broom. This should be done at least twice to insure perfect filling and the essential impermeability.

The pavement cannot be opened for traffic until after the cement in the joints has completely set, for which a delay of 4 or 5 days is considered necessary. During this interval the last operation is performed—viz., spreading a thin layer of dry sharp sand over the surface. The company claims that this dressing, crushed under the action of the wheels, incrusts itself in the wood and lends resistance to the wearing surface. It seems more probable that this coating is simply to protect the fresh mortar from the direct action of the wheels, for it can be maintained but a very short time on a traveled road, and is soon transformed into

a disagreeable greasy mud.

The paving of the Avenue des Champs Elysees was divided into two parts, in the first of which the city removed the old pavement, and in the second this work was

done by the company under a special contract.

For the first division, the removal of the old paving was commenced October 16, 1882; first beton laid October 20; commenced October 10, 1882; risk beton laid October 20; paving commenced October 24, and the first portion of the roadway opened November 2; the removal of old paving completed December 10; the last beton laid December 12; the surfacing finished December 14; the paving finished December 18, and the road completely opened December

The total duration of work for 14,000 sq. m. (18,340 square yards) of surface was 67 days, corresponding to an average progress of 2:0 sq. m. (252 square yards) per diem. Considerable time is necessary for the various successive operations, but only sufficient space should be maintained between them to prevent crowding and interference be-tween the workmen. These operations in the Avenue des Champs Elysees have always required 15 days, and though Champs Elysees have always required 15 days, and though this time might be somewhat reduced by decreasing the length of a section opened up, it is not safe to estimate for any shorter time; 15 days therefore constitutes the period necessary to put the work in operation and complete one section, and this time should be deducted from the total time to find the true daily advance, which would become in the above instance 270 sq. m. (324 cubic yards). The second part of the work commenced March 29, 1883, and required 62 days for a surface of about 13,000 sq. m. (17.030 square yards), giving the same mean daily

so, m. (17,030 square yards), giving the same mean daily rate of 210 sq. m. The actual advance was 275 sq. m. (330 square yards) per diem, and would have been much more if it had not been delayed by lack of materials. The conditions were much more favorable on account of the season, the absence of hindrances attending the commencement of work, and because the removal of the old pavement was done by the company, so that but for lack of materials an advance of 300 sq. m. (360 square yards) would have been made daily.

(To be continued.)

THE PROPOSED NIAGARA SHIP CANAL.

THE accompanying map shows the projected location of this canal, joining Lakes Erie and Ontario by a deep canal on American territory. It is a portion of one published by the Oswego Board of Trade in the belief that the success of the bill now before Congress will be furthered by a more general knowledge of the subject.

Six alternative routes are shown by dotted lines on the map, varying in length from seven to twenty-five miles, and estimated to cost from eleven to nineteen million dollars. They extend from the Niagara River above the Falls to the same river below the Falls, or to Lake Ontario, and have been surveyed by Mr. William Pierson Judson, Mem. Am. Soc. C. E.

The line apparently preferred ends at Wilson on Lake Ontario. Connection can be made with the Erie Canal at Syracuse through the Oswego Canal, as shown.

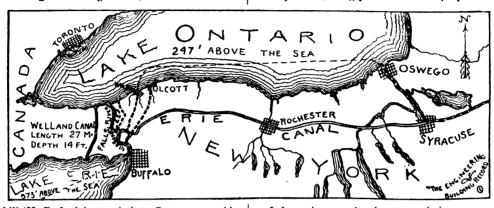

ant Engineer for Brown, Howard & Co., New Aqueduct, Tarrytown N. Y.; Edward Berton Kent, on a prelimiary survey for Chicago, Milwaukee and St. Paul Railway, Milwaukee, Wis.; William Willis Penney, Assistant Engineer St. Louis Water-Works, St. Louis, Mo; Louis Lincoln Tribus, Assistant to Charles B. Brush, Mem. Am. Soc. C. E., New York City; Harry R. Wheeler, Assistant Engineer Division r. New Croton Aqueduct, Sing Sing, N. Y.

AMERICAN WATER-WORKS ASSOCIATION.

THE eighth annual convention will be held at Cleveland, O., on April 17, 18 and 19, 1888. Headquarters will be at the "Hollenden," where special rate of \$3 per day is secured for those in attendance

An interesting feature will be the display by members of drawings representing a variety of novel ideas in waterworks construction.

Arrangements are also made for the associate members to display such samples, models or drawings of their productions or specialties as they may desire, special rooms, of easy access, being provided for this purpose.

The bill (H. R. 8.061) now before Congress provides for a commission composed of two members of the U. S. Corps of Engineers, two civil engineers, and one member of the Chicago Board of Trade; this commission to prepare plans for a canal to pass vessels of the class using the St. Mary's Falls enlarged canal-that is, nineteen feet draft.

Briefly, the proposed Niagara Ship Canal is intended to bring large steamers of 3,000 tons, or 100,000 bushels, 146 miles nearer New York than they can now come. Mr. ludson computes that this will produce a saving of freight charges of not less than three-quarters of a cent per bushel, and that the cost of the now proposed 20-foot canal will be nineteen million dollars by one route and eighteen millions by another.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

AT a regular meeting Wednesday, April 4, President T. C. Keefer presiding, after the transaction of regular business, the death was announced of George W. Cass, Fellow of Am. Soc. C. E., New York City, Charles Latimer, Mem. Am. Soc. C. E., Cleveland, O., and William A. G. Emonts, Junior Member Am. Soc. C. E., Reading, Pa., and the president was authorized to arrange for the preparation of their memoirs. A short paper was read by J. F. Flagg, Mem. Am. Soc. C. E., in the continuation of the discussion at the last meeting, on the "Flow of Sap in Trees," after which, by special invitation, Mr. R. K. Wright, Jr., lately Section Engineer on the Panama Canal, made some informal statements describing the condition and administration of the work, replies were offered by Messrs. Appleton and Colné, and some discussion by members of the society followed. The following gentlemen were elected:

As Members .- William Crulman Ambrose, Division Roadmaster Southern Pacific Railroad; Francis Webster Blackford, Jr., Resident Engineer Union Pacific Railway, in charge of construction work at Butte, Mont.; Howard Breen, Engineer Keystone Bridge Co., Pittsburg, Pa.; Edward Carlos Carter, Principal Assistant Engineer Chicago and North-western Railroad, Chicago, Ill.; John Joseph Donovan, Engineer in charge various branches in Montana of Northern Pacific Railroad, Helena, Mont.; Frank Louis Fuller, Engineer Marblehead Water-Works, Boston, Mass.: Bruce F. House Division Engineer Denver and Santa Fe Railway, Denver, Col. James MacFarlane, in charge of construction Anaconda Mining and Smelting Company's works, and of the engineering work in their mines, Anaconda, Mont.; Charles Clemons Rose, Division Engineer New York, Lackawanna and Western Railroad, Scranton Horace Edward Stevens, general engineering; Charles Frederick Stowell, Bridge Engineer New York State Board Railroad Commis sioners; Arthur Newell Talbot, Assistant Professor of Mathematics and Engineering, University of Illinois, Champaign, Ill. Charles Chancellor Wentworth, Principal Assistant Engineer Construction Department New River Railroad, Roanoke, Va.

As Associate.—George Henry Crafts, Bridge Constructor and general Contractor, Atlanta, Ga.

As Juniors .- William George Clark, First Assistant Engineer, City Engineer's Office, Toledo, O.; Arthur Leland Cornell, Assist-

Information as to hotel accommodations, space for display of products, may be had by addressing the Local Committee of Arrangements, of which H. F. Dunham, C. E., City Hall, Cleveland, is chairman.

Dunham, C. E., City Hall, Cleveland, is chairman.

Papers as follows are announced from among those promised: "Sanitary Protection of Rochester's Source of Water-Supply," J. Nelson Tubbs; "The Use of Salt-Glazed Vitrified Pipe," S. E. Babcock; Consumption of Water by Cities and Towns, H. W. Ayres; Water-Supply of Tokio, Japan, Y. Nakajima; "Quindaro Settling Basins and Syphon Well," R. C. Pearsons; "Reservoirs," Samuel McElroy; "Water-Works Records," J. M. Diven; "Weight and Thickness of Cast-Iron Pipe," J. W. Hill; "One Phase of the Problem," H. F. Dunham; "The Indirect Income of Water-Suppliers," F. L. Fuller; "Feed-Water Heaters and Condensers," Charles A. Hague; "Stand-Pipes for Water-Works," B. F. Stephens; "Recent Filtration Practice in India," S. Tomlinson; "Practical Results in Mechanical Filtration," William G. Richards; "The Use of Liquid and Gaseous Fuels," H. H. Harrison; "Approximate Determination of the Rental H. Harrison; "Approximate Determination of the Rental Values of Fire-Hydrants," J. Nelson Tubbs. Special rates have been secured from certain railroads,

particulars of which can be had from the Secretary, J. H. Decker, Hannibal, Mo.

PROPOSED IMPROVEMENT OF THE PORT OF PHILADELPHIA.

lT is proposed to extend the wharves on the water front of Philadelphia some 300 feet further out into the Delaware to accommodate the increased length of modern vessels.

To do this, however, and still leave sufficient width of channel to accommodate these large vessels it will be necessary to remove more or less of some of the small islands between Philadelphia and Camden.

When this is done, and the Camden wharves extended 300 feet also, there will remain an average channel width of 2,600 feet.

To remove these obstructions and obtain an average depth of 26 feet at low water, will, it is estimated, cost about \$3,000,000, and Col. W. P. Craighill, Lieut.-Col. Cyrus B. Comstock and Lieut.-Col. Henry M. Robert. who have investigated the matter for the Government, recommend that the work be done.

The Philadelphians are naturally desirous that the whole expense of the improvement be borne by the Government, but the engineer officers are of the opinion that if Philadelphia desires the acquisition of lands for this improvement it should purchase the islands and turn them over to the Government for removal.

CARELESS BRIDGE CONSTRUCTION.

On a railway bridge near Bombay the sills are said to project over the foot-plates of the locomotives. This, according to *Indian Engineering*, was the occasion of a recent "unfortunate accident," the engineer of a passing train having been summarily removed from his foot-plate by this ingenious man-trap.

DAMAGES COLLECTED FOR SEWAGE-FARM NUISANCE.

AT Warwick Assizes on Friday, before Mr. Baron Hud. dleston, an action was brought by William Thompson, architect, of Stratford-on-Avon, against the Mayor and Corporation of that town, to recover damages for nuisance occasioned by the Corporation sewage farm, and also to obtain an injunction to restrain the defendants continuing the farm under present arrangements. The Corporation of Stratford in 1885 set up sewage-works and farm within a quarter of a mile of plaintiff's residence, and from that time it was alleged a nuisance had been caused by horrible smells, which affected the comfort of plaintiff and his family, and depreciated the value of his house and land. Plaintiff complained from time to time to the Council of the nuisance caused, and made representations to the Local Government Board. In consequence Dr. Munroe was consulted, and advised the Council that the only way to remove the nuisance was to precipitate the sewage; but this work had not been carried out, owing to the heavy expense it would entail. Professor C. M. Tidy said he visited the works in February, and the stench from material then being removed from the tank was most offensive. The process that went on had practically no effect upon the sea age, and he had never before seen a worse-conducted place. Numerous other witnesses were called to prove that the nuisance was continuous, and had been in no way abated For the defendants, it was admitted a nuisance had been to no way abated. For the defendants, it was admitted a nuisance had been caused, but contended that the Corporation had done everything they could to abate it, and that plaintiff was only entitled to nominal damages. The jury gave a veronly entitled to nominal damages. The jury gave a verdict for the plaintiff with £1,000 damages, and his lordship entered judgment for that amount, and granted an injunction against the Corporation to be held over for twelve months.—Building News.

ACOUSTIC INSULATOR

THE Genie Civil recommends the use of shavings soaked in lime-water for packing between joists under floors to deaden noises, claiming that, besides adding little to the weight of the floor, this packing, if a solution of chloride of zinc be added to the lime-water, becomes incombustible

and drives away rats and mice.

It has been satisfactorily applied in hospitals and barracks, and is neater and cheaper than most substances commonly used.

Workmen handling it should wear roadmakers' specta cles to protect their eyes from the disagreeable dust, and should carefully wash their hands when leaving work.

MOVING THE HOTEL BRIGHTON

This enterprise is now well under way, and, the pre-liminaries having been arranged as described on page 230 of our issue of March 10, the locomotives were attached last Tuesday, and in two days moved the structure by short stages a total distance of 264 feet. Six locomotives were at first required to pull it up the initial grade, but when that was surmounted four were found sufficient to

ARCHITECTURAL DRAUGHTSMEN.

A number of architectural draughtsmen met in J. C. Cutler's office, at Rochester, N. Y., April 4 and formed a "T-Square Club." S. E. Hillger was elected president, and William H. Barnes secretary.

ENGINEERS' CLUB OF PHILADELPHIA.

THE club met March 17, Vice-President John T. Boyd

in the chair; thirty members and six visitors present: Howard Murphy, Secretary.

Mr. A. Marichal read a paper upon the "Testing of Cements," calling the attention of the club to the waste of money resulting from the incomplete knowledge of the

properties of cements.

Mr. Marichal asked for the appointment of a committee of five who would recommend a practical method of testing cements and present it to the club for its approval.

which, on motion, was ordered.

The sectretary presented, for Mr. Frederick II. Robinson, a complete description of the manufacture of gun-

Professor J. W. Redway followed with a discussion of the chemical reaction which takes place during the explosion of gunpowder and other explosives, giving a summary of results of experiments and investigations by self and others

Mr. L. F. Rondinella presented a paper upon "Incandescent Electric-Lighting," giving tables, formulæ, and calculations for the determination of the relative commercial values of lamps of higher efficiency and shorter life, with those of lower efficiency and longer life.

PERSONAL.

MR. JAMES C. BAYLES, President of the New York Health Board, and for many years editor of the Iron Age. has severed his connection with that journal.

MR. CHARLES KIRCHOFF, JR., who, for some time past, has had editorial charge of the *Iron Age*, is now announced as its editor.

MR. WM. R. BILLINGS, C. E., has resigned his position as Superintendent of the Taunton, Mass., Water-Works, and has accepted a position with the Chapman Valve and the state of Lating Cachend Mass. Mr. Manufacturing Company, of Indian Orchard, Mass. Mr. Billings' personal address is No. 15 Harrison Street, Taunton.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

FOR SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

COMPLETION OF THE ARCHES OF THE NEW HARLEM RIVER BRIDGE.

On Monday last the key segment of river arch of the new Harlem River Bridge, described in our issue of January 21, was successfully placed in position. This and the adjacent land span, completed some two months ago, are each of steel, with a clear opening of over 500 feet, and were furnished and erected by the Passaic Rolling Mill Co. All the arches are now completed, but it is not expected that the formal opening will take place before next fall.

TRADE CATALOGUE.

THE Silsby Manufacturing Company, Seneca Falls, N. Y., have just issued a pamphlet illustrating and describing a new portable, low-pressure, steam heating apparatus for public and private buildings.

ARCHITECTURAL COMPETITIONS.

ST. PAUL, MINN.—Several of the architects are working upon competitive plans for the new Germania bank building. The invitation to competition calls for two sets of plans, one set for a building 50x100, and the other for a building 100x100; but each must be for a seven-story structure, to be built of pressed brick and Bayfield sandstone.

WABASH, IND.—Plans are wanted here until June 11 for an Orphans' Home building. Address William Hazen, County Auditor, as above.

WEST SUPERIOR, WIS.—The compecition for pl for the new \$20,000 City Hall resulted in favor Architect J. D. Allen of Minneapolis.

For works for which proposals are requested see also the "Proposal Column," pages i-vii-viii-284-ix.

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

WINNSBORO, S. C.—WATER.— J. Withers, City Clerk, writes: "The subject of water-works for the town of Winnsboro is now under advisement by the town authorities."

SOUTH CENTRE, KAN.—WATER.—D. W. Relihan, City Clerk, writes: "Our people are talking about voting bonds to build a system of water-works, but no action has been taken by the City Council in the matter yet."

UHRICHSVILLE, O.—Concerning the water-works miect here, our correspondent writes as follows: project here, our correspondent writes as follows: "Will rent from the Dennison Water-Supply Company, of Dernison, O. For information inquire of C. B. Street, V. P., Dennison, O."

GREENPORT, L. I.—Concerning the water project here, G. H. Corwin, the Town Clerk, writes as follows: "At a Corporation meeting held about two weeks ago the village trustees were authorized to grant a franchise for water-works to Messrs. Swain & Lovell, of Brooklyn. I understand Messrs. John Lockwood & Son are the engineers."

CHADRON, NBB. — WATER.—R. G. Dorr, Town Clerk, writes: "Chadron will vote for the issuance of \$35,000 worth of municipal bonds April 3. The proposition will carry without a doubt, and when these bonds are negotiated the system will be erected."

Towson, Mp.—The Towson Water Company will erect a large reservoir here.

COLUMBUS, O-Engineer Danenhower has submitted his report on the proposed intercepting sewer, report places the entire cost at about \$500,000.

ALBANY, N. Y.—The Board of Finance has adopted a resolution which authorizes the issuing of bonds in the sum of \$200,000 for the purpose of purchasing engines and boilers and for the erection of suitable buildaries, the employment of engineers, surveyors, and other necessary assistants.

MONMOUTH, ILL.-Water-works are to be established

SAN DIRCO, CAL.—The Mount Tecarte Land and Water Company has been incorporated here; capital, \$3.500,000; W. H. Barton and others, incorporators.

Los Angeles, Cal.—The Old Mission Land and Water Company has eeen incorporated here; capital, \$192,000; J. F. Turner, and others, incorporators.

SALEM, MASS.—H. M. Meek, City Clerk, writes us regarding an item which has been extensively published to the effect that additions were to be made to the water-works system here as follows: "Our water-works have been in operation since 1869. No steps have been taken to improve them, and no improvement is contemplated."

Franklinville, N. Y.—Our correspondent writes: "Parties have been to this place and looked at a number of springs in the locality. No other steps have yet been taken, but no doubt before long other steps will be taken and we will have a system of water-works here."

CARTERVILLE, Mo.—Water-works for this place are talked of.

Orono, Mr.-Wat-r-works are to be established here.

Washington, Kan.—Bonds are to be issued for the construction of a system of water-works here.

BATESVILLE, ARK.—It has been decided to erect a complete system of water-works here this summer.

WARRIOR STATION, ALA.—It is reported that water-works are to be established at this place. R. H. Pear-son is said to be at the head of the scheme.

WAKEFIELD, CAN.—Water-works are to be established here.

DENTON, TEX.—It is reported that a system of water-orks will be established here.

HELENA, MONT.—It is reported that plans for a sew-rage system of this place are nearly completed.

SCOTLAND, DAK.-Water-works will be established ere. The City Clerk is G. O. Sindly.

Chrtopa, Kan.—Water-works will probably be es tablished here.

| SANTA CRUZ, CAL.—Bonds in the sum of \$100 000 will be issued for the construction of a system of water-works here.

Franklin, N. H.—Water-works are to be established ere and a committee has been appointed to take prehere and a committee has been appointed to take pre-limitary steps towards the end desired.

RALRIGH, N. C — The time for opening bids for the sewer construction has been postponed until April 16.

TECUMSEH, NEB.—The opening of bids for water-orks has been postponed from March 29 to April 17.

EDGAR, NEB. - Our correspondent writes: "Water-works bonds carried almost unanimously."

New York City.—The Aqueduct Commissioners have rejected all the bids for the construction of the pipe-line from One Hundred and Thirty-fifth Street down to the Central Park Reservoir, and will give a public hearing on the subject on April 11. It appears that such a public hearing is required by law, and during the contest over the late bids it transpired that no such public hearing had been given. The work will be readvertised.

PITTSBURG, KAN.—This place has decided to establish a sewerage system and at a recent meeting of the town officials a resolution was passed making the temporary committee a permanent one, with full power to proceed in the matter. Operations are to begin at once. J. C. Merrill is Chairman of the Committee.

Orono, Me.—Water.—Albert White, Town Clerk, writes: "Company chartered and organized and are awaiting the action of the Bodwell Water Power Co. in order to ascertain if they can contract with them for a supply of water.

UNIONTOWN, PA.—Extensive improvements are to be made to the water-works here.

ASHLAND, Wis.—It is stated that several miles of additional sewer mains will be laid in this city during

MADISON, FLA.—It is reported that W. T. Davis is interested in a water-works project for this place.

MOUNDSVILLE, W. Va.—The water-works question has been settled here and the system is to be built.

WATER-WORKS.—See our Proposal Column for information regarding water-works and water-works supplies at the following places: Goderich, Ont., Goldsboro, N. C., South Boston, Va., Florence, Ala, Tilbury Centre, Ont., Tecumseh, Neb., Pittsburg, Pa., Southbridge, Mass., and Columbia, S. C.

BRIDGES.

WATERTOWN, N. Y.—A bill has passed which authorizes this town to levy a tax and borrow money for the erection of two bridges.

Sheldon, VT. - A two-span bridge was let into the river at this place by ice knocking out the pier.

WILMINGTON, N. C.—A bridge is to be erected over the Black River, near this place, by the Cape Fear and Yadkin Valley Railroad Company.

KNOXVILLE, TENN.—A bridge is to be erected over the railroad tracks in this city by the Board of Public

NEW FLORENCE, PA .- A bridge is to be built here by

the County Commissioners.

New Obtreams, La.—A bridge is to be built here by the County Commissioners.

New Obtreams, La.—A bridge is to be placed over the St. Bernard Canal. For details address J. N. Hardy, as above.

LANCASTER, O.—The County Commissioners of Fa.r-field County will erect five new bridges. Address, for details, B. F. Dunn, as above.

OQUAKA, ILL.—A bridge is to be constructed over the Mississippi at this place.

New Brunswick, N. J.—Plans have been presented to the Middlesex Board of Freeholders for a new stone bridge over the Raritan River at this place to cost \$132,000.

DEFIRIT, MICH.—It is stated that a syndicate proposes to build a winter bridge across the river at this place, the structure to have three draws, and to be torn down, so far as the superstructure is concerned, at the opening of navigation. A bill giving the necessary charter has already passed the Canadian Parliament and Congress will be asked to have the United States Engineers examine the scheme, and report whether it would be an obstruction to navigation or not.

BRIDGES.—See our Proposal Column for information regarding bridge construction at the following places: Dover, Del., Annapolis, Md., Philadelphia, Pa., Hol-ton, Kan., and Gates Centre, Kan.

GAS AND ELECTRIC-LIGHTING.

HAVELSON, MASS .- Gas works will be erected here

BRATTLEBORO, ONT.—An electric-lighting plant to cost \$20,000 is to be erected here.

EXCELSION, MINN,-Electric-light works will be erected here.

Orono, Mr.-The selectmen have been authorized to light the streets of this place by electricity.

EASTHID, MINN.—The gas com pany will creet large works during the summer season.

SALEM, MASS.—It is reported that \$36,000 has been appropriated for electric lights.

LRE, MASS.—The public streets, etc., of this place are to be lighted by electricity.

DENTON, TEX.—It is reported that gas works are to be built here.

GRAFTON, W. VA.—The Grafton Gas Company will oon erect a 60-light arc plant. CHARLESTON, W. VA.—The Charleston Gas Company has decided to erect machinery for the purpose of manufacturing water gas.

BRAUMONT, TEX.—Thomas & Gorman will erect an lectric-light plant here.

LYNCHBURG, VA.—The Lynchburg Incandescent lectric Light Co. will enlarge its plant and add ma-

CATLETTSBURG, Kv.—It is reported that an electric-light plant is to be established here, and that H Well-man is at the head of the project.

STREET-WORK AND PAVING.

Buffalo, N. Y.—Considerable discussion is going on in the Board of Aldermen concerning a "vulcanite" pavement, which is said to be, in use at Philadelphia, Washington and Pittsburg.

BIDS OPENED.

Boston, Mass.—Granite, Etc.—The Court-House Commission have received proposals for furnishing 140.000 cubic feet of dressed granite and 8,000,000 bricks and the iron frame woth necessary in the completion of the new court-house. MISCELLANEOUS.

MILLVILLE, N. J.—A Presbyterian church, to cost \$15,000, 's to be erected here.

ST. PAUL, MINN.—The St Paul Fire and Minte Insurance Company will erect a large office builder with rao feet front on Third Street at the coract st Jackson.

MONTGOMERY, MASS.—3½-story summer high, 38x125 feet; cost, about \$13,000; 0. A M Butteriet, a, Richmond & Seabury, of Springfield; b, coarse not let.

MINNEAPOLIS, MINN.—About \$4.000 will be co-pended at the motor station on Lake Harriet in a summer garden and theatre.

WEST SUPERIOR, WIS .- The Land and River in provement Co will erect a \$75,000 dock here. CHATFIELD, MINN.—The city will expend \$150000 on a public school building.

NEENAH, WIS.—\$100,000 is to be expended in school buildings.

ABERDEEN, DAK.—Presbyterians will build a \$15,000 church.

SPOKANE FALLS, W. T.-Menteeth & Seitenbech will put up a \$100,000 business block.

NEW RICHMOND, WIS.—The Y M C A are to erect a building.

MIDDI.EBORO, MASS.—The Baptist Society # 11 erect a church to cost \$18,000 here.

KANSAS CITY, MO.—Maple av. near Ind ave. by dwell; cost, \$10,000; o, J & Gunnotte.

1105-117 Broadway, br dwell; cost, \$15,000; 0. JR Stark. Central, cor 15th, br dwell; cost, \$15,000: 0, Pa Soden.

HUTCHINSON, KAN,—Carter & Woodruff, architects are preparing plans for a business block to com Opera house; cost, \$80,000; located on Sherman

John McAdams will erect a \$20,000 residence.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 20.

EDITORIALS:

PUBLISHED EVERY SATURDAY

NEW YORK, APRIL 14, 1888.

LONDON, APRIL 28, 1888.

SINGLE COPIES. TEN CENTS. Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE. IN GREAT
BRITAIN. Subscription, 20s. per annum in advance, post paid.

THE ENGINEERING & BUILDING RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3c37). Its opinions upon all technical subjects are either prepared or revised by specialists.

> TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

> > OFFICE IN GREAT BRITAIN, 92 & 93 FLEET ST., LONDON.

TERMS, 201. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record (New York), and crossed ——— & Co.

Linden, Co., Continental subscriptions are also received by F. A. Brockhaus, Esq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subscquent date becomes a receipt for remittance. No other receipt is sent unless requested. Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered etter or by cneck or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

FILTER-GALLERIES AND COVERED RESERVOIRS.

WE print on another page an abstract of a part of the report of the Engineer of the Massachusetts State Board of Health upon matters connected with the water-supplies of the State, and we wish to call the attention of those who are interested in such matters to that portion which relates to the effect of filter galleries on the water of ponds in the immediate vicinity.

In the particular case reported by Mr. Stearns, the evidence of the chlorine determinations is sufficient to show that the water obtained from a filter-gallery distant 130 feet from the shore of a pond was in part derived from that pond. The changes in the water produced by this filtration are very marked. The sediment, turbidity, color and odor are almost entirely removed, and the free and albuminoid ammonia are greatly diminished. The filter-gallery water contains about one-tenth as many bacteria per cubic centimetre as are found in the pond. All the algæ of the pond were filtered out by the time the water had reached the filter-gallery.

Mr. Stearns concludes that in many instances a supply of water may be obtained from a bed of porous gravel adjoining an unfailing pond or stream, and that the water so obtained will probably be purer, cooler, and better in its commercial and sanitary aspects than the water taken directly from the pond or stream.

It does not follow that the results will be good when the filtering layer is thin, nor can such filtration be relied on to purify seriously polluted water.

Mr. Stearns in his report also calls attention to the fact that certain waters deteriorate by storage in open reservoirs, that this seems to be due to the growth of certain forms of vegetation, and that this may be prevented by the exclusion of light. This was tried in the case of the high service tank at Brookline with very satisfactory results.

In close connection with the reports of the Board of Health upon water-supplies is an interesting paper on the odor and color of surface waters, by Dr. T. M. Drown, which was read before the New England Water-Works Association at its meeting in Boston last December.

Dr. Drown has had charge of the chemical analyses of waters made for the State Board of Health in the Massachusetts Institute of Technology, and this paper may be taken as a preliminary sketch of a part of a more extended report to be made hereafter. As regards odor, he points out that the peculiar odor developed in some instances when the water is rapidly heated, and which he terms the "hot odor," is very different from the odor of the same water when cold, and is significant of certain forms of dissolved or suspended organic matters.

The difficulty of describing these odors, or of establishing anything like a scale of comparison which will be significant to others, is very great. Dr. Drown uses the qualitative terms "earthy,"
"straw-like," "moldy," "musty," "disagreeable," "offensive," and "peculiar," but it would probably be necessary to visit his laboratory and compare samples to learn the precise sense in which each of these is used. His color-scale is more easily worked. It consists of a series of thirty formed with nearly consists of a series of

in diameter and twelve inches long, the water standing nine inches high in the tube. Tint No. 1 is produced by Nesslerizing one cubic centimetre of the standard ammonium chloride solution containing o.oooo1 gram of ammonia; tint o.1 is produced by one-tenth of a cubic centimetre and tint No. 2 by two cubic centime-The relation between color intensity and the amount of albuminoid ammonia present appears to be tolerably close, but further investigation is needed on this point.

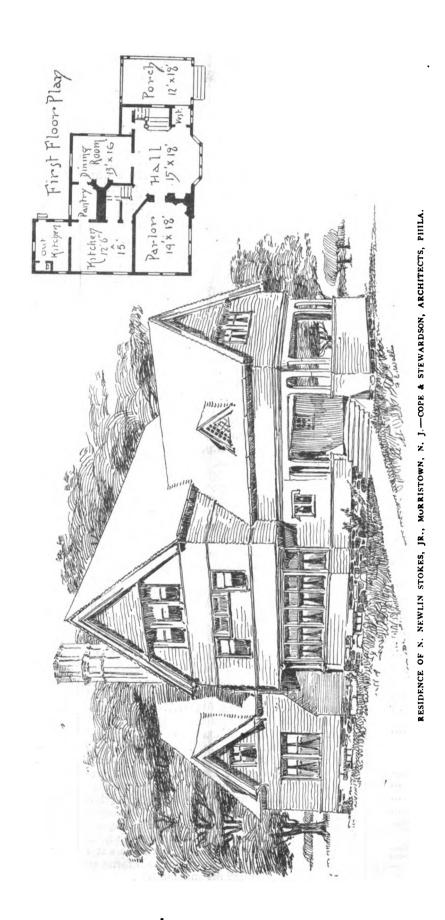

ACCIDENTS IN MINES.

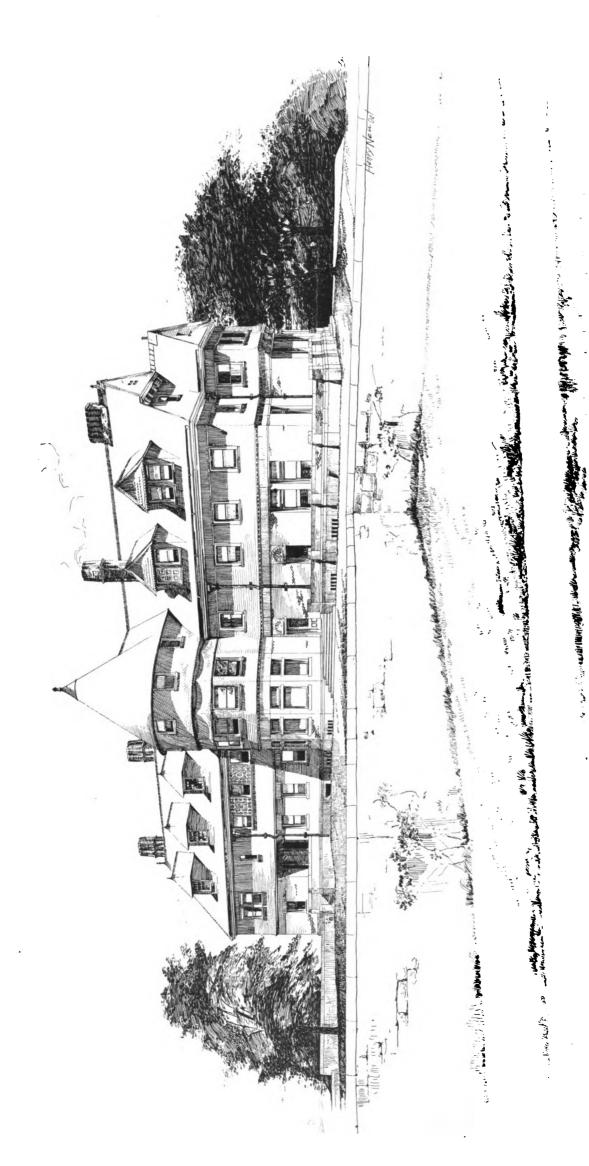

THE paper on "Accidents in Mines," by Sir Frederick A. Abel, read before the Institution of Civil Engineers in May, 1887, with an abstract of the discussion which followed, has just been issued as an excerpt from the Minutes of Proceedings, forming a volume of 196 pages octavo, which contains much matter of interest to mining engineers, and especially to those interested in the practical operations of coal mining. It is true that the paper has a much more limited scope than its title indicates, since it is mainly devoted to the subject of explosions in coal mines, with some references to accidents connected with hoisting machinery and falling in of roofs of galleries, etc.; but the subject of explosions alone, involving, as it does, the whole subject of the lighting of mines and that of various forms of explosives, is of great import-

The theory that explosions may be due to the presence of large quantities of fine coal-dust in the air, and that such an explosion may be as violent and as destructive as a fire-damp explosion, appears to be now generally accepted, in part on direct experimental evidence and in part because it is almost impossible to account for certain explosions which originate in and follow the intake of the ventilating air galleries, upon the supposition that they are due to explosible gas mixtures.

This has led to the use of means for moistening the air and laying the dust in the form of water sprays, steam jets, etc. One instance was cited by Mr. T. Forster Brown, in which in a large colliery an extensive line of water-pipes was laid along the main haulage roads having outlets giving off fine spray at intervals of forty yards, with the result of dampening the dust and reducing the temperature in a very satisfactory manner.

As yet there does not seem to be any thoroughly satisfactory form of miner's lamp, and the tendency seems to be to seek some form of electric illumination for the purpose. The use of water to surround a blasting charge of a high explosive, forming what is called a "water cartridge," is insisted on by Sir Frederick Abel, in part as a safeguard against accidental ignition of dust or gas mixtures and in part to distribute the force of the charge so as to avoid a crushing action in the immediate vicinity and produce work in bringing down or loosening coal over a large area. The rule which he gives is that the large area. The rule which he gives is that the quantity of water should amount to at least four times the volume of the charge of explosive. In speaking of the difficulty of detecting small amounts of fire-damp, the author considers that the best instrument for this purpose is the fire-damp indicator of Mr. E. H. Liveing, in which tints formed with varying amounts of ammonia by the Nessler reagent, the comparison being made in Nessler tubes three-quarters of an inch

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES.

RESIDENCE OF W. F. WELD, ESQ., BROOKLINE, MASS.

electric current, is photometrically measured and accurately indicates the amount of fire-damp in the air. This instrument will indicate the presence of fire-damp or marsh-gas when it amounts to only 0.25 per cent_ of the air tested. Of the deaths due to various causes in English coal mines from 1875 to 1885, a little over 23 per cent. were due to explosives, 40 per cent. to falls of roof and sides, and the remainder to miscellaneous caus es.

The greatest improvement which has been made in protecting the lives of miners seems to have been made in the machinery in the shafts. The average of shaft accidents during the ten years 1850-60 was one death to each 1,161 persons employed; during the next ten years it was one to 2,121, while from 1871-80 it was only one

to 3, 557.
The various forms of safety-clutches and safetyhooks to be used in connection with the cages and lifts do not seem to obtain general approval, and it would seem as if none of them were a cerprotection against a drunken or careless tain engi meer, yet that will not account for the removal of su chapparatus from many shafts, since it would seem that it might be occasionally useful, though not a certain preventive. We should be glad to obta in data for an account of the safety devices used in mines in this country and an estimate of their practical utility.

NELY YORK BENEFITED BY RIVER AND HARBOR IMPROVEMENTS ELSEWHERE.

T == E attention of those New York papers which are isposed to make light of the improvements of r avers and harbors in the South Atlantic States is invited to the following letter received from Col. William P. Craighill, U. S. A., which presents another argument for rational consideratior on the part of our metropolitan dailies of the matter of river and harbor improvements elsewhere than around New York Harbor. The following is his letter:

U. S. Engineer's Office, Baltimore, Md., April 11, 1888.

SI=: I have this moment read with much satisfaction your -editorial of April 7. Selt-interest is a powerful telescope through which to see at times, but in this case the Sun must have been dazzled by its own light to such an exten t as to not perceive that every commercial developon the Atlantic coast is more or less in the interest of New York City, the great financial heart of the country.

Ca ptain Bixby has shown clearly the importance of the minor improvements he referred to. While each may be comparatively small by itself, their aggregate makes a large volume, the effect of which is immediately felt by their local commercial centres-Charleston, or Savannah, or W ilmington, etc. Experience has shown that any importa_nt commercial development at such a local centre is immediately followed by a new steamboat line to New York - City, or by some other successful effort for increased -ction with that great centre.

W. P. CRAIGHILL. Yours respectfully,

EXAMINATIONS OF WATER-SUPPLY IN MAS-SACHUSETTS.*

BEGINNING the 1st of June, 1887, every public watersupply in the State was visited and examined by the engineer or one of his assistants, places for taking samples of water were chosen, and the methods to be followed were explained to those who were to take them.

explained to those who were to take them.

But few more than one-third of the whole number of cities and towns in the State have a public water-supply, yet the total population of the places supplied represents 82 per cent. of the population of the State. This estimate of population represents the whole number of persons in the municipalities supplied, and is consequently slightly in excess of the number of persons who can avail themselves of a public supply. There are but three towns having a population exceeding 4.500 that are not supplied, and where the population exceeds 3,500 the majority are supplied, while below this limit the reverse is true.

There are in the State 123 sources of public water-supply as follows: Ground water sources—springs, 16; large

ply as follows: Ground water sources—springs, 16; large wells. 16; tubular wells, 7; filter galleries, 7; filter basins, 4; total, 50. Surface water sources—artificial storage reservoirs, 36; natural ponds, 32; streams, 5;

The line of separation between the different classes is somewhat indefinite. A filter gallery or well on the banks of a stream may each furnish water of identically the same character, while another well may furnish the water of a natural spring which it has replaced. Natural ponds, by having their level raised, may flow extensive meadows, and so become less satisfactory reservoirs than meadows, and so become less satisfactory reservoirs than those that are wholly artificial. Tubular wells are frequently sunk in the bottoms of large wells or filter basins with the view of increasing the supply of water.

The thirteen cities having a population of more than 25,000 each all get their supply from surface sources.

Of the 23 cities in the Commonwealth, 20, having a total population of 1,030,282, own their own water-works, while 2 having a total population of 57,214, are wholly

total population of 1,030,282, own their own water-works, while 3, having a total population of 57,214, are wholly supplied by private companies.

Of the 103 towns having a public water-supply, 50, having a total population of 285,086, are supplied from their own works, and 53, having a total population of 222,796, by private companies. The total population of the cities and towns owning their own works is 1,315,368, against 280,010 for those supplied by private companies.

280.010 for those supplied by private companies.

About 200 samples of water collected from the existing water-supplies of the State, and from 36 places on 17 water-supplies of the State, and from 36 places on 17 rivers and ponds, are received monthly at the laboratory, in addition to a varying number collected as occasional specimens from other places or in connection with special investigations of new sources of existing works. Daily records of the temperature of the water at 50 places, and of the heights of water and other information needed to make an approximate estimate of the amount flowing in the rivers at to places are taken by water-works and mill the rivers at 19 places, are taken by water-works and mill superintendents, or special observers, and are forwarded

superintendents, or special observers, and are forwarded monthly to this office.

Schedules are prepared each month to show the day on which each sample of water should be collected, and are so arranged that the samples will reach the laboratory at a nearly uniform rate during the first five week days of each week, in order to permit them to be analyzed promptly when received. The schedules are also arranged so that waters having some relation to each other shall be collected on the same day or in the case of rivers, after such lected on the same day or, in the case of rivers, after such an interval of time as will allow the water to flow from one

sampling place to another.

The willing co-operation of the water-works superintendents and others, and their readiness to collect and forward samples of water and to take such observations as we have desired, have added greatly to the value of the

work done.

In arranging in the beginning where samples of water should be taken it was the aim to get them in such a way that the chemical analyses would not only furnish a standard for future comparisons, but that they should show in addition general laws affecting the purity of water-supplies. With this in view samples were taken of groundwaters from filter-galleries, wells, and basins, and of surface-waters in neighboring ponds or streams, to determine face-waters in neighboring ponds or streams, to determine the effect of such filtration as might take place; other samples were taken to show the effect of storing ground or surface waters in open distributing-reservoirs or in open or closed water-towers; others the effect of continuous filtration through a thin layer of sand or gravel; others the comparative quality of water taken from the surface, mid-depth, and bottom of deep reservoir; others a comparison between water entering a storage-reservoir and after standing in it, and others the effect of aeration caused by the flow down a long steep brook of water previously storad in a reservoir. viously stored in a reservoir.

Many results have already accumulated, and an examination of them indicates that in addition to the great fund of scientific knowledge which they will furnish, much of the practical value to those designing and superintending water-works may be learned from such comprehensive

When the first filter-galleries were built beside the rivers when the first liter-galleties were built beside the five-or ponds it was expected to get water filtered from the neighboring surface-supply. It was found, however, that the water from the galleries differed very much in chemi-cal analysis, temperature, and appearance from the sur-

face-waters, and before pumping stood at a higher level. From this it was concluded that the water did not come from the neighboring pond or stream, but from the land

There are, however, several reasons why it seems prob-There are, however, several reasons why it seems probable that water drawn from filter-galleries, or by other means from the ground in the vicinity of bodies of surface water, comes to a large extent from the latter source; and it was thought that if this could be shown to be the case, and it could be shown at the same time that the filtered water lost the general characteristics of surface waters and assumed those of ground-water derived from rainfall soaking into the ground, the knowledge would be of much practical value to those locating or enlarging a ground-water supply. water supply.

To settle the question, if possible, a special case was

chosen for thorough investigation where the supply for a town was pumped from a filter-gallery, distant about 130

town was pumped from a metaganicity, distant about 156 feet from the shore of a pond.

The amount of water pumped from this gallery during the year equals a daily average of about 900,000 gallons. The pumps are operated during each week day for about

ten hours, no pumping being done on Sunday.

The level of the water in the filter-gallery remains permanently below the surface of the pond, lowering when the pumps are in operation and rising when they are stopped. In the evening it was about four feet below the pond.

This particular source of water-supply was chosen in preference to any other because the pond was artificially salted by the drainage from manufacturing establishments on its feeders; so much so that it contained about ten times as much chlorine (one of the components of common salt) as most ponds at the same distance from the sea and not affected by drainage.

The value of an abnormal amount of salt in a surface

The value of an abnormal amount of sait in a surface water for determining the source from which water comes to a filter-gallery lies in the fact that it is a stable chemical compound, and is not removed when the water containing it in solution is filtered through the ground.

It in solution is hitered through the ground.

The water of the filter-gallery contains 2.4 parts of chlorine per 100,000, or about six times as much as is usually found in water at this distance from the sea. This large quantity may be accounted for in two ways: either by the filtration of water from the pond, or by some abnormal condition of the soil which makes the water from by the filtration of water from the pond, or by some abnormal condition of the soil which makes the water from the land side rich in chlorides. To determine whether or not the water from the land side presented this unusual feature, samples of water were collected from an unpolluted brook and pond in the vicinity, and from several pits dug deep enough to collect water coming to the filter-gallery from the land side. In the samples of the water from the pond, brook and three of the pits in which the water stood pond, brook, and three of the pits in which the water stood at a higher level than in the pond, the amount of chlorine varied from 0.25 to 0.45 in 100,000, averaging 0.37, or less than one-sixth of the amount in the filter-gallery. Just what the figures that have been given mean may be more easily understood by showing the results in a different form.

The average amount of water pumped daily from the filter gallery may be stated in round numbers as 900,000

gallons or 7,500,000 pounds.

The chlorine in the water is found to be 2.4 parts per 100,000, equivalent to 180 pounds of chlorine in the daily

pumpage.

If it is assumed, as is probably the case, that all the chlorine in the water is combined with sodium in the form chlorine in the water is combined with socium in the form of common salt, it can be shown from the relation which these two components always bear to each other that the total amount of salt pumped per day is 297 pounds. An equivalent amount of water derived from the land side would contain only 46 pounds of salt, while the same amount of water derived wholly from the pond would contain the pounds.

amount of water derived whorly from the point at the filter-tain 462 pounds.

These figures not only show that the water in the filter-gallery is a mixture of the waters from the pond and land side, but they permit a fairly good estimate to be made of the proportion which must come from each source to produce the degree of saltiness equivalent to that found in the water from the gallery.

Such an estimate shows sixty per cent. of the water to

Such an estimate shows sixty per cent. of the water to have come from the pond and forty per cent. from the land side, during the seven months under consideration.

Before leaving the subject of the source of this water-supply it may be well to state that it is improbable that much of the water derived from this pond comes through much of the water derived from this pond comes through the comparatively narrow strip of ground separating the pond from the gallery; in fact, the statement may be made in a general way that in the bed of a stream or pond the spaces between the grains of sand and gravel usually become choked up with silt and vegetable matter to such

become choked up with silt and vegetable matter to such an extent that little water will pass through any given square foot of surface; and it is only where a large area of bed overlies or adjoins the porous stratum that it is safe to expect that a large supply can be obtained by filtration. When the water is once in a coarse gravel stratum of considerable extent it may find its way readily to a filtergallery, even from a long distance. That some of the water came from a long distance to the gallery in the case specially investigated was proved by test pits dug near the shore across an arm of the pond and 1,000 feet from the pallery. gallery.

Where water from the land side is mentioned in this report, it refers only to water derived from rainfall soaking directly into the ground, and not to that which frequently enters a filter-gallery or well from the land side, having come by a circuitous course from the

^{*}Abstract of the report of Mr. F. P. Stearns, Chief Engineer of the State Board of Health of Massachusetts, for the year 1887, from report of State Board on Water-Supply and Sewerage, being Senate Document No. 4.

The water surface in these pits stood several inches below that in the pond, fluctuated with the change of level in the gallery, and the water from them contained more normal amount of chlorine found in the groundwater in this vicinity, showing that some of pond-water passed through these pits on its way to the gallery.

Coarse gravel will hold in its interstices about thirty per

cent. of its volume of water, and where the gravel beds are extensive the large body of water contained in them has to move slowly toward the filter-gallery to furnish the amount pumped, so that some of the water may be weeks or even months in its passage through the ground.

Upon examining the analyses of water from the pond and filter-gallery the difference between the two cannot in most features be accounted for by the mixture of water from the pond and land side in the proportion before stated. Sediment, turbidity, color and odor which are very noticeable in the pond-water, are absent in the water from the filter-gallery. The residues and chlorine do not show a greater difference than can be accounted for by the mix-

The change in the ammonias is the most noticeable feature, the gallery-water containing but one eleventh as much free ammonia and one seventeenth as much albuminoid ammonia as that from the pond. The greater amount of nitrogen as nitrates and nitrites (nearly all n'trates) in the gallery-water might be accounted for by the m xture of the waters, but it is more probable that the increase is due to the oxidation and consequent purification of the decomposing nitrogenous matters indicated in the pondwater by the presence of the ammonias.

The water of the pond is shown by the analyses to be entirely unfit for drinking, while water from the gallery analyses well in many respects, but is to be viewed with some suspicion on account of its source.

In addition to the chemical analyses of these waters. other examinations were made to determine whether bac-teria and the grosser forms of microscopic life (algæ, etc.) found in the pond-water were removed by its filtration through the ground to the gallery. The mean of these results shows that the gallery-water contains but one-tenth as many as that from the pond. In many other instances in this State, where comparisons have been made of the number of bacteria in surface waters and in the filter-gal-leries or wells beside them, much greater differences have been found than in the cases above given; an extreme instance showing a ratio 16,500 to 2.

The bacteria found in all of these cases may have been and probably were harmless, but since the best known of the pathogenic bacteria are no smaller, it seems fair to assume that the means which will remove one will remove

That filtration through even a moderately thin layer will under proper conditions, remove a very large percentage of the bacteria from water, has been very definitely shown by the experiments of Dr. Percy F. Frankland by practical experience in the filtration of the water-supplies of London and Berlin, and by recent experiments at the Lawrence Experimental Station, described in the report of the board which this accompanies. In fact, the efficiency of the Berlin filter-beds is now determined by the percentage of the bacteria which they will remove from the water.

The examination of the waters of the pond under consideration for microscopic growths other than bacteria, showed the presence in abundance of several species of algæ, some of which were gelatinous forms which readily algæ, some of which were gelatinous forms which readily decompose and produce disagreeable tastes and odors in the waters; other growths were present in small numbers. The water of the filter-gallery did not contain any of the species of organisms found in the pond, though it did contain a few other species—one in some abundance.

These results are in accordance with those obtained from other water-supplies somewhat similarly situated.

In the warmest weather in summer the tempera ure of the water of the pond was as high as 80° Fah., while that of the filter-gallery was about 52°.

As a general result of this and other special examinations.

As a general result of this and other special examinations, corroborated in many respects by similar results found at other water-supplies in the State, the following practical conclusions may be drawn:

That it is practicable in many instances to obtain a sup-ply of water from a bed of porous gravel adjoining an un-failing pond or stream, without reference to the amount of

tter that may be obtained from the land side. That where the soil does not contain soluble matters to injuriously affect the water, it will, when so obtained, be much purer by chemical and biological standards, will be much cooler in summer, and in all sanitary and commercial features will be much better than water taken directly from the pond or stream.

That since it is impracticable in many cases to get an entirely satisfactory supply of water, it is preferable to obtain a ground-water supply by filtration from a surface source that is somewhat objectionable, rather than take surface-water directly from a source that is some degrees

less objection ble.

There are other conclusions which ought not to be drawn to which it is equally well to call attention

It should not be inferred that the results above indicated will be obtained where only a thin layer of sand or gravel intervenes between the surface source and the filter-gallery, and the filtration is continuous, since examinations, in several instances, of water filtered under such circum-stances have shown it to be worse than that which had not been filtered; nor should it be inferred that it is safe to take a supply by filtration from a seriously polluted body of surface-water, since, while the chemical analyses show by far the larger portion of the decomposable organic mat-

ter indicated by the ammonias to have been removed by filtration, yet the small amount remaining may be of a harmful nature, and there is no definite assurance that the purifying powers of the soil may not at times be overtaxed.

It may properly be urged as an objection to seeking a supply of ground-water that the quantity to be obtained cannot be told with the same certainty as that from a visi-ble supply. The quality of the water, however, makes it desirable to secure such a source when practicable; and while the exact amount of water cannot be ascertained in advance of the actual construction and test of the well or filter-gallery, a competent engineer, experienced in these matters, can form a judgment upon which much reliance may be placed.

In addition to the analyses of the waters of the pond and

the filter-gallery, already discussed, the water in the open distributing reservoir has also been analyzed.

When the pumps are in operation, the surplus water goes to this reservoir, and nights and Sundays when the pumps are stopped it surnishes the water used. Complaint is made in summer by those using the water that it tastes badly when it comes directly from the reservoir, while that coming directly from the filter-gallery does not.

The chemical analyses show that in nearly all other respects the water has seriously deteriorated in quality by

storage. Sediment, turbidity and odor make their appearance in the reservoir water. Free and albuminoid ammonia, indicating the presence of decomposing or decomposable nitrogenous organic matter, have greatly increased, while the nitrogen in the form of nitrates has decreased, apparthe passage of a portion of the nitrogen from the inorganic to the organic condition.

A cause for this and a practical remedy appear to have been found by Mr. G. H. Parker, the biologist of the board, charged with the examination of water for organisms other than bacteria, and are contained in his accompanving report.

The remedy which he proposes (the entire exclusion of light to stop the growth of vegetation) has been applied in the case of the iron storage tank of the Brookline high service, and the serious trouble from bad taste, which previously existed, has entirely ceased; moreover, the chemical purity of the water in the tank is as great as at the

The marked deterioration, as determined be chemical analyses, of ground-water stored in large open reservoirs, is a feature in all cases that have been examined. The amount of deterioration is somewhat variable.

In a majority of cases water from such reservoirs has, at times, tasted badly. In but few cases has trouble of this kind been reported from water stored in iron tanks; but these few cases, and particularly the one already mentioned, make it desirable to exclude the light from any to be built in the future, or from any that give trouble at the present time. Where water from a pond or other surface source is pumped and stored in an open distributing reservoir no marked change in the analysis takes place.

CEMENT MORTARS FOR USE IN PUBLIC WORK.*

No. III.

(Continued from page 266.) SAND IN MORTARS.

WITH reference to the quality of the sand used for admixing with hydraulic cement to make mortar, all of the authorities upon the subject agree that the same should be authorities upon the subject agree that the same should be coarse, sharp, clean, and free from vegetable, earthy, loamy, or clayey matters. If suitable clean sand is not available, the impurities contained therein should be removed by thorough and repeated washing.

Vicat, in the course of elaborate experiments with limes and mortars in the early part of this century, established standards for size of grain of what he termed coarse sand and fine sand as follows: coarse sand being such as will pass through a sieve of 64 meshes per square inch and be pass through a sieve of 64 meshes per square inch and be retained on one of 289 meshes per square inch; while fine sand will pass through a seive of 289 meshes per square inch, and be retained on one of 625 meshes per square inch. On this definition he ranked the superiority of coarse, mixed, and fine sands with limes according to the following schedule

For eminently hydraulic limes, 1. fine; 2. mixed; 3. coarse.

For slightly hydraulic limes, 1. mixed; 2. fine; 3.

For fat or quick limes, 1. coarse; 2. mixed; 3. fine. It will suffice to say that with cement mortars much better results are obtained when the sand is of the size of

grain above described and is sharp and clean.

Mr. Clarke says that when the sand was formed of a mixture of fine and coarse grains nearly as good results

mixture of fine and coarse grains nearly as good results were attained as with coarse grains alone.

Before leaving this subject it may be of interest to refer briefly to the experiments made at Wilhelmshaven in 1877 by H. Arnold, C. E., as published in the Journal of the Hanoverian Architects' and Engineers' Society for 1883, and from which it was found that the size of gaain and quality of the sand used in Portland cement mortar are important factors in its ultimate strength.
With six different kinds of substantially clean sands and the same brand of cement mixed into mortar in the pro-portions of three volumes of sand to one volume of

*Ab-tract of a report by the Executive Board of the City of Rochester, N. Y., prepared by Emil Kuiching, M. Am. Soc. C. E.

cement, the tensile strength after seven days ranged from 101 to 243 pounds per square inch, and after two

101 to 243 pounds per square inch, and after twenty-eight days from 133 to 311 pounds per square inch, thus exhibiting extremely wide variations, depending largely upon the size and roughness of the grains of sand.

In every instance it was found that a greater strength was developed with a coarse-grained sand free from very fine particles and dust, than with a fine-grained sand, both being equally sharp. Mr. Arnold also points to the fact deduced from his experiments, that with the same cement but different sands of similar size of grain, the cohesion of the mortar may be found to vary considerably, and well of the mortar may be found to vary considerably, and with probably depend upon the chemical composition of the sand. He, therefore, concludes that in order to obtain satisfactory results from the cement mortar used in the construction of public works, the quality of the said available in the particular locality should first be taken into careful consideration.

If no other than a fine sand happens to be available and a given strength of the mortar is to be attained at the end of one week, experiments should be made to learn whether the proportions of sand to cement named in the specifications should be changed, since the strength diminishes rapidly with the quantity of sand used; and in such an event it may also be advisable to use an entirely different kind of cement. It is a necessary condition of success in mortamaking that every particle of the sand or "aggregate" be completely covered with the cement or "matrix"; and since, when the grains in a given volume are small, the magnitude of the total surface to be covered is greater than when the grains are large, it follows that fine sand requires a larger proportion of cement than coarse sand. Any specification or plan contemplating the use of a good coarse sand must, therefore, be altered if fine sand alone is used, or else the quality of the work will be impaired.

In support of the foregoing remarks, it has been quite generally observed by engineers that when most of our American natural cements are mixed entirely with fine sand, the process of hardening is greatly retarded, even if not entirely prevented, while the same cements, when tested not entirely prevented, while the same cements, when tested neat, exhibit a cohesive strength ranging from 50 to 136 pounds in twenty-four hours, thus showing conclusively the effect of admixing the fine material. An instructive pounds in twenty-four hours, thus showing conclusively the effect of admixing the fine material. An instructive instance of this kind was noticed in this city about a year ago, where an excellent quality of Akron "Star" cement was mixed with very fine sand from the Pinnacle pits in the proportion of 2½ sand to 1 cement. For several days the mass remained in a plastic state in the tin can in which it had been deposited, and upon being removed and exposed to the air upon a window sill for several mostly. exposed to the air upon a window sill for several months, it displayed very little strength and broke in handling. On the approach of cold weather, the largest fragment was kept in an apartment constantly heated by steam, and alter lying undisturbed therein for three months, pieces could asily be broken off with the fingers. At the present time, after having attained an age of one year, it is still quite friable and entirely unfit for use. Another mass of mortar prepared at the same time from the same cement, but with clean, coarse sand, mixed in the proportion of 3 sand to 1 cement, indurated promptly and exhibited far better qualities. qualities.

IMPURITIES IN SAND.

In order to determine what amount of lime, loam, or clay might be added to the sand of a cement mortar for the purpose of making the same more plastic, and at the same time without seriously affecting its strength, Mr. Charles Colson, C. E., made a large number of excellent experiments, which were submitted in 1878 to the Institu-tion of Civil Engineers, London. As a result he found that the addition of lime and loam reduces the initial strength of the mortar considerably, the reduction due to the addition of loam being more marked than by the addition of lime. A quantity of either of these substances amounting to one-twelfth of the volume of the sand was amounting to one-twelfth of the volume of the sand was found to be as large as could be admitted in the mixture with Portland cement to give, after six months, a cohesive strength equal to that of English gray-lime mortar of the same age. Thus, with three different samples of gray lime, mixed in the proportion of two sand to one lime, the tensile strength of the mortar after six months ranged from twenty-seven to forty-seven pounds per square inch; with Portland cement mixed eight sand to one cement, the arti-Portland cement mixed eight sand to one cement, the average strength was sixty-nine pounds per square inch: and by adding to this latter mortar an amount of quickline or loam equal to one-twelfth of the volume of sand the or loam equal to one-twelfth of the volume of sand, the strength was reduced to fifty-nine pounds and thirty-eight pounds per square inch, respectively. It will accordingly be seen that even after so long a period as six months, the addition of so small a proportion of loam reduces the tenacity of the mortar nearly one-half. It should also be remarked that the principal object of Mr. Colson's tests was to ascertain what proportion of Portland cement and would produce a mortar equal in strength to and as convenient to work as oray-line mortar mixed in the noconvenient to work as gray-lime mortar mixed in the proportions usually adopted for building purposes.

Another interesting series of experiments with Porland cement mortar, in which the sand used contained more or less peaty matter or vegetable mold, has quite recently been published by Mr. O. Lieven, Superintendent of a certain cement factory in Russia. The sand here contained 4.3 per cent. of humas and the moster made with it failed 4.3 per cent. of humus, and the mortar made with it failed to harden appreciably, even after a month's exposure in either air or water. Like results were obtained when the same sand was mixed into mortar with other brands of Portland coment. To show that shows a more were not Portland cement. To show that these cements were not at fault, they were mixed with clear standard sand, from any admixture of vegetable mold, in the usual proportions of three sand to one cement, and the mortans

acquired a tensile strength of 178 pounds per square inch after twenty-eight days. Mr. Lieven is of the opinion that the humic acid contained in the peat or vegetable mold unites with the free lime or lime compounds in the cement to form a kind of soap which envelops the smallest particles of the mortar and prevents the same from adhering together.

COMPOSITION OF MORTARS.

Debauve, in his large and excellent work entitled "Manuel de l'Ingenieur des Ponts et Chaussées," Fasicule 4. page 198, gives the following table showing the compo-sition of various mortars according to the best French authorities cited by him:

	Pa	ts by	Parts by measure of	of.	
KIND OF MORTAR.	Lime.	Puzzolana.	Cement.	Sand.	Remarks.
Common lime morter	3			2 8	Sand to be sharp and coarse
Same for outside walls	1.00			2.57	Sand to be sharp and coarse.
Lime and Puzzolana	1.00		:	3.76	Mortar slightly hydraulic.
Lime and Puzzolana	 8			2.78	Mortar strongly hydraulic.
Ordinary water lime	8	•	•	3. 8	• •
Strong water ime	_	1.00	:	2.50	Used in sewers of Paris.
Hydraulic lime for rendering					
or coating		1.00	:	2.27	Lime slaked by immersion.
Hydraulic lime of Theil	1.0	:	:	2.08	Harbor works of Marseilles, Toulon, etc.
Natural or " Koman " cement.	-	:	3 8	:	Neat for stopping springs or leaks.
Natural cement mortar				3. O	For rubble masonry, copings, etc.
Natural cement mortar	:	-	I.00	3.8	For walls not immediately loaded.
Portland coment mortar	:	:	: 8	2.40	For sea-wails, etc., face work.
Portland coment mortar	:	:	.8	3.69	For sea-walls, etc., backing and filling.
Portland cement mortar	:	:	<u>.</u>	ي. ن	For sea-walls, etc., coating or rendering
Portland cement mortar	:	:	٠ <u>.</u>	2.40	For arch masonry on land.
	:	:	1.00	3.œ	For backing or filling.

O ccasionally, for particular work, equal parts of cement ccasionally, for particular work, equal parts of cement and sand are specified, as for pointing mortar; but, as a rule it will be found that engineers at the present time require cement mortars for sewer, retaining wall and brid. ge masonry to be mixed in the proportions of one part of cement to not more than two parts of sand; and it is only when some particular brand of Portland cement has been satisfactorily proven to be capable of developing the requires is the appropriate are varied in such works. above proportions are varied in such works.

EFFECT OF FROST UPON MORTARS.

is a matter of common knowledge that ordinary quicklime mortar which is exposed to the action of frost before it has become well set or indurated will thereby become greatly injured in its adhesive and cohesive properties; and hence it is customary to suspend all building operations where such mortar is used on the arrival of the operations where such mortar is used on the arrival of the cold season. Should, however, it be necessary to proceed with the construction, experienced masons and builders sometimes make use of a quick-setting cement mortar in place of lime, and cease work when the weather is at all severe. It is, therefore, also of importance in private work to learn something of the behavior of cements under such a circumstances.

work to learn something of the behavior of cements under such circumstances.

The impression seems to prevail quite extensively that cement mortars are not appreciably injured by freezing, and that masonry may safely be constructed at any temperature below the freezing point, at which a man can still work, provided that either brine be used instead of fresh water, or that the materials be first heated. With regard to the use of brine or salt, it may be remarked that when the mortar will be injured thereby or not seems to depend principally upon the character of the cement. Most pend principally upon the character of the cement. To the natural or "Roman" cements suffer a considerable loss of strength if mixed with salt water, while the land cements do not appear to be materially affected.

Respecting the practice of heating the cement, sand water before mixing, and then using the hot mortar in old weather upon frosty stones or bricks, or depositing it in icy water, the experiments of William W. Mac ay. C. E., submitted in 1877 to the American Society of Civil Engineers, show indisputably that such a met of injury is effected when heated mortar, even if met od of treatment is entirely erroneous, and that a great amo nt of injury is effected when heated mortar, even if mad of Portland cement, is immersed directly in cold water. The tests were all made with Burham Portland cement which, when tested neat at ordinary temperature, a tensile strength of 278 pounds per square inch after several days. In one series of experiments, the ingredients of its mortar all had a temperature of about 40° Fah, and another they were heated to 100° Fah. These two sets briquettes were kept for seven days in precisely the manner, and were broken on the same day, so that hanges in temperature during this period would necessarily affect them alike. The averages of the tensile strengths acquired show that by first heating the ingredients to about 100°, then mixing them in air having a temperature of from 13' to 37°, and then upon exposing the briquettes for six days to the winter weather, their strength in the case of neat cement was only from 7 to 20 per cent. of that attained when the materials were mixed without heating, or with the temperature of the mortar at 40°; and in the case of mortar mixed in the proportion of 2 sand to 1 cement, the tensile strength of the heated mortar after 28 days was only 30 per cent. of that reached by the cold mortar at 40°. From these and other similar experiments Mr. Maclay concludes that the mixing of cement mortar with highly heated materials, for use above water in very low temperatures, greatly reduces its normal strength, and that for use below icy water its value will thereby be almost entirely destroyed. If mortar must be essarily affect them alike. The averages of the tensile thereby be almost entirely destroyed. If mortar must be used at all in such weather it should be used cold, and the used at all in such weather it should be used cold, and the only condition to be observed is that the materials shall be free from frost at the time of using. "In the experiments where the materials were mixed cold and then exposed to the winter weather, Portland cement mortar appeared to set without freezing, even in as low temperature as 13° Fah., except when it was windy; but where the briquettes were made of hot mortar they invariably froze as was proven by their becoming soft again when froze, as was proven by their becoming soft again when the temperature rose."

Portland cement was found to possess the peculiarity, also noticed by many other writers on the subject, of setting in a low temperature, wherein other varieties of cement will surely freeze. No definite limits of this action, however, have yet been assigned. Mr. E. Leblanc exposed cakes of Portland cement mortar to frost immediates. ately after mixing, and before any setting had occurred, with the result that "they cracked deeply, and in part

incurred by such freezing ranging after seven days from 2 to 22 per cent. in the case of neat cement, and from 3 to 24 per cent. in the case of the mortar mixed as above 24 per cent. in the case of the mortar mixed as above described; also ranging after twenty-eight days from 2 to 12 per cent. in the case of neat cement, and from 1 to 33 per cent. in the case of the mortar. It should be noted particularly that the foregoing results were derived when, pure, clean, and standard materials only were used. On the other hand, where the cement was adulterated with 30 per cent. of pulverized slag from a blast furnace the loss in strength by freezing was much greater than above given, especially in the case of the mortar. After seven days, this loss ranged from 6 to 62 per. cent., and after twenty-eight days from 21 to 44 per cent., standard sand having been used.

Other interesting experiments with regard to the effect of frost on Portland cement mortar were carried out early in 1886 at Hamburg, Germany, by Mr. M. Moeller, C. E., and an account thereof is contained in the "Deutsche Bauzeitung" for November 17, 1886.

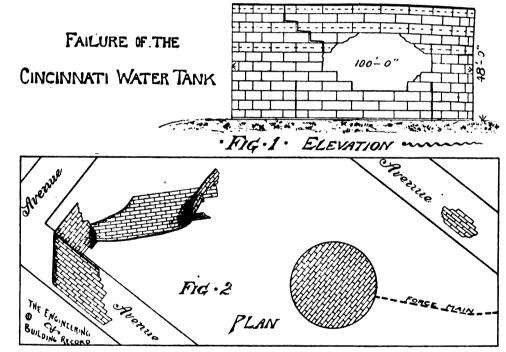

(To be continued.)

(TO BE CONTINUED.)

THE BURSTING OF A WATER-TANK IN CIN-CINNATI IN 1881.

THE epidemic of water-tank disasters which visited this country last fall has happily ceased, but its recollection is still sufficiently fresh to lend interest to the following account of a similar occurrence in Cincinnati nearly seven years ago, taken from the report of Mr. A. G. Moore, Superintendent and Engineer of the Water-Works of that

The tank, which was designed by Mr. Moore's prede

became disintegrated, but the detached fragments after being thawed were found perfectly hard." In Mr. Mac-lay's experiments none of the Portland cement briquettes lay's experiments none of the Portland cement briquettes when mixed cold cracked in the slightest degree, even when exposed to as low a temperature as 11° Fah., and they all became hard after thawing. This seems to be the prevailing opinion among engineers. Mr. J. Dutton Steele, C. E., in discussing the paper of Mr. Maclay, states that "cement mortar is not seriously impaired by being laid in frost, as its property of setting is simply held in suspense during the time it remains frozen." Gen. Q. A. Gillmore, U. S. A., in his work on "Beton," etc., remarks that "when the temperature is not much below the freezing point during the day work may be safely carried on, if care be taken to cover over the new material at night. After it has once set, and has had material at night. After it has once set, and has had a few hours to harden, neither severe frost nor alter-

a few hours to harden, neither severe frost nor alternate freezing and thawing has any effect upon it."

In the report of the work performed at the Royal Testing Laboratory of Berlin for 1886, there is an account of a number of experiments for ascertaining the effect of frost upon the strength of Portland cement, both neat and when mixed into mortar in the proportion of 3 parts of sand to I of cement. These tests were made in two distinct series, the first one involving only a single exposure to frost on and during the sixth day after mixing, while in the second series the briquettes were treated as follows: first, allowed to indurate for twenty-four hours in the air of a warm room: second. exposed for twenty-

follows: first, allowed to indurate for twenty-four hours in the air of a warm room; second, exposed for twenty-four hours to a freezing temperature of from +10° to +5° Fah.; third, thawed four hours in a warm room; fourth, placed under water until tested.

The experiments were made with six different brands of cement, and for each set of briquettes exposed to frost another similarly constituted set was kept in temperatures above the freezing point to serve as a basis of comparison of tensile strength. Upon testing the frozen and unfrozen samples, it was found that the effect of frost varied greatly with the quality of the cement, the loss in tensile strength

cessor, was of Bessemer steel, 100 feet in diameter and 48 feet high, and, when filled to its intended depth of 46 feet. held about 2,700,000 gallons.

The cylinder was composed of 12 courses of plates, 12 feet long and 4 feet high, varying in thickness from the bottom up as follows: $\frac{5}{8}$, $\frac{7}{16}$, $\frac{7}{2}$, $\frac{7}{16}$, $\frac{3}{8}$, $\frac{5}{36}$, $\frac{5}{16}$, $\frac{5}{16}$, $\frac{7}{16}$, and the upper courses were stiffened by internal angles and channels, presumably where indicated by dotted lines on Fig. 1. All the horizontal joints were lapped and single riveted, the vertical joints in the six lower courses were butted, strapped and double riveted and in the six upper ones were lapped and double riveted. The floor was also of 4x12 plates, all 3/6inch thick, with lapped and single-riveted joints. A ring of angle iron 4"x6"x¾" connected the sides and floor by one and two rows respectively of 15-inch rivets. The foundation seems to have been sufficient and was covered by a layer of sand on which the tank was supposed to have acquired a uniform bearing.

The contract provided that specimens from each plate should show a tensile strength of at least 65,000 pounds per square inch. This appears to have been fully complied with; the strength as recorded varying from 71,000 to 90,000 pounds.

Specimens tested from the broken plates after the accident showed a strength of from 70,120 to 75,200 pounds; an elastic limit of from 39,727 to 44,300 pounds, and a reduction of from 31.4 to 46.5 per cent.

The tank was completed in the fall of 1880 and remained empty until the 17th of June following when water was let in, and, twelve days later, when the water had reached a depth of 391/2 feet, a rupture occurred at the top edge of the third course, at a distance of 12 feet from the bottom of the tank, and immediately at the junction of the abutting plates of the fourth course. It extended through the solid plates and through the riveting, both vertically and horizontally; a section 24 feet in height by 48 feet in length being carried some 100 feet distant.

From the initial rupture the fracture descended vertically through the solid plate of the third, the vertical joint of the second, and the solid plate of the first course to its connection with the bottom, and from the top edge of the dislodged section it ascended obliquely through riveting and solid plates to the top. The entire remaining cylinder was torn from the bottom and deposited at a distance of about 150 feet from the foundation. The bottom remained in position, receiving only slight distortions.

In separating from the bottom the 5%-inch plate of the cylinder tore through the single line of rivets connecting it with the angle-iron ring before mentioned.

Figure 1 shows the location of the rupture, and Fig. 2 the location of the fragments after rupture.

The foregoing data will show that with the amount of water in at the time of rupture the factors of safety in the cylinder were as follows: at its lower edge about 3, and at the upper edge of the third course, where rupture began, about 41/2. The workmanship seems to have been good, and, although the margin of safety with a full tank was small, being only a little over 21/2, there does not seem to be anything in the structure of the tank to explain its failure, and we are inclined to agree with Mr. Moore, who says, that, in his judgment, the material, although possessing high tensile and fair ductile properties, could not withstand the aggravation of the excessive and continuous distortions which were caused by the prevalent high winds during its construction, which extended through many months, and adds: "At the period of my accession to this office the structure was advanced to thirty-two feet in height, and it was so readily disturbed by the wind that the workmen were at times compelled, for safety, to desert the scaffolding. Action was at once taken to stiffen the succeeding courses, but my impression is, that the integrity of the preceding work must have been reduced, as the immense diameter of the tank favored excessive vibration.

Our readers will remember that a similar cause was suggested by Mr. John F. Ward as a possible reason for the fall of the Seneca Falls stand-pipe. The lesson for tank and stand-pipe builders is too obvious to need further comment.

THE REMOVAL OF THE WELLS STREET BRIDGE, CHICAGO.

THE old bridge crossing the Chicago River at Wells Street was an iron structure built by Fox & Howard shortly after the fire. It was a draw-bridge 185 feet over all, with trusses spaced 19 feet 3 inches apart between centres, and two sidewalks outside of the trusses. The width of this bridge being inadequate for the traffic over it, contracts were let by the city for the building of a new bridge 60 feet wide.

The usual procedure in cases of this kind is to sell the iron in the old superstructure for scrap. In this case an agreement was made between the city and the North Chicago Street Railroad Company, whereby the latter company, in exchange for certain privileges granted, was to build piers and abutments at Dearborn Street, and to remove the old superstructure of the Wells Street bridge to Dearborn Street, the new masonry to be built of proper dimensions for this purpose. Dearborn Street is three squares east of Wells Street.

It was found that any other plan than moving the superstructure bodily was impracticable, because of its peculiar

construction. The top chord consists of four channel bars with top plate. These parts break joint in such manner that, in order to separate the chord into sections, it would have been necessary to cut out practically all the rivets. Suspension bars, lateral rods, etc., are adjustable members, and it is doubtful if the nuts for these could have been taken off without damage.

The plan of moving was as follows: Four scows, about 20 feet wide by 40 feet long each, were hired and were fitted with trestles on their decks as shown in the illustration. Two of these scows were placed under the middle of each arm of the bridge. The trestles were built to such a height that they would just clear the bottom of the bridge after sinking the scows nearly to the level of the water. The scows were sunk by boring holes in their bottoms and allowing the water to nearly fill them, after which the holes were plugged. After the scows with their trestles were placed in position under the bridge the water was pumped out and sufficient power was thereby obtained to lift the superstructure off of its supports. The drum was left attached to the trusses and transported with them. The scows, with the superstructure on top of them, were then floated down the stream with the current, the bridge, however, being first brought parallel to the stream by holding one end and allowing the other end to swing around with the current. The bridge was floated in this position through Clark Street bridge, which was swung open for the purpose. At Dearborn Street the bridge was turned around at right angles to the stream, and after placing it over the new centre pier the scows were again filled with water and removed with their trestles from under the bridge.

The work was done safely and quickly. Owing to ice and rain in the morning, operations were not begun until early in the afternoon of March 26. The rain had then ceased, but a strong west wind was blowing, which caused the current in the river to set towards the lake and lowered the surface of the water about six inches while the pumping was going on. Two tugs had been engaged, which assisted the men in the pumping. It took about three hours to empty the scows of their water.

As the bridge was lifted off the centre pier it was easy to see if there was any swaying. None, however, was perceptible except occasional slight oscillations. structure in floating down the river was very steady. In order to keep clear of the piers and pile-work at Clark Street the men, to the number of twelve, would move to one edge of the scows, but no swaying of the superstructure was apparent even then. The scows also scraped against obstructions on one or two occasions, but this caused no indication of danger.

It had been the intention to tow the structure by hand. but as the tugs had been engaged for pumping purposes and were on hand, and it was found perfectly safe to have them take the structure in tow, this was done, one tug being attached to the forward end of the forward scows and the other being attached to the rear end of the rear scows.

The latches holding the bridge to the abutments at Wells Street were drawn at about 4:45 P. M., and the moving was completed at about 6:15 P. M., at which time the superstructure rested safely on the centre pier at Dearborn Street, which, being higher by about 18 inches than the centre pier at Wells Street, it was found to be more convenient to move the wheels and track of the centre at a later day. Meantime bars of 4\%-inch round iron were used on which to turn the bridge temporarily, so as to have it point up and down stream.

wood-work in the old bridge was in such poor condition that there was no object in preserving it, and it was removed before the scows were placed in position. The metal work carried by the scows weighed about 120 tons.

The bridge will be put in use at Dearborn Street as soon as the approaches are completed, but as the city has not appropriated money for these, considerable delay may be

We are indebted for the above account to Mr. C. L. Strobel, M. Am. Soc. C. E., who planned and personall; superintended the entire operation, having taken the contract for it on behalf of the Keystone Bridge Company, of which he is the consulting engineer.

THE MANUFACTURE OF IRON AND STEEL IN INDIA.

THE manufacture of iron and steel appears to have been known in India much earlier than in Europe.

The Kutub pillar near Delhi is a prominent memorial of old Indian blacksmiths' art, and it would rather embarrass our modern European ironmasters, notwithstanding all their advanced appliances, if they had to produce such a piece of art as the wrought-iron column of Kutub in the way as it was produced some 1,600 years ago by Indian blacksmiths with their primitive machinery.

This column has a total height of twenty-three feet six inches, with a diameter of 16½ inches at base and twelve inches below the capital, the latter being 3½ feet high. Below the surface it expands to a bulbous form of two feet four inches in diameter and rests on a gridiron of iron bars

fastened with lead into the stone pavement.

This pillar has evidently been formed by gradually welding small pieces of iron together, but notwithstanding this rather difficult process, it shows no trace of a weld seam and no sign of rust, although exposed to the atmos-

phere for more than 1,000 years.

From the inscription which this column bears, *Indian Engineering*, from which this account is taken, concludes

Wrought-iron cannons of extraordinary length have been made in Assam without doubt, in a similar skilled way and difficult manner as the Kutub pillar at Delhi.

First, however, in importance in the history of Indian iron and steel industry is the fact that cast steel was made in India long before the manufacture of this most important metal was commenced in Europe, and that the excel-lent quality of Indian cast steel ("Wootz") has not been

reached in Europe as yet.

It is also hardly known that the material for the Damas cus blades, so celebrated in the middle ages and up to the last century, was made at Nirmal, a now rather important village in Hyderabad, from where Persian traders imported the same to Asia Minor, in spite of the great expenses, hardships, and even dangers they had to overcome to acquire this costly material from such an out-of-the-way

country, and so very difficult of access at that time.

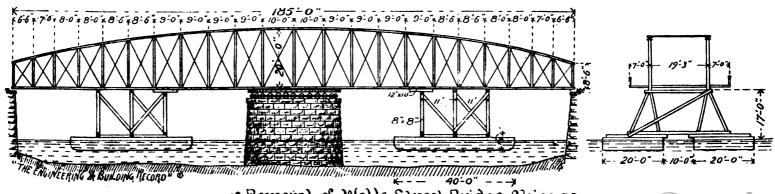

The methods employed by the natives of India for the production of iron and steel, of course, differ in their details with the different countries where they are practiced; they all correspond, however, in the following points:
(1.) All their methods are based on the use of vegetable fuel and no mineral suel is required. (2.) They all used compressed air for burning their suel. (3.) The methods are carried on on a small scale in each case. (4.) The quality of wrought iron or steel produced is in each case a most superior one. The following is a description of a native iron-works in Central India. The smelting-furnace is a shalt of clay, one foot square and three feet deep; this shaft is entirely filled with charcoal, and a charge of forty pounds of iron ore is heaped up over it; then the lighting and blowing commences. The bellows consist of two cylindrical leather bags which are pressed down alternately, whereby the compressed air is driven in a continuous stream into the oven through the funnels of clay, situous stream into the over through the tunnels of clay, situated about nine inches above the bottom of the furnace. After a couple of hours' blowing and several replenishings of charcoal, the smelting process is complete, when the master of the work draws from the bottom of the furnace. with a pair of tongs, an unshapely lump of iron, weighing from eighteen to twenty pounds; this is then dragged to the front of the building, when it is beaten with hammers till it is reduced to a disk of six to eight inches in diameter and two inches in thickness. As the natives add nothing to the ore in the furnace, the loss of metal through slagging is considerable. In this manner the work is continued ceaselessly for twenty-four hours, after which the furnace ceaselessly for twenty-four hours, after which the furnace requires repairing. During this time four laborers and one master are employed, the latter generally the owner of establishment.

The five men during the twenty-four hours turn out 165 pounds of half-finished iron.

The refining and finishing processes are carried on in rough open forges, and the articles manufactured are horse-

shoes, spades, clamps, and other small objects.

The same quantity of iron goods made with the present European appliances would consume but one-third of the fuel and one-half of the ore used by the native method.

~ Removal of Wells Street Bridge Chicago.

MAJOR-GENERAL Q. A. GILLMORE, U. S. A.

MAJOR-GENERAL QUINCY ADAMS GILLMORE, United States Army, died on the 7th inst. at his home in Brooklyn. He had been ill for about two weeks previous to his death with a complication of liver and kidney troubles, but for many years he suffered from malaria, contracted in the South during the war.

General Gillmore was born at Black River, Loraine County, Ohio, on February 28, 1825, his father being one of the earliest settlers of Ohio. He gained his early education in the country school, and later studied at the Norwalk (Ohio) Academy. For three years preceding his twentieth birthday he taught a district school and attended two terms at the high school in Elyria, Ohio.

He entered the academy at West Point in 1845, and graduated with high honors in 1849, standing first in his class of forty-three. He served as an assistant engineer in the building of Forts Monroe and Calhoun for the defence of Hampton Roads, and in 1852 he was made Assistant Instructor in Practical Military Engineering at the West Point Academy.

In 1856 he was promoted to a first lieutenancy, and was in charge of the fortifications in New York Harbor when the rebellion broke out. As Chief of Engineers he accompanied the Port Royal Expeditionary Corps, and took a prominent part in the operations upon Hilton Head, S. C.

General Gillmore took an active part in the seige of Fort Pulaski. He superintended the erection of the fortifications and commanded the troops in the engagement. The capture of the rebel stronghold in the Savannah River, through the superiority of his work and the skillful use of his artillery, at once established General Gillmore as a military man of rare merit, and he was rewarded by a promotion to Brevet Lieutenant-Colonel.

On March 30, 1863, he administered a crushing defeat to General Peagram in the battle of Somerset, for which he was brevetted Colonel, and later was given command of the Department of the South.

In July of the same year he was given command of the Tenth Army Corps, and directed the memorable operations against Charleston, S. C., which were characterized by marked skill and boldness, and resulted in his promotion as major-general of volunteers.

He was in command of the Tenth Army Corps at James River in 1864, and took an active part in the landing at Bermuda Hundred and the action at Swift's Creek. He was next engaged in the operations before Petersburg, and later commanded two divisions of the Nineteenth Army Corps in the defence of Washington.

During the pursuit of the rebels under General Early General Gillmore was severely injured by the falling of his horse, but was again in command of the Department of the South in 1865.

In December, 1865, he resigned his commission as major-general of volunteers, and returned to service in the Engineer Bureau at Washington, being subsequently appointed engineer-in-chief of all the fortifications and river and harbor improvements on the Atlantic coast south of New York. He was president of the Mississippi River Commission and of several boards for important river and harbor improvements, and as one of the judges at the Centennial Exposition in 1876 he made interesting reports on "Portland, Roman, and other Cements, and Artificial Stones," and on "Brick-making Machinery, Brick Kilns, Perforated and Enameled Bricks and Pavements." General Gillmore wrote a number of works on professional subjects that rank as authorities, among them being "Limes, Hydraulic Cements, and Mortars;" "Belton, Coignet, and other Artificial Stones;" "The Strength of the Building Stones of the United States," and "Roads, Streets and Pavements."

Oberlin College, O., conferred upon him the degree of Master of Arts, and Rutgers College that of Doctor of Philosophy.

General Gillmore was at one time president of the Kings County "L" road. He was married twice. Four sons by his first wife survive him.

He was buried at West Point.

STEEL VERSUS WROUGHT IRON FOR BUILDING PURPOSES.

THE following extract from a letter of Mr. C. L. Strobel, Mem. Am. Soc. C. E., not written for publication, will be found of interest:

"I have read the article 'Steel versus Wrought Iron for Building Purposes' in the issue of March 17, and you

are undoubtedly correct in the position you have taken are undoubtedly correct in the position you have taken. There is one element of economy, however, in favor of steel beams which was not mentioned. The lightest weight of 15-inch iron beams is 50 pounds per foot; whereas 15-inch steel beams are rolled weighing 41 pounds. The lightest weight of 12-inch iron beams is 42 pounds per foot; whereas 12-inch steel beams are furnished weighing 32 pounds, etc. If, therefore, a 12-inch 42-pound iron beam is required to carry a certain load, a 15-inch 41-pound steel beam can be substituted for it, giving not only much greater strength, but much less deflection as well.

""The rolling of these light sections in iron is difficult

"The rolling of these light sections in iron is difficult

"In connection, with the question of safety of metal constructions for buildings, I wish to call your attention to the general use of cast iron for columns. Formerly loads carried by columns were generally light, and the sections provided much in excess of the requirements. Of late, however, columns have assumed a much more important function in buildings. For high office buildings, warehouses, apartment houses, etc., the columns practically carry all the weight of the different floors in the building. The walls serve in many cases simply to fill in and form The walls serve in many cases simply to fill in and form an outer shell for the building. The factor of safety used is sometimes as low as 6. Practically no tests are made on cast iron as to quality. The columns are cast on their side, not on end as is usually called for in the case of water-pipe. The result is that in many cases the columns are very thin on one side and excessively thick on the other. Cast iron strutt taken out of old bridges show the other. Cast-iron struts taken out of old bridges show plainly how very unreliable castings are when made in this way. It is true that in buildings the loads are quiescent, but this does not improve matters much. A further consideration that should not be lost sight of is that the loads carried by the columns are almost invariably eccentric, so that cross strains are added to the direct compression. sive strains, thereby largely reducing the factor of safety.

ENGINEERS' CLUB OF ST. LOUIS.

THE two hundred and ninetieth meeting of the Engineers' Club of St. Louis was held at Washington University, April 4, 1888, President Holman in the chair, W. H. Bryan, Secretary, twenty-four members and four visitors present. The Executive Committee recommended Russell Parker for election to membership. He was balloted for and elected.

The report of the Special Committee on resolutions appropriate to the death of Frederick Shickle was adopted. Resolved, That, by the death of Frederick Shickle, the Engineers' Club of St. Louis has lost a most valuable member, one who has been with us from the beginning as a charter member, and whose zeal and life have been devoted to engineering pursuits-a man endeared to his fellow men by his kind and genial bearing and his ever courteous and upright conduct.

"Resolved, That we extend to his bereaved family our profound sympathy; and

"Resolved, That a copy of these resolutions be suitably prepared and presented to the family of our lamented

T. A. Meysenburg, William Wise, Committee.

The president presented a communication from L. E. Cooley, President of the Council of Engineering Societies on National Public Works, on the subject of "Reorganization of National Public Works." On motion it was made the special order for the next meeting, April 18.

The Secretary then read a paper on "Railroad Location; Field Practice in the West," by Willard Beahan. The author explained the difficulties to be overcome, and the most common methods employed. He also gave his own method, which he stated he had used largely, with very satisfactory results. The paper was discussed by Prof. Johnson and Messrs. Wheeler, Seddon, Moore, Bouton and Clark. There was considerable diversity of opinion as to the best method to follow.

Professor Nipher explained to the club a calorimeter he had prepared for the purpose of determining the heat value of fuels. The apparatus was shown and a test made. After some general discussion of Western fuels, the meeting adjourned.

FIFTH ANNUAL WATER REPORT OF MADI-SON, WISCONSIN.

THE report to the Water Commissioners of Madison, Wis., of their Superintendent, Mr. John B. Heim, contains, besides the usual local details, some matters of gen-

The population of Madison in 1885 was 12,063, and it is supplied with water under direct pressure pumped from seven artesian wells by two non-condensing Reynolds-Corliss engines combined with Knowles pumps of a joint capacity per twenty-four hours of 4,000,000 gallons. They pumped during the year 261,308,160 gallons, against

an average head of 224 feet, which gives 720 gallons per an average near of 224 feet, which gives 720 gailons per day to each of the 980 water-takers. This required 562 tons of anthracite coal, containing 86 per cent. of com-bustible, costing \$6.24 per ton, and burnt at the rate of 5.17 pounds per square foot of grate per hour. The cost 5.17 pounds per square foot of grate per hour. The cost of the coal required to raise 1,000,000 gallons one foot high was 5.98 cents, and the duty per 100 pounds of net combustible was 49.730,400 foot pounds. The revenue was \$13,470.69, and the operating expenses \$8,739.73, of which \$3,507.50 was for coal. The previous year Indiana block coal was used at a cost of \$2,747. The change was made in deference to the wishes of those who objected to the soot and smoke of soft coal.

The six reterior wells seemed to interfere with each

The six artesian wells seemed to interfere with each other, causing a deficiency in the supply, and the Shaw gang-well system used in Brooklyn, N. Y., was investigated, but found not suited for the location, so another six-inch well was bored and tubed 200 feet to rock, which gave a daily outflow of 115,000 gallons, and two more such wells have been contracted for. All persons have the privwells have been contracted for. All persons have the privilege of putting in meters at their own expense if dissatisfied with the water-rates. No kind of meter is specified, and only five are in use. The rates per 100 gallons are as follows: less than 300 gallons per day, 5 cents; 300 to 400, 4 cents; 400 to 1,000, 3½ cents; 1,000 to 5,000, 2½ cents; 5,000 and over, 2 cents. No rate to be less than

An interesting diagram is given showing the pumpage for each day, which varied from 455,400 gallons in April to 1,016,500 in August. There is also a map showing the location of all mains and hydrants with the normal pressure per square inch available at each of the latter.

Waste of water seems to be giving the usual amount of trouble. As soon as cold weather set in, in December, 1886, the consumption increased 25 per cent., with the result that during a night fire lasting less than three hours the pressure fell more than one-third at the pumping station, and when the regular consumption began in the morning suction was lost altogether, but, most fortunately.

by that time the fire was extinguished.

Careful inspection reduced the consumption from 25,000,000 gallons in December to 23,000,000 in January, and 17,000,000 in February, with no trouble from freezing of pipes. When inspection ceased the waste increased of pipes. When inspection ceased the waste increased again until 26,000,000 were used in August, which inspection again reduced to 21,000,000 in September. A lake connection is recommended to be used in case of fire, to be of 14-inch pipe carried out to 40 feet of water, at an

estimated expense of \$6,000 to \$8,000.

Six water-motors are in use and it has been decided not to permit the use of any more except for sewing machines, and it is recommended that sprinkling carts be filled from tanks only.

NASHVILLE MEETING OF AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

THE seventeenth meeting of the American Society of

OF MECHANICAL ENGINEERS.

THE seventeenth meeting of the American Society of Mechanical Engineers will convene in the city of Nashville, Tenn., on Tuesday, May 8, at 8 P. M., and will adjourn on Friday of that same week. The headquarters will be in the Maxwell House.

The exact details of allotment of sessions, etc., will be given on the docket which will also give the order of presentation of papers and which will be distributed in headquarters as a condensed programme.

The following papers are to be presented in the sessions and discussed: "Duty Trials of Pumping Engines," J. S. Coon; "Surface Condensers," Jay M. Whitham; "Large and Enlarged Photographs and Blue Prints," R. H. Thurston; "Proportioning Steam Cylinders," R. H. Thurston; "Automatic Regulator for Heating Apparatus," John T. Hawkins; "A Plea for the Printing Press in Mechanical Engineering Schools," John T. Hawkins; "A New Method of Inserting and Securing Crank Pins," C. C. Collins; "Estimating the Cost of Foundry Work," George L. Fowler; "A Safety Car-Heating System," Henry R. Towne; "Connecting Rods," William F. Mattes; "Notes on Warming Railroad Cars by Steam," William J. Baldwin; "A Foundry Cupola Experience," Frederick A. Scheffler; "The Best Form of Nozzles and Diverging Tubes," A. F. Nagle; "The Tetra Basic Phosphate," Jacob Reese; "Strains in Locomotive Boilers," L. S. Randolph; "Steam Excavators," W. L. Clement; "An Electric Speed Regulator," George H. Barrus; "The Effect of Circulation in Steam Boilers on Quality of Steam," George H. Barrus; "A Short Way to Keep Time and Cost," H. L. Binsse; "The Distribution of Steam in the Strong Locomotive," F. W. Dean; "River Practice of the West," John M. Sweeney; "A Persistent Form of Tooth," J. Burkitt Webb; "Wire Rope Fastenings," William Hewitt; "The Lateral Curves of Fishes as Offering Resistance," Harry de B. Parsons; "Mechanical Significance of Determination of Viscosity of Lubricants," J. E. Denton. Subjects and queries will also be presented for the topical discussions. Subjects and queries will also be presented for the topical discussions.

Special arrangements with railroad companies for reduced tates have been made, amounting to one and one-third fare instead of two for a round trip. For further particulars address the Secretary, F. R. Hutton, 280 Broad-

A WATER-MAIN BURSTS IN BOSTON.

THE 36-inch water-pipe that supplies the Fisher Hill reservoir from the Chestnut Hill reservoir burst in Beacon Street, Boston, on the night of the 5th instant, but was fortunately shut off so promptly that little damage was done beyond a local washout.

A LECTURE ON PLUMBING BEFORE THE NEW YORK TRADE SCHOOL.

No. II.

(Continued from page 280.)

In apartment houses where, boilers on several floors are supplied by the same vertical branch from the street main there is danger that if the lower stories use all the supply it may result in collapse of the upper boilers. This can be remedied by using an expansion-pipe, as shown in dotted line, Fig. 25, which will furnish air to prevent the possibility of a vacuum and consequent collapse. If this pipe is inadmissible vacuum-valves made to admit the air whenever there is any tendency to collapse may be used.

In Fig. 25, B B B are the boilers, W W W the water-backs, and H H II the hot-water service-pipes connected at C C C with the expansion-pipe D E, and fitted with swinging valves, V V V, that open only away from the boilers and will admit air when there is suction in the pipe. A is a stop-cock in supply-pipe F K.

Figure 19 shows an arrangement sometimes found, especially in stables, where, in order to secure a hot-water supply without expensive fittings, it is drawn directly from the water-back hot pipe without passing through any storage reservoir between water-back and faucet.

The trouble lies in the danger of burning or blowing up the water-back.

Frequently a coil of pipe is simply placed inside a round stove and connected at one end with the cold-water supply and at the other with the sink faucet.

This may answer if carefully watched and attended, but having no possibility of circulation requires frequent

drawing off, gives but a small supply of hot water, and is liable to burn out.

The New York Board of Health having required that each fixture shall be separately trapped, old systems are often altered in an attempted compliance, as shown in Fig. 16, where one trap at A was originally intended for both bowls and the trap B afterwards inserted and vented back to C on the vent-pipe from A. This makes a bad job worse, for the sewer-gas following the direction of the arrows finds an unobstructed entrance into the house.

This should be prevented as shown in dotted line, C D, by connecting waste-pipe from E to main waste.

In a tall building supplied with cold water from a storage-tank on the upper floor it is sometimes found impossible to draw water from the upper faucets.

This is occasioned by the great pressure in the bottom of the supply-pipe which forces the water through the lower faucet with such a velocity as to discharge it all as fast as the pipe can deliver it, provided the faucet happens to be big enough.

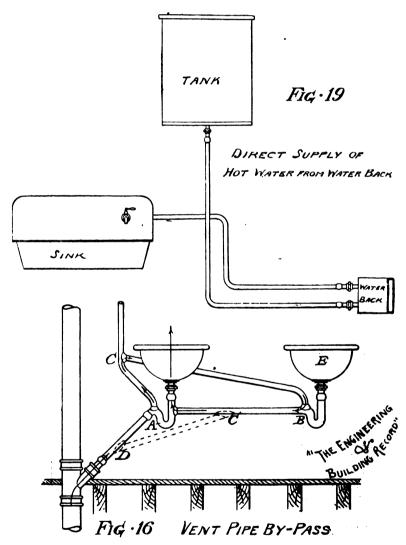

This is remedied by decreasing the size of the pipe from the top downwards. In a six-story house the pipe from tank to the fifth floor may be I 1/4-inch, thence to the fourth floor I-inch, thence to the third floor 1/4-inch, thence to the second floor 1/4-inch, and from the second to the first floors

The principal precautions are: (1) Placing them sufficiently deep in the ground; (2) keeping them away from outside walls; and (3) by properly felting them or packing in sawdust, mineral wool or other suitable material.

The bursting of pipes when they freeze is due to the expansion of the water, which increases its volume by about one-ninth, so that nine gallons of water when frozen would fill a 10-gallon vessel with ice, or ten cubic feet of ice when melted only produces about nine cubic feet of water.

The expansion of water in freezing has been determined by frequent experiments to be able to exert a pressure of about 30,000 pounds per square inch, an amount which compared with the 15 pounds per square inch exerted by a column of water 33 feet high, shows how impossible it would be for any pipe to stand it. Indeed, its tremendous power is illustrated by the practice in the Brooklyn Navy Yard of filling cannon with water, plugging them up, and allowing them to freeze, which bursts them into a thousand pieces.

If plumbing cannot be entirely protected from freezing, opportunity should be afforded for the emptying of pipes by proper grading to the lowest point where the danger ceases. When a pipe becomes frozen it may be thawed either by external heat, or, if it is straight and reason-

½-inch. This will furnish a proper supply at each faucet and prevent the lowest one from draining it away from all the rest.

When the house-supply is from a storage-tank in the top floor and the street-pressure will carry the water only part way up, it is often convenient to be able to draw at the lower faucets from either street or tank supply. This can be accomplished by putting a three-way stop-cock just below the level of street-water pressure and connecting it with the tank, the house-supply pipe, and the street-supply, so that while the house-supply is open turning the cock will admit street-water and shut off that from tank, or vice versa.

In this climate the freezing of water-pipes is a very serious danger, and since the Board of Health and Water Commissioners both lay the responsibility on the plumber and require him to prevent the necessity of letting water run to waste in order to prevent freezing, the problem of protecting water-pipes from frost is the most important and difficult one before the New York plumber.

ably short, an inaccessible pipe may be thawed by steam introduced through a rubber pipe and stop-cock with round waterway.

When pipes cross a floor over a ceiling it should always be protected from leaks by laying the pipes in a lead-lined trough, slightly inclined throughout its length, to a drippipe at either end that discharges in the cellar at the ceiling.

This precaution should always be observed, as the cost is trivial compared with the possible damage to the ceiling. It is, however, when possible, much better to avoid crossing the ceiling by running independent vertical lines up each side of the house.

Precautions should be taken to protect pipes from contact with fresh mortar, for the lime in it has a very corresive action on them.

GRADUATING EXERCISES OF THE NEW YORK TRADE SCHOOL.

THE presentation of well-earned diplomas to members of last winter's classes formed the principal feature of the pleasant exercises held last Friday, April 6, at the Trade School building.

Col. R. T. Auchmuty, who has individually founded

and maintained the schools, presided at the exercises, which he opened by a brief and earnest address, reviewing the scope and progress of the schools, and referring to the influence which its pupils might exert on the solution of

great labor problems.

Mr. John Burns made some stirring remarks, commending the assiduity and progress of the pupils, encouraging their further efforts and assuring them of the support of their friends who are encountering some opposition in the

attempt to provide trade instruction.

attempt to provide trade instruction.

General Daniel Butterfield, James Gilroy, of the Plumbbers' Association; G. Gill, of the Master Stone Cutters' Association; Joseph Scott, Chairman of the Committee of the Master Painters' Association; John J. Tucker, of the Master Builders' Association, and Prof. Thos. Eggleston, of the Columbia College School of Mines, officiated respectively in the presentation of diplomas to members of the classes in bricklaying, plumbing, stone-cutting, house painting and frescoing, carpentry and blacksmithing.

The regular courses leading to diplomas in the different trades consisted of instruction and the performance of actual work for two and one-half hours each Tuesday and Friday evenings from October 26, 1887, to April 4, 1888, besides lectures, blackboard illustrations and explanations of special features of work, and the scientific and practi-

of special features of work, and the scientific and practi-

cal principles involved.

The diplomas were classified as first, second and third grade, and were granted to the pupils according to their standard as determined by their attendance, proficiency and answers to the questions of the final written examina-tion. The plumbing class also were given examples of defective arrangement and required to explain and corrrect

Membership in the bricklaying, stone-cutting and carpentry classes was restricted to boys from 16 to 21 years of age; the other classes were unrestricted, but the ages averaged about 18 or 19 years. The attendance was chiefly local, but quite a number came regularly from a considerable distance for the privilege of instruction, and all paid the tuition fee of from \$10 to \$20 for each course. There was also a day course of instruction in plumbing, which was well attended by pupils often from distant cities, whose desire for education and improvement led them to incur the expense of traveling, tuition and maintenance during the expense of traveling, tuition and maintenance during

The founder and teachers of this noble enterprise are justly proud of the zeal and good conduct of the classes. Order and attention have been universal; valuable tools and materials have been carefully and honestly used, and the workmanship of the pupils has been exceedingly creditable.

The schools are receiving constant enlargements and improvements for the season of '36-7. The receipts from the various classes were \$4,848.28, and the expenses \$9,515.90. The first stason opened with thirty pupils registered, and the last with 446; and the attendance has been even a little larger than that—viz., day class in allumbing 24 evening classes in plumbing 150; in brickplumbing, 34; evening classes in plumbing, 150; in brick-laying, 120; in carpentry, 28; in stone-cutting, 15; in plastering, 28; in blacksmithing, 13; in painting, 38; in tailoring, 31; total, 457.

The following pupils in the plumbing class received

Ine following pupils in the plumbing class received diplomas:

In Plumbing—Chas. Dunn, W. H. B. Bridgeworth, G. J. Coetz, E. W. Gross, G. Diemer, F. Kubischta, C. J. Pickett, D. D. Whitlock, Jr., W. J. Zimmer, A. C. Lum, Martin Carey, Edwin Mills, L. F. Madden, J. F. Bolia, R. C. Cassell, Pierce T. Murphy, Chas. Ross, S. F. McCormick, E. J. Coppers, J. M. Harrington, Jos. Murphy, Jr., G. E. Parsells, W. S. Lamb, H. A. Schneider, Max Friedman, F. A. Seelig, J. H. Palmer, Wm. Bailey, H. H. Schneider, J. W. Toomey, D. W. Ayeres, Wm. K. Beddow, E. P. Sands, V. E. Reynolds, W. C. Walsh, H. Boylhart, Al. Watts, H. Graves, Conrad Dietz, R. P. McGowan, August Seeger, John Laverty, John Hahn, George Maxwell, John Badanes, H. McLaughlin, J. H. Mersfelder, Frank J. Clarke, G. H. Pheasey, W. J. Lennahan, D. J. Dolan, Michael Hanley, W. Kelley, J. D. Sloan, M. J. Garrey, A. J. Moore, Dennis Sullivan, J. O'Brien, Chas. Read, Jeremiah Galvin, Isaac D. Simonson.

PHILADELPHIA MASTER PLUMBERS' ASSO-CIATION ON SOIL PIPE TESTS.

(Special Correspondence.)

AT the meeting of the Sanitary Committee of the Master Plumbers' Association, which was held on April 5, to discuss and prepare a report on the most desirable and efficient method of testing soil-pipes, it was agreed, in sub-stance, to recommend to the association that for all new work a pressure of three pounds to the square inch be adopted before the fixtures are attached, and that in work, whether new or old, where the fixtures were attached and in position a test of 2-inch water gauge pressure be made. The chairman of the committee was directed to prepare a report covering the matter and present it to the associ-

STATION J OF THE NEW YORK STEAM CO.

No. II. (Continued from page 279.)

CONTINUING the description of this building, commenced in our last issue, we give this week a floor plan, or rather horizontal section; showing the general arrangement of the main steam-pipes, taken immediately below the roof so high as to show no windows, and just above the coal-bins, whose floor is supposed to be removed so as to show more clearly the piping immediately over the boilers, of which the drums only appear.

Steam is taken from a point near the rear of the drums for the two-fold purpose of obtaining dryer steam and making better allowance for expansion.

From the peculiar construction of these boilers, as will be seen in the transverse section of the building, the circulation is very strong, and a powerful current of mingled steam and water rises into the front end of the drums from the water-tubes below, but from that point to the rear there is comparatively little ébullition in the drums, and the steam and water have opportunity to separate as they pass back to the place where the former is drawn off.

A cast-iron breeches piece, with 5-inch branches, unites each pair of drums and connects them with a 6-inch branch,

E, leading to the main steam-pipe, D, which is ten inches in diameter. The additional length of these branch pipes. obtained by taking steam from the rear of the drums, permits their expansion and that of the main steam-pipe without undue straining of joints. The main pipes conduct the steam to two separators or dryers, C C. These are upright cylinders, thirty-four inches in diameter and ten feet high, into the lower part of which the steam enters, and from which it escapes through a dry pipe extending up inside while the disengaged water is drained off.

The steam next passes through the meters B B. These are so arranged that the steam flows through a variable opening with a constant difference of pressure due to a weighted plunger supported by the passing steam. As the velocity is thus practically constant, it is only necessary to record the amount and duration of the opening in order to know the volume of steam that has passed through the meter. The amount of the opening is recorded by a pencil, moving across a strip of paper, carried by clockwork. As the transverse ordinates of the figure thus formed are proportional to the opening of the meter, and the longitudinal ordinates are proportional to the time, it follows from what has just been said that the area of the fig are will be proportional to the volume of the steam This area is measured by a modification of passed. Amstler's planimeter, and with the smaller meters on the same principle which are used to measure the steam supplied to customers, the steam bills are based on the reading of the planimeter, while the marked strip or meter chart is preserved for future reference and check.

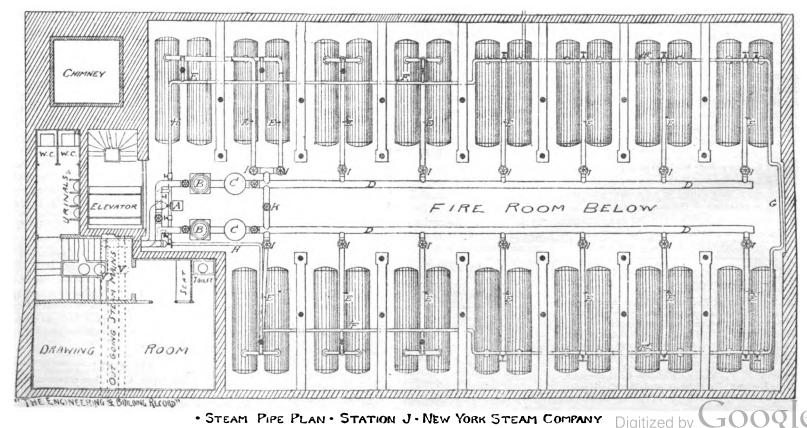

From the meters the steam passes down to the outgoing steam-mains, also ten inches in diameter, on which V V are the variators to allow for expansion. All the other pipes shown on this plan, except the one which goes to the pumps in the rear, are merely alternative connections to be used in case of accident or repairs. A is the ash chute,

As it is of vital importance that the steam-supply to so many customers who so absolutely depend on it should be continuous and secure, every precaution has been taken to prevent the apparatus from being disabled by any single accident.

Thus the main steam-valves I I are constructed so to close automatically in case the pressure in the boiler falls below that in the steam-pipe, by which, if a tube or joint should fail in any boiler, that boiler is immediately isolated and the others continue their work without inter-

In case the main steam pipes or any of their branches E E should be disabled, steam can still be taken from the boilers by the rear pipes F F, assisted, if need be, by the cross-connection G. As these are but four inches in diameter, it will take more pressure to get the same amount of steam through them, but that is not a serious matter. The cross-connection K has also been put in to cut out either separator or meter when necessary, and the various valves and connections between the meters and the outgoing mains are for similar precautionary purposes.

(To BE CONTINUED.)

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

THE NIAGARA SHIP CANAL.

OSWEGO, N. Y., April 9, 1888.

SIR: The maps and estimates for the proposed Niagara Ship Canal, referred to in your issue of April 7, are based upon surveys made in 1867, not by myself, as there stated, but by the late Mr. James S. Lawrence, C. E., and by Mr. Stephen F. Gooding, C. E.

Will you kindly publish this correction?

Yours very respectfully,

WILLIAM PIERSON JUDSON.

RECORDS OF TESTS OF COMPRESSIVE STRENGTH OF CEMENT.

New York, April 12, 1888.

SIR: Will you kindly inform me where I can obtain any information as to the compressive strength of cement, and especially as to any experiments on the compressistrength of cement joints in heavy masonry?

C. E.

WATER-WORKS CONSTRUCTION IN CALI-FORNIA.

FROM a letter of J. M. Graham, the Chief Engineer, we abstract the following data concerning work now in progress under his direction for supply of San Diego:

"The San Diego Flume Company are building an extensive system of works to supply water to city of San Diego and some other places; also a large amount for irrigation.

The natural flow of the San Diego River and other streams is diverted and carried 36 miles in a 4x6-foot flume to within 10 miles of San Diego, where a two years' supply for the city can be stored in a reservoir 500 feet elevation above tide-water. This reservoir will be filled in 40 days by the flume.

"A storage reservoir is also built in the Cuvamaca Mountains at an elevation of 6,000 feet; capacity, 4,000,-000,000 gallons, to be drawn on as the natural flow of streams may not be sufficient during dry seasons.

"The flume is the finest specimen of such work in the State, and is continuous (no ditching on the line), except one mile of tunnels, which are lined with masonry and plastered.

"Water is now running through 18 miles of the flume, and flume will be finished by July.

J. M. GRAHAM, "Yours truly, "Chief Engineer."

BRINGING WATER TO LIVERPOOL UNDER THE MERSEY.

To BRING the water from the Vyrnwy Dam to the city of Liverpool it is necessary to cross the Mersey River, and the arbitrator, Sir George Nares, appointed by the Board of Trade to fix the depth below the bed of the river at which the pipes must be laid, has decided that not less than 20 feet will be necessary.

As it would be impossible to lay the pipes at this depth owing to the character of the soil, which is running sand and silt, the engineers have decided to go down to a bed of boulder clay at a depth of from 80 to 100 feet below the river, where it is proposed to drive a tunnel about ten feet in diameter lined with cast iron.

Bids have been invited and the contract has been probably let by this time.

The rainfall in that vicinity has been so unprecedentedly small for some time past that the reservoirs supplying the city have little more than a third or a fourth of what they should contain at this time of the year, so that it has been necessary to restrict the supply of water to six hours a day, with a prospect of greater scarcity before the season is over, and many other large towns are even worse off.

NEW YORK BUILDING MATERIAL EXCHANGE OFFICERS.

THE Building Material Exchange held its seventh annual election at the Exchange rooms in Liberty Street on nual election at the Exchange rooms in Liberty Street on April 9. The following officers and trustees were chosen: George Moore Smith, President; James Rogers, Vice-President; Hiram Snyder, Treasurer; George M. Smith, James Rogers, Hiram Snyder, Nathan Peck, Oscar A. Gurnee, S. Wood Cornell, Walter Tomkins, Robert S. Sinclair, Hamilton V. Meeks, Richard R. Letourette, John J. Bell, Herman B. Homan and Sayres Hadley, Trustees. The treasurer's report showed the Exchange to be in a prosperous condition.

THE NEW YORK MUNICIPAL BUILDING PLANS.

It has been decided by the city authorities to invite the American Institute of Architects to submit a list of seven names from their number from which they may select a committee of three to act as judges upon the plans submitted for the new municipal buildings, noticed last week in these columns, to determine, first, whether a building should be constructed in accordance with any of the plans, and, second, whether any of the plans are entitled to the prizes offered, and in what order. The prizes are five in number, and are \$5,000 for the best, \$4,000 for the second, \$3,000 for the third, \$2,000 for the fourth, and \$1,000 for

The Mayor suggested that Professor Ware, of Columbia Ccllege, be appointed on the committee. It was afterward determined to assure the institute that the members of the committee selected would be properly remunerated for their services, and that, until the awards are made, no public view of the plans will be given.

ASBESTOS THEATRE CURTAINS.

THE London Engineer contains an illustrated description of the asbestos curtain for Terry's theatre, and also one designed for the Queen's theatre in Manchester. They are made of asbestos cloth specially strengthened by a fine wire running through each asbestos strand and stretched upon a counterbalanced iron frame sliding up and down in guides. A layer of asbestos cloth may be put on each side of the frame, leaving an air-space between.

SWISS WATER FOR PARIS.

THE London Morning Post says that a Swiss engineer, Herr Ritter, has submitted to the Paris municipality a plan by which the city may be furnished with an ample supply of water from an inexhaustible source—the lake of Neufchatel, Switzerland—at a cost \$60,000,000. Some time ago another engineer, M. Beau de Rochas, proposed to furnish Paris with water from the Lake of Geneva, at a cost of \$100,000,000, but the scheme was not accepted. Herr Ritter is more moderate in his estimate, and there is a probability of his success. The distance from the lake of Neufchatel to Paris is 312 miles, and the surface of the lake is 1,620 feet higher than the mean level of Paris, its total area covering 140 square miles. The water, which would flow with a speed of rather under 100 feet per second, would arrive at Paris at a temperature of 50° Fah.

Herr Ritter intends to draw off the water by an underground heading 262 feet below the surface of the lake, where it has a temperature of only 43°. The water would be taken through a tunnel twenty-two miles long under the Jura mountains, and thence in an arched conduit along the slopes of the hills to Paris, where it would arrive at an elevation of 394 feet, with a flow of 4,400 gallons per second, which would give a tremendous motive power. In this manner Paris could be furnished not only with an illimitable supply of excellent drinking-water, but also with the electric light in all the streets, and water-power in all the workshops at a reasonable price, independently of the advantages accruing to the districts through which the conduit would be laid, and which could also draw their supplies from the same source. Herr Ritter estimates that it would take six years to complete the works.

SUBSCRIPTIONS FOR BUILDINGS FOR RAIL-ROAD MEN.

THE New York Central and Hudson River Railroad has given the following Y. M. C. Associations along the line of its road the following gifts: East Buffalo, \$5,000; West Albany, \$2.500; DeWitt, \$1,000; total, \$8,500. These gifts are subscriptions toward the erection of buildings for railroad men at the points named.

Gas and Electricity.

Illuminating Power of Gas in New York City.

A PAPER CHIMNEY.

A NOVELTY in chimney-shafts is reported from Breslau. A shaft 54 feet high has recently been erected there, constructed entirely of solid blocks of paper cemented together. It is claimed that the shaft is both fire and lightning proof.

NOTES.

THE Minneapolis Board of Trade has adopted resolu. tions expressing its belief that the retirement of City Engineer Andrew Rinker at this time would be a public calamity.

MR. F. A. CALKINS, M. Am. Soc. C. E., has completed the plans for the sewerage system of New Rochelle, N. Y. and they have been accepted by the Board of Trustees They provide for the use of the separate system in most

MESSRS. E. L. CORTHELL, L. E. Cooley, H. B. Herr, W. P. Rice, and Mr. Kurth appeared before the U. S. Senate Committee last week in behalf of the Cullom-Breckinridge bill. Messrs. Corthell and Cooley, made arguments in its favor.

THE firm of Buck & McNulty, MM. Am. Soc. C. E., Civil and Mechanical Engineers, 53 Broadway, New York City, will be dissolved on May 1. Mr. Leffert L. Buck will continue in the same business at 18 Broadway, and Mr. George W. McNulty at 45 Broadway.

THE President sent to the Senate the following nominations in the engineer corps: Lieutenant-Colonel Cyrus B. Comstock to be Colonel; Major Jared A. Smith to be Lieutenant-Colonel; Major G. H. Ernst to be a member of the Mississippi River Commission, Vice-General Gillmore, deceased.

CALIFORNIA BITUMINOUS ROCK FOR PAVING.

OUR St. Paul correspondent writes that Mr. Ivan Prowattain, of Philadelphia, stopped in that city on his return from the Pacific Coast where he has been to inspect the bituminous rock found along the coast near Santa Cruz. He is to make a report to the City Council of Philadelphia, recommending the use of this rock for paving purposes and setting forth its advantages.

CHICAGO WESTERN SOCIETY OF ENGINEERS.

THE 247th regular meeting was held April 3. In the absence of the President, Mr. C. L. Strobel was made Chairman pro tem., L. E. Cooley, Secretary.

The following were elected to membership: Daniel Andrew With, Assistant Engineer, Town of Lake, Chicago. Ill.; Paul K. Richter, Engineer, Chicago Bolt and Forge Co., Chicago, Ill.; Edward B. Meatyard, Geneva Lake, Wisconsin.

A resolution was adopted approving the modified Cullom-Breckinridge bill.

CULLOM-BRECKINRIDGE BILL IN ST. PAUL. (From our Correspondent.)

ST. PAUL, MINN., April 9 .- For some time there has been before the Chamber of Commerce of this city awaiting final action a proposition asking the chamber to endorse the bill now before Congress establishing a Bureau of Harbors and Waterways. A counter proposition has been entertained in the shape of a petition which has been circulated in the West protesting against the proposed change. The Chamber of Commerce have not yet voted on the matter. This morning they received a letter signed by members of the Civil Engineers' Society of St. Paul to the effect that the society had endorsed the movement, and they asked the favorable co-operation of the chamber.

ANOTHER SYSTEM OF SEWAGE PURIFICA-TION.

A. M. DEFOSSE, of Brussels, has just patented a system f sewage purification. He, as is usual, claims that the cost is defrayed by the products. The process is, (1) precipitation by chemicals; (2) filtration through specially prepared turf, which is susceptible of cleansing and continual use; (3) filtration through a bed of spongy iron. After leaving the spongy iron the effluent passes to the river through a limestone bed.

PERSONAL.

MR. YEIJI NAKAJIMA, C. E., has accepted the position of superintendent of the construction of the water-works of Falls City, Neb.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

ANN AFBOR, MICH.—The Students' Christian Asso-ciation has decided on the plans of Spier & Rohns of Detroit for their new building. The building will be 60x90, and cost about \$25,000.

MILWAUKEE, WIS.—E. T. Mix & Co., architects, of this city, have made contracts with the North-western Guaranty Company, of Minneapolis, to furnish plans and architect's services for the erection of their 12story office building this summer. The building 12sto be 132x155 feet on the ground, and will be furnished throughout for bank and office purposes. It will cost about \$2.50.000.

For works for which proposals are requested see also the "Proposal Column," pages i-vii-viii-296.

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

Burrillville, R. I.—Water.—Our correspondent writes: "We had a meeting in relation to the waterworks April 9, and, I understand, they appointed a committee to confer with different parties in relation to the cost and of building the water-works."

East Saginaw, Mich.—Sewers.—John J. Granville, City Engineer, writes: "Proposals for constructing sewers to the extent of about \$30,000 will be received in the course of two or three weeks. Sewers to be constructed in accordance with the sewerage plan adopted in 1886."

FRANKLIN, N. H.—WATER.—Town Clerk H. K. Smith writes us: "The town voted to leave the matter of water-works in the hands of a committee of five to investigate and report at some special me ting. No report has yet been made by the committee."

MILWAUKEE, Wis.—The City Engineer is preparing plans for the improvement of the sewer system of the Sevent enth Ward.

WARRIOR STATION, ALA.—WATRR.—Our correspondent writes: "Arrangements have been perfected so far as to the securing of the locality for stand-pipe and engine for the pumping of the water. We hope to be able to supply water by June 15. The stand pipe will be 800 yards from Warrior River, from which place we will handle the water."

ORLEANS, NEB.—WATER.—Concerning the water-works election here, our correspondent writes: "Our election will be he'd April 23. There will be no oppo-sition. Mr. Richardson, of Lincoln, will be evil engi-neer in charge of work. It will be let by contract.

ITHACA, MICH.—It is reported that Mason L. Brown, C. E., of Detroit, Mich., is preparing plans for a system of water-works to be established here...

Little Falls, N. Y.—An additional appropriation of \$50,000 will be made for work on the water-works system.

PARKDALE, CAN.—It is reported that a \$20,000 system of water-works is to be established here.

FREDONIA, N. Y.—It is reported that a system of sewerage is to be established here.

NATRONA, PA.—Address P. S. Brackenbridge for details of extensive water-works improvements at this place.

Moundsville, W. Va.—Water.—L. G. Brock, Town Clerk, writes about the reported water-works project here as follows: "I he matter of water-works has often been talked about in our town, but as yet nothing has been done, and I do not see any immediate prospect for doing anything in that line. We have a mound here nearly 100 feet high which could well be used to build a tank upon, but although we have 2,000 or more population, yet the town is so scattered, it covers so rrunch space, that efficient water-works would be costly."

CARTERVILLE, MO.—WATER.—The Town Clerk here writes us as follows: "Carterville and Webb City, which joins, are both in favor of water-works. Nothing of efinite has been done as yet, but is being talked of by both the city officials and every body else. There has been some St. Louis parities here, but nothing done so arr."

CENTRRVILLE, MD.—WATER.—Our correspondent writes: "The election to determine the water-works question did not take place April 3 as was at first proposed. There will be a special election held for the purpose, but it has not yet been decided when to hold it. When the election does take place I will let you know the result; also other particulars."

BATESVILLE, ARK.—WATER.—Town Recorder J. E. Rosenburgh writes us as follows: "A water and electric-light company has been organized, composed of the leading business men of our town, and an ordinance passed granting them certain rights and privileges and requiring them to have one-half mile main laid and supplying water to the citizens in two years from date of passage, April 7, 1888."

OMAHA, NEB.—It is reported that the sewerage system of this city is to be improved at a cost of \$100,000.

ELLENSBURG, N. Y.—It is reported that B. E. Craig & Co. will construct a system of water-works here.

CLYDE, N. Y.—WATER.—Our correspondent writes, under date of April 9, as follows: "No action has been taken concerning water-works excepting the village trustees called a meeting of the taxpayers which was held this P. M. I understand the vote stood two majority in favor, but what the intention of the trustees is now I am unable to answer. They may take further action and may let it drop where it is."

WINONA, MINN.—The proposition to expend \$20,000 improving the c ty water-works failed to carry at the recent election.

recent election.

NAHVILLE, TENN.—SEWERS.—City Engineer J. A. Jowett writes us as follows: "Our sewerage system is practically mapped out and we are spending about \$35,000 per annum in construction. The districts requiring it receive first attention. The work is not let as a whole, but each sewer, or section of a sewer, is let as a separate contract. Our water-works are now receiving our special attention. The natural fittering-gallery and pump-wells are finished. The Holly-Gas-kill Co. are preparing to erect a new engine. The reservoir is being rapidly constructed. The total estimated cost of the work, including main pipe-line, is \$1,000,000. The main-pipe line to the reservoir will not be let before next spring."

INDIANAPOLIS, IND.—WATER.—F. S. W. Duns, Vice-President of the Indianapolis Water Company writes:
"We will lay about 12,000 feet of mains, from 6 to 12 inch. Contracted for the pipe with Addyston Pipe Co., Cincinnati, O. Have contracted with the Holly Mig. Co. for two engines, 350 horse-power each, to run our pumps power devices. Co. for two engines, 350 horse-power each, to run opumps, now driven by water, when we are short water.

Madison, FLA. -W. T. Davis can give details of the roposed system of water-works for this place.

NASHVILLE, TRNN.—E. L. Gregory is said to be at the nead of a project to erect an improved system of water-works for this city, at a cost of \$1,200,000.

CHIFTON, O.—Bonds are to be issued for extending the sewerage system here.

PEMAQUID, ME,—It is reported that the Pemaquid Land Co. will establish a drainage system here.

Minneapolis, Minn.—The Board of Trade has recommended larger water-mains.

FORT RILEY, KAN.—For details of a system of water-works to be erected here, address Captain Pond, Quartermaster's office, as above.

HELENA, MONT.—WATER.—J. W. Wade, City Engineer, writes us about water matters here as follows: "G. N. Miller, San tary Engineer, of St. Paul, is preparing plans. City bonds to raise \$150,000 have not yet been sold, but will shortly find buyers. Then it is probable that city will advertise for bids in the constructive work. It is not expected that the system contemplated when complete will cost less than \$300,-000."

WATER-WORKS. -- See our Proposal Column for information regarding water-works and water-work sup-plies at the following places: New London, Conn., Asbury Park, N. J., Kingston, Ont., Fort Riley, Kan., Toronto, Can.

BRADY, TEX.—It is reported that water-works are be established here.

· BRIDGES.

BLOOMSBURG, PA.—County Commissioner W. E. Knox writes: "For the purpose of erecting an iron wagen bridge over the Susquehanna River here a company has been organized, with a capital of \$50,000, a charter applied for, and all the preliminary steps taken. A letting will be had about May 1, at which time all bridge parties will have an opportunity to bid."

DANBURY, N. C.—An iron bridge is to be erected here by the County Commissioners. Ed. Pfaff can furnish details.

OREGON CITY, ORE.—The County Commissioners will bund a bridge over the Willamette River, at this place, to cost \$24,000.

New London, Conn.—A new bridge is to be erected here by the New York, Providence and Bosson Rail-road Company. J. W. Miller, General Manager, New York City, can give details.

NEW YORK CITY. - The Union Bridge Company, of this city, has been awarded the contract for the foun-dations, masonry and superstructure of the bridge to be built by the New York, Providence and Boston Railroad Company over the Thames River at New London, Conn.

GUNTERSVILLE, ALA.—A bridge is to be erected over the Tennessee River at this place by the Tennessee and Coosa Railroad Company.

NASHVILLE, TENN.—It is reported that a bridge is to be built at the canal at Cumberland Mountain by the Nashville, Chattanooga and St. Louis Railroad Company.

RAILROADS.

MONTANA.—Cable roads are talked of at Butte and at Phillipsburg, in Montana, and, apparently, with a fair prospect that they will be built at one or both places. That at Butte is 7,000 feet long, to cost about \$70,000, and that at Phillipsburg 3 miles long, to cost about \$300,000.

GAS AND ELECTRIC-LIGHTING.

WEBSTER CITY, IA.—A company of capitalists from Des Moines will erect a gas-plant here this summer.

OSKALOOSA, IA.—The gas works here are to be enlarged to the extent of \$15,000.

ST ALBANS, N. Y .- An electric-light plant will be established here.

Paris, Ga.—The sum of \$25,000 is to be expended on improving the gas-works here. Address Paris Gas and Electric Light Co.

BARTOW, FLA.—An electric-light plant is to be established here.

STREET-WORK AND PAVING.

TOPEKA, KAN.—Several streets of this city are to be aved during the summer. Macadam and cedar block paved during th will be wanted.

SOMERVILLE MASS.—About \$50,000 is to be expended on paving, etc., the streets of this place.

OMAHA, NRB.—Several miles of streets are to be repaved this summer.

CLIFTON, O.—Extensive improvements are to be made to the streets here.

BIDS OPENED.

New York City.—The following was the only bid submitted for supplying and laying cast-iron waterpipes, hydrants, gates, etc., supplying and laying sewer-pipes and sub-irrigation tiles, constructing manholes and sewage tanks, supplying and setting up steam-pumps, wells, connections, etc., at Central Islip, Long Island, N. Y., opened April 7 by the Department of Public Charities and Correction: James Moore, \$29,072.

New York City.—Plumbing.—The following bids for reconstruction of the plumbing at the City Prison were opened April 7 by the Department of Charities and Correction: P. Carraher, Jr., \$6,453; James Armstrong, Jr., \$6,650; C. Nally. \$6,837; John Spence, \$7-654; John Regan, \$7,847; George Cody, \$9,350; James Moore, \$13,000.

554; John Keyan, \$7,847; George Cody, \$9,350; James Moore, \$13,000.

Yonners, N. Y.—Engine and Boilers.—The following bids for a 2,000,000-gallon pumping-engine and boiler were opened March 20 by the Board of Water Commissioners; engine high-pressure: Gordon & Maxwell Co., \$4,000; Knewle's Steam-Pump Co., \$4,000; Knewle's Steam-Pump Co., \$4,600; Knewle's Steam-Pump Co., \$5,300; The Volker & Felthousen Manufacturing Co., \$3,175. Compound condensing engine: Gordon & Maxwell Co., \$5,600; Knowles Steam-Pump Co., \$6,635. Compound condensing engine: Gordon & Maxwell Co., \$6,600; Knowles Steam-Pump Co., \$8,681; H. K. Worthington, \$6,537; Deane Steam-Pump Co., \$8,700; National Iron-Works, \$6,800; The Volker & Feithousen Manufacturing Co., \$6,350.

For two steei boilers, 66 inches diameter, with 66 3½-einch tubes 16 inches long: Payne & Co., \$2,500; McNeil & McI achlan, \$3,200; Cunningham Iron-Works, \$7,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,250; Nichola & McI achlan, \$3,200; Cunningham Iron-Works, \$7,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,250; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$7,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,250; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,250; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,200; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,200; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,200; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,750; Whittier Machine Co., \$3,232; The Bigelow Co., \$3,200; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,750; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,750; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,000; Nichola & McI achlan, \$4,000; Cunningham Iron-Works, \$2,000; Nichola & McI achlan,

was awarded April 6 to H. R. Worthington, and the contiact for boilers has not yet been awarded.

Hamilton, O.—Bridge.—The following proposals for the construction of an iron bridge superstructure over the Miami River, at Poastlown, were opened April 5 by the Butler County Commissioners:

Pittsburg Bridge Co., Pittsburg, Pa., \$24,000; Smith Bridge Co., Toledo, O., six plans from \$75,400 to \$18,-000; Wrought Iron Bridge Co., Canton, O., three plans, \$51, \$52,00 and \$52 per lineal foot; Groton Bridge Co., Groton, N. Y., \$20,800 and \$22,000; P. E. Lane, Chicago, Ill., \$14,827; Variety Iron Works Co., Cleveland, O., \$14,000; Indiana Bridge Co., Muncie, Ind., \$17,909; Penn Bridge Co., Beaver Falls, Pa., \$18,515; Massillon Bridge Co., Bassillon, O., \$20,000 and \$18,500; Brilin Iron Bridge Co., Binghamton, N. Y., \$21,500 and \$29,000; Milwaukee Bridge and Iron Works, Milwaukee, Wis., \$14,899; Mt. Vernon Bridge Works, Mount Vernon, O., \$16,900, \$10,245 and \$19,265; Columbia Bridge Co., Dayton, O., \$45,500 per lineal loot; King Bridge Co., Cleveland, O., \$14,675, \$16,404, \$16,575, \$16,925, \$16,573; for iron joists, \$1,350 additional; Missouri Valley Bridge Works, Leavenworth, Kan., \$15,775.

The Commissionersawarded the contract to the Smith Bridge Co. for \$16,500.

The contract for the masonry was awarded to Cummings & O'Connor, of Indianapolis, Ind., at \$10,-

983 50.

MILWAUKER, WIS.—DREDGING.—The following bids have been submitted to the Board of Public Works for the contract to build the inlet for the flushing tunnel and to do the necessary dredging. C. H. Starke, 27 cents per cubic yard for dredging and \$21,000 for the construction of the inlet; Wm. Forrestal, 35 cents for dredging and \$23,250 for the inlet. The contract will be awarded to Starke should the bid prove to be within the limits of the appropriation.

NEWPORT, KY.—The following bids for change of effluent system of water-works were opened April 2 by B. R. Morton, Water-Works Superintendent: P. Murray, Cincinnati, O. \$11,095; Owen Patterson, informal, Baltimore, Md, \$12,227 50; J. Hahn, Newport, Ky., \$14,620; J. Barter, Newport, Ky., \$16,385; Thomas J. Peter, Cincinnati, O., \$16,442.50; C. J. Limrick, Newport, Ky., \$16 405.

The contract was awarded to P. Murray.

SAVANNAH, GA.—RAILROAD.—The contract for building the Belt Vine for the City Suburban Railroad of this city has been awarded to T. William Harris & Co., of No. 2 Nassau Street, New York City.

CHICAGO, ILL.-The contract for five new tripleexpansion condensing pumping-engines, with a capacity of 15,000,000 gallons per twenty-four bours each, was officially awarded by the Commissioners, April 7, to Edward P. Allis & Co., of Milwaukee, Wis., the total cost given being about \$369,785. PPILADELPHIA, PA.—DREDGING.— The following bids for dredging docks in the Port of Fhiladelphia were opened by the Board of Port Wardens April 2: National Dredging Co., Wilmington, Del., 273 cents per cubic yard; Frank C. Sumers, Philadelphia, Pa., 273/c.; Thomas G. Locke, Linwood, Pa., 32C.; American Dredging Co., 27c.

BOSTON, MASS. - CURRSTONES - The Park Commis BOSTON, MASS.—CURBSTONES.—The Park Commissioners have received the following proposals for supplying granite curbstones: Cape Ann Granite Co., \$3.64% per lineal toot; Rockport Granite Co., \$2.89; James A. Colson, \$3.04; A. A. Libby & Co., \$3.60; James J. Vernon, \$2.87; Lanesville Granite Co., \$2.75, The contract was not awarded.

MINNEAPOLIS, MINN.—Bridge.—R. M. Douglass has been awarded contract for bridge across Bossett's Creek at \$2,280.60.

Creek at \$2,280.60.

St. Paul, Minn.—Steam-Heating, Eic.—Bids for the building of the new reformatory at St. Cloud were opened April 3 as follows:
Steam-heating—Allan Black, \$4,003.80; E. H. Murphy, \$4,703; Thomas Davis, \$4,338.84; Holland, Thompsin & Co., \$4,035.44; F. S. Martin, \$5,242; C. F. Parmlee, \$4,356; E. F. Usborne & Co., \$5,057.32.
Cell-work—Haugh, Ketcham & Co., \$3,320.9; Diebold Safe and Lock Company, \$11.560.

Cast and Wrought fron Work—Haugh, Ketcham & Co., \$27,679.40; Clark, Raffen & Co., \$3,200; St. Paul Foundry Con pany, \$5,275; Paul Roofing and Coinice Company, \$5,275; Pernsylvania Slate Company, \$9,874; Scribner-Libby Co., \$0,632.

Plumbing—Allan Black, \$7,452.50; W. J. Freaney, \$7,200; J. G. Holmes, \$5,075; W. W. Sykes & Co., \$6,270; J. P. Adamson, \$5,400; Prendergast Bros., \$7,550.

Stone and Brick Work—W. Arnold & Co. (all work except iron), \$112.398; George J. Grant, \$71,400; Matt Breen, \$1,650.

Excavation—G. J. Grant, \$1,660; Matt Breen, \$1,650.

Carpenter-work—G. J. Grant, \$8,125; Matt Freen,

,650. Carpenter-work—G. J. Grant, \$8,125: Matt. Ereen, \$8,92 \$8,921.
Fainting and Glazing—George Nesbett, \$1,633; G. Winding, \$1,927.77.

MILWAURER, WIS.—DREDGING.—C. H. Starke & Co. have been awarded the contract for doing the dredging in the rivers of this city for the coming season. The following were the bidders: W. T. Casgrain, co cents per cubic yard for doing the dredging in the Milwaukee River, 18½ cents per yard in the Menomonee River, and 18 cents in the Kinnichinnic River; D. O. Dickson, of Recine, 20 cetts per yard for the Milwaukee River and 18 cents for the Kinnickinnic and Minomonoe Rivers; C. H. Starke & Co. will get 18 cents per yard for the Milwaukee River and 18 cents for the other two.

for the other two.

TYPHOID FEVER AND WATER-SUPPLY.

At the Congress of Hygiene at Vienna, Professor Brouardel read a paper on the propagation of infectious diseases by drinking-water; and, among his proofs of such propagation, cited the increase of typhoid fever in Paris when the impure water of the Seine was furnished for drinking instead of the much purer spring-water which is usually used for this purpose. This particular branch of his argument has been criticised by the Chief Engineer of the Paris Water-Supply, M. Bechmann, in a paper entitled "Les Eaux de Paris et la Fièvre Typhoide," which was presented to the Society of Public Medicine.

Professor Brouardel had stated that in 1886 there was a temporary deficiency in the pure water-supply, that from July 20 to August 7 the Seine water was distributed in certain quarters, and that the number of persons affected with typhoid who were admitted to the city hospitals rose from 40 for the week ending July 24 to 150 for the week ending August 7, and fell to 80 for the week ending August 21. M. Bechmann replies to this that the substitution of river for spring water was only made in three wards of the city, while the statistics show that at the time referred to by M. Brouardel there was an increase of mortality from typhoid all over the city, and that this increase was, if anything, greater in the wards supplied with springwater than in those supplied by impure water, and that hence there is no evidence that the change in the water-supply had anything to do with the fever outbreaks. The figures and diagrams which he gives do not prove anything particularly except that typhoid fever existed throughout the city, and he seems to have over-looked the fact that Prof. Brouardel had based his conclusions, not on the number of deaths from the disease; but on the number of cases of it which entered hospital. M. Bechmann does not deny that it is desirable that the water of the Seine should not be furnished for drinking purposes, but he considers that his branch of the service has been attacked and is in arms to defend it, claiming that it has not been proved that typhoid has been spread by the Seine water.

It is, however, very seldom that positive proof in such cases can be furnished; the best that can be done is to show that it is more or less probable that the disease has been due to a certain cause, the practical point being to estimate these probabilities with reference to the cost of preventive means. It would certainly seem that the probability that the water of the Seine may cause disease has been shown to be so great that it should not be supplied to the city for drinking purposes, and that Paris should take the necessary steps to avail itself of the irreproachable sources of supply which M. Bechmann states have been acquired in 1884.

THE LIGHTING OF THE SUEZ CANAL.

As the increasing requirements of commerce have outgrown the capacity of the Suez Canal, the management have decided to double its width and increase its depth and also to light it, so that it can be used by night as well as by day. As the latter can obviously be much more cheaply and quickly done, and will alone double the commercial capacity of the canal, it will be proceeded with at once.

The canal consists of long straight reaches connected by curves. For the reaches, accord-

ing to the London Times, the leading or range lights will be white, of sufficient power to be usefully visible at a distance of six or eight miles and placed where possible at the intersection of the centre lines of two adjacent reaches so as to enable vessels to keep strictly in the centre of the channel. If this is not possible, they will be so screened as to be seen only from the reach with which they are in line. On curves the lights called channel lights are to be placed alternately on either side of the centre of the channel and at a uniform distance from it. Those on the Asiatic side will be green and those on the African side will be red. They are to be fixed on buoys or standards according to circumstances. If on buoys the Pintsch system will be used, and compressed oil-gas will be used for all lights. All ships navigating the canal at night must be provided with some approved system of electric-lighting.

NEW YORK'S URGENT NEED OF THE QUAKER BRIDGE DAM.

IT is gratifying to note, even at this late day, that the New York Times has come to realize the pressing necessity of a work that this journal has been urging for years-namely, the construction of a reservoir of adequate capacity to store the water needed to supply the new aqueduct now nearly completed.

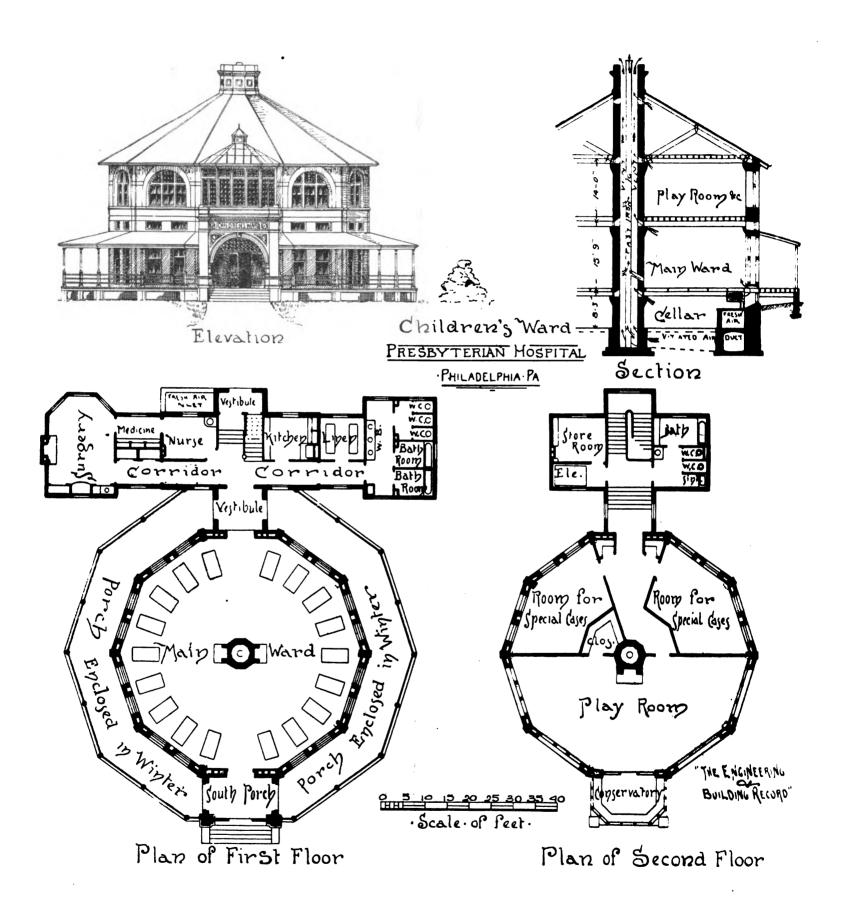

Without such adequate storage capacity the new aqueduct will be worse than useless, for, as has been well pointed out by the Times, it will merely enable the people of New York to use up more rapidly their present inadequate supply, and thus hasten a water-famine, which will be all the more keenly felt because of the preceding abundance.

When, in 1883, a commission was appointed to take measures to secure an increased supply of water for the city, it was promptly recognized that additional capacity both of storage and conduit would be required, and that simultaneously, either being almost entirely useless without the other. About the aqueduct there was fortunately no material difference of opinion or chance for alternative plans, and, as has been said, it is nearly completed. The dam, however, has been less fortunate. Although its necessity was obvious, and the proper site for it at Quaker Bridge early pointed out, conflicting interests caused obstructive opposition, and it was not until within a year that the commission finally decided on the Quaker Bridge site and requested their engineer to prepare plans for a dam in that locality. This has been carefully and, we believe, satisfactorily done, but now another difficulty has arisen.

Although there seems to be little question that the dam as designed will answer all requirements, it is strongly urged in certain quarters that by making certain changes in the plan, involving, it is admitted, additional expense, the dam can be made stronger and will look prettier.

One of the commissioners has, from the first, favored this proposed modification, and, in view of the magnitude of the interests involved and the unprecedented size of the structure, the commission were perhaps justified in calling in, as they recently have done, Messrs. Joseph P. Davis, J. James R. Croes, and William F. Shunk to advise them further on this point. When these gentlemen shall have rendered a verdict, which we trust will be as speedily as practicable, it is to

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES

A COUNTRY HOUSE

be hoped it will be accepted as final, and the work be proceeded with at once.

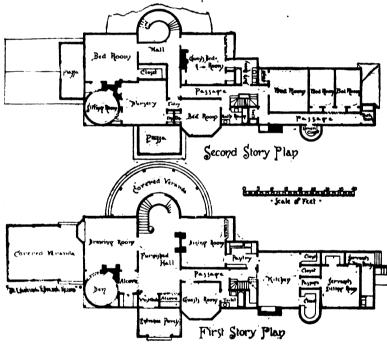

The delay already incurred by the commission exposes a million and a half of people to great discomfort and even danger, which must at best continue for some time, but its prolongation for an unnecessary day would be most reprehen-

BROOKLYN BRIDGE TERMINAL FACILITIES.

For the present the controversy over the respective plans for improved terminal facilities of the Brooklyn Bridge is settled by the unanimous adoption by the Bridge Trustees of the report of their committee on terminal facilities, of which Mr. T. C. Clarke, Mem. Am. Soc. C. E., was the expert member. This report we print in full on another page. They have dwelt mainly on the large item of expense for acquiring real estate involved in adopting the Wellington plan, taking the view, in which we think most citizens will concur, that such a sum of money would better be used for the building of another bridge.

The discussion over this problem, and the able way the matter has been presented to the public by Mr. Wellington, cannot but have the effect of drawing attention to the inevitable floor of the toilet-room is also of tiles. The plaster work throughout is of hard sand finish. There is ample capacity for twenty-seven beds-eighteen in main ward, four in each of two rooms for special cases, and one in a crouproom on the second floor, where there is also a large playroom, half the size of the main ward, with conservatory attached over the south porch.

The warming is by steam at low pressure, generally "indirect," but with direct radiation in the surgery and medicine room, vestibules, conservatory, and secondfloor toilet-room. The fresh air is admitted through the inlet on the west side of the north entrance, at 8 feet above ground level, to a masonry duct of 20 square feet area, which extends all around the outer wall of the ward at the level of the basement floor, and which is entirely shut off from the basement. The radiators are hung to the basement ceiling directly under each of the flues, and are enclosed in galvanized sheet-iron boxes, to which the fresh air is admitted from the duct below through galvanized-iron necks 12 inches square to each flue. There is a damper-valve in each neck. The openings into the ward are sixteen in number located under the sills of the windows, which extend to within 7 inches of the floor. The riser of each of these window-sills forms the mouth of the warm-air flues, and each is covered by three 6x18-inch valved registers. A propelling-fan is placed in the freshair duct near its outer end, and connected by belt to its engine, which is placed outside the duct in the basement. Tests with the anemometer give an average velocity of dis-

Mr. Wellington, with the New York City Hall as a centre, forcibly suggests the importance of beginning other bridges, if not tun-Doubtless New York will oppose an expenditure of this sort on the ground that it would increase the taxable value of another county at the expense of this city. The effect, however, of the discussion will be to hasten the consolidation of the two cities. That accomplished, this phase of the problem would be eliminated

OUR ARCHITECTURAL ILLUSTRATION. A COUNTRY HOUSE-R. H. ROBERTSON, ARCHITECT, NEW YORK.

CHILDREN'S WARD, PRESBYTERIAN HOS-PITAL, PHILADELPHIA.

This building has recently been completed at a cost, inclusive of furnishing, of about \$35,000. It has been erected by Mrs. John Wanamaker in memory of her mother, Harriet Erringer Brown, and has been presented by her to the managers of the hospital.

The material is pressed brick and terra-cotta trimmings, with slate roofs. The floor of main ward is of iron beams carrying hollow tile flat arches, intended for a flooring of tiles, but afterwards changed to hard white maple. Main ward is wainscoted with tiles six feet high, as is also the toilet-room in east wing of the office building in rear. The

charge at the register with the fan at sixty revolutions of 192 feet per minute, the temperature of the incoming air being about 110°. The windows of the ward have double sash, with a space of 8 inches between the glass, and each window has a transom over it, the supports of which are flush with the ceiling of the ward and which open above the roof of porch. There are also transoms extending to the ceiling over every door in the building. The vitiated air of the ward is removed, artificially, through ten cold flues in the angles of the walls, each 9x13 inches, which discharge into a duct, eighteen square feet in area, directly under the fresh-air duct (there is a brick arch and concrete and cement floor between the two ducts), and which has two connections, across and under the floor of basement, into the base of the central aspirating shaft. This shaft is four feet internal diameter and is sixty four feet high. The top is entirely open. It has in it a coil of 150 lineal feet of 1-inch diameter steam-pipe to accelerate the discharge of air, and has also three open fireplaces connected with it, two in the main ward and one in the play-room over it. The ten vitiated-air flues in the outer walls have each a valved register opening 12x17 inches at floor and 12x12 inches at ceiling, and there are also ten valved register openings, 9x12 inches each, into the stack itself at the ceiling of the ward. The anemometer showed an average outgoing current at the floor openings of these ten flues-ceiling registers all closed-of 165 feet per minute; and a velocity in the contracted throat of the fireplaces—no fire on—of 355 feet per minute. Temperature in room, 72°. The play-room and the two special care rooms, on the second floor over main ward, are warmed

and ventilated in the same manner and on the same scale and showed similar results.

The fresh-air supply to the nurse's room, linen-room, and toilet-room in the office building is taken through sheetiron ducts from the main fresh-air duct, and the ventilation is by means of "Barker" registers in the flues, which are connected together in the loft and carried into the brick flues of the kitchen chimney.

In connection with the plumbing advantage was taken of the tall chimney of the boiler-house, some 215 feet from the children's ward, to dispense with traps, leaving the fixtures entirely open, and connecting a ventilating-pipe from the main trunk of the underground drainage into it. It is, of course, expected that the fire in this boiler-house will be constant every hour in the year, so proper draught is expected at all times by the designers. The only traps used are one at the foot of each rain water conductor, and one running trap on the main drain before it joins the city sewer in the street.

The building has been erected from the designs and under the personal supervision of the architects, Messrs. John McArthur, Jr., and John Ord.

MATTHEW ARNOLD ON ARCHITECTURE IN AMERICA AND THE NAMING OF AMERICAN TOWNS.

(From The Nineteenth Century.)

THE charm of beauty which comes from ancientness and permanence of rural life the country could not yet have in a high degree, but it has it in even less degree than might be expected. Then the Americans came originally, for the most part, from that great class in English society among whom the sense for conduct and business is much more strongly developed than the sense for beauty. If among whom the sense for conduct and business is much more strongly developed than the sense for beauty. If we in England were without the cathedrals, parish churches, and castles of the Catholic and feudal age, and without the houses of the Elizabethan age, but had only the towns and buildings which the rise of our middle class has created in the modern age, we should be in much the same case as the Americans. We should be living with much the same absence of training for the sense of beauty through the eye, from the aspect of outward things. The American cities have hardly anything to please a trained or natural sense for beauty. They have buildings which cost a great deal of money and produce a certain effect—buildings, shall I say, such as our Midland Station at St. Pancras; but nothing such as Somerset House or Whitehall. One architect of genius they had—Richardson. I had the pleasure to know him; he is dead, alas! Much of his work was injured by the condition under which he was obliged to execute it. I can recall but one building, and that of no great importance, where he seems to have had his own way, to be fully himself; but that is indeed excellent. In general, where the American's succeed best in their architecture—in the art so indicative and educative lent. In general, where the Americans succeed best in their architecture—in that art so indicative and educative of a people's sense for beauty—is in the fashion of their villa cottages in wood. These are often original and at the same time very pleasing; but they are pretty and coquettish, not beautiful. The mere nomenclature of the coquettish, not beautiful. The mere nomenclature of the country acts upon a cultivated person like the incessant pricking of pins. What people in whom the sense for beauty and fitness was quick could have invented, or could tolerate, the hideous names ending in ville—the Briggsvilles, Higginsvilles, Jacksonvilles—rife from Maine to Florida; the jumble of unnatural and inappropriate names everywhere? On the line from Albany to Buffalo you have in one part half the names in the classical dictionary to designate the stations. It is said that the folly is due to a surveyor who, when the country was laid out, hapto designate the stations. It is said that the folly is due to a surveyor who, when the country was laid out, happened to possess a classical dictionary. But a people with any artist sense would have put down that surveyor. The Americans meekly retain his names, and, indeed, his strange Marcellus or Syracuse is perhaps not much worse than their congenital Briggsville.

AMERICAN PUBLIC HEALTH ASSOCIATION.

THE sixteenth annual meeting of the American Public Health Association will be held at Milwaukee, Wis., No-

vember 20 to 23.

The Executive Committee have selected the following topics for consideration at said meeting: (1) the pollution of water-supplies; (2) the disposal of refuse matter of cities; (3) animal diseases dangerous to man; (4) maritime quarantine, and regulations for the control of contagious and infectious diseases, and their mutual rela-

tions.

The Local Committee of Arrangements has already commenced work to insure a large and profitable meeting. All communications relating to local matters should be addressed to Robert Martin, M. D., Commissioner of Health, Milwaukee, Wis.

Mr. Henry Lomb, of Rochester, N. Y., now well known to the American public as the originator of the "Lomb Prize Essays," offers, through the American Public Health Association, two prizes for the current year, on the following subject: "Practical Sanitary and Economic Cooking, Adapted to Persons of Moderate, and Small Means." lowing subject: "Practical Sanitary and Economic Cooking Adapted to Persons of Moderate and Small Means."
First prize, \$500; second prize, \$200.
For terms and conditions address Dr. Irving A. Watson, Secretary, Concord, N. H.

BUILDERS' AND CONTRACTORS' ENGINEER-ING AND PLANT.

No. XXXI.

(Continued from page 213.)

OIL RIVET FURNACES AT THE FORTH BRIDGE WORKS.*

COAL furnaces and hand-bellows were found to be inadequate for the requirements of the special riveting plant The former occupied too much at the above works. space, and interfered with work going on above them, while the latter do not give a uniform heat to the rivets and are too costly. To supply the want, several forms of burners and furnaces were made, of which the illustrations represent the latest and most approved design. The oil consumed is distilled from the waste gases issuing from blast-furnaces, and though the price has considerably increased since the introduction of the lucigen lamp, it is still a cheaper fuel than coal for rivet heating. Figs. 1 and 2 are sections of the furnace, which weighs 25 cwt., and measures 6'6"x2'4"x1'9". It is an iron box made up of 1/4inch plates, with angle-iron framing, lined with fire-brick, and provided with three openings at N, with sliding doors for placing and removing the rivets. A fire-brick arch is built about three inches below the top plate of the furnace, thus leaving a passage along which the air necessary for combustion is led, receiving on its way a considerable amount of heat. The admission of air is controlled by two small doors on the end of the furnace at M. The heated air comes into the combustion or heating-chamber just above the entering jet of oil, and out at the opposite end through a short 6-inch funnel. The oil-tank, not

CEMENT MORTARS FOR USE IN PUBLIC WORK.*

No. 1V.

(Continued from page 289.)

THE results showed that Portland cement mortar, whose time of setting is lengthened by the addition of sand, or lime, or both, suffers severely in loss of tensile strength by the action of frost, and that such loss becomes greater as the proportion of sand or lime is increased; further, that a quick-setting Portland cement will indurate in spite of the frost, provided that it be protected therefrom for two days after having been tempered, and that it be as dry as possible before exposure to the cold. It was also found that the mixing of such materials with brine renders the mortar more capable of resisting the influence of frost, and that this statement likewise holds true for slow-setting compounds, such as I cement, I lime, 3 sand. Mortars thus prepared and mixed with fresh water instead of brine, and kept for two days at a temperature of + 41° Fah., and then exposed to frost, lost nearly all strength, so that even after four months pieces could easily be broken off from the briquettes with the fingers; whereas, when tempered with strong brine, their strength after seven months was about fourteen times greater. Accordingly, if the mortar can be kept from freezing for a few days by the use of salt or brine, so as to allow the setting to take place, much

It may also be deduced from these experiments that when it becomes absolutely necessary to lay masonry in freezing weather, quick-setting Portland cements, mixed with small proportions of sand and water, should alone be employed; and when a satisfactory quality of work is expected or required, the use of brine or salt should be resorted to, as well as the protection of the newly laid masonry at night by means of adequate coverings. In case, however, that the temperature is lower than + 23° Fah., even these precautions will not prevent more or less

OIL RIVET FURNACE AND BURNER FORTH BRIDGE WORKS $Fig \cdot 3$ 5-43/4 PASSAGE BRICK HEATING CHAMBER

shown, contains about fifteen gallons, or sufficient to keep the furnace going about four hours. From it a flexible hose leads to a connection on the side of the burner at D, Fig. 3, to which the oil is forced by an air-pressure of twenty pounds per square inch, maintained in the tank, while air at the same pressure is supplied to the burner at O.

M PASSAGE

The flow of oil and air is regulated by stop-cocks on each pipe, and their proportion is further controlled by adjusting the distance between the cap R and the tip S on the air-tube T, which slides through the stuffing-box U, and is moved in or out by the wing-nut P, while prevented from turning by the guide V.

The air-jet atomizes the oil, driving it in a fine spray into the combustion-chamber, where it meets the heated air already mentioned. The heat produced is very intense, being sufficient to melt the surface of the fire bricks if not properly controlled. The quantities of air and oil can be so nicely adjusted as to produce either an oxidizing or a reducing flame. For rivet heating the latter is preferable. and a little smoke should always be issuing from the fun-The burner is of brass, and is fastend by jam-nuts X Y to a small bracket, L, at the end of the furnace.

THE following additional engineers for work in placing the Nicaragua Canal line have arrived, from New York, at the headquarters of the Surveying Expedition: J. H. Covode, J. Clyde Power, chiefs of parties: Benjamin F. Bates, First Assistant Engineer; E. D. Very, Henry J. Dodge, second assistants; George F. Pohlers, Rodman and Draughtsman; W. H. Pearlbrook, Rodman. damage. Under such circumstances, moreover, it is some evident that the stones or bricks should be free from snow Under such circumstances, moreover, it is selfor ice and as dry as practicable; also, that all the materials, including the sand and cement, be free from frost by being kept at a temperature above the freezing point for some days before being used in the work. The safest rule, however, is to cease operations with mortars of any kind during the prevalence of frost.

FIG.2 SECTION ON G-H

HE ENGINEERING & BUILDING RECORD'

In a paper read before the American Society of Civil Engineers in July, 1886, its author, Alfred Noble, C. E., states that "in the construction of the lock at the St. Mary's Falls Canal, the laying of masonry was discontinued about October 20 of each year, on account of the frequent recurrence of freezing weather. On the last day of the work done in 1877, mortars made of Portland cement and of a good quality of American natural cement were used in adjoining portions of the same wall. Both mortars were mixed in the proportions of I cement to I sand, and The following the masonry was laid during a light rain. The following spring, the surface of the Portland cement mortar was sound, showing perfectly the marks of the rain drops, while the natural cement mortar was disintegrated to a depth of three or four inches." Mr. Noble also mentions agent of three or four inches." Mr. Noble also mentions a few other cases where Portland cement mortar was used in laying masonry during very cold weather without affecting the subsequent induration of the mortar noticeably. The inference to be drawn from his paper is, that if it becomes imperative to use mortar in freezing weather, Portland cement should be used.

Similar effects of frost wars also noticed by Mr. Francis

Similar effects of frost were also noticed by Mr. Francis Collingwood, C. E., on the Rosendale cement mortars, mixed in the proportion of 2 sand to 1 cement, used for the masonry of the East River bridge, sinche states that "the tops of the various pieces of masonry were always gone over carefully in the spring, the concrete which had been put in late, would usually be found disintegrated to a depth of from one to four inches, but below this it was

*Abstract of a report by the Executive Board of the City of Rochester, N. Y., prepared by Emil Kuiching, M. Am. Soc. C. E.

found sound. The rule seemed to be that it was unsound only so far as it was exposed alternately to freezing and thawing; and wherever it had taken a set before freezing. and had not been thawed out for some time, it was sound."
The experience of Mr. George S. Morison, C. E., with cements as given in his discussion of Mr. Noble's paper. is in full accord with what was therein stated, and in his exis in full accord with what was therein stated, and in its ex-tensive practice as a designer and builder of large bridges, he uses Portland cement exclusively in all places where the mortar is liable to freeze before setting. Mr. Eliot C. Clarke, C. E., also mentioned that in experimenting with concretes of Rosendale and Portland cements, which had been exposed to the weather for three years, he found that the former were injured and disintegrated from year to year, while the latter were not affected at all.

Recent expressions of opinion from many other excel-lent authorities respecting the action of frost on cement mortars are to the same effect as above recited. It is generally agreed that the freezing of freshly prepared cement mortar will not destroy its capacity to harden after becoming thawed, but exactly how much its cohesive and adhesive strength will thereby become impaired does not appear to be definitely known, neither is the effect of re-peated freezing and thawing very clearly pointed out. In our winters it frequently happens that water freezes in the shade, while at the same time ice melts in the sunlight, and hence under such circumstances in a wall facing south a slow-setting mortar in the face will be alternately frozen and thawed, while that in the rear will continue to remain frozen. This condition of the work cannot fail to be prejudicial to its ultimate strength, and cannot fail to be prejudicial to its ultimate strength, and manifestly demands that a strong and quick-setting mortar be used if the laying of masonry be continued in freezing weather. Numerous instances of failure of walk and abutments built in the winter might be cited, which are fairly attributable to the thawing out of the frozen mortar after the warm weather had set in, whereby it becomes almost as soft as when first mixed. In such cases the thawed mortar acts rather as a lubricant than as an efficient binding material, and if the structure is then subjected to lateral forces of considerable magnitude, deformation or failure is sure to follow unless a very wide formation or failure is sure to follow unless a very wide margin of safety has been allowed in the design. When, however, the dimensions are fixed with reference to economy and the use of ordinarily good materials and workmanship, as generally happens, the action of frost becomes a very serious factor in the stability and durability of the work, and therefore care should be taken in the proper selection of the cement. It must always be remembered that frozen cement mortar will not set so long as it remains frozen, and that when it becomes thawed it is simply in the condition of material freshly mixed, which, while in that state, imparts no more strength to the structure than

A rather close observation for a number of years of the effects of frost on Buffalo and Akron cement mortars, mixed in the proportion of 2 sand 1 cement and 3 sand to I cement, leads to the conclusion that such mortars enirrely disintegrate to a depth of several inches in exposed joints of masonry laid in cold weather; also, that when used as coatings or renderings of rough stone surfaces a flaking thereof occurs by frost which leads to rapid disintegration. If it is imperative that masonry be built in free-ing weather, a quick-setting Portland cement mortar should be used, instead of such as is prepared with natural cements; also, that even when Portland cement is used with brine, work should be suspended when the temperature is lower than 25° Fah. it good results are to be expected, and, finally, smaller proportions of sand should be used than during the prevalence of higher tempera-

REPORT ON CEMENT AND MORTAR TESTS MADE BY MESSRS. MARX AND MOSSCROP FOR THE EXECUTIVE BOARD OF ROCHESTER, N. Y.

ITHACA, N. Y., June 26, 1887.

E. KUICHLING, ESQ., Member Executive Board of the City of Rochester :

SIR: I have the honor of transmitting to you the results of the tests upon cements and sands furnished by you, and made in the cement-testing laboratory of this department of the Cornell University, by Professor Marx and Instructor Mosscrop. This report is forwarded to you for the use of the Executive Board of the City of Rochester.

Very respectfully,

Dean, Department of Civil Engineering, C. U.

^{*}This is the third of the series on the plant used at the Forth Bridge prepared by E. W. Moir for the Engineering and Building Record.

CEMENT TESTING LABORATORY DEPARTMENT OF CIVIL ENGINEERING, CORNELL UNIVERSITY, ITHACA, N. Y., June 25, 1887.

Prof. E. R. Fuertes, Dean, Department Civil Engineering, Cornell University:

SIR: The undersigned have the honor to submit the following report on two cements and five sands sent to this laboratory by Mr. E. Kuichling, member Executive Board, City of Rochester, for the purpose of determining the relative values of these cements for constructive pur-

poses.

There were received by us five sands, which we designated "P." "R. I.," "R. II.," "R. III.," "R. IV.," and two cements, one "Akron" brand, of which Messrs. McConnell & Jones are the agents, and one "Buffalo" brand, of which Messrs. Whitmore, Rauber & Vicinus are the agents. Each sand and cement was sifted in the nest of standard sieves, of which sizes are given in Table I., and gave the following results as shown in Tables II. and III., No. I being the residue left on sieve No. I, and No. 6 being the material which passed through all the sieves.

A microscopic and chemical analysis was made of each

At the outset it is evident that two things are to be determined—namely, which is the better cement, and also which is the best sand as used with these cements.

COMPARISON OF CEMENTS.

Adopting the volumes, three (3) of sand to one (1) of Adopting the volumes, three (3) of sand to one (1) of cement as of the most common occurrence in daily practice, tests were made with each cement and each of the sands designated "P" and Standard quartz, and also tests of the neat cements for periods of time equal to three days, one week, two weeks and one month, with results as given in Table IV. The standard quartz sand herein mentioned is simply a pure crushed quartz rock, of a fineness sufficient to pass through sieve No. I and be caught on sieve No. 2, and is the nearest approach to a standard sand to be used in the comparison of various cements, that can be obtained. It may be remarked that both of the cements be obtained. It may be remarked that both of the cements stood the prescribed tests for blowing.

These results need no discussion, showing for themselves that the Buffalo brand is the better cement.

COMPARISON OF SANDS.

Now, with reference to the sands, using the same volumes as before, three (3) sand to one (1) cement and the same periods of time over which the tests were extended, tests were made with each cement and each of the five sands, with results as shown in Table V.; and from this and the following investigations we name the sands in the following order as regards merit: R. I., P., R. IV., R. III., R. II.; R. I. being the best, and R. II. the poorest. EFFECT OF FINE PARTICLES IN SAND ON THE VALUE OF

EFFECT OF FINE PARTICLES IN SAND ON THE VALUE OF
THE LATTER FOR USE IN MORTARS.

Beyond the above, which covers Mr. Kuichling's request proper, we beg leave to submit the following, which is by far the most important part of this report, and which we believe to be of general importance to all constructing engineers, rather than of local importance, as it will enable them to judge of the quality of a sand fairly, and on its merits, without waiting a considerable length of time while tests are being made in some laboratory.

The ordinary specification for masonry, in speaking of sands, requires "a clean, sharp sand." All sands contain more or less of a fine, powdery material resembling dust or loam, and which ordinarily passes as such, but in reality is not generally of that nature. The effect of this material on the quality of the sand for constructive purposes, and how much, if any, can be allowed in a sand without necessitating its rejection for constructive purposes, was the point to which we next turned our attention.

Using sand "P" as giving good results and being the one most accessible, we proceeded as follows: From the affeige capalizing the sand in Table II it will be noticed.

one most accessible, we proceeded as follows: From the sifting analysis of this sand in Table II. it will be noticed that the sand is composed of six parts, numbered 1 to 6 inclusive, I being the coarsest and 6 the finest. The sand was sifted and the finest part rejected—that is, we had was sitted and the finest part rejected—that is, we had left a sand composed of parts I to 5 inclusive; also more of the sand was sifted and parts 5 and 6 rejected, leaving a sand composed of parts I to 4 inclusive, and so on leaving out each time an additional part, and thus we obtained five new sands composed as follows: P—(6), P—(5 and 6), P—(4, 5 and 6), P—(3, 4, 5 and 6) and P—(2, 3, 4, 5 and 6); the dash — in each case denoting minus, or subtraction

and 6); the dash — in each case denoting minus, or subtraction.

With these five sands and adopting the same per cent. of sand, cement and water as were used in the original "P" tests with Buffalo cement, tests were made with that cement and extending over three days, one week, two weeks and one month, with results as shown in Table VI.

Evidently from this table the taking out of the fine parts

Evidently from this table the taking out of the hne parts does not improve the sand, but we should ordinarily look then for a continued deterioration, if this holds true, whereas for the sand P—(3, 4, 5 and 6) a sudden increase in strength takes place; the explanation of this is as follows: Having given a sand and cement which are to be mixed into mortar for use, we then know that the best mortar will be the one in which all the particles of sand are coated with cement, and all the voids in the sand are filled with the same material; also, that in proportion as voids are left unfilled in the mortar, the compound deteriorates in strength; and further, that the proper amount orates in strength; and further, that the proper amount of water to be used, is the amount which reduces the cement alone to a workable mass, and that any excess of water which it may be necessary to add to reduce the

mortar to a workable condition, owing to the presence of a large per cent. of fine particles in the sand, will detract from the strength of the mortar on short-time tests. Determinations were made of the number of voids in

1,000 cubic centimetres (c. cms.) of each of these sands and the results are given in Table VII.

Now, since in all these tests, the same weights of sand, cement and water were used in mixing the different batches,

cement and water were used in mixing the different batches, then on the above-stated grounds, the only cause for variation in strength must lie in the fact that in one case there are more voids to fill than in another. Now, on inspection of column 7, Table VII., we find that taking out part 6 increases the voids, and that subtracting 5 and 6 has the same effect, the voids in a given volume being thereby increased; the same result is also obtained on taking out 4, 5, and 6; and from Table VI., we note a continued deterioration in strength. By taking out 3, 4, 5, and 6, the voids diminish to a trifle less than the voids in (P—6), wherefore the strength should increase to above the strength wherefore the strength should increase to above the strength of this last named sand, which we find in Table VI, to be of this last named sand, which we find in Table VI, to be the case. For the last or coarsest sand in said table, the voids are the greatest so far obtained, and the strength then should be the smallest; and on comparison we find such to be the case. From the results in Tables II., VI. and VII., just discussed, we feel justified in saying that the presence of 20 per cent. of silicious material, in a sand so fine that it will pass through seive No. 5, is not sufficient ground for rejecting such sand offered for use in constructive purposes. From Table VI, it is evident that a certain amount of this fine material, depending upon the mechanical composition of the sand, may even be benemechanical composition of the sand, may even be beneficial, since these fine particles fill voids and thus reduce the quantity of cement, which is used for filling voids alone, and allowing it to act in other places as a cementing or covering material for the particles of sand.

Pursuing this question of fine material still further with reference to the sands P., R. I., R. II., R. III. and R. IV.,

we give in Table VIII. the per cent. of siftings 5 and 6 in each sand, and also the proportions by weight that were used in mixing. We can then notice how the sands arrange themselves with reference to fineness, the coarsest being R. I., then in succession P., R. IV., R. III., and R. II, the latter being the finest—which is the same order in which they were previously arranged with reference der in which they were previously arranged with reference to strength; also, that on the basis of the amount of water used, they will arrange themselves in the same order, showing that the cement remaining the same, and the sand changing, the amount of water will change according to the relative amount of fine material in the sands, giving us then a sifting analysis as a simple and sound basis on which to judge the relative merits of sand.

which to judge the relative merits of sand.

In order to see whether the question of voids alone in sands of widely varying mechanical composition was a safe criterion for judgment with reference to their constructive value, we took each one of the five sands—P., R. I., R. III., R. III., R. IV.—and determined the voids in 1,000 c. cms., the results being given in Table IX.

From column 5 it is evident that we cannot consider this point alone, but, as previously shown, we must bring into the discussion the amount of fine material present and the consequent excess of water, over and above the amount necessary to reduce the cement to a workable condition. Proceeding on this basis we get Table No. X., and by taking columns 3 and 4 together, we can form our estimate and reach the same results as before. It must, however, be borne in mind that the above figures refer to a special case in which the that the above figures refer to a special case in which the proportions are by volume three (3) of sand to one (1) of cement, and would change for other proportions of sand

In general we would conclude that the larger the amount of fine material present in a sand, the poorer the sand for

constructive purposes.

That a proportion up to 20 per cent. of silicious material, so fine as to pass through sieve No. 5, may, for economical reasons, be allowed in a sand without any

That a certain amount of this fine material, depending upon the mechanical composition of the sand, may even be beneficial.

With this we must close our report; the subject is interwith this we must close our report, the subject is inter-esting and one which will produce beneficial results on further study. Other points that we had hoped to take up we have been obliged to postpone for lack of time. The question of the effect of frost on cement mortars was touched upon and results were obtained which were sur-prising, and which led us to postpone further investigation until a more favorable time.

> Yours very respectfully, CHARLES D. MARX, Asst. Prof. Civil Eng. Dept. ALFRED M. MOSSCROP, Instructor Civil Eng. Dept.

NEW YORK AND BROOKLYN BRIDGE.

REPORT OF COMMITTEE ON TERMINAL FACILITIES. To the Board of Trustees of the New York and Brooklyn

Bridge.

Gentlemen: The undersigned, on the 23d of February, received from the Board of Experts their report on the enlargement of traffic facilities at the New York terminus of the bridge. This report, which you have received, is a very careful and exhaustive one, worthy of the reputation of its authors, and one which clears the way toward arriving at definite conclusions.

The Board of Experts were not asked to estimate the cost of the improvements recommended by them, and immediately upon receiving their report the Chief-Engineer, Mr. Martin, was instructed to make careful estimates of the cost of lands, buildings, new machinery and cars necessary to apply the circulating system as designed by A. M. Wellington, C. E., to both termini of the bridge. His report, just received, gives the cost as follows:

COST OF THE WELLINGTON CIRCULATING SYSTEM FOR EIGHTEEN-CAR TRAINS.

Description.	New York Terminus.	Brooklyn Terminus.	Total.
Real Estate for Stations Real Estate for Store Yards	\$1,797,750	\$456,500 448,000	\$2,254.250 448.000
Station Buildings	1,100,000	1,155,000	2,200,000
New Plant and Machinery			475,000
100 New Cars	• • • • • • • •		400,000
Total			\$5,777,250

This is a very large sum, and one which it might be se to expend, so far as it would go, in providing new bridges or tunnels rather than to expend it upon the pres-

ent bridge.

The attention of your committee and that of the Chief Engineer was then directed to see how the present system can be enlarged. The Board of Experts in their report (p. 10) say: "The maximum capacity of the bridge rail-(p. 10) say: "The maximum capacity of the bridge fairway can only be attained by increasing the number of cars per train to the limit most desirable in actual service (which experience in operating them alone can demonstrate), and in fixing the headway intervals as short as absolute safety requires for handling trains of increasing lengths." This is very sound advice, and acting upon it,

investigations have been made, which show that it is iminvestigations have been made, which show that it is impracticable to run eighteen-car trains as proposed by Mr. Wellington. The Chief Engineer considers, and your committee agree with him, that four-car trains are about as long as can be safely and quickly handled.

This does not affect the adoption of the circulating system at all, for that is merely a method of avoiding switches and an adaptation to limited space. The space in Brooklyn is not limited, and there is no reason why the present rectangular system with tail switching modified

present rectangular system with tail switching, modified as suggested by the Chief Engineer, will not answer every purpose for the Brooklyn terminus for some years to come.

purpose for the Brooklyn terminus for some years to come.

The same system can also be applied to the New York terminus, and no encroachment beyond the present lines of tracks upon Centre Street, and no new lands will be needed. This modification of the present system is merely to add two more tracks parallel to the present ones, with intermediate platforms, all as shown in accompanying drawings, marked:

A. proposed New York terminus.

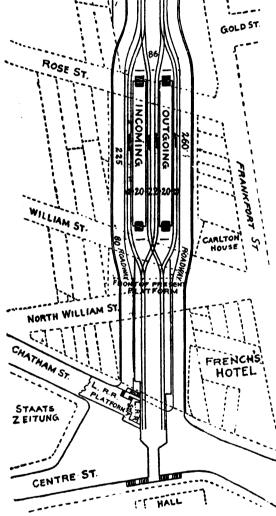

B. proposed Brooklyn terminus.

B, proposed Brooklyn terminus.

A double set of rails will be required on each track, to avoid the use of switches for incoming trains, and leave the tracks unbroken. Under the present system the capacity of the Bridge Railway is limited by the time required to stop trains, unload them, switch them into place and reload them, which is *eighty seconds*.

But if two trains can be loaded and unloaded simulta-

neously, they can be dispatched in half the time now required, say forty seconds, thus doubling the present capacity of the road.

The following table will show the increase:

•	between conds.	of cars	f trains	of cars		ngers d per ur.
Systems.	Intervals 1 trains. Se	Number o	Number o	Number of per ho	Seated, 42 in car.	Seated and standing,
As now operated with 3-car trains As now operated with 4-car trains	80 80	3	45 45	135 180	7,500	17,010
Proposed plan, 4 tracks and 4 cars	40	4	90	360	15,120	45,360

cost of this improved system is estimated by the Chief Engineer, as follows:
RECTANGULAR SYSTEM, FOUR TRACKS.

	N.Y. Station.	Brook- lyn.	Total.
Real estate for stations	None.	None.	None.
Station buildings	\$140,000	\$120,000	200,000
Seventy-five new cars			300,000
New plant and machinery	•••••	· • · • • • • •	40,000
Total			\$773,000

Your committee have no doubt that this improved rect. angular system is the one to be first carried out, and used until the traffic outgrows it.

There is nothing new or experimental about it. Its safety has been tested by over four years' experience and the conveyance of ninety million passengers, in more than 700,000 trains without accident to life or limb with the exception of the loss of a foot by a passenger in Decem-

ber, 1885.

It requires only slight alterations of the present machinery, and the alterations to the tracks, platforms and buildings can be carried out gradually and paid for out of These changes. the earnings of the bridge, as in the past. These changes will not interfere in the least with the traffic upon the

bridge.

The safety appliances recommended by the Board of Experts can be equally well applied to this system as to the circulating system, should it be decided that they are needed.

second set of overhead tracks, to carry So also a trains of the Brooklyn elevated railways, can be applied to one system as well as another if they are wanted.

It now only remains to consider what shall be done in

the future, when this system is outgrown

The number of passengers carried in 1887, by three-car

The number of passengers carried in 1887, by three-car trains in eighty seconds apart, was 27,940 000. With the same average number of passengers per car the yearly number that can be carried will be about 75,000,000.

According to the estimate of the Board of Experts this number will not be reached until 1895, or seven years from now. Up to that time this proposed system will answer with an expenditure of \$773,000.

It seems to your committee that it would be a more prudent and conservative course to put this system in open

dent and conservative course to put this system in opera-tion and postpone the large expenditure until the traffic demands it.

In this age of inventions there is no knowing what the next seven years may produce, and if the Bridge Trustes are not hampered by a present expenditure of nearly six million dollars, they will be ready for the best thing that

offers.

We now recommend that the President and Chief-Engi

First-

-To put four-car trains in operation on the present system.

Second—To prepare for the doubling of this system as above described and shown in plans A and B, and put it in operation as soon as the needs of the traffic shall de-

mand it.

And your Terminal Committee now ask to be discharged.

All of which is respectfully submitted,

T. C. CLARKE, C. E., JAMES HOWELL, President, Committee.

BROOKLYN, April 17, 1888.

THE PROPOSED SEWERAGE OF WICHITA KANSAS.

MESSRS. ROSEWATER & CHRISTIE, Civil and Sanitary Engineers, of Omaha, Neb., have submitted plans and estimates for the sewerage of Wichita, Kansas.

The position of the city embraced by the scheme extends along the Arkansas River about four miles, and is about one and a half miles wide. It is a slightly undulating plain, with surface slopes so light as to give less than four feet to the mile, even in the most favorable portions of the city. The high-water level of the Arkansas River is less than three feet below the level of the lower sections of the city and about six feet below the business centre.

There is, however, a large bend in the river just below the city, in which the fall is so great that it is possible to keep an intercepting main ten feet below the surface and with a grade of four feet to the mile still discharge above the high-water level of the river at the bend.

As the natural surface drainage of the city was reasonably good, and the cost of a combined system was estimated at about \$1,500,000 as against \$365.374 for a separate system, the latter was recommended, of which the following are the leading features:

Laterals to be of eight-inch salt-glazed vitrified pipe, with grade of 400 and provided with 250-gallon flushtanks, to be ventilated through perforated manhole covers every 400 feet, and by soil-pipes extending above the house-roofs.

Mains to be from fifteen inches to three feet in diameter, Mains to be from fifteen inches to three feet in diameter, to be built of bricks in Portland cement, when over two feet grade to be Tro; they will be low enough through the city to be flushed from the river and will have self-flushing gates as well. The total length of sewers is estimated at 84.7 miles, divided into mains, 5 miles; submains, 13½ miles; laterals 66.2 miles.

It is suggested that the mains and sub-mains be built at the expense of the city in which case the assessment for

at the expense of the city, in which case the assessment for the laterals alone would be 33 cents per foot front of abutting lots. If the whole cost is assessed on abutting

abutting lots. If the whole cost is assessed on abutting lots it will be 62 cents per foot front.

Mr. H. S. Maddock, a civil engineer of Chicago, has also estimated on a combined system for part of the city, and one of his plans contemplates pumping the sewage.

THE PLUMBING CATECHISM OF THE NEW YORK TRADE SCHOOLS.

No. XV.

(Continued from page 604, Vol. XV.)

WE are indebted to Mr. Edward Murphy for the copy here presented of the questions and answers prepared by him for the plumbing class at the New York Trade School. This subject forms the eighth topic in the series of which we have presented the seven preceding ones in Vol. XV.

HOUSE PUMPS.

1. Explain the principles on which the action of a pump depends and enables it to lift water?

When a vacuum is formed in the suction-pipe of a pump the pressure of the external air forces the water to rise into the pump, provided the lift is not too great.

2. What is the greatest perpendicular distance that a pump can lift water from?

Theoretically, water should rise about 33 feet. Practically, pumps draw only from 23 to 28 feet.

3. Does it make any difference in the working of a pump whether the water is at a greater or less distance from pump?

It does, as the nearer the pump is to the water the more easily water can be raised.

4. Describe some of the pumps used for ordinary purposes.

The suction, the force and lift, and the double-action or ship pump. There are many others.

5. Have double-action pumps any advantages over singleaction, and why?

They have, because they keep up a steady stream and labor is economized, as every stroke up or down is effective. In the single-action pump, the down stroke only does the work.

6. Describe the different parts of a pump and explain the action of the valves.

The barrel or cylinder, the piston, the valve at bottom, the fulcrum, the brake or handle, top and bottom caps, couplings and packing boxes or glands.

7. In a badly working pump where should the trouble be first looked for, and how should it be remedied?

For leakages in the pipes or couplings; next in the valves. Pipes should be made air-tight and valves put in proper condition.

8. What difficulty is experienced in pumping hot water or volatile fluids?

The vapor prevents a vacuum being formed. In that case the pump must be very close to the fluid.

9. What advantage is gained by using large pipes for suction and rising pipes?

Friction is lessened, therefore more water can be obtained and the labor is diminished. There is no danger of making pipes too large.

10. What is the object and advantage of using air and vacuum chambers on pumps?

As they contain large quantities of air which is compressible the pump is assisted by its alternate compression and expansion.

II. What m-terials are used in the construction of pumps, and which appears to be best adapted for the purpose?

Brass, copper, and iron, sometimes glass. Brass would seem the best.

12. In pumping from wells what precaution should be taken with ends of suction-pipes?

They should be covered with a basket of fine wire gauze or by perforated metal cap.

13. In supplying large house-tanks what other means besides hand labor are employed?

Steam, hot air, and gas.

14. What is a driven well? An artesian well?

A driven well is one where the pipe is driven into the ground by a maul until water is found. An artesian well is one where the hole is drilled a great distance through the ground or rock, and then piped down to the water.

15. What is a submerged pump and where is it used?

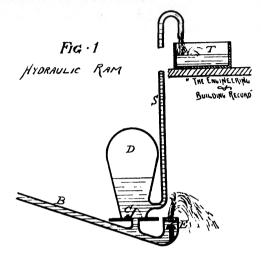

A submerged pump is one placed entirely under water, which it forces to the required point. It is chiefly used where the water is foul or gritty, as in cellars and sewers and for tanneries, etc.

16. When water happens to be 75 or 100 feet or more below the level of ground, how can it be raised if a pump will not draw over 30 feet?

The pump must be set within drawing distance of the water and forced the rest of the way.

17. Explain the principle and working of the hydraulic ram and wherein it differs from a pump?

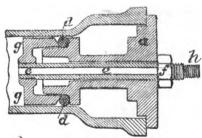

The hydraulic ram is a contrivance for raising a small quantity of water to a considerable height by utilizing the momentum of a larger quantity of water flowing downwards. It differs from a pump in that it neither has a piston nor produces a vacuum, and that it must always be placed below the source of supply.

In Fig. 1 the water is received through the inclined pipe B, the momentum of its discharge raises and closes wastevalve E, when the pressure opens valve C and forces water into air-chamber D until the pressure is relieved and C closes and E opens, when the water again commences to come down B, and the operation goes on continually. The air in D is compressed by the entrance of the water into the chamber and forces it up the pipe S as soon as the valve C is closed.

PLUG FOR TESTING PIPES.

THIS device, invented by Jacob Jooss, is described in the Revue Industrielle, from which the illustration is taken. Its principle is the same as that of several that we have recently described-namely, the lateral expansion of an elastic ring produced by compressing it in a direction parallel to the axis of the pipe. Its use is very simple. A plug having been introduced into each end of the pipe to be tested, the nut f of each plug is screwed up, drawing together the head a and the follower g by the rod e, and compressing between them the India-rubber ring d, which is thus forced out against the inside of the pipe until sufficient tightness is secured.

PLUG FOR TESTING PIPES

One of the plugs has the rod e hollow with a thread at h, to which a proving pump can be connected.

The head a, it will be noticed, is adapted to fit either the bell or spigot end of the pipe, and the portion of the follower g which bears against the ring d is inclined so that the tendency of the proving pressure to force the plug out serves to wedge the packing ring more tightly against the inside of the pipe.

NATIONAL ASSOCIATION OF MASTER PLUMB-ERS OF THE UNITED STATES.

THE Essay Committee of the National Association announce the following subjects for consideration at the forthcoming convention. Each of the constituent associa.

tions are requested to state which of the subjects they pro pose to discuss:

- 1. The Qualifications for Conducting the Plumbing Business:
 Does the plumber have the same confidence reposed in him as the family physician; if not, why not?

 2. How to Promote the Unity of the Associations: What benefits are derived from the National Association? Upon what does the security of the local and national association depend?

 3. The Disposal of Drainage in Inland Cities: Can it be made a source of profit as a commercial enterprise?

- 4 The Holly Water System: Is it advantageous for inland cities?
- 5. The Artesian Well as a Source of Water Supply: Under wha ircumstances is it to be preferred to other means? How most ecomically can the water be conducted to be used in our houses?

 6. Is the public benefited by competition in the p'umbing trade?
- Salt-glazed Sewer Pipe versus Cast-iron Pipe for Interior
- 8. Lead Pipe versus Galvanized Iron Pipe: Has the former any advantage as waste-pipes over the latter? Can the latter be protected from corrosion?
- 9. Indirect versus Direct Supply to Water-Closets and Ur nals.
- ro. The Lighting of a Country Residence: Material to be used. If gas, how obtained, or manufactured?
- 11. Surface-Water Drainage: Should it be separate from the sewerage system in cities? Importance of surface-drainage in small towns and country places.

 12. Best Material to be used for Ventilating Pipes Connected with Plumbing Fixtures: Iron, lead, galvanized iron, etc. Method of making joints. Where should ventilating-pipes be discharged?

- making joints. Where should ventilating-pipes be discharged?

 13. The Drainage of a Country Residence: System of disposal where there is no sewerage. Extent of prumbing in such a house.

 14. American Earthenware versus Imported Ware: Is there any difference as to quality? Is there any prospect that the tormer will some time be used exclusively in this country?

 15. Hot Water as a Means of Warming and Ventilating Buildings: As compared with the use of Steam. How far does the plumber's work extend in fitting up such a system?

 16. How to Prevent Waste of Water in Cities: Methods of Inspection. The use of Meters. Kind and character of house fixtures.

 17. The Out-door Water-Closet in Coid Climates: Method of construction. Advantages over a common privy.

 18. Disposal of Garbage: Of a city or village. Of individual house refuse burning in stoves. Garbage-burners.

 19. The Rise and Fall of the Lead Worker in the Plumbing Trade.

 20. The History of the Pump.
- - The History of the Pump.
- 21. Electricity in the Plumbing Trade: Applications. Dangers to workmen from electric wires.
- 22. The Automatic Flushing Apparatus.
- 23 The Plumber as an Inventor: Make application to sanitary goods and appliances. Comparative value of the plumbers' invention in this line over those of the manufacturer, dealer or "specialist."
- 24. Natatoriums or Public Baths: Their construction. Benefits to be derived as a Sanitary measure.
- 25. The Air Currents of the Interior of Bui'dings: How effected by changes of temperature and prevailing winds. Are the seals of traps of plumbing fixtures affected by them?
- 26. The Plumbing Fraternity-Past, Present and Future.
- 27. The Proper Training of Apprentices.
- 28. The Habitations of the Poor: What is the condition of the plumbing and drainage? Cite instances of profitable and healthful habitations for the poor.
- 29. Is it Desirable to Establish a Home for the Aged or Infirm Plumbers? Should it be a State or national institution? How formed and supported?
- 30. On the Expediency of Establishing a National Trade School: How should it be organized and supported?

 31. The Inspection of Plumbing and House Drainage: Should the inspector be governed by the Board of Health or by a board of plumbing and house-drainage commissioners? How often should such inspections be? In what manner should the work be tested?

PHILADELPHIA MASTER PLUMBERS' ASSO. CIATION.

(Special Correspondence.)

AFTER considerable discussion over the recommendation of a special committee regarding tests of house drain-pipes, previously published in these columns, the following resolutions were adopted:
"That we recommend to

ing resolutions were adopted:

"That we recommend to the Board of Health for adoption as the proper test, that a pressure equal to three pounds to the square inch be applied to the soil-pipes or drainage system in new houses or to entire new work in old houses before the fixtures are attached or placed in position.

"Resolved, That for all work with the fixtures attached or in position that a pressure equal to one inch water-gauge shall be the proper test."

The resolutions were forwarded to the Board of Health,

and at their meeting on April 17, after tacking on a resolution that a fee should be charged for each such test, the subject was referred to a committee.

THE Chicago Master Plumbers' Association enjoyed their annual ball April 12 at the First Cavalry Armory. Handsome gold badges went to the retiring officers. The Arrangement Committee was A. W. Murray, T. C. Boyd, and ex-Alderman Ryan.

HOT-WATER BOILERS AND FLOW-PIPES IN THE HOUSE OF NOTRE DAME,
TORONTO, ONTARIO

A CORRESPONDENT, while investigating the methods of warming buildings by hot water in Canada some time since, sent us the following sketches, etc., of the boilers and flow-pipes of the heating apparatus in the House of Notre Dame, Toronto.

He writes: The extraordinary small space occupied by the boilers in this building compared to the space required for steam-boilers for the same sized building surprised me. The actual floor-space of the two boilers was only 7 feet 3 inches by 4 feet. This, of course, did not include the fire-room and the space taken up by the connections. The latter, however, take immensely more room than the boiler, all of which, though, would occupy much less space than any steam-boilers could that would be suitable for such a building. I was unable to find the amount of heating surface in the building on account of the difficulty of going through the rooms etc., but I was enabled to make sketches and measurements of the boilers and the pipes, which you will see in Figs. I and 2.

As all the valves on the flow-pipes are tagged and numbered, and the rooms they control marked on them, I by this means approximated the surface as given below. Circuit 9.—Size, 2 inches; room A and parlor; 200 square feet.

Circuit 10.—Size, 2½ inches; reception-room and two vestibules; 300 to 400 square feet.

Circuit 11.—Size, 3 inches; top floor and new hall; 400 or 500 square feet.

Circuit 12.—Size, 2 inches; rooms 29, 30, 31, and corridor; 150 square feet.

Circuit 13.—Size, 2 inches; rooms 6, 7, and 8; 150 square feet.

Circuit 14.—Size, 2½ inches; corridor 1 and room D; 200 square feet.

Circuit 15.—Size, 1½ inches; corridor 2 and room 14; wall coil, 120 square feet.

Circuit 16.--Size, 11/2 inches; top floor; wall coil, 100 square feet.

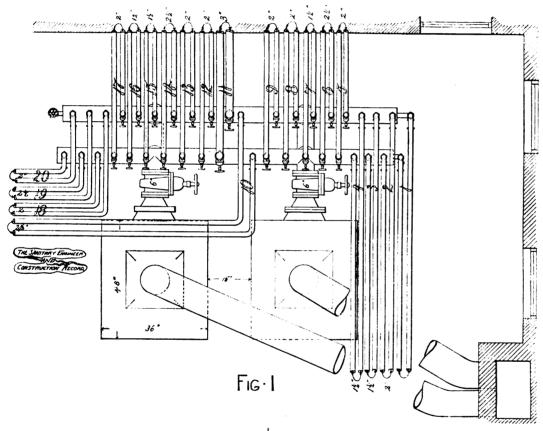

Circuit 17.—Size, 2 inches; back hall and office; 150 square feet.

Circuit 18.—Size, 2 inches; north wing, library and reading-room; 150 to 200 square feet.

Circuit 19.—Size, 2½ inches; north wing, first floor; 300 to 400 square feet.

Circuit 20.—Size, 2 inches; corridor, north wing, closets, etc.; 150 square feet.

The total surface in this building cannot be much short of 3,700 square feet, and a room 12x12 feet is certainly

It will be noticed a six-inch valve controls the main flow and return pipe of each boiler. To each valve is joined a header or manifold, and from these manifolds the flow and return pipe for each subdivision of the house is taken in pipes ranging from 3 inches to 1½ inches in diameter, as will be seen by reference to Fig. 1. Each couple or circuit is numbered from 1 to 20 inclusive, and the size of the pipes with the rooms of the building they supply and an approximate estimate of the surface made by one who is accustomed to heating apparatus is given in the following list:

Circuit No. 1.—Size, 2½ inches; room supplied are, chapel, practice-room and bath-room; square foot surface probably not under 400 feet.

Circuit No. 2.—Size, 2 inches; large bath-rooms; surface, 150 square feet.

Circuit No. 3.—Size, 1½ inches; bath-room; surface, 75 square feet.

Circuit No. 4.—Size, $1\frac{1}{2}$ inches; two coils in chapel; surface, too square feet.

Circuit No. 5.—Size, 2 inches; coil, south-west corner sitting-room, first floor; 120 square feet.

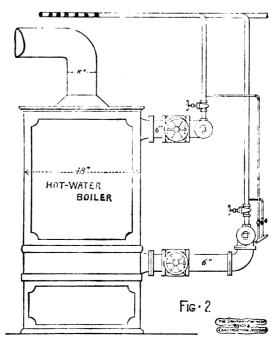

Circuit No. 6.—Sitting-room, second floor, and girls'

dormitory; size, 2½ inches; 250 square feet.

Circuit 7.—Size, 1½ inches; breakfast-room and room

C; 100 square feet.

Circuit 8.—Size, 2 inches; rooms 2 and 4 and water-closet; 150 square feet.

more than ample for the plant, so far as boilers and valves are concerned.

The necessity for so many small pipes or circuits 1 cannot see the philosophy of. Still it is the result of practice here, and men who have tried a large single main instead say they cannot get as good results and are not so sure of what they will obtain as with the system shown here.

The heat from these mains is, as a general thing, not lost. It warms the halls and rooms of the basement and their influence is felt through the whole house, and correspondingly less surface is required in many of the upper parts of the building.

A means of drawing the water from any single circuit is shown in Fig. 2. A pipe of small diameter is joined with the flow and return pipe just above the stop-valve in each case.

The fuel used in this building was given at three tons per week in cold weather.

ENGINEER.

WATER-BACK VERSUS HEATING COIL.

FORT SUPPLY, I. T., April 8, 1888.

SIR: Suppose you want to put up a 40-gallon cylinder boiler close by a range, how will you heat the water in the boiler? Would you have a coil of pipe running from the boiler through the side of the range in contact with the fire and then return into the boiler, or would you have the boiler connected by pipe with a water-back attached to the range? Which is the best method?

The intention is to have a constant supply of hot water on hand for bathing purposes, the hot water to be conveyed by about sixty (60) feet of pipe to the bath-room. Have you ever known an accident to happen from the bursting of a heating coil inside of the range? Please give your views fully on the subject and oblige.

Yours respectfully, WATER-BACK.

[If the range is constructed for a proper size water-back we should use it. If not, we should use the pipe. We do not recall any instance of the bursting of such a pipe, except when circulation was obstructed by frost, then result would be as bad if not worse with water-back. If the water-back is too small to produce the hot water required more available heating surface may be secured by the U-shaped pipe used in its place.]

SIZE OF CHIMNEY FLUE FOR BOILER.

HONESDALE, PA., April 4, 1888.

SIR: We have a house which calls for 300 square feet of direct and 100 square feet of indirect radiating surface.

The boiler used is capable of supplying 650 square feet of direct radiating surface. The chimney flue 8 "x9", and has good draft, but fire in boiler burns very poorly; we claim chimney flue should be at least 12 x12'. Will you please answer through your columns?

Yours, etc., W. W. Woon.

[A chimney flue of half a square foot of cross section is rarely enough for a house-heating boiler even of the smallest

In very cold weather, with the apparatus you describe, the consumption of coal may be reasonably set at twenty pounds per hour. Each pound of fuel will require and liberate gases to the amount of about 600 cubic feet at the temperature which they pass into the chimney, or 12,000 cubic feet in all. To pass this through a flue of 8'x9' or half a square foot will require an effective velocity of 6.6 feet per second over its whole area. This velocity, though easily obtained theoretically in flues of any practical magnitude, is rarely obtained in house-flues on account of the amount of resistance caused by rough brick-work and short or square turns. The leakage of air also through the comparatively thin walls of the flue is considerable, and when boilers have brick setting there is also a considerable infiltration or leakage of air through the walls of the setting. which has to pass off by the chimney flue. An 8'x12' flue might be ample, though if we were building a chimney we would make it 12"x12", if of brick. A 12-inch circular pipe built into the walls we consider equally as good as a 12-inch square when made of brick, as they are usually built.]

CREDIT FOR FIRST USING NESSLERIZED AMMONIA AS A STANDARD FOR COMPARISON OF COLORS OF NATURAL WATERS.

Boston, April 17, 1888.

SIR: The credit of first using Nesslerized ammonia as a standard for comparison of the colors of natural waters belongs to my friend, Prof. A. R. Leeds. I had overlooked this when I wrote my paper on the "Color and Odor of Surface Waters," which you notice in your issue of April 14.

Yours, T. M. Drown.

COMPRESSIVE STRENGTH OF CEMENT.

IN reply to question in your last issue, experiments on the compressive strength of cement have rarely been made since the easier tests on tensile strength have been held to indicate approximately (?) compressive, transverse, and shearing strength. John Newman, the latest English authority on cement, says: "As the compressive strength of cement is very much greater than its tensile or adhesive strength, unless it be for an exceptional purpose, there is no occasion to ascertain its power of resistance to compression."

there is no occasion to ascertain its power of resistance to compression."

Boehme, Bauschinger, and Mauk, careful German investigators, have found for best, slow-setting, finely-ground Portland cement a compressive strength of 4,540 to 4,200 pounds per English square inch. If cement is to perform an important function as a material of construction, distinct from its duty of filling the joints in heavy masonry, and thereby increasing stability by an increase of friction between the adjoining blocks, nothing but such Por land cement as above should be relied upon. Such car.fully selected material may be used with a smaller coefficient of safety than any natural stone, and hence may be rated as the equivalent of the most valuable building be rated as the equivalent of the most valuable building stones obtainable.

For joints where the cement is not in contact with the atmospheric air the cement may be used neat, since, unlike lime, it does not require sand for mixture, and the admixnme, it does not require sand for mixture, and the admixture of sand rapidly weakens its strength. When mixed with one, two, and three parts of sand its strength is reduced to 71, 51, and 42 per cent. of its strength when used neat, as proved by J. Grant in London, and Doctor Michaelis in Berlin.

WASHINGTON.

ADOLPH CLUSS.

STEEL VERSUS WROUGHT IRON FOR BUILD-ING PURPOSES.

PHŒNIXVILLE, PA., April 18, 1888.

SIR: Referring to the statements of Mr. C. L. Strobel, Mem. Am. Soc. C. E., in your issue for April 14, relative to the weights of steel and tron rolled beams and the economy of weight claimed in favor of steel, it may be of interomy of weight claimed in favor of steel, it may be of interest to note that for three years past iron beams have been rolled at the Phœnix Iron Works as light in weight as the steel beams specified. Fifteen inch iron beams, weighing 41 pounds per foot, and 12-inch iron beams, weighing 32 pounds per foot, are made without difficulty and with most satisfactory results. The experiments of Mr. James Christie, Mem. Am. Soc. C. E., "do not show that steel of any grade is stiffer under working loads than wrought iron"; and his further statement that "beams of either steel or wrought iron having uniform lengths and cross sections will deflect uniformly, under equal loads, below the elastic limit of wrought iron " is fully borne out by the observations of many tests. tions of many tests.
Under these circumstances the superior economy claimed

for steel beams does not appear to be warranted by the for steel beams does not appear to be warranted by the facts, and the editorial comments of your issue of March 17 are as clear and definite a presentation of the comparative merits of the two metals as could be desired.

Very truly yours,

AMORY COFFIN,

Mem. Am. Soc. C. E.

WHO SELLS CLAMOND OR WELSBACK INCANDESCENT GAS BURNERS?

PROVIDENCE, R. I., April 10, 1888.

SIR: Can you tell me whether the incandescent gas-burners, Clamond or Welsback, are for sale in this country, and, if so, where?

C.

[Referred to our readers.]

"E," of Chatham, N. Y., is notified that anonymous communications cannot be answered. Names are always required as evidence of good faith.

BOSTON SOCIETY OF CIVIL ENGINEERS.

THE monthly meeting of the Boston Society of Civil Engineers was held April 18 at the Society's Room, and called to order at 7:30 r. M. by President Fitz Gerald.

Ten new members were elected, and, after transacting current business, Mr. L. Frederick Rice read a paper on "The Methods and Apparatus used in the recent test of Water-Meters at Boston," and showed the apparatus used for weighing and recording the water measured.

A paper was also read by Mr. Weston, of Providence, on "Use and Test of Water-Meters in Providence."

on "Use and Test of Water-Meters in Liousens Forty-two members and fifteen visitors present.

ENGINEERS' CLUB OF KANSAS CITY.

AT the regular meeting April 2 there were thirteen members and eleven visitors present, and the minutes of the previous meeting were read and approved.

A letter from Mr. L. E. Cooley to the Committee on National Public Works was presented by Mr. Chanute, stating that delegates from the various engineering societies would meet in Washington April 9 and 10, and requesting that the Kansas City Club be represented.

The club voted to defray the necessary traveling expenses of a delegate to Washington, the delegate to be selected by the Executive Committee.

Contributions to the discussion of the evening were read from Messrs. C. E. H. Campbell, of Council Bluffs, lowa; C. G. T. Bouscaren, of Cincinnati; George L.

Strobel, of Chicago, and A. J. Tullock, of Leavenworth. The following were elected as members: Charles C. Gilman, Robert Gillham, Charles S. Brown, James H. Grove, E. J. Remillon, Frank Allen: and as associate members, J. B. Hodgdon, George K. Musselman.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.

THE regular monthly meeting of this society was held at Pittsburg, April 17th, Vice-President Prof. J. A. Brashear in the chair.

Messrs. Louis B. Fulton and Geo. B. Barbour were elected members.

Mr. P. Barnes, Superintendent of the Steel Department of Jones & Laughlin, made some remarkson "The use of Aluminum Alloy in Steel."

Mr. Barnes said: If this question of the use of aluminum

alloys is to be brought up, what additional requirements as alloys is to be brought up, what additional requirements as to quality are we likely to have pressed upon us? For himself, he did not see that that there was anything further necessary than the methods now employed. He next asked, to what extent have makers of alloys a claim upon steel makers, if the latter decline to experiment with the alloys which are sometimes thrust upon them? He hought that the expense of the experimenting, should be thought that the expense of the experimenting should be borne by the makers of alloys.

Mr. Metcalf stated that the only use he had ever heard

made of aluminum in steel was to make the ingot sound. One of the effects of aluminum is to "quiet" boiling steel

One of the effects of aluminum is to "quiet" boiling steel almost immadiately.

M1. Hunt said that it was claimed for aluminum alloy that added to steel it gave the metal fluidity. He had found the claim sustained, but thought the alloy at \$4.00 per pound cost more than it was worth.

Mr. Hibbard, of the Linden Steel Company, said that after three experiments with an ordinary steel, about 18 carbon, 50 manganese and \(\frac{1}{0} \) per cent. aluminum, they obtained an average tensile strength of 70,000 lbs., and an elongation of 27 per cent.; and without aluminum similar stock gave but 65,000 lbs. ultimate, with but 22 per cent. elongation.

Mr. Brashear stated that some experiments with aluminum alloys for tools and for polished surfaces were very satisfactory.

Mr. Clapp, of the Pittsburg Testing Laboratory, commended the wearing powers of the metal.

Mr. Barnes said that perhaps the presence of silicon might account for the quieting of boiling steel, as well as the aluminum.

Mr. Hibbard stated that in the case he mentioned there

was only about one eighth as much silicon as was usually used for that purpose.

At the May meeting the paper to be presented will be "Fifteen Years of Steel Making," by Mr. Koch, Superintendent of the Spang Steel and Iron Company.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

ARERICAN SOCIETY OF CIVIL ENGINEERS.

A REGULAR meeting of the society was held at their rooms on the 18th inst., Vice-President J. James R. Croes in the chair. The secretary read a paper by Mr. D. V. Purrington, secured by request for information on the manufacture of bricks as practiced by the Purrington-Kimbell Brick Company of Chicago. No originality was claimed for the method employed, and the paper was simply a straightforward description of sensible and successful work, as follows:

A Chambers stiff mud machine, the first of its kind to be used was set up early in 1882, and fed with clay

be used, was set up early in 1882, and fed with clay dredged from the Chicago River. This proved too wet for the machine to work advantageously, though the hard blue clay underlying the city worked very well.

Another machine was soon after purchased and set to work on clay that had been dredged from the Illinois and Michigan Canal 25 years before, of which in 3 years they made 46,000,000 bricks, the yearly maximum being 10,000,000 for a machine with a dryer, and 6.500,000 for

This clay being exhausted, 47 acres were purchased at Purrington, 14 miles from Chicago, and the present works erected in 1886. The clay there is very hard, although slightly granular. At first it was obtained by pick and spade, but eleven men could not mine and load enough in ten hours for 45,000 brick, and dynamite was soon freely used as the bank got harder and dryer. When the clay was very hard a pound of dynamite in a 2-inch hole would only shatter and crack the bank so as to make it easier to

dig.
In the Chicago clay, which was of an India-rubber texture, the dynamite merely made an egg-shaped cavity about as big as a half barrel, around which the clay was very solidly packed without crack or fissure.

In loamy or sandy clay a hole 1 to 8 inches in diameter is made for the charge to the surface.

Dynamite soon proved unsatisfactory, and a steam-shovel was set to work. The first one proved too light and a was set to work. The first one proved too light and a second was obtained with a one yard bucket, though built for a yard and a half. This bucket cuts three feet wide and four to six inches deep and twenty-five feet vertically. and four to six inches deep and twenty-five feet vertically, and two yards, sufficient to make 1,000 brick. can be dug and handled in less than one minute, or enough for 225,000 bricks in ten hours, including shifting, etc. Two-yard dump-cars were at first used to transport the clay, but, as it kept one man busy all the time to repair them, a section of track was arranged to tip with the car on and secured to it, which was found economical and satisfactory.

The cars are drawn by a hoisting drum over a platform on which the clay is dumped, and from which it is fed to two Cockell pulverizers which whittle the clay into small chips. From these the clay passes to the brick machines, one to each pulverizer, with an average capacity of 44,300 bricks in ten hours, from which the newly formed bricks are run on cars into the eleven drying tunnels, ninety-four feet long, from which the steam is removed by exhaust fans. They will thoroughly dry 50,000 bricks in twenty-four hours. Artificial drying costs less than out-of-door drying.

The following force make, dry, and set in the kilns an average of 177,200 brick per day: Four machine men, four boys on platform, eight men at pulverizers, two men at hoisting machines, one engineer on steam shovel, one foreman on steam-shovel, one craneman on steam-shovel. six men in clay bank, twelve boys loading cars with green bricks, four men putting cars in dryer, four men to fire dryers and remove cars, four men to do the same at night, twenty-four men setting and wheeling, one engineer, two foremen, one carpenter, one blacksmith, three laborers—

total, eighty-three.

Very satisfactory experiments have recently been made in burning the brick with crude oil. Two million one hundred thousand brick have been thus burnt, but the results, though very promising, are not yet considered con-

A paper by Mr. Jose R. Villalon was also read by the author, describing the manufacture of author, describing the manufacture of brick from the ground refuse of slate quarries at Phillipsburg, N. J.

"These slate brick are very hard, ring well, are compact and homogeneous, fine grain, free from pebbles, and

pact and homogeneous, fine grain, free from pebbles, and rarely crick; their color varies from light rose to Philadelphia brick red. They do not shrink or warp in burning, and cut easily with the trowel. They are very strong and absorb very little water, so they make a dry wall and do not suck the moisture from the mortar. Their eost is, for pressed brick, \$12 to \$20 per M., and for paving-brick, \$12 to \$13. For the latter purpose they are specially suited, as they are readily cleaned and do not hold ice like other pavements."

The papers were discussed by Mr. Calvin Tomkins,

The papers were discussed by Mr. Calvin Tomkins. who gave information regarding the manufacture of brick on the North River and in New Jersey. The want of uni-formity in size of brick he attributed to unequal shrinkage in the burning.

AMERICAN WATER-WORKS ASSOCIATION.

(From our Corresponder t.)

The eighth annual meeting was held in Cleveland, O., April 17th, 18th and 19th, President J. T. Fanning, of Minneapolis, Minn., presiding. The first session was held Tuesday morning, and after the transaction of regular business the society listened to a paper by the president on "Water-Supply Treatments and Sources."

At the afternoon session invitations were received from City Engineer Rice, The Globe Iron Co., Lake Shore Foundry and others to visit their works and shops, and a committee was appointed to make suitable arrangements.

The reports of executive and finance committees were

The secretary reported that during the last year 44 active, 5 associate and 1 honorary member had been elected, and that 7 members had been lost by death or resignation, leaving a net increase of 43.

The society now numbers 210 active, 54 associate and 1 honorary members.

The last year's total receipts were \$1,080.25. of which a cash balance of \$156.55 remains. This report was approved and accepted.

The death was announced of John Ryle, of Paterson, N. J., and of W. C. Stripe, of Keokuk, Iowa. Mr. Stripe was closely identified with the growth of the society and was one of its most efficient laborers.

A committe was authorized to prepare obituary memoirs. Papers were read on "The Sanitary Protection of Rochester's Water Supply," by Chief Engineer J. Nelson Tubbs; "The Use of Salt-Glazed Vitrified Pipe," by S. E. Babcock, C. E., and "Consumption of Water by Cities and Towns," by H. W. Avers, C. E.

Mr. Y. Nakajima not being present to read his paper on the "Water-Supply of Tokio, Japan," it was omitted from the programme, but directed to be printed in the proceedings as appearing with the rest.

The reading of the papers was followed by interesting discussions, which we will present in another issue, and will report the transactions of the subsequent sessions.

Many guests of the association, and a number of exhibitors of special articles for water-supply and kindred uses. were in attendance.

The following members were present: Chas. P. Allen, Denver, Col.; H. W. Ayres, Hartford, Conn.; S. E. Babcock, Little Falls, N. Y.; C. E. Borke, Cleveland, O.; Calvin S. Brown, New York, N. Y.; D. M. Clark, Elyria, O.; Edwin Darling, Pawtucket, R. I.; A. N. Denman,

Des Moines, Iowa: I. M. Diven, Elmira, N. Y.: H. F. Dunham, Cleveland, O.; J. T. Fanning, Wilkesbarre, Pa.; E. W. Frost, Colorado Springs, Col.; L. H. Gardner, New Orleans, La,: W. S. Hamilton, Youngstown, O.; J. W. Henion, St. Louis, Mo.; Frank W. Holly, Lockport, N. Y.; Thos. N. Hooper, Davenport, Iowa; Geo. Hornung, Newport, Ky.; A. J. Jones, New Brunswick, N. J.; J. P. Maxwell, Boulder, Col.; Wm. Molis, Muscatine, Iowa; B. R. Morton, Newport, Ky.; Chas. N. Priddy, Leadville, Col.; W. G. Richards, Atlanta, Ga.; Wm-Ryle, Paterson, N. J.; Benj. F. Stephens, Flatbush, N. Y.; John W. Troy, Pierre, Dak.; J. Nelson Tubbs, Rochester, N. Y.; T. Woodruff, Bridgeton, N. J.; Fred Adee & Co., New York, N.Y.; Richard Beaumont, Kankakee, Ill.; J. B. Clow & Sons, Chicago, Ill.; Columbus Water Works, Columbus, O.; Hersey Meter Co., Boston, Mass.; E. H. Kellogg & Co., New York, N. Y.; Lake Shore Foundry, Cleveland, O.; A. W. Morgan, Buffalo, N. Y.; H. Mueller, Decatur, Ill.; R. D. Wood & Co., Philadelphia, Pa.; H. R. Worthington, New York, N. Y.; Wortley, Ted & Co., Kansas City, Mo.

The following were elected officers for ensuing year: A. N. Denman, of Des Moines, President; J. N. Diven, of Elmira, W. G. Richards, of Atlanta, John W. Henion, of Minneapolis, Charles U. Priddy, of Leadville, and H. W. Ayers, of Hartford, Vice-Presidents; J. H. Decker, of Hannibal, Mo., Secretary and Treasurer. The next annual meeting will be held in Louisville.

The reports of papers and discussion on them we are obliged to defer for a subsequent issue.

LONDON CORRESPONDENCE.

\$5,000 for Essay on Water-Supply—Gas in Madrid
. Theatres Prohibited—Electrical Railway in Vienna
—A Patent Decision—Midshipmen to be Instructed
in Steam Engineering.

THE King of the Belgians offers a prize of 25,000 francs for the best work on the question of water for towns, referring specially to Brussels and its suburbs. The competition essay may be in any language and in either manuscript or printed form. Competitions must be received before January I, 1893, at the Bureau of the Minister of Public Works, Brussels. Existing works, unless materially altered, and in the form of a new edition published between 1889 and 1892, are not available to take part. No particulars are announced as to the judges, but in any case the universal value of the competition, which is, of course, in the first instance, specially for Belgium, is apparent.

A REUTER's telegram from Madrid states that the regulation as to the abolition of gas in the theatres, and the universal substitution of the electric light, has just been officially notified. The change must be made within five months from date.

MESSRS. SIEMENS & HALSKE, the electrical engineers, have had an electrical tramway in regular work for some months past in Vienna. The current is supplied by a fixed dynamo. Conductors, resting on iron chains, in a masonry channel, and in contact with which are two sliding shuttles, run the whole length of the line, which is about eleven kilometres. Steel-wire spiral cords act as transmitters of power from the motor-spindle to the car-axles.

A PATENT case of unusual form has just been settled on appeal in the House of Lords. The Limited Horse Shoe and Nail Co. sued a Glasgow firm—Messrs. John Stewart & Co.—for infringing patent rights in selling horse-shoe nails, manufactured in Sweden by machinery which infringed the patents of the Horse Shoe Co. Damages were laid at £10,000. At the first trial damages were awarded the plaintiff company £530, but on appeal by the defendants these were reduced to £50; the House of Lords have, however, confirmed the first judgment. The principle that goods made abroad by machinery patented in England and put upon the market here by firms other than the patentees of the machinery are thereby constituted infringements of patents.

THE Admiralty have taken a step in the right direction with regard to the better education of midshipmen in the questions of steam and marine engineering. Before passing as a sub-lieutenant a midshipman must, in future, produce a certificate from the engineer of his ship, countersigned by the captain, testifying that the applicant has been on duty a certain number of hours in the engine-room, has a practical knowledge of the various parts of the ma-

chinery, and has proved himself competent to run a service steamboat. The last qualification he must have acquired during his final year of service as midshipman. Hitherto no special facilities have been afforded for acquiring the information, but in future the midshipman will take the stoke-hole and engine-room in his regular watch-

FINE SANITARY SYSTEM.

AN OHIO TOWN WHICH IS A LITTLE AHEAD OF KNOXVILLF.

(From the Knoxville Times.)

THE Board of Health of the city of Knoxville, the Board of Public Works, the City Council, and in fact all the city authorities will be delighted to read a description of the sanitary system which resembles the sanitary arrangements of Knoxville in many respects. Dr. T. C. Hunter, of Napoleon, O., makes the following report to the State Board of Health of Ohio:

"We have no board of health, and no health officer, as

"We have no board of health, and no health officer, as the members of the Council seem to consider them expensive and useless appendages. They pay but little attention to sanitary science. We have as many privy-vaults, cesspools, and stables as are usual in county seats fifty years old; we endeavor to keep all the filth produced on and in the soil. It is true that we have a good deal of sickness from impure water, but think it cheaper to bury a few than to clean up. When any one dies of preventable disease, we piously say, 'The Lord gave, and the Lord hath taken away.' We feel satisfied, as we know the Lord is long suffering and kind, and that He seems willing to bear all the blame. As the latter (of three sewers) is the pride of the town, I will describe it. It is 18 inches in diameter, and extends about 3 squares, where it finds an immense catch-basin. From the catch-basin a two-food sewer runs to the canal, two squares. The sewage is carried under the canal by a culvert three feet square, and thence to the river through a 15-inch sewer-pipe. The catch-basin is lined with brick four inches thick, and is deep enough to hold 300 barrels of filth before it will reach the outlet. This will necessarily hold the amount of sewage all the time, and give an opportunity to filter through the brick walls, and thence reach the neighboring dwellings and wells. The joints of the sewer-pipe are loosely placed together without cement of any kind. They are warranted to leak at every joint. The cellars and privy-vaults on the street are connected with the sewer by six-inch sewer-pipe. They are all made large, as we all know that the liquid portion will leak out at the joints, and leave the solid portion to ferment and furnish an abundant supply of sewer gas for the use of the people. The water-supply for the sewer is the rainfall on about forty acres of land. There has never been more water in it than would run through a four inch pipe.

would run through a tour inch pipe.

"The subject of water-works has been discussed a little within a few weeks on account of the discovery of an abundant supply of pure soft water gushing out of the gravel at the foot of the bluff on which our principal cemetery is located."

NOTES ON BRICKS.

MR. D. RAMÉE, in the London Architect, says that three main points with reference to bricks have to be taken into account: (1.) The power of resistance under pressure; (2) the appearance of the fracture, which should present an even texture, and a fine and brilliant grain. without cavities in the interior, and neither ribbony nor stony; (3) the exterior, which should be smooth and regular, the angles and edges sharp and straight. When the size of the bricks is equal throughout the mass it is a proof that the brick earth has been well prepared and the bricks generally well made. A brick when struck should give forth a clear ringing sound. Good bricks are generally of a dark reddish brown color, and sometimes they show vitrified spots on the surface; it is not well, however, to depend too much on this last fact, for it is often only an indication of the amount of heat to which the brick has been subjected, while the clay of which the brick is made Bad bricks are may be impure and ill-prepared. readily recognized by their reddish-yellow color, but still more by the dull sound which they emit when struck; their grain being soft they crumble easily and absorb water with avidity. A good brick should not absorb more than about one-fifteenth of its own weight of water; it should appear, and in reality be, dry. A brick that does not take up any water at all is too muchy burnt; the mortar adheres to it imperfectly, but it is a good conductor of heat. Such bricks may be used in damp soil and for pavements. When a brick left in water either scales or swells, it is of bad quality, and contains caustic lime. A brick which, being made red-hot, and then having water poured on it, does not crack, is of extraordinary and rare quality; and those which have borne the effect of moisture and dryness during two or three winters without scaling or cracking are excellent. In order to try if bricks will bear the effect of frost, let one be boiled for half an hour in a solution of sulphate of soda, saturated /

cold, and then suspended by a string over the vessel in which it has been boiled. In twenty-four hours the surface of the brick will be covered with small crystals; the brick is then to be immersed again in the solution until the crystals disappear, and again suspended, repeating this operation for five days, the crystals reforming after each immersion. If after this treatment a number of particles of the brick are found at the bottom of the vessel containing the solution, the bricks are incapable of supporting the effects of frost.

OBITUARY.

DR. CORNELIUS REA AGNEW.—This distinguished eye and ear specialist died at his home in New York City on the 18th inst. He had been in good health until recently.

Dr. Agnew was born in New York City in 1830, and was of Huguenot, Scotch, and North Irish extraction. From Columbia College he was graduated in 1849, and then began the study of medicine under Dr. J. Kearney Rogers. In 1852 he received his diploma from the College of Physicians and Surgeons, and soon after was appointed House Surgeon to the New York Hospital, and then its Curator. Then he accepted the position of Surgeon to the Eye and Ear Insirmary, but made it a condition that he should first go to Europe to complete his studies.

Returning to New York in 1855, he started in practice for himself. The next year he married Mary, daughter of Lora Nash, a merchant in this city. Governor Morgan appointed him Surgeon-General of the State of New York, and at the outbreak of the war the Governor appointed him Director of the State Volunteer Hospital, New York. When the United States Sanitary Commission was organized Dr. Agnew was elected a member, and although he had a large private practice he devoted all the rest of his time at great personal sacrifice to the succor of the soldier. The life-saving work of the Commission at Antietam, the battles of the Wilderness, and the relief to the wounded and sick soldiers who returned from Southern prisons was made so successful principally by the carefully arranged plans of Dr. Agnew, which were superintended by him.

Dr. Agnew was one of the four gentlemen who founded the Union League Club in this city that gave so great material assistance to the Government during the war, and he became one of its vice-presidents,

In 1866, at the request of the Faculty of the College of Physicians and Surgeons, he established an ophthalmic clinic there, and in 1869 he was elected Clinical Professor of Diseases of the Eye and Ear. The following year he organized the Brooklyn Eye and Ear Hospital, and also the Manhattan Eye and Ear Hospital, the latter in this city. He had been appointed in 1865 one of the Managers of the New York State Hospital for the Insane at Poughkeepsie, and was twice reappointed.

As early as 1859 Dr. Agnew was elected a trustee of the public schools in this city, and was made president of the board. Several years later he was selected a trustee to organize a School of Mines in Columbia College, and in 1874 he became a trustee of that college. In 1872 he was chosen president of the Medical Society of the State of New York. He was secretary of the first Sanitary Reform Association organized in this city, and one of the committee which made the first draft of the health laws of the city.

BUILDING OF THE \$2,500,000 CRUISER.

SECRETARY WHITNEY has written a letter of instruction to Rear Admiral Gherardi, commanding the New York Navy Yard, in regard to the projected construction at that yard of an armored cruiser to be known as the "Maine," provided for by the act "to increase the navy establishment," approved August 3, 1886. The limit of cost, excluding armament, is \$2,500,000.

PERSONAL.

MR. ROBERT GRANT, author and lawyer, has been appointed to succeed Col. Horace T. Rockwell as Water Commissioner.

C. A. GOMPERT, architect, having returned from Europe, has resumed the practice of his profession at Milwaukee, Wis.

CHIEF ENGINEER D. J. WHITTEMORE, of the Chicago, Milwaukee & St. Paul road, who has for the past four weeks been confined to his house almost uninterruptedly with a slight attack of pneumonia, is improving in health, and expects to be out shortly.

DR. C. P. WILKINSON has been elected President of the Louisiana State Board of Health, vice Dr. Joseph Holt, resigned and removed from the State. He is a graduate of the Washington and Lee University and of the Louisiana Medical University.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

DF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

TRADE CATALOGUES.

WE have received from Henry S. Northrop, orner Centre and Franklin Streets, New York, is new catalogue, illustrating his "paneled sheet-iron ceilings," showing plan, sections and details of executed work, and giving information of interest to architects and builders.

WE have received the catalogue of J. B. ohnston, 119 Lake Street, Chicago, illusrating a line of builders' hardware, house rimmings, stone-work, and stable fittings, selected for illustration with a view to meet 'all but the most exceptional requirements," and will be sent free to architects and builders.

ARCHITECTURAL COMPETITIONS.

DENVER, Col.-Plans are wanted here until June 11 or a court-house. For c reular of instructions address loseph H. Smith, County Clerk, Arapahoe County, as above.

For works for which proposals are requested see the "Proposal Column," pages i-vii-viii-308-ix.

Persons who make any use of the information they find in these columns we trust will not count to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

RIVERSIDE P. O., MASS.— WATER.— Concerning water-works matters here, our correspondent writes: "The Riverside water-works have been in operation for several years. The owners have asked for a charter so that they might have rights in the highway and take water from other sources, but do not intend putting in new works at present."

CHICAGO, ILL.—WATER.—Mr. Yerkes is preparing plans for a thorough overhauling of the Washington Street tunnel. It is reported that a new tunnel will practically be built inside of the old one, at a cost of about \$100,000.

PEMAQUID, ME.—DRAINAGE.—J. E. Nichols, Secretary of the Pemaquid Land Company, writes: "We have not surveyed and plotted all our land. It is uncertain about our taking any measures for drainage this season."

DOVER, N. H.—WATER.—The Boston Herald says: "It has been voted that the plans of Percy M. Blake, of Hyde Park, Mass., for water-works be accepted. The contracts for piping and special castings for said water-works were awarded to the Camden Iron-Works, of Philadelphia, Pa., for \$68,951.

Chetopa, Kan.—Water.—Our correspondent writes regarding the water project here: "No definite arrangement made as yet, but will be this summer. Will keep you informed."

YOUNGSTOWN, O. — WATER.— Our correspondent writes: "There is talk of putting a filter in the water-works here, to cost \$35,000."

OMAHA, NEB.—Sewers.—George W. Tillson, City Engineer, writes: "We are not improving our sewerage system, but are gradually extending it. Last year we constructed is. I miles of sewers, and expect to do as much this season. We now have about fifty miles of brick and pipe sewers. A portion is the separate system complete, another portion storm water exclusively, and still a third of the combined."

POWTLAND, ME.—WATER.—Seth L. I arrabee, of the Diamond Island Water Company, regarding reported water-works scheme, writes: "We shall open another spring and set up another wind-mili, giving another source of supply. Sha'l erect an additional tank and extend our supply-pipes to take in about twenty additional houses. The enterprise is designed for summer cottages."

JERSEY CITY, N. J.—WATER.—The Board of Public Works has again postponed the date of opening bids for the improved water supply, the new date being May 7. See our proposal column.

SANTA CRUZ, CAL.—WATER.—W. H. Bias, the city clerk here writes: "The city bought the present water-works system, but the bonds were not legal; so the business will have to be gone through again."

MINNEAPOLIS, MINN—WATER METERS.—In view of the increas d consumption of water, resulting from the continued growth of the city, Water Registrar Moody has recommended that the city furnish meters to consumers, chaiging a small rental for the same.

WASHINGTON, MO.—WATER.—The proposals for the water-works system at this place, which were to have been opened April 2, will not be opened until May 10. For additional details see our Proposal Column.

FORT RILEY, KAN.—WATER.—Our correspondent writes: "Bids are to be opened for a water-works plant at Foit Riley, Kan., May 9. The system includes driven wells, one million-gallon compound duplex pump, a 500,000-gallon reservo r, some four miles of mains, boiler house and residence, etc. J. B. Johnson is consulting engineer." See our Proposal Column.

Dubuque, Iowa.—Sewers.—It is probable that eps will soon be taken towards the construction of the roposed sewerage system for this place.

PITT-BURG, KAN—SEWERS.—Two surveys have already been made for the sewerage system to be established here, and specifications and estimates are now being prepared. As soon as the details are completed and the necessary ordinances passed the work will be commenced.

BELLWOOD, PA.—WATER.—The Bellwood Water ompany has been incorporated here with a capital of 15,000. R. G. Ford and others, incorporators.

BUSHNELL, ILL.—WATER.—At an election held here April 17 the people decided in favor of establishing a \$10,000 system of water-works.

TACONY, PA.—WATER.—A petition has been presented to the City Conneil of Philadelphia from the Disston Water Company asking permiss on from the Council to lay water-pipes in this pace to supply the residents with water. It was stated in the petition that it would cost Philadelphia \$05,000 to supply lacony with water from the Wentz farm reservoir. The matter was laid over.

GREENVILLE, MISS. — WATER. — The Greenville Water Works Company has been incorporated here. Capital, \$75,000. L. Mettesser, and otners, incorporators.

WAYLAND, MASS.—WATER.— It is reported that the people of this place anticipate establishing a waterworks plant and a sewerage system.

LIGONIER, IND.—WATHR.—It is reported that a system of water-works is to be established here. Address the Town Clerk.

GLEN ELDER, KANS.—WATER.—Bonds are to be issued for the construction of a system of water-works.

PARKHIIL, ONT. — WATER. — It is reported that Deputy Gibbs can furnish details of a water-works

CHICOUTIMI, QUEBEC.—WATER.—It is reported that water-works are to be established here.

water-works are to be established here.

Memphis, Tenn — The Memphis Artesian Water Co., successors to the Memphis Water Co., contemplate extensive additions to their plant, in which is included a steam-pipe, two neighbor plant, pumps, two miles of 36-inch pipe, besides several miles of 20-inch, to-inch and 10-inch, and smaller sizes. Some thirty mills will be connected to the new pumping-plant. How much of this plant is not yet contracted for our correspondent has neglected to inform us.

Mr. W. L. Cameron, for many years superintendent of the old company, has charge of local construction, Mr. Thos. J. Whitman, of St. Louis, being the consulting engineer.

GIRARD KANSAS.—WATER.—Our correspondent writes: "This city would like to have proposals for the construction of a complete set of water works. Contractors to own works and furnish water to city at annual rental, on thirty-year contract. The city has a population of 3,200, has three railroads and is about to build another. Coal can be delivered here at seventy-five cents per ton. There is being built an exensive zinc smeller, and the city has just ordered a survey for a sewerage system." For further information address James S. James.

KINGSTON, ONTARIO.—WATER.—The time for re-ceiving proposals for the water-tower and engine has been extended until May 8. See our Proposal Column.

WATER-WORKS.—See our Proposal Column.

Water-Works.—See our Proposal Column for information regarding water-works and water-works supplies at the following places: St. Augustine, Fla., Washington, Mo., Girard, Kan., Pittsburg, Pa., Allegheny, Pa.

BRIDGES.

Austin, Texas. — The county commissioners are taking steps toward the erection of a \$60,000 bridge here. The surveys are already being made. Mayor Nalle can furnish details

Washington, D. C.—The Senate has passed the House bill to authorize the construction of a bridge across the Ohio River, at the head of Brunot's Island.

NEWARK, N. J.—The joint committee of Essex and Hudson County Freeholders on the new bridge over the Passaic pass'd the following resolutions April 17. Resolved, That this special committee recommends the building of a bridge in the Twelfth Ward, Newark, both counties concurring; and, further, that the location of said bridge be from the loot of Chambers Street, Newark, and Fourth Street, Harrison. Resolved, That our county engineers be instructed to procure plans and specifications of said bridge and meet the committee at a meeting to be held April 23 at this place.

SHORT CREEK, W. VA.—A bridge is to be erected here by the Brook County Commissioners.

STRAFFORD, N. H.—It is reported that the select-men will erect a bridge here, and that details can be had of James S. Stiles.

SAN MIGUEL, CAL.—It is reported that a bridge is to be built here by the County Commissioners.

STAUNTON. VA.—An iron bridge is to be erected over the Middle River, in Augusta County. G. C. Bruce of this place is preparing the plans.

Grand Forks, Dak.—It is reported that the County Commissioners will erect two bridges over the Red River at this place, the total expenditure to be \$75,000.

PIERRE, DAK.—A company has been formed here to construct a bridge between this place and Fort Pierre, at an estimated cost of \$30,000.

BRIDGES.-See our Proposal Columns for information regarding bridge construction at the f llowing places: Laurel, Md.; Pittsburg, Pa.; Clinton, Mass.; Denver, Col.; Boston, Mass.

GAS AND ELECTRIC-LIGHTING.

RED OAK, Iowa.—An electric-light plant is to be established here.

HAVELSON, MASS.—It is proposed to establish gas-works here.

CHICAGO, ILL.—Chief Engineer Gerecke and Professor Barrett are at work making the plans of the engines for the new electric-plant for street lighting. The plant will be located in the same building as the river-light plant.

GRAVESEND, N. Y.—The Atlautic Flectric-Light Co. has been incorporated here. Capital, \$25,000-James J. Powers and others, incorporators.

JOLIET, ILL.—The Joliet Flectric-Light Co. been incorporated here. Capital, \$50,000. Lew Ingalls and others, incorporators.

Georgetown, D. C .-- The Potomac Electric-Light and Power Co. has been incorporated here. J. W. Thompson and others, in corporators.

STREET-WORK AND PAVING.

OMAHA, NEB.—Geo. W. Tillson, City Engineer, writes us as follows: "We expect to ay about 400,000 yards of pavement mostly coan block on a concrete base and curb the same streets, which will take not less than 20 miles of curbing."

RAILROADS.

TIFFIN, O.—A street-car line is to be built here by local capitalists.

FLUSHING, L. I.—For details of street-railroad construction here address Dennis Sullivan, contractor, as

BIDS OPENED.

HOLTON, KAN.—BRITGE.—The following bids for constructing bridge across Soldier Creek, 20-foot span, 12-foot roadway, were received by Board of County Commissioners of Jackson County. April 13: Massillon Bridge Co., Massillon, O., \$1,125; Canton Wrought Iron Bridge Co., Canton, O., \$1,054; King Iron Bridge and Manufacturing Co., Cleveland, O., \$1,057; Smyth Bridge Co., Toledo, U., \$1,175; Lane Bridge and Iron Worss, Chicago, Ill., \$1,004; Columbia Bridge Co., Toledo, U., \$1,180; J. C. Chase, Holton, Kan., \$1,070; J. M. Ferguson, Holton, Kan., \$1,000; Kansas City Bridge and Iron Co., Kansas City, Mo., \$1,087.

ALBANY, N. Y.—RESERVOIR, ETC.—The following bids for building reservoirs and laying pipe lines were received by the Secretary Special Water Commission March 29: Cranford & Valent ne, Brooklyn, N. Y., \$271,594; Jacob Holler, Albany, N. Y., \$435,127.59; Sullivan & Eklers, Albany, N. Y., \$421,015.59; Houlihan & Flagler, Cohoes, N. Y., \$485,628.83; John H. O'Rourke, Brooklyn, N. Y., \$490,357.92. Contract awarded to Cranford & Valentine.

OREGON CITY, OREG.—BRIDGE.—The County Court of Clackamas County on April 7, awarded a contract for the construction of a bridge across the Willamette River at this place to the Pacific Bridge Company, of San Francisco, for \$23,000.

San Buenaventura, Cal...—Sewers.—The following bids for constructing a system of sewers for this city, were opened April 6, postponed from April 2, by J. F. Newley, Clerk: Walker a Mahoney, Los Angeles, Cal., \$23,855.34; Alex McBean, San Francisco, Cal., \$23,873.82; M. Macdonald, San Bernardino, Cal., without iron pipe outfall. 5co feet, \$18,695.63; Hobson & Wilkinson, Ventura, Cal., \$18,705.90; San Francisco, Sewer-Pipe Association, for iron stone pipe only, delivered on ground. \$5,533.08; G. D Vincent, San Francisco, Cal., \$25,004.90, no bid on 12-inch iron pipe.

cisco, Cal., \$25,004.90, no bid on 12-inch iron pipe.

MILWAUKRE, WIS.—SEWER-WORK.—The following contracts for street-work were awarded April 13 by the Hoard of Public Works: Jacob Werner, sewer on Highland Boulevard, \$3,20 for 30-inch brick and \$1.70 for 18-inch pipe sewer; Daniel Driscoll, sewer on Fowler Street, \$3,70 for 36-inch and \$3.40 for 30-inch brick, and \$1.85 for 18-inch pipe and \$1.50 for 15-inch pipe sewer; also sewer on North Avenue, \$0, \$6.80, \$4.80, \$3.50 and \$7, for 72, 48, 42, 36 and \$4-inch sewer respectively per lineal foot. The bids of J. C. F. Brand and Charles Brand, for building the sewer in an alley in blocks 37 and 38, in the Fifth Ward, were at \$3.25 each per foot.

and 38, in the Fifth Ward, were at \$3.25 each per foot.

OAKLAND, CAL., B-IDGE.—The following bids for reparing the bridge at Alvarado were opened April 11 by a committee of the Board of Supervisors: W. T. Vettch, \$1.53 per linear foot; Alex. Thomson, \$1.78 per linear foot; Gran er & Son, \$1.39 per linear foot; Pacific Bridge Co., \$26 per 1,000 feet of lumber used; Pacific Bridge Co., \$26 per 1,000 feet of lumber used; John K. Carpenter, \$1.38 per linear foot; San Francisco Bridge Co., \$1.30 per linear foot; William McDonald, \$1.37 per linear foot; C. L. Crissman, \$1.28 per linear foot. The contract was awarded to the California Bridge Company.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 22.

PUBLISHED EVERY SATURDAY

NEW YORK, APRIL 28, 1888.

LONDON, MAY 12, 1888.

SINGLE COPIES, TEN CENTS. Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE. Subscription, 20s. per annum in advance, post paid.

IN AMERICA

THE ENGINEERING & BUILDING RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

> TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

> > OFFICE IN GREAT BRITAIN, 92 & 93 FLEET ST., LONDON

TERMS, 200. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record (New York), and crossed ———& Co.

Continental subscriptions are also received by F. A. Brockhaus, Ksq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

I he date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by eneck or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

FINANCIAL HISTORY OF GAS-LIGHT-ING IN GREAT BRITAIN.

A VERY interesting chapter in "Burdett's Official Intelligence" for 1888 is on "The Official Intelligence for 1888 is on "The Financial History of Gas-Lighting" in Great Britain. Parenthetically we may say that the "Official Intelligence" is a "Précis of Information regarding all British, American, and Foreign Securities," edited by Mr. Henry C. Burdett, of London, and now in its seventh year.

An opinion of the electric light is found in one of the opening sentences, to the effect that it "cannot at present compete commercially with gas, and has not, therefore, as yet made any great progress as a general illuminant." Undoubtedly this industry is in a more promising condition with us than in England.

The first public street-lighing with gas took place in Pall Mall in 1807, and as an outgrowth of this experiment the Chartered Gas-Light and Coke Co. was organized, receiving a royal charter in April, 1812.

According to a return presented to the House of Commons in 1847, there were at that time 128 companies established by Act of Parliament. In 1866 the number had increased to 175 with a combined capital of £15,246,727. The Board of Trade returns, which were first made in 1882, gave, at the end of 1886, 164 gas undertakings belonging to the local authorities, and 378 belonging to companies. The total authorized

capital was £73,069,670, and the total quantity of gas sold was over eighty billion cubic feet.

With regard to the powers of existing companies, it is stated that although a company authorized by Parliament to supply gas in a dis-trict could rest assured that under ordinary circumstances no other company would be similarly authorized for that district, it is competent for any person or body of persons, without Parliamentary authority, to build gas-works and distribute gas within an area already occupied by an authorized company. Unauthorized companies are, however, liable to many annoyances and dangers not met by those working under Parliamentary sanction.

The statement that the "supply of gas by municipalities has proved very popular and successful, as well as economical," does not agree with the results of similar experiments in this country. There are twenty-nine cities, with above 50,000 population, which at the present time are supplied with gas by stock companies. The most important of these are London, Edinburgh, Liverpool, Sheffield, Dublin and Bristol.

In speaking of the dividends paid by gas companies Mr. Burdett states that according to returns made in 1850 there were 134 companies in existence. Of these nineteen were paying the maximum dividends of 10 per cent.; ten between 9 and 10 per cent.; seven from 8 to 9 per cent.; thirty-six from 6 to 8 per cent.; and thirty-two less than 6 per cent.

"Practically it may now be said that the large majority of gas companies in successful working (excluding new undertakings and those which for temporary reasons have lately diminished their dividends), are paying the full dividends to the state of the large st

dends authorized by law."

"The maximum price of gas which may be charged is usually settled by the special Act of the company," and varies according to the size of the town, etc. While the law makes it compulsory upon a company to supply gas to all applicants, it permits a reduction in price to large

From the first introduction of meters down to about the year 1832 the price was 15s. per 1,000 feet, and from this

date the price was gradually reduced until, in 1840, the date the price was gradually reduced until, in 1849, the metropolitan companies were supplying common gas for 6s. per 1,000 feet. "It is only in small places nowadays that as much as 5s. has to be paid for gas."

At the end of 1886 eighty-eight companies out of 539 were selling gas at less than 3s. per 1,000 feet.

By an order of the House of Commons power is given to a "committee to which a gas bill is referred so to regulate the price of gas to be charged to consumers, that any reduction of an authorized 'standard rate' shall entitle the company to make a proportionate increase of the authorized dividend, and that any increase above the standard price shall involve a proportionate increase of dividend." "The scale of increase and decrease which may be regarded as practically universal, is that 'for every penny or part of a penny charged in excess or in diminution of the standard price in any year, the standard rate of dividend shall for such year be reduced or increased by five shillings in the hundred pounds per annum."

The adoption of this plan, which is known as the "sliding scale," has resulted in a considerable reduction in the price of gas. The latter part of Mr. Burdett's paper is devoted to a more detailed history of gas-lighting in the metropolis.

DR. CORNELIUS R. AGNEW.

By the death of Dr. Cornelius R. Agnew, By the death of Dr. Cornelius R. Agnew, which occurred April 18, after a brief illness, New York City has lost one of its most public-spirited and valuable citizens. He took an active interest in the work of Columbia College, of which he was one of the trustees; was influential in the organization of the School of Mines, and was especially interested in the Department of Biology and Hygiene of that institution. While his practice was confined that institution. While his practice was confined to the diseases of the eye and ear, he was active in the promotion of all medical, educational, and sanitary interests, and being a man of broad culture, having extensive general information and a ready use of pen and tongue, he was able to exercise a powerful influence among those with whom he was associated in many different fields of usefulness.

His services to the U.S. Sanitary Commission in the late war will long be remembered, and we quote the following letter, as it indicates his feelings toward soldiers at that time:

To the Editor of the Evening Post:

SIR: Permit me to place one flower on the grave of Dr.

Since retain the to place one nower of the grave of Bi.

C. R. Agnew, in grateful remembrance of his kindness to soldiers during the late war.

I was severely injured in the eye while fencing with a brother officer at the headquarters of the Army of the Potomac. Gen. Meade's Surgeon-General advised that 1 Potomac. Gen. Meade's Surgeon-General advised that I should at once be sent to Dr. Agnew in New York, and this was done. For thirty days Dr. Agnew's care was bestowed upon me with marvellous skill and the tenderness of a loving parent. At the end of that time I was able to return to duty, when, upon asking the Doctor for his bill, he laid his hand on my shoulder and looked into my eyes and said: "Captain, what I have done for you is only an expression of what I feel is due to every man who wears your uniform. You do not owe me anything."

On my way back to the army I met a captain of artillery whose hearing had been injured by the bursting of a shell near his head. We had met often at Dr. Agnew's office, and, on comparing notes, each learned of the Doctor's generous kindness to the other.

Only a few people know of Dr. Agnew's devotion to the men of the army. To me, "The world seems lonely without him."

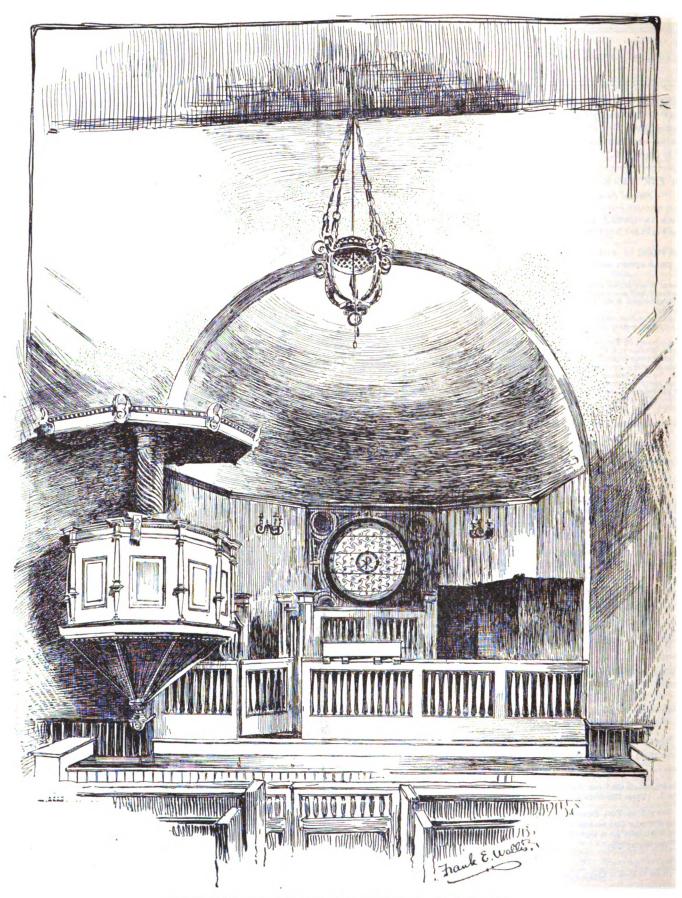

Respectfully yours,

AN EX-OFFCER OF THE U. S. ARMY.

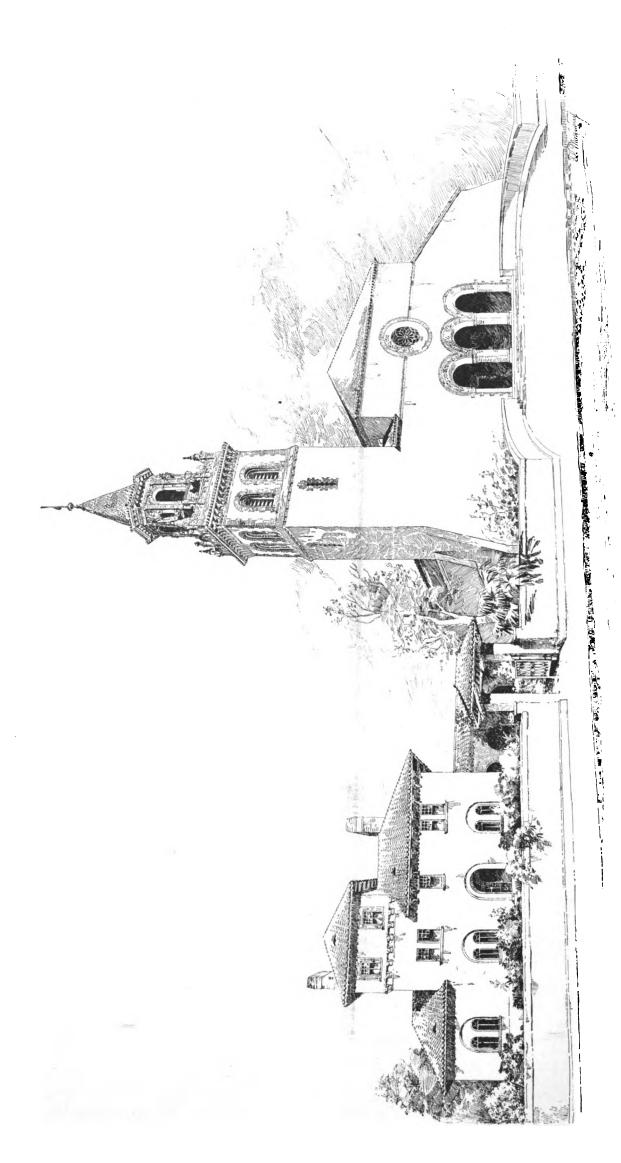

He took a warm interest in the work of this

He took a warm interest in the work of this journal, and was always ready to furnish it with advice and information.

PULPIT IN THE METHODIST EPISCOPAL CHURCH, ST. AUGUSTINE, FLA.

THE ENGINEERING & BUILDING RECORD ILLUSTRATED SERIES.

THE METHODIST EPISCOPAL CHURCH AT ST. AUGUSTINE, FLA.

We deplore his death as a calamity to the whole community and as leaving a vacant place in many circles which it will be difficult, if not impossible, to fill.

NO MORE BUILDINGS IN NEW YORK CITY HALL PARK.

WE are glad to note that the opposition of this journal, followed by the Real Estate Record and of some of the leading dailies of this city, rotably the *Tribune*, to the proposed scheme for meumbering the City Hall Park with additional buildings, has had such influence with the Legislature that the Assembly, by unanimous vote, has passed the bill prohibiting the erection therein of the new building for the criminal courts, and in the law authorizing the erection of a new Hall of Records there is a similar provision. The bill has also been favorably reported in the Senate. Its becoming a law, however, sho uld not be in any way construed to prevent the payment of the promised premiums to those who, with that inducement, have submitted competitive designs for the proposed buildings in good faith. These designs represent much honest hard work that should not lose its reward merely because the authorities have wisely changed their minds. In this matter of compensation it is gratifying to note that the Sinking Fund Commissioners will have expert assistance in the persons of several well-known archit ects to be selected from a number whose names have been submitted by the New York Chapter of the American Institute of Archi-Their influence will no doubt secure tects. justice to the competitors.

OUR ARCHITECTURAL ILLUSTRATIONS.

ST. A UGUSTINE M. E. CHURCH AND PARSONAGE.

THIS building was recently erected largely at the expense of Mr. H. M. Flagler, the owner of the Ponce de Leon Hotel. It is built of the same material, shell concrete and terra cotta. The architects were also Carriere & Hastings, of New York.

PULPIT IN THE METHODIST EPISCOPAL CHURCH, ST. AUGUSTINE, FLA.

THE MONEY VALUE OF VENTILATION IN WORKSHOPS.

A PAPER on this subject was read by Mr. Joseph Corbett at a recent meeting of the Manchester Association of Engineers, and abstracted as follows in the London Architect: The author maintained that in engineering workshops each man should have at least 25 square feet of floor area and at least 400 cubic feet of space for comfortable ventilation. The quantity of fresh air required per man per hour was not less than 1,000 cubic feet, even in cold weather, and with inactive employment; from four to ten times that amount was required for laborious work in warm weather. In arranging for the ventilation of a workshop, people might take the simple course of making openings in the walls, windows or roof, the currents in and out of the building depending on the wind and on the rise of temperature. Such means, however, afforded only inadequate and contradictory means of ventilation. With regard to cowls and whirligigs, which depended on the wind for their action, it might be said of them that they were most active when least wanted, and were least active when most wante-d; indeed, he thought there were few mechanical appliances by which the public was more humbugged and more completely sold than by the various wind whirligig ventilators which were successfully puffed and advertised by many persons. After describing, with the aid of diagrams, various methods of ventilation, Mr. Corbett said the best of all known means for inducing and regulating the ventilation of workshops were fans driven by power. In most workshops the power could be given by shafting, or steam could be supplied to a little engine attached to the fan. In some cases it would, he considered, pay well to apply a zas-engine for the purpose, the power required being very small compared with the results attained. Thus, one Indicated horse-power would under lavorable conditions drive 12,000 cubic feet of air per minute, or 720,000 cubic feet per hour in and out of a workshop, which was equal to the draught of about 200 parlor chimneys, and afforded the minimum ventilation

required for 720 workmen. Even in mild weather, when tenfold ventilation was required, it would serve 72 men. With such a power at hand there was no excuse for illventilated workshops, for all the risks of back-draught and the irregularities and contrarieties of wind ventilation were overcome by the power fan, which would by the simple regulation of its speed give as much or as little air as was required. The fan should be fitted to the outlet, as it was difficult to disperse its violent draught when used on the inlets; and as only one outlet was best for each room, that was the one place for the fan. An outlet shaft would be required, as the fan could not advantageously discharge through a side opening, which might meet the pressure of strong wind at times. Sometimes, where dust had to be kept down, and had to be carried away from lathes, etc., it was convenient use the space under a boarded ground floor as the exhaust chamber leading to the fan, each lathe, etc., having an exhaust pipe through the floor, and one or more pipes being laid down from near the ceiling to carry off the gas fumes, etc. In concluding, Mr. Corbet said that by proper attention to health in the workshop any man now working in an uncomfortable and unhealthy shop might be made at least one per cent. abler, more active, and more efficient in his work. Taking an average workman to be worth £100 a year to his employer, that one per cent. meant £1 per year, or equal to £20 of capital. All that he had suggested would not cost £20 per man, in most shops not £5 per man. He hoped, therefore, that both on the low ground of mere money value and on the high ground of duty to workpeople his paper would convince employers of the true economy of health in workshops.

AN ARCHITECTURAL COMPETITION IN ENGLAND.

THE ideal competition, from the standpoint of the more grasping promoters, is one so arranged that the amount of blackmail levied from the competitors for plans and particulars, etc., would balance the expenditure on premiums. We have apparently an instance of an attempt to adopt this ingenious arrangement in a competition hailing from the island of tripeds and feline monstrosities.

The wide-awake directors of the Villiers Hotel Company (Limited), Douglas, Isle of Man, are prepared to receive any number of designs, showing the laving out of their property, with an hotel, boarding-houses (plural), and lock-up shops (ditto). The would-be competitors must expend one guinea on lithographed plans of site, etc., without, so far as I can see, any hope of ever seeing it again. In consideration of the services of the profession, the directors offer premiums of £30, £15, and £5 respectively. The directors, doubtless, having heard of the rush for the great half-timbered compet tion, reasoned in this wise: "According to 'Cocker, £30 + £15 + £5 = £50 =total amount expended on premiums. If we can induce fifty impetuous voung architects to subscribe fifty guineas, by charging for particulars, the competition will not only be charging for particulars, the competition will not only be self-supporting, but prove a remunerative undertaking, yielding a profit equal to five per cent, per a very few weeks." Behold their ingenuity! The competition pays its own way and a percentage into the bargain.

Such a farce, happily, is impossible. Although the possibility of attracting a large number of competitors may lurk in the minds of the directors, they appear, in the advertisement, to be most well-meaning towards architects.

vertisement, to be most well-meaning towards architects. Therein they set forth the conditions they will observe, should there be only two or three competitors! This is about the number that I trust they will receive. I sincerely hope that all who respect their calling will refrain from subscribing to this charity for the benefit of the directors and shareholders of the Villiers Hotel Company (Limited). One might just as well pay the "one-pound-

one" direct into the coffers of the company.

Mark the grand extra inducement offered to competitors in this competition. The directors will exhibit the successful plans in their hotel during the coming season. As I have before observed, the next season in the Isle of Man is expected to be something almost too good. Hav-ing regard to this, it is a pity the folk there cannot offer the work hinted at above, another scheme is required, showing the property laid out to suit the architect's own views as to what would be the most successful financially. It only remains to say that, in the advertisement of this new 'plum," I do not find any definite promise as to the carrying out of work.—London Building News.

THE commencement of the works for the Manchester Ship Canal has emphasized the necessity of providing a good system of sewerage for the city, as, at the present time, a good deal of offensive matter finds its way into the river and creates a nuisance. Parliamentary powers are asked to borrow £450,000 for this purpose; the scheme being to acquire 95 acres of land to precipitate the sewage.

NEW EXPLOSIVES

In reviewing the recent additions to the explosive compounds placed upon the market, the Genie Civil attributes much the greater progress to Swedish investigators, and says that chemists have abandoned the old mixtures, based upon nitro-glycerine, and adopted these long since enumerated by M. Berthelot in his work "On the force of Explosive Materials."

Among the latest Swedish productions are: Romite, invented by Sjoberg. This is a fine yellowish powder, appearing like pounded fire-prick. It is composed of nitrate of ammonia, napthaline and paraffine mixed, chlorate of potassa and carbonate of ammonia, in variable proportions. It does not explode in free air, even in contact with flame; is insensible to shocks, however violent, receiving with impunity rifle-balls fired from a short distance. It is only exploded by a fulminate-of-mercury cap when confined in a closed space. Experiments in the mines at Christiania by a commission of engineers and artillery officers showed an efficacy nearly equal to that of dynamite and an action especially adapted to its use in quarries. Romite has been tried in fire-arms, where it gives greater initial velocity and less smoke than black powder, although the recoil appears to be more violent. For blasting, Romite is stated to be a rival of black powder, to which it is superior in force, though not quite equal to dynamite.

Bellite was patented at Stockholm in 1885 by M. Car. Lamm. and is composed of two solid elements-viz., a nitrate of either ammonia, potassa, soda or barytes, and a nitrate of some hydrocarbon, as bi-nitro-benzine, tri-nitro napthaline, etc. The two substances are reduced to powder and intimately mixed in a revolving cylinder, steam-heated to a temperature of 100° C.

Between 50° and 100° the hydrocarbon melts and forms a coating about the particles of the other nitrate. When cold it is pressed into cartridges and becomes hard and solid. Bellite does not freeze; it disintegrates at 90° C. and commences to evaporate at 200°. It burns with a sooty flame if suddenly heated, but the flame is extinguished it the external heat is withdrawn. It can be exploded either in an open or confined space by a fulminate-of-mercury cap, but not by shocks, flame, or a Bickford fuse. The gaseous products of its explosion are carbonic oxide and watery vapor.

M. Favier manufactures in Belgium an explosive anal-M. Favier manufactures in Belgium an explosive analogous to bellite, which is a mixture of mono-nitro-napthaline and nitrate of ammonia, which forms a fine, greasy, hygroscopic powder, with a sweet taste and smell of almonds and a specific gravity of 0.95. It cannot be exploded by shock or ignition. Two grammes of fulminate of mercury will explode it in the open air, but if the powder is compressed explosion will not be produced in a 40-rearmer cartridge with less than 14 grammers of fulminate. gramme cartridge with less than 14 grammes of fulminate, and the cartridge will not explode in free air at all, but only in a confined space.

RECLAIMING LAND IN EGYPT.

[Cairo Correspondence of the London Standard.]

I HAVE just returned from a visit to the Aboukir reclamation works, which are now well advanced. As this scheme has always been regarded more or less as a test of scneme nas always been regarded more or less as a test of the possibility of reclaiming salted land, too much importance can scarcely be attached to its success or failure. The concession, comprising about 30,000 acres, is the largest that has been made of late years, and if the result proves satisfactory similar concessions will probably quickly be given in other districts. The irrigation capals and proves satisfactory similar concessions will probably quickly be given in other districts. The irrigation canals and drains are already completed over about 12,000 acres, all converging on a point on Aboukir Bay, where two powerful Gwynne engines are discharging foul salt water into the sea at the rate of 240,000 tons every twelve hours, this water holding in solution 8,400 tons of solid salt. In the course of next week the machines will be kept working all the twenty four hours, when this amount will of course the twenty four hours, when this amount will, of course, be doubled. The same system will be applied next year to the remaining 18,000 acres, and it is hoped before long to offer the whole as a cultivable surface for the benefit of the town of Alexandria, which possesses scarcely any ara-ble land within a radius of ten miles. The experiment is being watched with the greatest interest, both by Alexan-drian speculators and by the authorities of the Departments of Finance and Public Works.

DULUTH'S WATER-SUPPLY.

DR. SHERWIN, in his annual report to the Board of Health of Duluth, recommends a general extension of the water-mains of the city so that the citizens may no longer be compelled to rely on wells and springs or the peripatetic water peddlers, which latter are alleged to get their supplies from very polluted sources. He also recommends that the intake of the water-works be moved to a point further down the lake further down the lake.

The Board has recommended the erection of a garbage

crematory like the one in Chicago.

AMERICAN WATER-WORKS ASSOCIATION.

(Continued from page 306.)

THE convention held morning and afternoon sessions on the 18th and 19th inst., at which most of the expected papers were presented and many points suggested by them discussed.

At the Wednesday morning session the Question Box was opened and the topics considered. In the evening the association accepted an invitation from the City Civil Engineers' Club to attend their regular meeting, where papers were read by Mr. John Whitelaw and Mr. A. W. Madison, respectively Superintendent and Secretary of the Cleveland City Water-Works.

The last session was devoted to committee work, election of officers, etc. Members were requested to prepare volunteer papers on "Use of Liquid Fuel," and "Flushing of Street Mains," and Messrs. Allen, Fanning, Gardner, Priddy, Harrison, and Gerecke promised to contribute papers on various subjects at the next meeting. The convention was then adjourned, to meet next year in Louisville, Ky. In the evening many of the members and their guests met at a banquet given by the association, and the following morning most of the delegates who remained were entertained by Mr. C. E. Burke by a carriage ride to the Lake Shore Foundry, the Cleveland Pumping Station, and other places of interest.

The following members of the association arrived after the list in last week's paper had been prepared:

Ezra Clark, Hartford, Conn.; F. L. Fuller, Boston, Mass.; R. M. Gow, Medford, Mass.; R. Holme, Denver, Col.; H. E. Keeler, Chicago, Ill.; and E. H. Phipps, West Haven, Conn.

During the convention the following members were elected:

E. C. Cooke, C. E., Tiffin, O.; C. A. Judson, Superintendent Water-Works, Sandusky, O.; J. S. Walker, Engineer Water-Works, Birmingham, Ala.; J. T. Lakin, Superintendent Water-Works, Rockford, Ill.; E. J. Snow, Constructor Water-Works, Brooklyn, N. Y.; F. W. Gerecke, Engineer Water-Works, Chicago, Ill.; J. A. Bond, Engineer Water Works, Wilmington, Del.; S. W. Harris, Engineer Water-Works, Racine, O.; J. Young, Hydraulic Engineer, Geneseo, N. Y.; T. J. Neville, Water Register, Rocl.ester, N. Y.; R. C. B. Bement, Engineer and Manager of Water-Works, St. Paul, Minn.; F. W. Sheppard, Manager Water-Works, New York; A. R. Wadsworth, Superintendent Water-Works, Farmington, Conn.; J. W. Taylor, Superintendent Water-Works, New Castle, Pa.; W. T. Harris, Secretary and Treasurer, Jackson, Tenn.; G. H. Benzenberg, City Engineer, Milwaukee, Wis.; P. Morley, Superintendent Water-Works, Liverpool, O., active members; and W. Oliphant, Cold-Water Filtering Co., Jersey City, N. J.; J. B. Edson, New York City; Rouse & Hills Co., Cleveland, O.; Jewell Pure Water Co., Chicago, Ill.; Hall Electric Pump Co., Plainfield, N. J., and W. D. C. Richards, New York, associate members.

We will give in this and succeeding issues abstracts of the papers read, with discussions on them.

CLEVELAND, OHIO, WATER-WORKS.*

I have been invited by the resident members of your Committee of Arrangements to prepare a brief description and history of the Cleveland Water-Works, and to read the same at this meeting.

the same at this meeting.

While I have been identified with these works two-thirds

of the period of their existence, and am therefore familiar with nearly every detail, I must confess that when called upon to write a description and give a historical sketch the task seems very much greater than when the subject was first suggested to me, and I make the attempt with no small degree of misgiving as to my ability to do the subject justice. subject justice.

The first definite action taken to procure a public water-

supply for the city of Cleveland was the appointment of Mr. T. R. Scowden as Engineer, who, on the 28th of February and afterwards in June, 1853, reported plans and estimates. Of three plans submitted, the one locating the works west of the mouth of the river was adopted, the water from this point being less liable to contamination by the discharges from the river. The work of construc-tion was commenced in 1854 and lake water let into the mains for the first time on September 24, 1856.

mains for the first time on September 24, 1856.

The reservoir had a storage capacity of 6 million gallons and was built on the top of an artificial bank raised 22 feet above the street-level. The engine-house, boiler-rooms and stand-pipe tower rested on a foundation laid on a solid timber raft, that in turn was laid on quick-sand. The pumping machinery consisted of one pair of purely Cornish beam engines, exact duplicates. The steam-

cylinders are 70 inches diameter with a stroke of 10 feet. The double beam is 29 feet 10½ inches between end centres. Width across the tulcrum, 6 feet 8 inches. Weight

of beam, with centre-shaft, is 40 tons.

The arms of the beam are unequal, the longer end connecting with the steam-cylinder being 15 feet 11 inches; the end connected with pump-plunger is 13 feet 11 ½ inches. The pump-plungers are 30 inches in diameter and have a stroke of 8 feet 9 inches, the displacement for each stroke

being nearly 321 gallons.

The maximum speed, pumping against a head of 166 feet in the stand-pipe, was about 11½ strokes or 100 feet

per minute when running a single engine.

The boilers are of the Cornish type, 6 feet in diameter and 30 feet long. The best duty these engines have ever shown is about 50 millions. Water was delivered to the reservoir through a 24-inch pumping-main about 2,200 feet long. From the reservoir to the central part of the city water was brought by a 20-inch pipe. This pipe furnished all the water used east of the rive until 1866.

The works as originally completed consisted of one pair of Cornish engines, having a daily capacity, when coupled together and run continuously at the greatest speed they cou'd attain when so coupled, of about 7½ million gallons. The pipe system, including three miles of mains from 16-inch to 24-inch, was only 13 miles, and one-half of the small pipe was 4-inch.

small pipe was 4-inch.

The number of stop-gates was 130 and of fire-hydrants

Water was taken from the lake at a point 300 feet from the shore and one mile west of the river and conveyed to the pumps through a brick aqueduct of oval form, 4x5 feet and about half a mile long. The works when completed according to the original design of the engineer, cost \$526,713. Mr. Scowden, in his final report to the Board of Trustees, says: "The capacity of these works to deof Trustees, says: The capacity of these works to de-liver water is greater than the originally estimated wants of the population the works were intended to supply, which was for 100,000. They are, however, capable of supplying at least 200,000 inhabitants with an abundance of water. By an enlargement of the main pump-barrel and plunger to each Cornish engine which was contemplated in the plans, the supply may be increased to almost an unlimited extent. No fear can be entertained that the unlimited extent. No fear can be entertained that the present water-works in the next fifty years will fail to yield a superabundant supply of water." In 1867, just eleven years after the completion of the original works, the average consumption of water per day was 1,908,000 gallons. Four years later the consumption had doubled, and the rate of annual increase had reached 25 per cent. In 1870 the work of building the lake tunnel was com-menced; the purpose of this was twofold—first, to secure a supply of water uncontaminated by the discharges from the river, which was then, as now, the outlet of many main sewers, as well as being the channel for conveying to the lake the refuse from the many oil-refineries and slaughter-houses situated along its banks and tributaries.
The second and equally important object was to secure an increased supply of water. It was found that during low stages of water in the lake that the quantity delivered to the pumps was not equal at times to the capacity of one engine, and the rapid rate of increase in demand admonished the board of the danger of a water famine in the near future unless the supply was increased. Chicago about this time had completed her first tunnel and investigations of the formation underlying the lake in front of us showed substantially the same kind of clay, and it was showed substantially the same kind of clay, and it was decided to adopt the plan so successfully carried out by our Western neighbor. Work was commenced in the latter part of August, 1869, and after battling with many difficulties a tunnel five feet in diameter and one and three-fourth miles long was completed and put in use about the 1st of March, 1874, at which time the daily average consumption had reached about 5½ million gallons with a maximum monthly use of 6% milmillion gallons with a maximum monthly use of 6.8 milmillion gailons with a maximum monthly use of of a millions. In July, 1874, just eighteen years after the original works were completed, a new pumping-engine of ten million gallons daily capacity was added to the plant that was to furnish all the water required for fifty years. Two years later another engine of the same size was added. Thus, in 1876, just twenty years from the date of the completion of the first plant, the machinery required for making

posed to be ample for fifty years.

The third new engine was added in 1882 and a fourth in 1884, leaving the pumping capacity at this time, exclusive of the original Cornish engine, forty millions, with two of the original Cornish engine, forty minions, with two fifteen million Knowles engines now in process of erection. These will doubtless be ready for service by July next, when the total capacity will be seventy million gallons

certain a supply of water in times of greatest demand was of a capacity more than three times greater than was sup-

Main pipes were, of course, necessary to take the water from these engines. For the supply of the east side of the river, one 16-inch, one 20-inch, and two 30-inch mains are in use, with one 30-inch for the supply of that part of the city west of the river. In crossing the river three wroughtiron pipes are used, two of them being 36 inches and one 33 inches in diameter. They are all half an inch thick, double riveted, and are from 220 to 270 feet in length and dip, by easy curves, about 25 feet below the water-line, trenches having been excavated in which to place them.

In 1882 twenty acres of land were purchased and appropriated, on which to build a reservoir for the supply of the lower and average elevations of the older portions of the city, and a lot on which to place buildings and machinery for elevating water to levels that could not be reached with a head suitable for the northern and western part of the Main pipes were, of course, necessary to take the water

At the same time another tract of ten acres was purchased, distant about 100 rods east of the city limits, on which to build a reservoir for a high-service system. The head of water in the low-service reservoir is 170 feet, head of water in the low-service reservoir is 170 teet, that in the higher one being 325 feet above Lake Erie, or a difference of 155 feet. The dividing line between the high and low service systems being fixed arbitrarily on the 120-foot contour line, giving a maximum head for the upper service of 205 feet, and a minimum head of twenty that the low service was made. The minimum head in the low service was made greater than in the upper one, for the reason that only 2 ery limited area is embraced within the 305-foot contour

The low-service, or what is designated Fairmount Res. ervoir (named from one of the streets passing it). consists of two distinct basins of unequal size, made to conform to the outline of the land. The capacity of the larger one is 47 millions and the smaller one 33 million gallons. The high-service reservoir covers nearly ten acres, and

has a storage capacity of about 38,000,000 gallons. Water the old Cornish engines that were removed from the lower pumping-station to a building erected for their receptor, at the lower reservoir. The main leading to the upper reservoir is thirty inches in diameter and 13,000 feet long. The total number of miles of pipe in the two systems on the first day of January last was 25134, of which fiften miles is in the high-service system. We have about 5,000 stop-gates in both systems, and 2,517 fire-hydrants.

The number of service connections at this time is about

25,000. We have in use 1,525 water meters and registers, and during last year the average quantity of water meas-

ured per day was nearly 5.500,000 gallons.

The total water pumped in 1887 reached a daily average of 22,250,000 gallons, while the average for the month of July was nearly 32,000,000. The minimum monthly average was in April, when the quantity was only 17,700,000

n the 24th of March last a contract was awarded for building an additional tunnel from the inlet crib to the building an additional tunnel from the inlet cub to the lower pumping-station. This tunnel will be 7 feet in diameter and 9,200 feet long, and is calculated to deliver 110,000,000 gallons per day with a head of 13½ feet on the suction-pipes. In estimating the delivery, due allowance was made for the inequalities of surface in the masonry as well as for the angles at the shafts. When this work is completed the daily delivering capacity of the two tunnels will be over 150,000,000 gallons.

two tunnels will be over 150,000,000 gallons.
[A map showing the relative position and area of the high and low-service districts was exhibited.]

DISCUSSION OF PAPER ON CLEVELAND WATER-WORKS.

In reply to various questions, Mr. Whitelaw stated that the present annual revenue from the water-works is about 400,000; that the population of Cleveland has increased from 17,500 in 1850 to 43,800 in 1860, 92,800 in 1870, 160,100 in 1880, and, by police census, 214,000 in 1886. The average daily consumption of water per capita is \$\phi\$ eatlons. The total cost of the water-works plant to date

is \$5,500,000.

The tunnel into the lake is through clay similar to that encountered by the Chicago tunnel. It is generally very hard and dry and traversed by fractures through which the water entering cut away the clay and brought quicksand into the tunnel. When this occurred a bulkhead was built across the heading and the tunnel was deflected around the bad ground. Several such curves made the tunnel the bad ground. pretty crooked.

At other points soft clay was encountered and shields pushed by hydraulic rams were used in the heading for about 130 feet.

The tunnel twice crossed old channels of the river, but experienced no difficulty from them.

experienced no difficulty from them.

The crib is pentagonal, about 90 feet across and 60 feet deep, built of pine timber strongly braced. The floor and sides were planked with oak and the lower 15 feet was calked. It was towed to place and loaded with stone; gates were then opened and it was sunk by the water immediately five vessels, stationed one on each side, disharded 1,000 tons more of stone into it, and this weight together with the action of storms, caused it to settle 15 feet in the clay. The crib is sunk in 38 feet of water and is protected with rip rap.

The water is admitted through free inlets 2½x5 feet, and on one occasion, in very cold weather, when the layish

and on one occasion, in very cold weather, when the lavish use of water, being wasted to prevent pipes from freezing, caused an unusual suction the openings were choked up for a number of hours by accumulated masses of snow and ice.

Since then boilers and double steam pipes have been provided to thaw away such obstructions if necessary

No straining has ever been attempted, but a trial is to be made of a system of vertical racks

When spring freshets occur while the lake is covered with ice, the river water is spread out to the crib, and on these rare occasions only, sewage matter is detected there.

Last July the collection was commenced on four lines, east and west of the crib, of water taken from points 4 feet below the surface and 5 feet above the bottom of the

Four stations were taken on each line, the first ½ mile from shore, and the rest at 1/2-mile intervals. The water was collected on the stormiest days, sealed up in glass-stoppered bottles and analyzed, and comparisons made with samples taken from the surface and a depth of 75 feet at a point 15 miles out from shore. The best samples were found on the west line at the outer station, but no difference were approximate at the outer station, but no difference were approximate at the outer station. ence was appreciable near the shore.

^{*} Paper by John Whitelaw, Memb Am. Soc. C. E., Superintendent, read before the American Water-Works Association, at Cleveland, O., April, 1888.

Experiments were made last October on the use of oil for fuel for the boilers, and it was found that the cost of pumping 22,500,000 gallons of water with the use of coal was \$64.22, and with oil \$81.33 a difference of \$17.11 in favor of coal, the oil costing 134 cents per gallon. The water-work's secretary, Mr. W. A. Madison, supplemented the description with an explanation of the system by which the 25,000 accounts are kept and collected twice by which the 25,000 accounts are kept and confected twice a year with a force of only five regular office employees. All the accounts are entered in two books which are posted daily. A machine, stamping consecutive numbers up to one million, numbers every bill, stub and ledger account, and they are kept by this number only.

Suggestions as to Methods for an Approximate Determina-tion of the Yearly Rental Value of Fire Hydrants, as Connected with any System of Water-Works.*

THE popular notion among both engineers and laymen in relation to this subject seems to be, that the fair yearly rental value of a fire hydrant as connected with a particular system of water-works, is an indeterminate quantity. The great range of prices which obtains in the various towns

great range of prices which obtains in the various towns and cities of the country, varying as it does from \$15 to \$125, is probably the result of this popular belief.

After considerable reflection, I am clearly of the opinion that this popular conception is entirely inaccurate. This remark I regard as especially true in relation to all waterworks plants which have been intelligently constructed with a due regard to the relative requirements for domestic and fire uses

tic and fire uses.

Preliminary to the discussion of the proposed methods of determination, it may be premised, that this yearly rental value will vary with each plantand will also slightly vary with each series of years of greater or less length, dependent upon improvements and extensions made neces-sary by increased consumption of water and the growth of

business interests to be supplied and protected.

The principal elements which enter into the determination of this question of values are as tollows:

1. A knowledge of the relations which exist between the maximum amount of water provided, under the plan of Construction, for fire purposes, and the maximum amount provided for all other uses at the same moment. This determination of relations to be made not only as to the supply through the conduit, but also as to the distribution pipes through each street.

2. A knowledge of the relative amount of power required to furnish the maximum amounts of water for fire purposes and domestic uses, in the case of a pumping

system, or of head in case of a gravity supply.

3. A knowledge, in case a reservoir or stand-pipe is used, of the increase in capacity required, because of the fire protection.

A. A knowledge of the number, size and character of the fire-hydrants and their branches and the specials and gates used in the fire provision.

5. A knowledge of the annual cost of superintendence of and repairs of the fire hydrants.

The intelligent water-works engineer, when called upon to design a water-works system, after having determined the source of supply, proceeds to inaugurate a careful inquiry into the question of maximum volume of supply required. This latter determination, in view of the almost phen omenal rapidity in growth of many American towns, is very largely problematical and its value will largely depend upon the experience, intelligence and sound judgment of the engineer; and whether the determination proves a correct one or not, it must be made.

The usual method is by careful inquiry and examination of the location and its natural advantages for business expansi on to arrive at a judgment of the probable eventual population and the character of the business enterprises to be most largely instrumental in the growth of the town in

When the probable maximum population at the end of 30 to 50 years is settled upon, it is further assumed that a domestic supply of from 60 to 100 gallons per capita per day is a fair and conservative provision, and the total daily supply is then for convenience stated in gallons per

It is also probably safe to assume that one-half of said daily consumption will occur during eight hours. The whole system of pipeaze must be adjusted to this maximum rate of domestic consumption.

The next subject of inquiry is the maximum quantity of water per minute which must be supplied for fire protection, and under what head.

To properly sould the

To properly settle this question, a familiar knowledge of the character, number and situation of the manufacturing and other industries in the town is required, as on these depend the number, volume and power of fire-streams required 10r protection.

Having settled upon the maximum number and character of the fire-streams fairly required at any one time in any special locality and the resulting number of gallons of water per minute which will thus be used, this number of gallons per m inute required for domestic use during the eight hours of s supposed greatest consumption, will constitute a fair determination of the maximum number of gallons per minute and the maximum number of gallons per minute and the maximum number of gallons per minute of the maximum number of gallons per minute of the maximum number of gallons per minute of the maximum number of gallons per minute of the maximum number of gallons per minute of the maximum number of gallons per minute of the maximum number of gallons per minute of the maximum number of gallons per minute and the minute of the maximum number of gallons per minute and the minute of the maximum number of gallons per minute and the minute of the minut fair detern ination of the maximum number of gallons per minute which must be supplied through the conduit. A further determination must also be made of the probable population and resulting domestic consumption in the various squares and main avenues of the town. This population

*Paper by J. Nelson Tubbs, Memb. Amer. Water-Works Association, read before the American Water-Works Association at Cleveland, O., April, 1888.

amount added to the required fire protection consumption

as previously determined will also determine the size of the several distributing mains.

The foregoing data being at hand, let the sum of the following items represent the increased cost of the plant, its maintenance and operation because of the provision for

fire protection:

(a) The excess in cost of conduit because of the necessity of seeking more distant sources of supply at greater eleva-

(b) The excess in cost of conduit, to include fire provision, from the point where a collecting reservoir might be located if a domestic supply only was desired.

(c) The excess in cost of the stand-pipe or reservoir

because of the fire provision.

(d) The excess in cost of the distribution in the town

itself because of the fire provision.

(e) The excess in cost of the specials used in the mains for hydrant branch, connections, over the same length of straight pipe, also including increased cost of setting and jointing same.

(f) The whole cost of the hydrant branches and laying

(g) The excess in cost of all gates and their setting in consequence of the increased size of the mains for the fire provision.

(h) The cost of all fire-hydrants and their setting.
(r) The cost of the annual repairs of the fire-hydrants

(i) The cost of the annual repairs of the internyonality capitalized at 5 per cent.

(j) Two per cent. of the cost of the fire provision as determined by the summation of items (a) to (h) inclusive, to cover cost of care and management of the fire plant and

said 2 per cent. capitalized at 5 per cent.

(k) A sum, the accumulated interest of which, at 5 per per cent., will produce the cost of the fire provision in, say, 35 years, thus providing for its renewal at the end of that period
(1) The excess in cost in case of a pumping plant should

be included in the items (a) to (h) inclusive, and the yearly excess in cost of operation should be capitalized at 5 per

The annual interest on the gross-sum of these several items, calculated at such a rate as capitalists are willing to receive for money loaned on good water works securities in the particular locality in question, divided by the number of hydrants in use, may be said to approximately represent the yearly rental value of each of said hydrants.

When thus determined for a system of water-works in-telligently designed, the yearly rental value of a fire hydrant will change very slightly, so long as the domestic consumption, including waste, does not exceed the amount contemplated by the original plan of construction.

It is a fact, much to be regretted, however, that very many existing systems of water-supply have been designed by persons totally incompetent for such a duty, and many have been constructed on too small a pattern either because of a lack of means or the stupidity of the local management.

such cases, the works when first constructed and before the domestic consumption has become large, may and in most cases do furnish water for fire protection in suffi-cient quantity and under a sufficient head for all practical purposes, but as the domestic use, with its concomitant waste, increases, the volume and head for fire-streams diminishes year by year, until the only value the system has for the latter purpose is the possible furnishing of insufficient quantities of water to steam fire-engines at convenient points for use.

In cases of this kind a yearly determination of values

should be made and the methods modified to the following

Instead of seeking to determine the ultimate domestic consumption, the actual rate of such consumption at the date of the examination may be used until such time as the domestic uses have absorbed so much of the volume and head of water as to render necessary the intervention of steam fire-engines and other appliances to supplement the volume, power, and effectiveness of the streams at the hydrants, when some other method of determination will have to be adopted, the water-works having then assumed a value for the extinguishment of fires but little in excess

of the old street fire-cisterns or reservoirs.

When the works have reached this condition, there should arise but little controversy in relation to values, and a determined effort should be made for a reconstruction of the system under the advice of an engineer of judg-

ment and experience. One other modification of conditions may possibly be encountered in the experience of the engineer, and that is where, for some cause, the element of sufficient head for effective modern fire-streams has been deliberately neglected, but where an adequate volume for that purpose has been provided at each hydrant.

The writer can perceive no reason why the method of determination of the rental value hereinbefore indicated may not be applied in such a case.

If in the exercise of a wise discretion the engineer shall conclude that the mere furnishing of an abundant volume of water at each hydrant, leaving the head to be supplemented by other appliances, shall prove of sufficient value to compensate for the increased cost of the works because thereof, there can certainly be no good reason adduced to prevent the application of the foregoing methods for de-

In such a case we are justified in the assumption, that the supplementing of the head at the hydrant by other appliances, is cheaper than that of providing the head in the original plan of construction.

The writer has had occasion to use the foregoing described methods of determination in the settlement of a controversy between a water works company and the citizens of a flourishing manufacturing village in the State of New York, in which the yearly rental paid for each firehydrant had previously been \$50, but which by this method of determination was reduced to \$34.50.

The determination was finally accepted by both parties as a satisfactory solution of the problem of hydrant rental

This method had been applied and accepted in the granting of water-works franchises in other towns where the plans had been fully settled, also in the determination in my own city of the allowance which should be made to the water-works fund for public uses of water.

The method thus briefly stated is respectfully submitted

for the consideration and criticism of the members of the

That the foregoing method may be more readily followed and understood, I append the following illustration of its application to an assumed gravity supply,

tration of its application to an assumed gravity supply, the case being purely an ideal one:

Assume a village situated on practically level ground, with seven streets, each 100 feet wide, running north and south, and designated respectively, commencing with the most westerly, as A, B, C, D, E, F, and G Streets. Also six streets 100 feet wide running east and west, and designated respectively, commencing with the most northerly, as First, Second, Third, Fourth, Fifth, and Sixth Streets. These divide the village into thirty squares, the sides of each being 500 feet long.

each being 500 feet long.

It is further assumed that each square has, or will have, a population of 120, making a present or eventual total

Tris also assumed that at a distance of 5,000 feet north of the north line of the village a minimum supply of water equal to 375 gallons per minute may be collected directly into a reservoir at an elevation of 200 feet above the level or the town. Also that the same amount of water may be collected directly into a reservoir 125 feet high at a point 2,500 feet north of the north line of the village, or midway between the town and the reservoir as at first assumed.

Under these conditions what would be the fair yearly

rental value of each two-way fire-hydrant?

DETERMINATION

Making the maximum estimated requirement...... 1 275 gallons per minute.

The first assumed reservoir has an elevation of 200 feet plus the village, equal to a static pressure of 86.6 pounds To deliver at the north line of the village (a distance

from the reservoir of 5,000 feet) 1,275 gallons per minute through a 12-inch main, involves a friction loss of about 10 pounds per square inch, which deducted from the pressure, 86.6 pounds, due to the head of the reservoir, leaves a working pressure at the hydrants at the intersection of the conduit with First Street of 76.6 pounds per square inch.

As the longest line of rubber 2½-inch hose required to be used at this point (with 11/6-inch nozzle) need not exceed 300 feet, the friction loss in the hose would be exceed 300 teet, the friction loss in the hose would be about 29 pounds, which deducted from 76 pounds would leave an effective pressure at the nozzle of say 47 pounds, which would produce streams reaching about 120 feet horizontal and a vertical height of 90 feet.

Such streams would be regarded as sufficient for a town of the population assumed, and hence the size of the conduit may be fixed at 12 inches diameter.

The post questions to be determined are whether a

The next questions to be determined are, whether a reservoir placed at an elevation of 125 feet would be high enough for domestic use in case the fire provision is abandoned, and if so, what should be the size of the conduit?

The second reservoir is assumed to be placed at an ele-

The second reservoir is assumed to be placed at an elevation of 125 feet plus the village datum, equal to a static pressure of 54 pounds per square inch.

The friction loss in a 6-inch pipe, 2,500 feet long, discharging at the rate of 375 gallons per minute, is about 14 pounds, which, deducted from 54 pounds due to the elevation of the reservoir, would leave an effective pressure at First Street of 40 pounds, equal to 92 feet head, which would corry the water to the upper stories of all buildings. would carry the water to the upper stories of all buildings, if provided with service-pipes of reasonable size, and the conduit for a domestic supply may, therefore, be fixed at six inches diameter.

The excess in cost because of obtaining sufficient head for the fire service may be stated as follows and designated

Amount of Item (a)..... \$4.006

The excess in cost because of increased size of the conduit for the fire service from the second or lower reservoir town may be stated as follows, and designated as item (b):

Amount of item (b) \$2,138

The next question to be considered is to what extent the size and cost of the reservoir is to be affected by the addition of the fire provision.

tion of the fire provision.

In the case assumed, the minimum flow of the collected water is placed at 375 gallons per minute, while the average requirement for the whole twenty-four hours is at the rate of 250 gallons per minute. It follows that for the domestic supply only, a very small and comparatively cheap reservoir may be designed and safely employed, say with a capacity of 100,000 gallons or less.

The fire provision must, however, be provided from stored water, and the minimum amount thus stored must equal 900 gallons per minute during the continuance of a fire.

fire.

In a manufacturing town a single fire may require firestreams for a period of at least four hours, and it is not
unusual that three such fires should occur within a period
of twenty-four hours. This would require a storage as
follows: 900 gallons per minute for twelve hours or 720
minutes equals 680,000, say 700,000 gallons, to which add
100,000 gallons for domestic storage, and we reach the
conclusion that we require a reservoir of a storage capacity
of 800,000 gallons when we include the fire provision, as
against one of 100,000 gallons for the domestic system
alone.

The determination of the difference in cost of the two reservoirs is not difficult, and, therefore, for our present purpose we will assume the amount of this difference in cost and designate the same as item (c).

We will now proceed to the determination of the increased size and consequent cost of the pipe distribution because of the fire provision; and to illustrate will take the case of the main in First Street, or the most northerly street in the village, and which is 3,700 feet long and intersects the conduit at "D" Street.

At the north-west corner of the village at the west end of First Street, and at a distance of 1,850 feet from the intersection with the conduit at "D" Street, it is required to furnish as follows:

to furnish as follows:

The friction loss in a 10-inch pipe, 1,850 feet long, under these conditions is about $5\frac{7}{10}$ pounds, which will give practically the same character of fire streams as at corner of D' Street, where the 12-inch conduit for the stream and the same character of the stream and the same character of the stream and the same character of the stream and the same character of the stream and the same character of the stream and the same character of the stream and the same character of the same character o "D" Street, where the 12-inch canduit first reaches the north line of the town, especially so in case any less than six streams should be used at once.

By a similar calculation we might determine the size of main required for each of the two systems.

We will assume for the use of brevity that this has been done with the following results:

Sizes of Mains Required for the System including the Fire Provision.

Sizes of Main's Required for the Domestic Supply Alone.

On making the necessary combinations, we find that the distribution which provides a fire protection will require a weight of straight pipe 236 net tons in excess of the domestic system, and about 6,000 pounds of special castings. A detailed calculation will also show that the laying, jointing, etc., of the first system will cost about \$900 in excess of the second.

The following statement includes these several includes

The following statement includes these several items, and indicates the excess in cost of the village distribution because of the fire provision, and may be designated as

Estimate.

The assumption is made that the town in question will require fifty fire-hydrants, and Item (e) will represent the excess in cost of hydrant branch specials and cost of jointing, etc., over the same length of straight pipe.

Estimate,

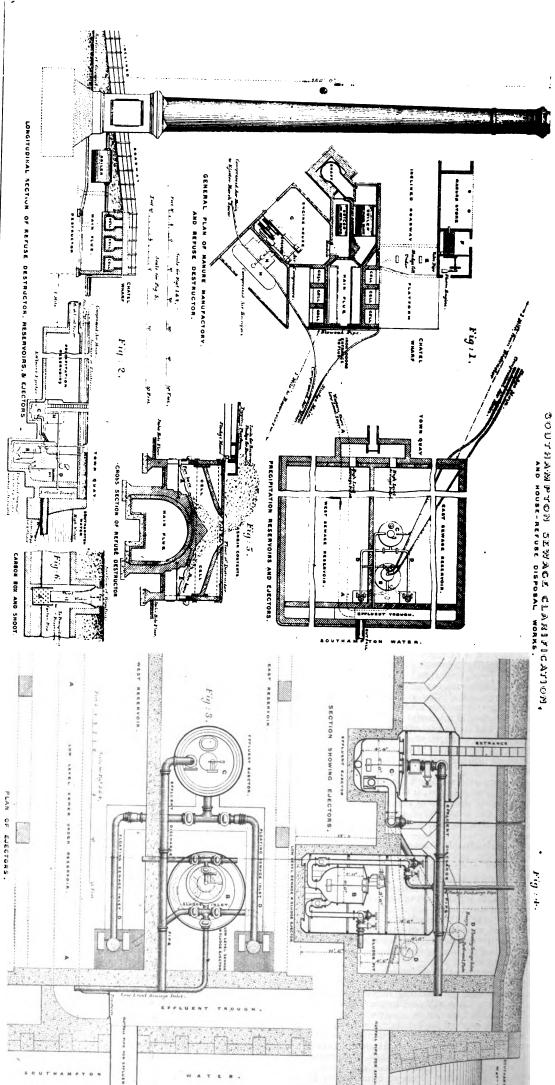

10,7to pounds specials for hydrant branches, at 3 cents.. \$321 Extra cost of setting, jointing, etc., over straight pipe.. 100 Deduct.

4,000 pounds straight pipe saved, at 1.7 cents...... \$68

Item (f) includes whole cost of hydrant branches and laying same.

Amount of Item (t) \$600

Item (g) embraces the increased cost of valves required in consequence of the increase in the size of the distribution mains required for the fire provision. As these can

Cost per day.

easily be exactly determined, I simply assume an amount for my purpose of illustration.

Excess in cost of gates and setting, Item (g)\$500

Item (h) includes the cost of all fire-hydrants and

Estimate.

50 two-way fire-hydrants, at \$30 50 setting fire-hydrants, at \$4	
Amount of Item (h)	<u> </u>
Amount of Item (n)	#1. /00

Summation of Preceding Items Comprising Cost of Fire Provision.

1,00.300	
Item (a)	\$4,096
Item (b)	2,138
Item (c)	
Item d)	9,104
ltem 'e)	353
Item (t)	600
Item (g)	500
ltem h)	1.700
Cost of the fire provision. Item (i) is the capitalization of the yearly cost of repairs of fire hydrants as follows, so hydrants at \$3 = \$150 + 5 cents = . Item (j) is the capitalization of the yearly cost of care and management of the fire plant, as follows: The cost of plant = \$21,001 × 2 per cent = \$439.82 + 5 cents . Item (k) is a sum, the accumulated interest of which, when compounded at 4 per cent, will in 35 years amount to the cost of the fire provision plant and also repay the original sum at the end of the period, as follows:	3,000 8,796
Formula $S = \frac{x}{1.04 n - 1} \times P$. In which $S = sum$	

which will at end of 35 years at 4 per cent. produce (S + P).

P = original cost of fire plant.

n = number of years in which plant is to be renewed.

As water-works bonds can readily be sold at from 31/4 to 5 per cent. using the larger rate we have \$41,252 \times 5 per cent = \$2,062 60 yearly interest on same, which must be paid from fire hydrant rental.

\$2,062.60 + 50 hydrants equals \$41.25 per year as the rental value of each hydrant in the case assumed.

DISCUSSION OF PAPER ON RENTAL VALUES OF FIRE-HYDRANTS.

Q. Is provision made in this system for extension of the fire-service?

A. Yes; but occasional readjustment is required.
Q. Is the storage capacity sufficient? I know of a sim-

sized village where a recent fire required 2,000,000 gallons of water.

A. The case in the paper is an assumed one, and the matter is entirely one for the designer's judgment. In Rochester we have 1,700 hydrants, for which we are paid about \$50each. For this and other public service we receive from the city an annual credit of \$100,000.

One member thought that consideration should be given in such estimates to the element of uncertainty of the amount of water required, and danger to pumps from sud-

den demands for fire-service.

Another member thought the best way out of the dilemma is to get a round sum per mile from the city, and then permit them to use as many hydrants as they wished

SOUTHAMPTION SEWAGE - CLARIFICATION AND HOUSE-REFUSE DISPOSAL WORKS.*

THE author was instructed, by the Corporation of Southampton, to devise a scheme for the clarification of the sewage of a part of the borough, which was discharged into Southampton Water at the Town Quay, and also for the more efficient collection and disposal of the house refuse of the whole town. He accordingly proposed the adoption of Messrs. Manlove, Alliott, Fryer & Co.'s refuse-destructor, to serve the double purpose of destroying the ash-bin contents and garbage and of disposing of the sewage-sludge deposited, in the process of clarification, in two existing reservoirs adapted for the purpose (Figs 1 and 2). Formerly the sewage of a district of the town, amounting to 500,000 gallons in twenty-four hours, from a population of about thirteen thousand, for the most part flowed by gravitation into these reservoirs, from whence it was discharged into the tideway at low water; whilst a small portion, coming from a low-level sewer, passed through iron pipes A A, laid under the reservoirs, direct into the tideway (Fig. 1). The reservoirs act alternately, one being left still for the precipitation of the sewage, whilst the other is being filled.

In order to render the discharge of the effluent from the reservoirs independent of the tide, and to raise the lowlevel sewage into the reservoirs for treatment with the rest. two of Shone's pneumatic ejectors were put down (Figs. 3 and 4), one of 360 gallons capacity, B, placed below the invert of the low-level sewer, which serves for discharging

the sludge as well as for raising the low-level sewage, and the other of 700 gallons capacity placed in the east reservoir at C (Figs. 1 and 2). In each reservoir there is a floating sewage inlet, D D, consisting of a pipe connected with the large ejector, and shackled to a buoy which makes the pipe rise and fall with the water level, keeping its mouth, which is covered with a perforated plate, a few inches below the surface of the effluent, to prevent the passage of any floating matter (Figs. 3 and 4). Directly the clarification by precipitation has been effected to a certain depth, a valve is opened, admitting the effluent into the ejector C, whence it is at once discharged into the tideway. A supplementary sewage outlet is also provided in each reservoir for discharging the effluent by gravitation when the tide is low enough. When the whole of the effluent has been thus drawn off, the buoy, resting now upon the floor of the reservoir, keeps the mouth of the inlet sufficiently high to prevent the admission of any sludge; and the sludge is then admitted into the ejector B by opening a valve, and is transmitted by pneumatic force through a line of 4-inch cast-iron pipes, nearly a mile in length, to the destructor erected on the Chapel Wharf (Figs. I and 2).

The sludge is discharged into a cell, E, from whence it is drawn as required through a valve-pipe, and, after mixture with road-sweepings in an incorporator, F. driven by a small steam-engine, is turned out as a good, dry portable manure, which has all been readily bought up by agriculturists, since the commencement of the works, at 2s. 6d. per load delivered at the works. On an average, seventy cart-loads of ash-bin contents are daily collected and destroyed, a small portion only being occasionally sold; and twenty-five tons of refuse, when burnt, generate sufficient steam for the carrying on of the works for one day, being about a fourth of the refuse collected in the borcugh, including the roadsweepings which are never burnt. In wet weather, the road-sweepings are stored and dried; and the fine ashes from the destructor are incorporated with the sludge in their place.

The refuse destructor has six cells or furnaces, each capable of burning 8 to 9 tons of garbage per day (Figs. 1, 2 and 5). The products of combustion pass through a 30horse power multitubular steel boiler, in the main flue, to the furnace-shaft. There is also a bye-pass in which a smaller boiler is placed, to enable the works to be continued during cleaning and repairs. No obnoxious fumes from the combustion have been perceived. The steam generated in the boiler is employed for driving the engines G, of 31.5 indicated horse-power, which compress air into two large receivers H H, whence it passes in a 5-inch main to the Town Quay, where it is automatically supplied to the ejectors when required for working them; and it also reserves for driving the precipitated sludge through the main to the destructor, before referred to, being led from the receiver by a pipe to the head of the main at the Town Quay.

All obnoxious matters are collected throughout the borough in specially constructed, covered, iron tumblercarts, which go up the inclined roadway approach to the destructor, and discharge their contents direct into the cells. The road-sweepings are discharged into a hopper over the incorporator, and, after passing over a rocking screen, are mixed with the sludge as required.

The residue from the continuous day and night combustion consists of about twenty per cent, of good hard clinkers and sharp fine ashes: the clinkers are used for the foundation of roadways and the manufacture of pavingslabs: the fine ashes are employed for mortar, as well as in the preparation of sludge for manure. Porous carbon is used for precipitating the sludge; it is mixed, with one pound of sulphuric acid per hundred weight and clean water, into a stiff paste, and led through a shoot, I, into a box, J, with perforated sides, placed in the sewer, Fig. 6. The sewage flowing past washes the carbon gradually out of the box, and is thoroughly mixed with the carbon by the time it discharges into the reservoirs at a manhole 150 feet off. A small stream of water falling down on the carbon prevents its consolidating. The box is filled three times in twenty-four hours; and this method of dosing the sewage has proved quite efficient and satisfactory.

A pressure of air of 40 pounds on the square inch is required for working the sludge-ejector and 10 pounds for the effluent-ejector. Eight tons of sludge are dealt with per day; and arrangements were provided for burning the sludge. The sludge was discharged into a tank on the

floor of the destructor, and drawn out through ports in the front opposite the feed-openings of the cells, where its moisture was absorbed by the ash-bin contents, backed up against the ports with this object; and the mixture was then raked into the fires (Fig. 5). Large quantities of sludge have thus been destroyed; but the process has been discontinued owing to the ready sale of the sludge when prepared for manure.

THE PLANT OF THE BOSTON HEATING COM-PANY.

No. I.

As most of our readers are aware, pipes for the circulation of superheated water for heating and power purposes have recently been laid in a portion of the city of Boston, and believing that this use of hot water by such novel methods and on so large a scale cannot fail to be of interest, we give the following illustrated description taken from a paper read by Mr. A. V. Abbot, Chief Engineer of the National Superheated Water Co. of New York, before the Boston Society of Civil Engineers, November 16, 1887.

We are also indebted to Mr. Abbot for the electrotypes of the accompanying illustrations, of which one herewith given is a general view of the arrangement and application of the system, and the other is a map of the district in which pipes have been laid.

The object of a heating system is to distribute heat from place to place; and whatever means are used to carry heat from point to point are simply auxiliary, the distribution being the end to be accomplished.

Before proceeding further we must establish some standard by means of which heat can be measured. The unit that is adopted in this country is the quantity necessary to raise a pound of water one degree. With it we can express quantities in the terms of that measure-for example, 1,000 units of heat is the quantity necessary either to raise one pound of water 1,000° or 1,000 pounds of water one degree.

To carry any substance from one point to another we wish to select for our means of transportation that arrangement which will enable us to convey the greatest amount for the least expenditure. Take the following example:

If a range is to be maintained at a temperature of 250°. it is proposed to supply water at 400°. Suppose there is introduced into the range a cubic foot of water at 400°, the weight of the cubic foot of water is 53.63 pounds. If the temperature of the range is to be kept at 350° the water can only be allowed to fall to 350°. The fall in temperature is therefore 50°. The whole quantity of heat liberated by the fall of the temperature of the water is 53.63x50x1.0174.* or 2,728 heat-units.

The vehicle which is most commonly used instead of water for the transportation of heat is steam. Supposing, instead of admitting to the vessel a cubic foot of water, we admit therein a cubic foot of steam at the same temperature of 400°. Now if that steam falls from 400° to 350°, a portion of the steam is condensed and the latent heat liberated. A cubic foot of steam at 400° weighs 0.547 pounds, and at 350° it weighs 0.3056 pounds; the difference between the two is 0.24 pounds. The latent heat of evaporation of steam at 400° is about 830 units per pound; therefore by multiplying 830 by 0.24 we obtain a product of 199.2 as the number of heat-units set free by the fall in temperature of a cubic foot of steam from 400° to 350°. It has been seen that the cubic foot of water will deliver 2,728 units of heat, while the

^{*}Paper read before the Institution of Civil Engineers by William Benjamin George Bennett, Assoc. Mem. Inst. C. E. The illustraions are from drawings made by the author.

^{*} The additional .0174 is due to a very slight increase in the specific heat of water as the temperature rises.

cubic foot of steam yields 199. The ratio of these two quantities is 13.7 to 1. Hence it is obvious that 13.7 cubic feet of steam must be circulated to do the same amount of heating as may be accomplished by one cubic foot of water. Just as soon as the steam has fallen to the temperature at which it is required to maintain the range, the steam must then be exhausted to give place to a new supply.

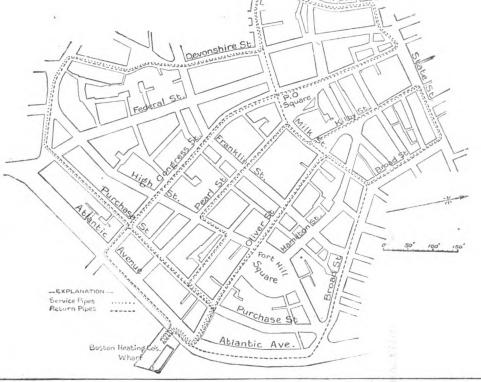

It is true that steam, being a light, aeriform fluid, will flow through pipes much more easily than water will. By the well-known laws of hydraulics the relative velocities at which fluids travel through pipes vary inversely as the square roots of the densities. The square roots of the densities of steam and water are as I to 9.87. Consequently, under the same conditions, with the same length of pipes, the same resistances in the pipe, and the same pressure on the circulating medium, 9.87 cubic feet of

steam would flow to one cubic foot of water. But for equal volumes the water is to the steam, as far as heat carrying power is concerned, as 13.57 to 1, whereas the relative volumes which would be transmitted through a pipe under the same conditions are as I to 9.87. The expense of delivering to a distant point any fluid depends simply upon the amount of mechanical work necessary to overcome the resistance of the pipe. velocities at which water and steam will flow under the same conditions are as 1 to 9.87; but the relative volumes necessary to deliver the same quantity of heat are as I to 13.7; hence the current of steam must must have a velocity 1.35 times greater than would be given it by the pressure necessary for the water-current. Remember that the velocity of transmission through a pipe is not a question of weight, but a question of volume. A 4-inch pipe will, at the same velocity, carry no more cubic feet

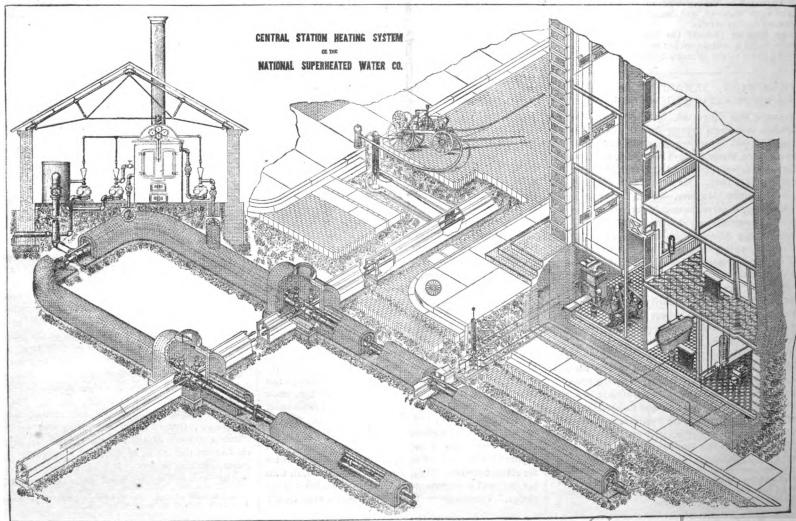

of mercury than it will of hydrogen gas, although the density of the mercury is several thousand times that of the hydrogen. It will carry more pounds of mercury, but no more cubic feet. So to deliver equal quantities of heat there must be in the case of steam a velocity of 13.7 times that of the water. The mechanical work, which is the measure of the expense of transportation of a fluid, varies as the cube of the velocity at which the fluid flows. We have seen that, under similar circumstances, if the velocity of the water-current is 1, the velocity of the steam-current to transport an equal amount of heat, must be 1.35 times as great as would be given by the amount of mechanical work that would be sufficient to give the required velocity to the water. Cubing, it is obvious that

required velocity to the water. Cubing, it is obvious that the relative expense of transporting equal quantities of heat, by steam or water, will be about as I to 2½.

It is usually assumed that a current of steam flowing through a pipe is maintained by the expansive force of the steam itself. Precisely: but this expansive force in the steam is only attained by a fall in pressure and temperature, and, consequently, by a corresponding amount of condensation. Returning to our former example, if, at the end of a long pipe, it is wished to deliver steam at 400°, corresponding to a pressure of 250 pounds to the 400°, corresponding to a pressure of 250 pounds to the square inch, it would be necessary at the central station to put upon the boilers a sufficient pressure in addition to that at which it is expected to deliver steam to overcome the inevitable friction of the pipe between the boilers and the place where the steam is to be delivered. In a long line this friction is of considerable amount, so that in order to accomplish the necessary delivery of steam the boilers would be called upon to bear a burden equal to the amount of radiation of the line plus the amount of the amount of radiation of the line plus the amount of frictional resistance offered to the steam-current. The frictional resistance may, of course, be reduced to a minimum by the use in the line of pipes of very large diameter. This has frequently been done with the inevitable result of very largely enhancing the cost of the plant and increasing the difficulties both of construction and of maintenance. In the case of the water plant, it is only necessary to subject the boilers to the pressure requisite to give the temperature at which it is wished to deliver the water plus the much smaller amount of radiation which takes plus the much smaller amount of radiation which takes place from a pipe of less diameter than that employed in the steam plant, the frictional resistance of the pipe the steam plant, the frictional resistance of the pipe being entirely overcome by means of a forced circulation obtained by pumps. The boilers, which perhaps are being entirely overcome by means of a forced circulation obtained by pumps. The boilers, which perhaps are the most difficult part of the system, are much more easily constructed and maintained. Thus, by means of the use of an incompressible fluid like water, and the employment of a pump to produce circulation, a much higher initial pressure can be placed upon the pipe line to overcome the frictional resistances of the pipe. This enables us to employ a very much smaller pipe than is customary to use in steam plants, and largely decreases the expense of the system and the difficulties of construction and maintenance.

DOMESTIC ENGINEERING, ETC., IN THE CEN-TRAL TRUST COMPANY'S BUILDING, NEW YORK CITY.

No. I.

TANK SYSTEM.

In the recently completed building of the Central Trust Co., of New York, there are a number of interesting features in the plumbing, the most prominent of which it is proposed to describe in successive articles.

The architect was Mr. Charles W. Clinton; the master plumber was Mr. John Toumey.

The water-supply of this building is under three divisions-viz., for the steam-engines, for domestic purposes, and for the elevators.

volume of confined air becomes too great, a rod is inserted through P, and, pushing up the ball, allows its escape. Inside the tank a float, H, is attached to the lever I, which is fixed at J to the shaft of pulley K, around whose face a steel wire, L, is wrapped, and thence led to the mechanism of gauge, M, whose index gives the height of water in the tank, which is also transmitted by electricity, over the wires O O to an annunciator in the engine-room. A direct column gauge, Q, is also attached to other end of the tank (see Fig. 2).

Figure 3 shows the tank for domestic supply. It is about six feet high and eight feet square, and was built, in its present position, of ¼-inch iron plates. N is the 21/2-inch feed-pipe, A the 3-inch fire-supply, and B and C are 2½-inch supplies for the upper and lower parts of the building. D is a supply to janitor's rooms, branched with pipe E to water-closet. G and F are relief pipes from house and fire supply respectively, and simply open into the top of the tank. B is for house supply and C is for emptying tank. I is a large copper float, which rises and falls on guide-rods J J, and, by the steel wire K K, operates the gauge needle in the engine-room and indicates the height of water in the tank. The tank is set in

mains in street to supply stores, residences, etc.? If not. mains in street to supply stores, residences, etc. r 11 not, would you inform me your best method for constructing one? Our city is considering the question of laying a plant (or rather our electric light company is), and I would be pleased to receive your valued idea in your next issue.

Yours respectfully, SAMUEL C. TURNER.

[In Vol. VII. we published an illustrated account of the New York Steam Company's plant of this city, and on April 7 commenced an illustrated description of their latest and most complete steam-station. We shall describe in this and succeeding issues the hot-water plant now in use in Boston and constructed by the Boston Heating Company.]

SIZE OF TRAP-VENT PIPE.

CORNING, N. Y., March 30, 1888.

Sir: Please inform me early, through your journal or otherwise, what size pipe you would recommend to ventilate a trap made of 1½-inch pipe; or, in other words, about how much smaller can the ventilating-pipe be than the trap pipe to prevent its syphoning?

Very respectfully yours,

C. E. CORBIN.

[The size depends on the distance the vent-pipe has to go to reach air. We should advise using 11/4-inch pipe.]

AMOUNT OF COAL REQUIRED TO HEAT WATER FROM 40° TO 200°.

Togus, ME., April 12, 1888.

SIR: Will you kindly inform me how many pounds of coal would be required to heat water from 40° up to 190° or 200°?

Boilers are evaporating eight pounds of water to one

pound of coal, and the desire is to apply steam, at forty pounds pressure, to heating water, passing it through a brass coil in a hot-water boiler, the water of condensation

The amount to be heated to 190° or 200° is about 300 gallons per hour (average), or 7,200 gallons in twenty-four hours, and the question is, How much will it cost per gallon to heat it?

An answer at your early convenience will much oblige.
Yours, very truly, Engineer.

[To warm one pound of water from 40° to 200° Fah. will require 160 heat-units, and, as 300 gallons of water at 40° Fah. weigh very nearly 2,500 pounds, it is evident that it will require 400,000 heat-units per hour to be taken in form of steam from the boilers. This is the equivalent of 440 pounds weight of steam per hour at 40 pounds pressure condensed to water at the same temperature, and i cooled to the atmospheric pressure and temperature will require about 410 pounds weight. Then, if you get 8 pounds weight of steam per pound of coal, it is plain it will cost you the value of 55 pounds per hour to warm the water (300 gallons); or, in other words, 5½ gallons o water can be warmed by I pound of coal in the case you cite.]

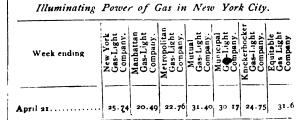

CAUSE OF CORROSION IN HOT-WATER RE-TURN-PIPE.

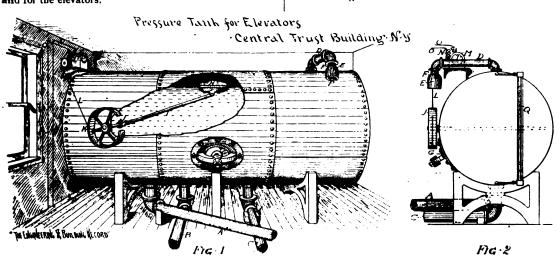

ISLE OF WIGHT, ENGLAND, March 6, 1888.

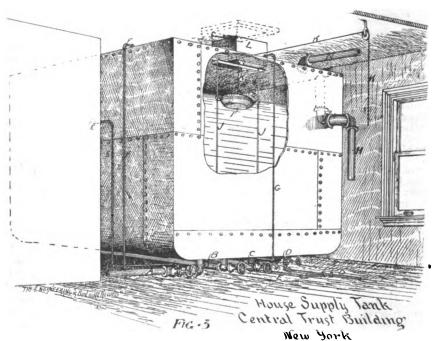

Six: If not troubling you too much, perhaps you could enlighten me through the columns of your valuable journal as to the following: On taking out a piece of pipe in a return (or circulating-pipe) I found the waterway almost completely stopped with iron rust, which led me to recommend the pulling out of the whole system of piping, and, on pulling it out, I found the whole of the return (circuting-pipe) corroded, but the flow (hot water) comparatively clear. What I want to know (putting aside the system clear. What I want to know (putting aside the system, which is one I should not recommend) is, why should one pipe be so much more corroded than the other? I have sent you rough sketch of piping and system to show connections to water-back, which was until recently connected as shown in Fig. 2. Yours respectfully, PLUMBER.

[You do not give us sufficient data to enable us to form a definite opinion. If the tank is of iron, we can readily see how the scales, sediment, etc., would settle into the return-pipe and stop it, as your sketch shows it coming out of the bottom of the tank.]

Gas and Electricity.

A 3-inch connection with the street-mains is branched to supply storage-tanks for each of the three systems. The engine tank is an open one, situated in the basement, and presents no features of especial interest. The other two tanks are in the upper story, and are illustrated by the accompanying sketches.

The pressure tank for elevator service, which was constructed by Otis Bros and Co. (Figs. 1 and 2), is a boiler-shaped cylinder, six feet in diameter and fourteen feet long, and was built in position of iron 3/8-inch plates, and is designed for a working pressure of eighty pounds per square inch. It is connected with 6-inch feed-pipe A and the 5-inch pipes B and C, which respectively supply the regular and the emergency cylinders.

The pipe D opens freely into the boiler, and carries at the opposite end a valve chamber, F, in which a rubber ball, E, rests loosely on the valve-seat, and is forced down tight upon it by the pressure in the tank. Whenever the a safe of a inch iron. There are two of these, one to indicate the level of water in the tank, and one to control the pump.

L is a well and M its trap-door, giving access from the roof to the interior of the tank. The tank is supported on rolled-iron beams. After the construction of this tank it was found inadequate, and another was built on the roof to supplement it.

(TO BE CONTINUED.)

Correspondence.

STEAM AND HOT WATER HEATING PLANTS FOR CITIES.

CHESTER, PA., April 21, 1888.

SIR: Would you please inform me if you have ever shown in your paper a diagram of a steam-plant such as are now being constructed in different cities by tapping

RATIO OF HEIGHT OF CHIMNEY TO RATE OF COMBUSTION.

THE height of a chimney depends a good deal upon the surrounding conditions. When there are no obstructions, like very high buildings or hillsides, Professor Thurston's approximate rule is very convenient. It is to add one to the pounds of coal burned per square foot of grate per hour, divide this by two and square the quotient. The result is the height of the chimnery in feet. If the rate of coal consumption is fifteen pounds per square foot of grate per hour, then the height would be

$$\left(\frac{15\times 1}{2}\right)^2 = 64 \text{ feet.}$$

From this it will be seen that the rate of combustion varies very nearly as the square root of the height of the chimney.

To find the diameter of a round stack equal in area to the flues in the boiler, Wood and Iron gives this rule: Multiply the diameter of one flue, supposing they are all of the same size, by the square root of the number of flues, and the product will be the required diameter of the equivalent round stack.

PUBLIC LIGHTING OF NEW YORK.

THE report for 1887 of S. McCormick, Superintendent of Lamps and Gas in the City of New York, shows that during the year 1,017 new gas-lamps have been lit and 151 electric lights, the average number of lights of both kinds during the year being 25,471. Nearly 102 miles of gas-mains were laid, of which two-thirds were laid by the Standard Gas Co. Altogether 1,119 miles of gas-mains are in use, of which 1,023 are on Manhattan Island. The Equitable Gas-Light Co. pays the city twenty cents per foot for every foot of main it lays, which since 1883 has amounted to \$97,852.40. No other company pays any-

Fourteen miles of new streets were lit, making an aggregate length of 478 miles of lighted streets. To this must be added 14 miles of piers and nearly 134 miles of bridges, with 62 acres of parks and 234 acres of market; 342/3 miles of streets are lit by electricity, and the total mileage lit, and under contract to be lit, by electricity is 673/4.

The contract prices for street lighting per annum, including gas, lighting and extinguishing, vary from \$12 to \$29 per lamp, and for electric lighting per light per night from 19.9 to 60 cents. Gas of 18 and 28 candle-power has been contracted for at \$1.25 per 1,000 cubic feet.

The average pressures per quarter have varied from 3.07 inches of water to 0.93 inches.

ENGINEERS' CLUB OF KANSAS CITY.

A REGULAR meeting was held in the club room April 16. The president reported in brief what action had been taken by the delegates at Washington respecting the Cullom bill, stating that there would be no difficulty in its passage by the Senate, while in the House, though there was not the same unity of feeling, no great opposition was looked

for.

Resignation of Mr. George C. Stealy was accepted.

The discussion of Professor Waddell's pamphlet, began in the last regular meeting, was then continued as follows:

A paper was read by Mr. W. H. Breithaupt; the secretary read contributions from Professor De Volsen Wood, Messrs. read contributions from Professor De Volsen Wood, Messrs. Samuel G. Artingstall and Edwin Thatcher, Professor P. C. Ricketts and Mr. W. L. Cowles. These were discussed by Messrs. Goldwark, Wynne and Breithaupt, and replied to by Professor Waddell.

Mr. Chanute then presented the following resolutions, which were adopted by the club:

"First.—That a committee of three be appointed by the president to prepare and submit to this club a form of memorial to the Legislature of this State, together with a draft of a law inaugurating a proper inspection of bridge and that for this purpose the committee may consult with

public spirited counsel.
"Second.—That the secretary be instructed to notify

other engineering societies and clubs throughout this country of the action taken by the club, and to solicit their co-operation in this movement.
"Third.—That in case of the appointment of similar

or Third.—That in case of the appointment of similar committees by other clubs, the committee of this club be instructed to confer and co-operate with them in drafting the project for the proposed law, and in drawing up general specifications and rules to guide the State inspector."

Mr. Chanute mentioned the following means as proposed for effecting the desired reform: (1) The employment of expert engineers; (2) The use of legal standards of strength, as was once recommended by the American Society of Civil Engineers; (2) The formation of a pool of re-

ciety of Civil Engineers; (3) The formation of a pool of responsible bridge builders as outlined in Prof. Waddell's pamphlet; (4) State inspection, as now in use in Massa-chusetts and New York. The latter was generally considered the most feasible.

Mr. Wynne thought expense in the latter case might be avoided by inspecting the existing bridges as opportunity occurs, keeping on hand a force simply sufficient to report on new work

on new work.

On vote of the club the above resolutions were adopted, amended by the substitution of "Executive Committee" for the word "Club" in the first clause.

The chair appointed as members of the committe proposed Messrs. Chanute, Waddell, and Breithaupt.

Adjourned.

ENGINEERS' CLUB OF PHILADELPHIA.

THE regular meeting was held April 7, Vice-President John T. Boyd in the chair, Howard Murphy, Secretary; thirty-nine members and one visitor present.

The Secretary presented, for Mr. Frederic H. Robinson, a description of the electric street-railway at Wilmington,

Del.
Mr. William H. Robinson presented an illustrated Mr. William 11. Robinson presented an illustrated paper upon "Rope or Cable as a Transmitter of Power."

The Secretary presented, for Mr. C. A. Preston, a description of the effect of gases, etc., from stacks upon iron, illustrated by a drawing of the Charles Street Bridge over the N. C. Railway tracks at Union Station, Baltimore, Md., and by a very complete and interesting set of specimens of iron from the bridge.

Mr. Herbert Bamber presented notes upon two experi-

Mr. Herbert Bamber presented notes upon two experi-

Mr. Herbert Bamber presented notes upon two experiments with cement mortar.

Mr. Howard Murphy presented a diagram showing the results of Watertown Arsenal tests of the crushing strength of Potomac red sandstone and other building stones, bricks and brick masonry. The diagram shows the following:

No.	MATERIAL	Crushing St pounds per s	
Tests.	TATERIAL.	From	To
6	Lee, Mass., marble	20,504	22,900
10	Potomac red sandstone	16,625	22,102
2	Conshohocken, Pa., limestone	14,090	16.340
6	Montgomery Co., Pa., blue marble	12,810	13,610
	Philadelphia pressed bricks	9,590	13,700
3	r miadelphia pressed bricks	7,210	9,050
4	Indiana limestone	7,190	10 620
11	Philaderphia hard bricks	5,540	20,830
10	Ohio sandstone	3,940	16,280
6 6	Philadelphia brick masoniy in cement mortar	1,600	2,685
	mortar	799	1,914

He also noted the other qualities of the Potomac red sandstone, which are of special value to the engineer in construction—its durability under the action of frost, fire and wear, and its resistance to dampness.

Mr. Edward Hurst Brown mentioned that the reason the Potomac red sandstone was not more used for architectural purposes was that, while of a beautiful color, owing to its extreme hardness it was very difficult to dress, and to its extreme hardness it was very difficult to dress, and also that very often in an apparently perfect stone a flaw world develop in dressing the face which would render it useless for facing stone. He also mentioned having seen at Brentsville, Prince William Co., Va., an old church built of practically the same stone, taken from the neighboring Bristow Quarry, which had stood for over one hundred years, exposed to war and the elements, and which showed no signs of defects due to frost or action of the weather. weather.

A communication by Mr. G. Y. Wisner, C. E., for years connected with the Lake Survey, entitled "The Physical Phenomena of Lake Harbors," was submitted by title. It shows that the progressive movement of sandy spits is attributable to the resultant waves and currents produced by the periodic oscillations of the lake surface, and that the effects are a produced by the periodic socillations of the lake surface, and that the effects are similar to those produced by the flood-tide on the Atlantic Coast, as explained by Professor L. M. Haupt in his paper on the "Physical Phenomena of Har-

ENGINEERS' CLUB OF ST. LOUIS.

THE meeting was held April 18, 1888, President Holman in the chair, twenty-seven members and two visitors present. W. H. Bryan, secretary. John H. Mueller and Charles W. Stagl were elected members.

A communication from the Council of Engineering Societies on the Reorganization of National Public Works was considered.

was considered. Prof. Johnson moved the reappoint-ment of a committee on national public works. Seconded. A general discussion followed, participated in by Messrs, Johnson, Seddon, Engler, Bryan, Nipher, Burnet, Russell, and Blaisdell. Mr. Seddon moved as a substitute sell, and Blaisdell. Mr. Seddon moved as a substitute that the matter be referred to a committee of three, to report not later than May 16, which was carried. The chair appointed as such committee F. E. Nipher, S. B. Russell, and A. W. Hubbard. Mr. S. Bent Russell then read a paper on "Thickness of Water-Pipe, with Some Experiments on Ram." His remarks were illustrated by a number of charts, tables and formulæ. He showed that great discrepancies existed between standard authorities on the question of thickness of pipe. In general the thickness of the smaller sizes is fixed by questions of manufacture and handling. The question of hydraulic ram was one on which very little data could be had. Mr. Russell had conducted a series of experiments himself, the results of which were shown, and an empirical the results of which were shown, and an empirical formula deduced. Messrs. Seddon, Wheeler, Johnson, Holman, and Biaisdell took part in the discussion.

THE ELECTRIC CLUB ELECTION.

THE first annual election of the Electric Club since it moved into the new rooms, 17 East Twenty-first Street was held Wednesday evening and resulted in the following gentlemen being chosen unanimously: President, Henry C. Davis; Vice-Presidents, E. T. Gilliland, George W. Hebard, O. E. Madden and George L. Beetle; Secretary, Charles W. Price; Treasurer, Willard L. Candee. The Board of Managers consists of Theodore N. Vail, George B. Coggeshall, Henry D. Stanley, M. W. Goodyear, Cyrus O. Baker, Jr., J. N. Keller, John C. Tomlinson, Charles W. Gould, Charles W. Spear, A. H. Patterson, H. L. Storke, Henry A. Reed and John A. Seely. On the Committee on Membership are Henry Hine, George Worthington, George T. Manson, Henry D. Lyman and Lieut. F W. Toppan, U. S. N.

After the election dinner was served in the club room. and the members listened to the report of President Davis.

MASSACHUSETTS INSTITUTE OF TECH-NOLOGY.

ENTRANCE examinations will be held in Boston on May 31 and June 1. A second series, for those unable to be present in June, will be held on September 18 and 19.

For the convenience of applicants outside New England, entrance examinations will be held on May 31 and June I in the following places:

New York City; Philadelphia, Pa.; Montreal, P.Q.; Chicago, Ill.; St. Louis, Mo.; Cincinnati, O.; San Francisco, Cal.; Washington, D. C.; Nashville, Tenn.; St. Paul, Minn.; Pittsburg, Pa.; Santa Fe, N. M.

To be admitted as a regular student in the first-year class of the School of Industrial Science, the applicant must have attained the age of seventeen years, and must pass a satisfactory examination in arithmetic, algebra. plane geometry, French (or German), English grammar and composition, history and literature, and geography.

For detailed information in regard to requirements for admission and for catalogues of the school, address James P. Munroe, Secretary, Massachusetts Institute of Tech nology, Boston, Mass.

PAVEMENTS FOR LEAVENWORTH.

AT a recent public meeting of the Board of Trade an animated discussion was held regarding the kind of pavement for one of the prominent thoroughfares, the paving of which it was said would cost over \$100,000. The drift of the opinions uttered seemed to be in favor of paving the street with brick, on the ground that a brick-yard to make the brick could be established at home and the money be retained there, whereas if any other sort of pavement were used the money for the materials would have to be sent

BRIDGES IN ALLEGHENY COUNTY, PA.

THE annual report of County Engineer Charles Davis shows that there are 155 bridges in Allegheny County; 33 are of wood, the bulk of which were built 16 years ago. only one of them being still in good condition; 100 are of iron, costing about \$280,000, of which 15 were built last year at a cost of \$50,175. The 10 stone bridges. costing \$30,000, are in good condition. The total amount required for bridge work during the present year is \$128,200, of which \$3.500 is needed for general repairs, \$33,900 for 15 bridge renewals, and \$90,840 to construct 20 new bridges already authorized.

THE contractors for the flushing-turnel at Milwaukee have been using such heavy charges of dynamite as to crack the walls of adjacent houses, and in some instances marble mantels were broken. The Boa Td cf Public Works has directed them to use smaller charges or stop the work.

THE Supreme Court decides in favor of the use of cables on the Third Avenue Railroad. About 450 horse cars on the Third Avenue Railroad, soon to be displaced by a cable, will be sold to the Japanese Government, for use in Tokio, and be shipped around the Horn.-Iron Age.

PERSONAL.

B. V. SIMPSON has been elected City Engineer and Water Commissioner of Winona, Wis.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

TRADE CATALOGUES.

WE have received from the United States Fire Clay Co., Cleveland, O., their new catalogue and price-list illustrating the pipe, fittings and other goods manufactured by them.

MESSRS. ROGERS & KING, of Montreal, Canada, have sent us their catalogue and price-list of the different boilers manufactured by them.

TRUE INWARDNESS-BY AN HONEST MAN.

WE have receive a trade catalogue under the above title, which is intended to illustrate the special machinery manufactured by Mr. Ster-ling Elliott, of Newton, Mass. The unique feature of this catalogue is the humorous il-lustrations on alternate pages, which are well rendered, and are calculated to amuse the readers and probably secure the retention of the catalogue. We quote the preface to the catalogue in full:

"It is customary in writing an description.

the catalogue. We quote the preface to the catalogue in full:

"It is customary in writing up descriptive matter relating to manufacturing to begin with the earliest obtainable knowledge of the subject and tell how the ancients used to do certain portions of the work, and then show the various improvements which have been made from time to time. For instance, we might illustrate the first lathe, which had for its respective ends two trees, and in which the rotary motion was imparted by means of a trong cut from the hide of a missionary, and, passing around the piece to be turned, fastened at either end to a bow made of a hickory limb. Then we might go on at length with an attempt to prove that the lathes in use by us are of superior construction to those used by remote antiquity; but, in view of the following illustrations, we feel sure that such a proceeding is unnecessary.

"Illustrated articles descriptive of the various departments of mills and shops have become so common, that, in order to heep 'in the swim,' we have tound it necessary to let the cold, unfeeling world into some of the secrets and inner workings of a manufacture mich one could prefer to keep from the public gaze, and particularly from rival manufacturers. We do not allow strangers inside the works; but, knowing how anxious our customers must be to understand the methods employed in producing fine machinery we show herein some of the many points of interest."—S. Elliott.

ARCHITECTURAL COMPETITIONS.

ST. PAUL, MINN.—Willcox & Johnston, of this city, have been awarded the making of the plans for the St. Luke's Hospital in the competitive contest which has been held. The first building of the hospital to be erected will cost \$75,000.

For works for which proposals are requested see also the "Proposal Column," pages i-vii-viii-320.

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

MILTON, ORE.—Water.—It is reported that immediate steps are to be taken towards the construction of the water-works system here.

Brady, Tex.—Water.—Regarding the report that water-works were to be established, County Clerk W. McShaw writes: "Our town is not now in a situation to establish water-works. Will advise you when we are ready to do so"

MONTROSE, COL.—Water.—H. Tarbell, Town Recorder, writes us under date of April 16 as follows: "On A pril 3 at a general electron the qualified electors voted to create an indebtedness not to exceed \$50,000 for the construction of water-works for the town. No steps taken yet to let contract. Will probably have plans and specifications prepared after to-night's meeting of the Board of I'rustees."

Constitute of the Board of Trustees."

CHICOUTIMI, QUEBEC.—Water.—Concerning water-works matters here, our correspondent writes: "On special order from the City Council an engineer, Mr. J. F. Gray, of Quebec, has made a survey and has turnished the Council with plans and probable costs of an aqueduct. A committee has been formed to look for the chances of making it, and as soon as possible tenders will be asked, and if accepted by the electors of the city the work will be carried on."

CARDINGTON, O.—Water.—Concerning the report that a system of water-works was to be erected here, C. W. Case, Secretary of the Board of Trade, writes as follows: "Nothing definite has as yet been done looking toward the establishment of water-works in this place—merely informal talk."

MT. VERNON, N. Y.—Sewers.—The bill before the Legislature authorizing the construction of a \$50,000 sewer for this place having passed, as amended, both Houses and been signed by the Givernor, the village trustees at their meeting April 24 employed C. S. Mc-Clelland to purchase the necessary right of way along its route and engaged Engineer W. E. Worthen, of New York City, to superintend the work. He can be addressed for details.

Chippewa Falls.—Sewers.—Several blocks of sewers are to be constructed here this summer and bids will soon be wanted for the work.

ALTOONA, PA.—Water.—The Board of Water Commissioners has ord-red the laying of several blocks of additional water-mans, also the repairing of others. Details can be furnished by the C.erk of the Board.

WICHITA, KAN.—Sewers.—Santary Engineer Rudolph Hering has been engaced by this city to decide which of numerous sewer projects is the best, and to furnish an accurate idea of the cost of each. After his decision immediate steps will be taken towards commencing the work. Mayor Allen can furnish details.

GLOVERSVILLE, N. Y.—Water.—At a special ballot of the taxpayers in this village, April 20, on the question of obtaining an additional supply of water from a source recommended by the village trustees, the project was deteated by a strong majority. This is the same project which was defeated about a year since. All parties agree that more water is needed, and are willing to be taxed to get it, but, it is stated, a majority appear to believe that the supply from the source in question will prove insufficient.

question will prove insufficient.

KNOXVILLE, TENN.—Sewers.—The Board of Public Works, in a statem in rendered by it to the citizens of this city, has estimated the cost of the proposed sewerage-system at over \$75,000, the amount appropriated for that purpose in March, 1887. The Board suggests that the additional amount required be raised by a system of taxation, and that the work of construction proceed according to the plans, specifications and figures procured by them. The matter is to be left to the taxapyers, who will probably decide at an early day. Details can be had by addressing Isham Young, of the Board.

BUSHNELL, ILL.—Water.—O. C. Hicks, City Clerk here, writes as follows: "Bonds voted for water-works, Stand pipe system contemplated. Action to be taken May 7, 1888."

COOUILLE, ORE .- Water .- The North Coquille Water Co. has been incorporated here with a capital of \$1,200. R. D. Sandford, and others, incorporators.

ORLEANS, NEB.—Water.—The election to decide the water-works question, which was held here April 23, decided in favor of the measure, and operations are to begin at the earliest possible day. For details address the Town Clerk.

LAGRANGE, TEX.—It is reported that water-works are projected for this place.

PENN'S STATION, PA.—Water.—It is reported that a water-works system is to be errected here by Messrs. James A. Chambers and H. S. McKee.

WALDOBOROUGH, Mr.—It is reported that an appropriation has been made for the construction of waterworks here, and that details can be furnished by C. P. Redman.

MEMPHIS, TENN.—Water.—With reference to the extension of the water-works system here by the Artesian Water Company, to which reference was made in our columns last week, Mr. W. L. Cameron, Superintendent, writes us that the two new 10.002,000-gallon pumps, with boilers, etc., contemplated for the permanent plant at the wells are not contracted for, and that there is also a considerable quantity of water-pipe, valves, etc., not yet purchased, for which propositions would be received.

Brunswick, Ga.—Sewers.—It is reported that plans are being prepared for a sewerage system for this place and that the Mayor can turnish details.

SHEFFIELD, ALA,—Sewers.—It is reported that a system of sewerage is to be established here.

Sylacauga, Ala.—Water.—A reservoir is to be built here to furnish water for fire protection.

TECUMSEH, NEB.—Water-Works.—The contract for constructing a complete system of water-works for this place has been awarded to Benjamin S. Clark, of Holdredge, Neb., at a cost of \$20,000.

WATER-WORKS.—See our Proposal Column for information regarding water-works and water-works supplies at the following places: New York City; Clarksburg, W. Va.; Pawtucket, R. I.; Jersey City, N. J.; Chippewa Falls, wis.; Boston, Mass.; Wheeling, W. Va.; Norwalk, Conn.

BRIDGES.

Newton, Mass.—I. F. Kingsbury, City Clerk, writes: "The conscruction of two bridges, of stone arches, is now under consideration, one at Washington Street, Newton Lower Falls, crossing to Wellesley, the other at Bridge Street, Nonantum, crossing to Watertown, both over Charles River. The town of Wellesley hestates in doing its part this year, resulting in delay and possibly involving additional expense, which Newton wishes to avoid."

AUSTIN, TRX.—The project to erect a bridge over the Colorado River, at this place, is progressing rap-idly. Engineer Andrewartha, who is in charge of the estimating and construction, can furnish complete details. Address him as above.

Berrien Springs, Mich.—An iron bildge is to be erected over the St. Joseph River at this place by the County Commissioners.

ASHUBLOT, N. M.—A bridge is to be erected at Fuller's dam.

MILPORD, PA.—Concerning a report that an \$8,000 bridge was to be erected here our correspondent writes; "The tridge in question is not a county bridge. It is owned by a stock company and runs across the Delaware River. Three spans, about 550 feet total length. The stockholders are to meet. May, at which time a new Board of Managers is to be elected. Probably at that date some conclusion may be arrived at. What we want is to know the probable cost of the structure? No doubt ample notice will be given of time of letting contract."

wever, Iowa,—The Supervisors of Des Moines and Lee counties have decided to erect a bridge over the Skunk River at this place, and they have appointed Messrs. Lowery, of Lee County, and Benne, of Des Moines, a committee to advise with some competent engineer, secure his idea as to the most favorable location of the bridge and learn approximately its cost. It is probable that they will take immediate steps toward building the structure. For details address either of the above parties.

PIERRE, DAK.—Bridges.—Mayor C. W. Johnston, of this place, writes us as follows regarding the report that a bridge was to be constructed from here to Fort Pierre: "In reply to your inquiry will say that no bridge company has as yet taken hold of the project for bridging the Missouri at this point. Bills have passed Congress for that purpose, and if the President approves the Sioux bill now before him work will undoubtedly be commenced within a year."

CLEVELAND, O.—Our correspondent writes that the fire at the King Bridge Co.'s shops on the 18th inst. was confined to the roof and walls of the old blacksmith shop and will occasion no delay in their work, as everything was put in operation again in 48 hours, and the entire plant will have been transferred in a few weeks to their new shops.

Grand Forks, Dak.—Our correspondent writes: "The letting of the contract for bridges in this city has been postponed in lefinitely."

DUBLIN, GA.—Our correspondent writes: "Our county has issued bonds to build a bridge across the Oconer River at this place and has sold the bonds for the cash and has the money on deposit in Macon for that purpose, Notice for bids will be published soon. Dublin is accessible by railroad from Tennille on the Central Railroad."

LYNCHBURG, VA.—Concerning the report that the Lynchburg & Durham Rairoad was to erect an extensive bridge over the Staunton River, J. W. Goodwin, the Chief Engineer of the road, writes as follows: "No contracts have been made yet for any truss bridges. All graduations, masonry, trestle and pile work is under contract for sixty nules south of Lynciburg and for ten miles north of Durham, N. C."

FORT HUNTER, N. Y.—There is a project on hand to bridge the Schoharic Creek at this place with a \$20,000 structure. Details can be furnished by N. L. Stover, Amsterdam, N. Y.

ASBURY PARK, N. J.--The Borough Commissioners of this place can give details of a system of bridges to be erected over Wesley Lake by the Ocean Grove Camp Meeting Association.

DUNLAP, TENN.—It is reported that two bridges are to be constructed here, and that details can be furnished by the County Commissioners.

WARREN, MASS.—A 69-foot iron bridge is to be erected here. For complete details see our Proposal Column.

NEW BRUNSWICK, N. J. -It is reported that the Board of Freeholders will erect a bridge here to cost

CHESTERFIELD, N. H.—Concerning the report that a bridge was to be elected over the Connecticut River at this place, City Clerk W. G. Cain writes as follows: "A committee has been chosen to investigate the matter. C. C. P. Goodrich is chairman."

BANCROFT, MASS.—Reports say that the towns of Beckett and Middlefield will erect a large bridge here.

WARSAW, N. Y —It is reported that a large bridge is to be erected here by the Eric Railroad.

Bridges.—See our Proposal Column for information regarding bridge construction at the following places: Independence, Mo.; Emporia, Kans.; Warren, Mass.; Faye teville, W. Va.

GAS AND ELECTRIC-LIGHTING.

UNIVERSITY PLACE, GA .- An electric light plant is to be established here.

LEONARD, TFX.—Gas works are to be established here. Charles Cund is president.

New York City.—The Consolidated Gas Co. will expend \$140,000 on its plant this summer.

MEDIA, PA.—An electric lighting plant, to cost \$10,000, is to be erected here.

Los Angeles, Cal.—The Lowe Gas and Electric Co. has been incorporated. Capital, \$2,000,000. T. S. C. Lowe, and others, incorporators.

ADA, O.—The Ada Natural Gas and Oil Co. has been incorporated. Capital, \$5,000. S. W. Phillips, and others, incorporators.

DBNISON, O.—The Home Electric Light, Heat and lower Co. has been incorporated here. Capital, \$15,-00. M. Moody, and others, incorporators.

WAUWATOSA, WIS.—It is probable that an electric-light plant will be established here. Details can be furnished by J. O. Meyers.

MONTEAGLE, TENN.—An electric-light plant is to be established here.

RAILROADS.

Madison, Wis.—The Wisconsin Midland Railroad Company has filed a resolution with the Secre-tary of State of its intention to construct a line from Fond du Lac to Madison, a distance of seventy-five

Suffolk, VA. — A street railroad is to be constructed here by the Montrose Land and Improvement Co.

NORFOLK, VA.--A street-railroad is to be constructed here. Details can be had by addressing James W. McCarrick.

LEONARD, TEX.-A street railroad is to be built here.

Details can be had of W. T. Gray.

STAUNTON, VA.—It is said that an electric street railroad is to be built at this place by the Staunton. Thomson-Houston Electric Light Co. •

BIDS OPENED.

MONTGOMERY, ALA.—The following bids for constructing sewers were received by City Council April 16: A. Pennel, —, \$57,025,56; Figh & Ball, Montgomery, Ala., \$52,020,66; Howland & Ellis, Boston, Mass., \$44,762,71; J. A. Gabouny, Montgomery, Ala., \$41,724,113; J. J. Everson, Akron, O., \$40,894,25; T. C. Hrooks & Co., Jackson, Mich., \$35,644,16.

The contract was awarded to Howland & Ellis.

The contract was awarded to Howland & Ellis.

New London, Conn.—Sewers.—The following bids for constructing about 3,752 feet 8-inch pipe-sewer, 843 feet 10-inch pipe-sewer, 247 feet 12-inch pipe-sewer, and 200 vertical feet of manholes, were opened, April 19, by the Board of Sewer Commissioners: Jacoby & Madden, Bridgeport, Conn. \$5,556.65; M. S. Austin, New Britain, Conn., \$5,574.60; F. B. Durfey, Norwich, Conn., \$5,602.29; John A. Gill, Boston, Mass., \$5,901.79; C. B. Cadwell, New Britain, Conn., \$5,984.96; Edward McManus, Waterbury, Conn., \$7,180.28; Shaw & Whittlesey, Providence, R. I., \$8,491.35. The contract will also include about 950 cubic yards of rock excavation, the price for which (\$4.50 per yard) is fixed by the Board of Sewer Commissioners.

The contract was awarded to Jacoby & Madden.

The contract was awarded to Jacoby & Madden.

SOUTHBRIDGE, MASS.—Reservoir Dam.—The following bids for reservoir dam were received by A. C. Moore, Esq.: Thomas Hennessey, Holden, Mass., \$3,', 797; G. W. & J. M. Hendrie, Easthampton, Mass., \$4,000; Wellington & Kimball, Burrillville, R. I. \$4,100; I. R. Rooke, Fayville, Mass., \$3,869.50; H. H. Pike & Co., Cambridge, Mass., \$7,863.

MILWAUKEE, WIS.— Hose.—The following contracts for fire-hose have been awarded: Rundle, Spence & Co., 2,000 feet "Hercules" rubber hose, at 90 cents per foot; the B. F. Goodrich Co., 2,000 feet 2/5-inch "White Ancha" rubber hose, at 90 cents per foot.

Boston, Mass.—Carpenter's Work.—The following bids for carpenter's work at the Chestnut Hill pumping station were opened April 21: John McLaren, Boston, \$5,755; W. J. Jobling, Boston, \$7,340; Goodwin & Monroe, Boston, \$7,435. The contract was awarded to John McLaren.

g8c., \$3, \$4.50, \$5 25, \$14.35, \$18, \$55, \$10, \$3.15; total, \$55,254.

Section 5,—12,400 cubic yards, earth excavation and refilling, 50 cubic yards rock excavation, 500 cubic yards concrete masonry, 800 cubic yards brick masonry, American cement, 1 cubic yard dimension stone, 8,500 feet B. M. lumber, 900 spruce poles. H. H. and H. E. Pike, 80 c., \$6, \$5, 25, \$4.25, \$14.25, \$17, \$35, \$33, \$3.25; total, \$40,085. David Hall, 78 c., \$2.80, \$5, \$33, \$3.25; total, \$40,085. David Hall, 78 c., \$2.80, \$5, \$5, 50, \$13.10, \$15,85, \$30, \$25, \$4; total, \$40,781.50, \$12.75, \$15.25, \$27.25, \$2.30; total, \$40,781.50 Michael Kicman, 90 c., 10 c., \$7,50, \$5,50, \$14, \$14.05, \$30, \$25, \$35, \$1013, \$52,672.50.

Section 6.—15,500 cub c yards earth excavation, 50 cubic yards rock excavation, 500 cubic yards forck excavation, 500 cubic yards forck excavation, 500 cubic yards brick masonry, 100 cubic yards trubble-stone masonry, 23,000 cubic yards brick masonry, Portland cement; 5 cubic yards dimension stone mascnry, 60,000 leet, B. M., lumber. William Wittaker, 80c., 25c. \$4, \$45, 50, \$12,70, \$14,70, \$40, \$22; total, \$51,377.50. Thomas S. Rowe, 75c., \$2, \$5, \$6, \$13, \$14, 60, \$34, \$25; total, \$5, 53, \$1, 182, \$12.82, \$14, \$77.50; total, \$45,707. Michael Kiernan, 75c., 10c., \$7,05; \$6, \$14, \$45,50, \$31, \$25; total, \$57.535.

Sr. PAUL, Minn.—Building.—The Board of Manager of the back Cloud Byformatory have reigned all

10C., \$7.05. \$6, \$14.\$14.50, \$31.\$25; total, \$55.735.

ST. PAUL, MINN.—Building.—The Board of Managers of the St. Cloud Reformatory have rejected all bids published recently. At a meeting just held Archit of Stevens submitted his report in regard to the proposed change in specifications for the building, thereby lessening its cost. It was decided to construct the building of brick with granite trimmings, instead of having the walls of granite as at first proposed, and the expense will thus be decreased about \$45.000, leaving the net cost of the building about \$90.000. The secretary of the board was instructed to advertise for bids according to the modified specifications.

Boston, Mass.—Abutments.—The following bids for abutments for Harvard Bridge were opened April 25 by the Commissioners; Boynton Bros., Boston, Mass., \$12,226.05; William H. Ward, Lowell, Mass., \$15,900; Charles H. Edwards, Quincy, Mass., \$18,557; Shields, Carroll & Neelon, Toronto, \$19,659; Thomas A. Rowe, Newton, \$22,500; George S. Barnes, Boston, \$31,012. The contract was awarded to William H. Ward

GOVERNMENT WORK.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEVER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 23.

PUBLISHED EVERY SATURDAY

NEW YORK, MAY 5, 1888.

LONDON, MAY 19, 1888.

SINGLE COPIES, TEN CENTS. Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE.

In America Subscription, 20s. per annum in advance, post paid.

THE ENGINEERING & BUILDING RECORD, conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

> TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

> > OFFICE IN GREAT BRITAIN. 92 & 93 FLEET ST., LONDON.

TERMS, 20s. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

British and Continental subscriptions should be sent to the London office. Checks, express money, and postal orders should be made payable to the order of The Engineering & Building Record (New York), and crossed —— & Co.

Continental subscriptions are also received by F. A. Brockhaus, Esq., Querstrasse 29, Leipzic, Germany, and Asher & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us promptly of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by cneck or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

TUBERCULOUS HOUSES.

CAN a house become so infected that those who live in it for any length of time are specially liable to become affected with consumption? It seems very probable that this may occur, and that a certain proportion of those cases of consumption which are said to be due to heredity, as where several cases occur in one family, are in reality due to common residence in an infected house.

The volume of the transactions of the Epidemiological Society of London for 1886-7 just published contains a paper by Dr. Arthur Ran-some entitled "Some Evidence Respecting Tubercular Infective Areas," in which this question is discussed, and attention is especially called to the frequency with which groups of several cases of deaths from consumption in one family occur in small, badly-ventilated cottages situated on damp clay soils. With our present knowledge of the conditions necessary for the growth of the tubercle bacillus, and of the very persistent vitality of its spores as found in matter spit up by consumptives, seeing that this matter may be dried and ground to dust and yet the spores remain for weeks capable of development into the specific bacilli if they can only get a week's lodgment where they can get food and a sufficiently high temperature, it is probable that every one inhales more or less of these spores, but that in healthy lungs and throats they do not flourish and are soon removed.

If, then, we accept the theory that a particular group of houses, or even a particular house, may be specially dangerous as a cause of tuberculous disease, it must be because the bacilli or their spores are found in such places in unusually large quantity, or because the locality and conditions are such as to specially favor the growth of these organisms, or because the locality and conditions exercise such an influence on those who live in them that the bacilli find it possible to grow and develop in their lungs or air-passages, or, finally, because of a combination of these. The first reason is not a probable one, because very careful investigation in hospitals for consumptives, in which the number of bacilli and spores present must be relatively large, does not indicate that healthy persons, such as nurses, etc., living in them are specially liable to contract the disease.

It is dampness and want of ventilation that makes a house or a group of houses dangerous, and they probably do this, in large part at least, by causing or promoting slight inflammations of the air-passages, sore throats, bronchitis, etc., which lower the vitality of the tissues and so make them fit to support the tubercle bacillus.

If into such dangerous houses a case of consumption is brought, it is easy to see how the house may become infected and a source of specific contagion as well as of general debility or disease.

Dr. Ransome gives illustrations of the wide difference in the death-rates from consumption between different squares or groups of squares in Manchester and Salford, showing that it is in the narrow streets and courts, where there are many back-to-back houses having usually no cellars and no ventilation, that the mortality from consumption is greatest. The moral is the same as usual—seek a well-ventilated, thoroughly dry house, on a dry subsoil, and you need not worry overmuch because you have "consumption in the family." It is consumption in the house that you have most to dread.

DANGEROUS ELECTRIC-LIGHT WIRES.

On April 15 a young man was instantly killed in New York by touching the pendent end of a "dead" wire. It appeared from expert evidence given at the coroner's inquest that the insulation of electric-light wires is necessarily imperfect in wet weather, and that in such weather if two "dead" wires are in contact with the same electric-light wire, no matter how far apart, and reach one to the ground and the other nearly so, a person standing on the ground and touching the latter wire will receive the full charge of the dynamo. It was stated that there are many miles of "dead" electric-light wires on the poles, as it costs as much to take a wire down as to put it up, and the opinion was expressed that the underground system was the only safe one.

The verdict of the jury was to the effect that the death was caused by the neglect of the United States Illuminating Co. in not removing the loose wire.

Since this accident another death has occurred in the same city from touching a low-hanging " live" light wire.

CAUSE OF DELAYS IN GOVERNMENT WORK.

As an illustration of the various causes that produce delays in the prosecution of Government work for the improvement of our rivers and harbors, we would cite the recent report of General Duane, Chief of Engineers, U. S. A., forwarded to Congress by the Secretary of War, in which it is pointed out that the improvements for the navigation of Black Warrior River, Ala.; Cumberland River, Tenn.; Kentucky River, Ky.; and the Allegheny River, Pa., and the improvement of the harbor at Ludington, Mich., are either delayed or cannot be commenced for the reason that there is not legal authority to acquire the land necessary for the erection of the improvements thereon.

A bill has been introduced in Congress authorizing the Secretary of War to institute proceedings in the name of the United States to enable him to condemn land, secure right of way or material needed for the prosecution of work authorized by Congress, providing, however, that when the owner of such land or right of way fixes a price that the Secretary of War considers reasonable, he may purchase the same at such price without further delay. Until this bill is passed we presume these improvements cannot be carried out, notwithstanding an appropriation has been made therefor.

THE ASSEMBLY CHAMBER CEILING IN THE CAPITOL AT ALBANY.

WE give, on another page, the final report of recommendations of the expert commission appointed by the Legislature some three months ago to examine the vaulted stone ceiling of the Assembly Chamber of the New York State Capitol. Their preliminary report was given in our issue of February 18.

The commission consisted of John Bogart, State Engineer and Surveyor; Thomas C. Clarke, Civil Engineer; and Richard M. Up-john, Architect; and to the former of these

gentlemen we are indebted for copies of these reports and for courtesies extended to our representative who recently visited Albany and made a careful examination of the defective structure, and secured data from which we propose in an early number to give such an illustrated description as may enable our readers to clearly understand the points at issue.

OUR ARCHITECTURAL ILLUSTRATIONS.

AN OLD PORTAL.

A HOUSE IN WORCESTER, MASS.—PEABODY & STEARNS, ARCHITECTS.

REPORT ON ASSEMBLY CHAMBER CEILING, NEW YORK STATE CAPITOL.

To the Honorable the Speaker of the Assembly of the State of New York:

SIR: Under a concurrent resolution of the Legislature the State Engineer was requested to cause an examination to be made of the Assembly Chamber in the new Capitol,

and subsequently an additional centre was found necessary and put in place to support one of the ribs of the northern vault.

At the request of the committee a second report was made on March 7, 1888, confirming the recommendations of the first report that the ceiling be taken down, and adding that its place should be supplied by one of lighter construction and more favorable for parliamentary pur-

poses.

We now beg to submit a final report.

Before referring in detail to the ceiling of the Chamber, we desire to refer to the condition of the staircase adjacent to that Chamber. This condition is such that it must be repaired, and we judge from the examination that can at present be made, that the repairs may be effected by rebuilding the part below the first floor with new and enlarged foundations. But it is possible that further developments, when the work is entered upon, may show that it will be necessary to take down and rebuild the whole of this staircase. We think, however, that this will not be requisite.

requisite.
Our examination of the foundation of the structure leads us to say that the base of the main tower, now unfinished, is very heavily loaded, and, in our opinion, it will be unwise to continue a heavy construction for this tower; and, in fact, to add any great weight upon that foundation, without, in some manner, enlarging its area.

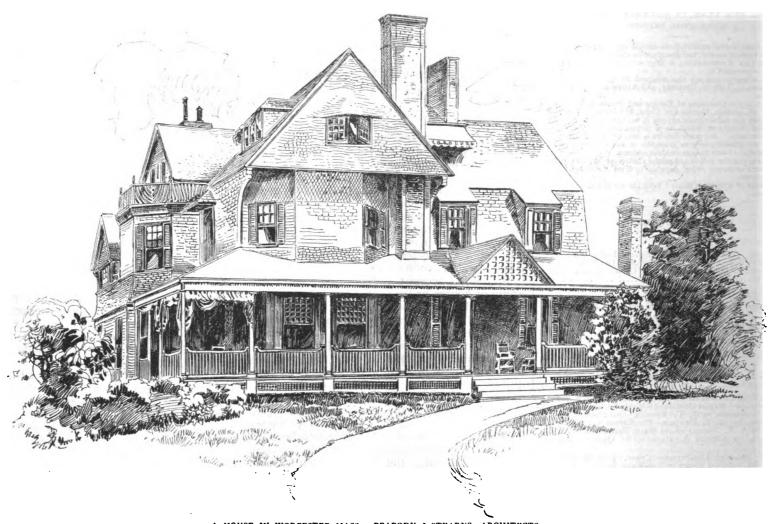

the ceiling of the Assembly Chamber were defective. We have also been informed by a number of members of that body that the acoustic properties have been decidedly imbody that the acoustic properties have been decidedly improved since the temporary flat ceiling of plank has been in position. This leads to the suggestion that the new ceiling should be flat, and it may be constructed of wood or of metal, possibly with glass panels. It would then be similar in treatment to the ceilings of the Senate or House of Representatives at Washington, or to that ceiling of the Senate Chamber in the Capitol at Albany. Skilled architects can undoubtedly design such a ceiling so as to give to the Assembly Chamber a stately and ornate architectural effect. The weight of such a new construction would be much less that the present ceiling.

The brick and iron floor over the Assembly vault need not be replaced unless possibly by a light fire-proof construction as a protection to the new ceiling below.

The side walls of the three dormers should be replaced by metal and slate.

The side walls of the three dormers should be replaced by metal and slate.

When these weights are removed, and the new weight added, the walls of the rooms below the Assembly Chamber will be relieved of some 2,700 tons of load, and we do not anticipate, in that event, further serious settlements or cracks. We recommend that the golden corridor be repaired by removing the easing of the wall piers and putting in heavy iron girders at the floor-level to carry these piers which now rest on brick corbels. New stone must

A HOUSE IN WORCESTER MASS, -- PEABODY & STEARNS, ARCHITECTS

and particularly the ceiling and foundations and supports thereof, for the purpose of ascertaining its present condition and stability, and danger, if any, to be apprehended therefrom, and to associate with him in such examination and report Mr. Thomas C. Clarke and Mr. Richard M. Upjohn, and to report the results of such examination, together with their judgment as to the remedy for such defects as should be revealed by their investigation.

Immediately upon receiving notice of this appointment the Commission designated by the resolution met, examined the drawings furnished, and also made a personal examination of the ceiling of the Assembly Chamber. This examination revealed such a dangerous condition of things that a report was at once made to the Legislature on February 3, 1888, upon the pressing and immediate question of danger. In that report the actual condition of the ceiling was described and reference made to the numerous fractures found in it, and recommendation made that the Assembly Chamber be immediately vacated, that strong and properly-supported centerings be put up, and strong and properly-supported centerings be put up, and that the whole of the ceiling be taken down as soon as possible, and such steps taken as would relieve the pressure on the walls and supports.

Action was taken by the Assembly upon this report, and a square tower of timber was erected in the Chamber, its supports being carried to the foundations, and upon it

centres were put supporting the ribs of the main vault,

Referring now to the Assembly Chamber, and that portion of the building above and below it, we recommend that the following portions should be removed with as little delay as possible after the close of the present

1.438 tons. Total weight removed..... 3.230

The weight of the two gable walls in the attic support

The weight of the two gable walls in the attic supporting the chimneys may be transferred by trusses to the walls at the side of the central arch.

It is the opinion of this Commission that a design should be adopted for the reconstruction of this part of the Capitol building which will throw upon the walls and foundations as small a weight as is consistent with good construction and proper architectural effect. This can be effected by a ceiling of wood or of metal, constructed so as not to throw lateral pressure on the outer walls and so as to load the supporting walls below the Assembly floor as little as possible.

It has been stated to us by many members of the Legis-

It has been stated to us by many members of the Legis lature that the acoustic properties of the stone vault of

when take the place of that which is now cracked and shattered. The casings of the temporary library should be repaired in the same manner.

When these things are done, and we believe they can be completed before the beginning of the session of 1889, this portion of the Capitol building will, in our judgment, be in a safe and permanent condition, and require only the ordinary repairs.

It seems proper that this Cameria.

It seems proper that this Commission should add that the lamentable condition of parts of this great building is not due to bad workmanship, because the workmanship is really very good. Neither is it due to bad foundations, because we find that the settlement of the foundations has been slight and not very irregular, while those foundations are, in places, loaded beyond what was intended in the original design and construction. The ruin of the vaulted ceiling is due to the fact that dedesign and method of construction and loading of these arches and vaults have been such as to give pressures which have resulted in the disintegration of the structure; the joints being, in many places, open, and in others compressed to such an extent that the stone has splintered and is full of cracks.

All of which is respectfully submitted.

(Signed)

JOHN BOGART,

AN OLD PORTAL.

CEDAR-BLOCK PAVEMENT AT LEAVENWORTH, KANSAS.

NOTICING in an exchange a discussion regarding proposed new pavements for Leavenworth the statement that a cedar-block pavement on a certain street had proved a failure, we wrote to City Engineer George T. Nelles asking for facts and details as to the manner in which the pavement was laid. The following is from his reply:

The pavements in question were put down on two of our principal business streets and on one resident street, and consisted of 7-inch sound white-cedar blocks 4 to 8 inches in diameter laid on a 6-inch concrete foundation. The work was all done in accordance with the specifications in general use for this class of work. The work was done during the summer and fall of 1887, so that the reliable test of use cannot be brought into play. So far as I am able to judge from my knowledge of the manner in which the work was done, and from present indications, the work will become a perment and letting as any payment of this prove as permanent and lasting as any pavement of this class. The cedar blocks were of unexceptionally good quality, live and sound, and free from the usual imperfecquality, live and sound, and free from the usual imperfections of this class of material. The assertion made in the clipping herewith to the contrary is absolutely without foundation. Owing to the inferior quality of the sand and broken stone available here for carrying on works of any magnitude, the concrete foundation may not be up to the standard. Still I confidently believe it is ample for the purpose, and that it will outwear a great many sets of condar blocks. I have recently had occasion to examine cedar blocks. I have recently had occasion to examine some of the concrete laid during freezing weather last fall, and found that, although not perfectly set, it has not been in the least disturbed by the frost or the traffic over it. I have not arrived at the true inwardness of the attack on cedar pavements, but think that the idea that the pavements laid last year are failures arose from the fact that several very ugly settlements have taken place where the pavement was laid over heavy fills, which, until repaired, greatly injures the appearance of the work; and from which was put down without cross-ties by laying the streingers directly on the concrete, and being dependent entirely on the blocks to hold it down, and in consequence has raised the blocks in places. There is nothing, so far as I can see, connected with this work that can be cited as an experience with cedar block pavements."

STRENGTH OF CEMENT MORTAR.

BY IRA O. BAKER,

Professor of Civil Engineering, University of Illinois.

[Written in answer to a correspondent who, on page 294 of THE Engineering and Building Record, inquired for data on the strength of cement mortar, particularly in thin layers.]

NEARLY all experiments on the strength of mortars have been made to determine its tensile strength. That this is unfortunate has been admirably shown in the excellent article on "Cement Mortars," by E. Kuichling, Mem. Am. Soc. C. E., lately published in this journal. The following table, carefully compiled from a large number of reliable experiments, gives the tensile strength of cement mortar:

Table Showing the Tensile Strength of Cement Mortars.

Compo of 1			Rosen	DALE.			Port	LAND.	
Mor	tar.	A	lge of	Mortar		1	Age of	Mortar	
Cement.		1 week.	t month.	6 months.	r year.	ı week.	1 month.	6 months.	ı year.
ī	۰	100	180	275	300	300	400	450	500
1	1	60	100	180	225	175	250	340	375
I	2	25	60	125	170	120	150	245	290
I	3	20	40	80	121	90	110	175	220
1	4	15	25	60	90	75	75	130	170
1	5	10	15	50	80	60	65	110	130
1	0		10	45	75	50	35	90	100

An examination of the results of about sixty experiments, made with the U.S. testing machine, seems to show that the compressive strength of mortar, as determined by testing cubes, is from 8 to 10 times the tensile strength of the same mortar at the same age. Of course these results are not very valuable as showing the compressive strength of mortar as employed in the joints of masonry. It is well known that mortar when tested in thin layers between materials stronger than itself is considerably stronger than when tested in cubes. The increase in strength depends mainly upon the thinness of the joint and the strength of the pressing surface. No extended experiments have been made in this direction.

The following data on the compressive strength of concrete will give some idea of the relative compressive strength of mortars of different composition.

The compressive strength of 6-inch cubes of concrete exposed to the air for six months, as determined in connection with the construction of the St. Louis Bridge, was as follows: with the proportions of I part cement (Akron and Louisville), 1 part sand, and 4 parts broken limestone, the mean compressive resistance from nine trials was 1,200 pounds per square inch (85 tons per square foot). With the proportions of 1, 2, 4, the average resistance of twelve trials was 940 pounds per square inch (70 tons per square foot). Tests with the U.S. testingmachine, at Watertown, Mass., between steel gave an average of 1,544 pounds per square inch (110 tons per square foot) for 4-inch to 16-inch cubes of concrete 46 months old, composed of I part Rosendale cement-paste, 1 ½ parts sand, and 6 parts broken stone. Under the same conditions concrete composed of I Rosendale cement paste, 3 sand, and 6 broken stone stood 102 pounds per square inch (73 tons per square foot). Another sample of cement gave 1,078 pounds per square inch (77 tons per square foot) for concrete, 22 months old, composed of 1 part cement, 3 sand, 2 gravel, and 4 broken stone. Ten experiments with a single sample of Portland cement gave 3,067 pounds per square inch (219 tons per square foot) for Portland concrete composed of I cement paste, 3 sand, and 6 broken stone. The concrete under the Washington monument, composed of I Portland, 2 sand, 3 pebbles, and 4 broken stone, when six months old stood 144 tons per square foot.

The data in the following table, even if not exactly in the line asked for, are very instructive. The experiments were made with the large U. S. testing machine at Watertown Mass., upon brick piers 12 inches square and from 1 foot 4 inches to 10 feet high, and gave the compressive strength as follows:

1 .		=		_				Reference No.
	7 Clear Portland cement I	6 Clear Rosendale	5 1 Portland cement, 2 sand 8	4 r Rosendale cement, 2 sand I	3 2 mortar, (1 lime, 3 sand), 1 Portland cement 1	2 2 mortar, (1 lime, 3 sand), 1 Rosendale cement I	I lime, 3 sand	COMPOSITION OF MORTAR.
-		-	3 2,544	1,972	1,411	1,646	5 1,508	Ultimate strength of pier in pounds per square inch.
-	2,375 3,483	521	545	162	192	183	124	Strength of the mortar tested in 6-inch cubes between steel, in pounds per sq. in.; mean of 3 trials.
	:	:	10	:	i	:	٥	Min.
		:	27	:	:		200	Strength of pier per sq inch in per cent. of the strength per sq. inch of the brick.
	16	:	17	13	9	::	5	Mean
	0.7	:	4.7	12	7	9	12	Strength of the pier in terms of the strength of the mortar, each per square inch.

The brick were unusually strong, having an average strength of nearly 1,500 pounds per square inch, tested flatwise between steel; it does not appear that an increase of 50 per cent. in the strength of the brick appreciably affected the strength of the masonry. The mortar was 141/2 months old when tested. The piers were from a year and a half to two years old when tested. The strength of the piers varied with the height; in a general way the experiments show that the strength of a prism 10 feet high laid in either lime or cement mortar, is about two-thirds of that of a 1-foot cube laid in the same way, although a conclusion derived from so few experiments (22 in all) is not entirely reliable.

In attempting to draw conclusions from any experiments, it must be borne continually in mind that the result of a single trial may possibly be greatly in error; in this case, this precaution is very important, since the difference between experiments apparently exactly alike was in some cases as much as 50 per cent. A great variation in the results is characteristic of all experiments on stone, brick, mortar, etc. Except on the ground of a variation in experiments, it is difficult to explain why the fourth mortar

is weaker than the second, while the masonry is stronger; or why the masonry in the fifth line is stronger than that in the seventh. However, the experiments are enough to show conclusively that increasing the strength of the mortar adds to the strength of the masonry; for example, notice that the substitution of the fifth mortar in the table for the first adds 70 per cent. to the strength and doubtless much more to the durability. Similar experiments* show that masonry laid in mortar composed of one part Rosendale cement and two parts sand is 56 per cent. stronger than when laid in mortar composed of one part lime and four parts sand. A member of the Institute of Civil Engineers (London) says that "brick-work laid in lime is only one-fourth as strong as when laid in clear Portland cement.'

Of course, the apparent efficiency of the masonry, as given in the table, depends upon the manner in which the strengths of the brick and mortar were determined, as well as upon the method of testing the masonry; for example, if the brick had been tested on end the apparent efficiency of the masonry would have been considerably more, or if the mortar had been tested in thin sheets the strength of the masonry relative to that of the mortar would not have been so great. The piers began to show cracks at onehalf to two-thirds of the ultimate strength.

It should be mentioned that the mortar with which these piers were built appears to be much weaker than similar mortar under like conditions; compare 72 and pages 126, 166, 188, 197 of the Report of Tests of Metals, etc., made at Watertown in 1884. Ordinarily mortar is 8 to 10 times as strong for compression as for tension, whereas the first six mortars in the preceding table were but little stronger in compression than such mortar should have shown under tension. The officer in charge is "unable to offer any explanation; the cement was bought on the market, and the maker's name is not known." The cement was not tested. However, the experiments are consistent within themselves, and therefore show relative strengths cor-

Some German experiments; gave results as in the table below. It is not stated how the strength of the brick or of the masonry was determined. The term cement in the table refers to Portland cement. The permissible strain allowed on brick masonry by the building regulations of Berlin are less than one-tenth of the results in the table.

CARL PFEIFFER.

R

In the death at Washington, D. C., April 27, of Carl Pfeiffer, the profession and American Institute of Architects has sustained the loss of an active and prominent member who is deeply mourned by a wide circle of friends and associates.

Mr. Pfeiffer came from Germany to this country at the Mr. Pfeiffer came from Germany to this country at the age of 15, about 35 years ago, and has devoted himself zealously and successfully to his professional duties, which of late years have been largely of consultation. He was prominent in hospital and asylum work and especially interested in the accompanying ventilation problems. He was the architect of the Church of the Messiah, the Roosevelt Hospital, the Insane Asylum at Middletown, and the Comman Hospital at Seventy seventh Street and Fourth German Hospital, the Insale Asylum at Middletown, and the German Hospital at Seventy-seventh Street and Fourth Avenue, New York, Fifth Avenue Presbyterian Church (Dr. John Hall), besides many other important edifices.

He was for two years Secretary of the American Institute of Architects, and was a member of the National

Academy.

For some years his health has been precarious, and he was overtaken by his last illness while returning to New York from Asheville, N. C., which he had visited in vain hopes of benefit from the change.

+ erun - should be 15000 lbs.

BUILDERS' AND CONTRACTORS' ENGINEER-ING AND PLANT.

No. XXXII.*

* This heading was accidentally omitted from the accounts of the erection of the Harlem Bridge and of the Poughkeepsie Bridge in the issues of January 21 and March 3, respectively, which should have been numbers XXIX. and XXX. of the series.

(Continued from page 300.)

ERECTION OF POUGHKEEPSIE BRIDGE.-NO. 2.*

MASONRY.

THE safe completion last fall of the submerged work successfully terminated an enormous and costly task, which was subject to many unusual and complicating conditions.

About 40,000 barrels of cement were used in the cribs. and 20,000 in the masonry, 11/2 or two barrels being required per yard for the concrete. Portland and Rosendale brands were used, subjected to continual tests of specimens taken from at least every tenth barrel. The specimens tested were molded into briquettes of the standard form and section recommended by the American Society of Civil Engineers. Several briquettes of neat cement were made of each sample and allowed to set from one to sixty days in the air and under water, and were then broken in the machine described on page 117 of our issue of January 21. The specifications required standard strength, which was attained in all cement used. The concrete in the cribs was made in the proportion of one part cement, two parts sand and three parts broken stone, crushed when necessary to pass through standard gauge.

Figures 5 and 6 show the Cockburn Barrow and Machine Company's steam-mixer used for making concrete for the A square iron box B is provided with collars R R, which rest on friction-wheels C C mounted on the cast bed-frame A. The materials in requisite proportions are delivered to hopper H and supplied with water through pipe W. The material passes through collar D into B, and is thoroughly mixed by the constant revolution of the box turned by a separate engine (not shown) that is geared directly to spur-wheel G. As the weight increases in the hopper the plastic concrete is forced out of the end E, which delivers it ready for use to the buckets, one of which is always being filled. One of these machines has a capacity of 150 cubic yards of concrete in ten hours, and on one occasion two machines delivered 431 cubic yards in 10 hours.

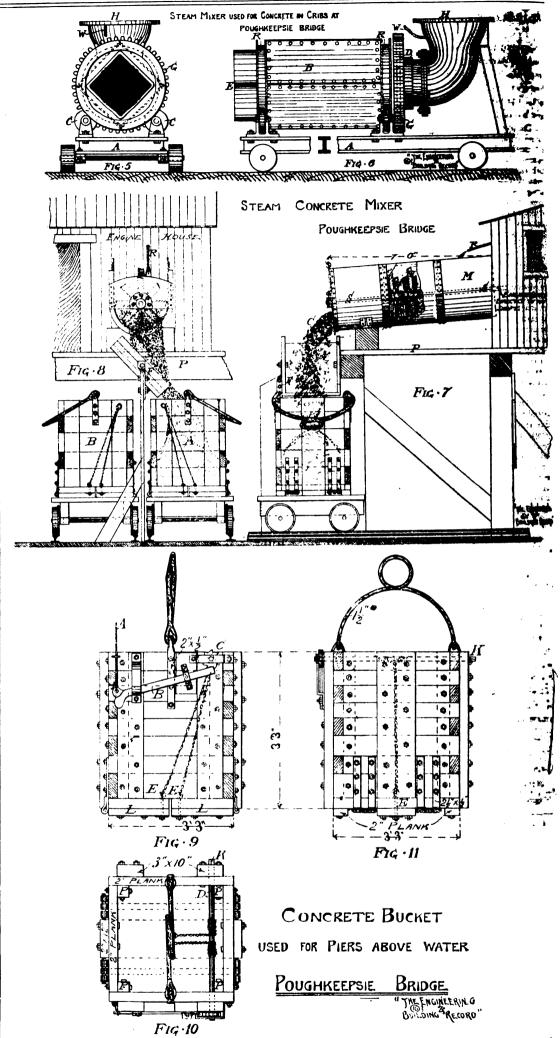

About 12,000,000 feet B. M. of timber was used in the cribs, and bolted together with 1,200 tons of iron.

The pier masonry is bedded on the caisson floors from 10 to 15 feet below high-water line and is about 30x90 feet on the base and 40 feet high. The piers are faced with dark coursed limestone from the quarries at Sandy Hill, N. Y., and capped with dressed coping of the same, with cut stone beds for the tower pedestals. The facing stones were laid in cement mortar, 1 part cement and 2 parts sand. The anchor-bars were placed before the piers were carried up, and solidly built in as work progressed. The face walls are one stone in thickness, and the interior chamber is filled with concrete in proportions of 11/2 barrels Portland cement to 1 cubic yard of gravel well packed and rammed. The stones in the concrete did not exceed two inches in any dimension, but large irregular blocks were bedded in it throughout.

Figures 7 and 8 illustrate the concrete-mixers for the pier work.

The steam-mixer M is placed on an elevated platform P, upon which the materials are delivered. On the deck below a tramway leads from the foot of the hoisting derrick, and terminates in a Y, which permits a second car and bucket B to be presented before the first one, A, is quite filled, so the mixer can work continually. Water is supplied to the mixer by pipe R, and laborers constantly shovel the sand, cement and stone into the iron trough M whose ends are closed, and whose cylindrical bottom surface is just cleared by the inclined blades W W that are fastened to the shaft S, continuously driven by an engine geared to its upper end. The materials are supplied at the upper end of M, and thoroughly incorporated by the agitation of the blades before they are ejected at C. The delivery is in a constant stream, that is caught on the pivoted chute F and deflected into either bucket A or B This mixer has a maximum capacity of 100 cubic yards of concrete in 10 hours; it is driven by a separate engine, and even when working up to its capacity requires but few attendants. One hundred laborers would be required to make the same amount of concrete by hand in a less satisfactory manner,

*No. 1 of these articles, containing the General Description and an ecount of submerged work, appeared in our issue of March 3.

The buckets used for carrying the concrete from mixers to the pier hold about one cubic yard, and are so convenient and well made that we show them in Figs. 9, 10, and 11. They are built of oak plank, the sides and bottom two inches thick, well reinforced by batten cleats, and bolted to corner posts P P. The hinged bottom is in two leaves, L L, having eye-bolts, E E, through the free edge. Chains through these eves are fastened to the shaft D, which is turned by a crank at K, and winds up the chain, closing the leaves L L. The shaft is secured at any time by the

ratchet C and pawl B. After being filled the bucket is received by the derrick and swung over the place where its contents are required. The cord A is then pulled and disengages the pawl B, the shaft being released, the chain unwinds, and the leaves L L open and discharge the concrete; the bucket is lowered, the chain rewound, and it is again ready for filling.

The stone, cement, etc., were handled in the usual manner by mast and boom derricks run by steam-engines, of which a considerable number were used by the contractors.

EIGHTH ANNUAL CONVENTION OF THE AMERICAN WATER-WORKS ASSOCIATION.

(Continued from page 315.)

WATER-SUPPLY SOURCES AND TREATMENTS.

By J. T. FANNING, President of the American Water-Works Association.

Nutural Clarification .- The waters from mountain streams among the granite hills, though unfortunately within the reach of so few villages, are the purest among the sources of water supply, and are also the clearest except in floods.

Then next, the waters from the gneiss, trap, and other unstratified hills, and then upland lake waters are excellent, but these when gathered in reservoirs exposed to the light may be as prolific producers of tiny plant life as a newly-fertilized lawn.

We must store them in darkness and keep their temperature law or they will require artificial clarification.

ature low or they will require artificial clarification.

As the hillside streams and waters of the upland lakes abrade their channels and shores and receive the drainage of the forests and swamps, they take in mineral and organic sediments, and on reaching the lower valleys as large rivers there comes the necessity for their artificial clarification in some degree to fit them for supplying potable water. For villages and towns not on the upland, clarification, in some form, is a subject of most vital importance.

Along the bases of such hills as furnish the best surface

Along the bases of such hills as furnish the best surface waters are found the best examples of naturally clarified waters in their clear flowing springs.

The villages and towns of the midlands and plains have to create artificial springs to receive the advantages of natural clarification. This they may do in various forms of driven and other wells, infiltration tanks and galleries, but these for reasonable success must be in silicious sands or corese grantly that the flow may be apple and the or coarse gravels, that the flow may be ample and the mineral impregnations slight. Large proportions of soluble minerals in the soils lead to undue hardness in the water and render them unavailable for infiltration pur-

poses.

The areas of the water-sheds of the wells and galleries are controlling conditions, for the rainfall upon each water-shed area, less evaporation, is the true source of supply, and the uniformity of continuous flow is governed by the storage capacity of the soil and the rate of percolation to the given well through its sub-strata. If the gallery and sources of flow are shallow, then the water-shed must be closely contributed lest some organic taints be corrected.

be closely scrutinized lest some organic taints be carried down in solution from the surface.

Three principal conditions of successful infiltration of potable waters are: (1) Sufficient water-shed; (2) pervious receiving and conducting strata; and (3) insoluble storage

The most successful infiltrations for supplies of towns

The most successful infiltrations for supplies of towns and the large villages have been into relatively long and narrow galleries, and the values of their waters have varied according to the nature of the filtering soils.

The mineralogical conditions suggested above indicate in a general way where infiltration supplies may be sought with a reasonable degree of success. In their most successful use, about one-tenth of an acre of bottom surface in the gallery has supplied 1,000,000 gallons of water, requiring a gallery say eight feet wide and 540 feet long.

Granular sands offer the best possible conditions, and are sometimes available in the islands and shores of lakes and streams. Without the most favorable conditions, extent of gallery required makes infiltration unavailable to

and streams. Without the most favorable conditions, extent of gallery required makes infiltration unavailable to the medium-sized and larger cities of the valleys.

Deep-Well Water-Supplies.—Different systems in the construction of water-works have their respective waves of popularity. Just at present driven and drilled wells are attracting much attention, and all over our land prospectors are drilling deep for water, oil, and gas. Discussions of the "germ theory" of disease have been frequent of late, in which drinking-water from surface sources is assumed to be sometimes a conveyer of micro-organisms. assumed to be sometimes a conveyer of micro-organisms, that become lodged in the human system and induce various fevers and epidemic diseases. These have had much influence in leading individuals and villages to seek their water-supplies deep below the habitations of the protowater-supplies deep below the habitations of the proto-phyta and protozoa, and there is a popular notion in most localities that if a well is only drilled deep enough any-where a flow will be the reward as copious as when Moses smote the rock in the wilderness. There are localities where an artesian flow of water or oil is a probability, and other localities where the financial expenditure for a test is unwarranted. An intelligent geological study of any locality is the basis of a prediction whether granite, lime-stone, sandstone, shale or coal will be found in the sub-strata, and likewise it is the basis on which to found the prediction of the presence or absence of water or oil that

strata, and likewise it is the basis on which to found the prediction of the presence or absence of water or oil that will flow with sufficient volume and pressure.

An invariable condition for the production of a flowing well is an inclined or pervious stratum overlaid by an impervious stratum, and usually an impervious stratum underlies the pervious one. To illustrate these conditions on a minute scale take a china saucer and cover its interior with a thin layer of sand, and then place within it another smaller saucer covering the sand. Now if the sand between the saucers be filled with water to the brim of the inner saucer, and a fine hole be drilled through the lower portion saucer, and a fine hole be drilled through the lower portion of the inner saucer, then an artesian flow will be the result. Substantially this condition is often found in the sandstone regions, and where an extensive coarse granular stratum

of stone or of gravel lies inclined between fine-grained stone or clay, and has a broad outcrop at its highest ex-posed edge, a copious supply of water will be found, and the volume of water it can continuously supply will always be dependent on the replenishing rainfall supplying its

higher portion.

This condition cannot be anticipated where the igneous rocks are near the surface, or where the rock is fine-grained as in limestone or slate, unless they are badly shattered. Potable artesian water can rarely be anticipated in the bituminous belts, now well defined in the settled portions of our continent, and usually well outlined in the eological maps of our States, and only in these latter may

geological maps of our States, and only in these latter may oil and gas reasonably be anticipated.

As with the gallery supplies, so with the artesian supplies do we find the extent of available water-shed to interpose a limiting condition, and rarely can the medium and larger-sized cities of the valleys find an ample deep-well clarified supply by searches among their substrata.

If they will have clarified water they must employ some form of artificial clarification to improve their available surface water-supplies. We have already alluded to the usual necessity for such clarification, but when the necessities that grow out of our physical requirements are opposed by municipal financial weakness, the weakness usually proves the stronger.

Artificial Clarification.—Sedimentation, precipitation, filtration, and aeration of water-supplies are subjects that have been ably discussed in these meetings and some valuable papers relating to these topics are ready for presen-

uable papers relating to these topics are ready for presentation during this annual gathering, so that a mention in outline only is proper at this time.

As in natural clarification so in artificial the chief objects

are the removal of:

1. Mineral matters in suspension, consisting chiefly of silicious and caicareous sands, marls, loam, and clay.

2. Dissolved organic matters in suspension, both vegetable and animal

3. Live organisms, both vegetable and animal, and the dissolution of the organic and mineral solutions in the water, including the removal of acquired color and the restoration of a due proportion of oxygen.

As incident to the study of clarification of waters, attended to the study of clarification of waters.

tion has been drawn to the forms of aquatic life that lead to the chief necessity for such treatment. We have observed that the clear mountain streams if held in storage, and we may add also pure waters generally if stored with light and summer warmth, develop certain of the fresh-water algae with rapidity, and of such plant life the desmids

They are harmless while living, but if abundant give

odor and opaqueness to the water as they decay.

The oscillatoria and confervæ incline to waters with calcareous impregnation and are indicative of hardness to

The bacteria are of the lowest group of algæ and incline The bacteria are of the lowest group of algæ and incline to waters having organic pollutions, and these are the microscopic plants we are taught most to fear. Their presence has been believed to be invariably associated with the putrefaction of decaying animal and vegetable matter, and their tenacity of life is remakable.

Dr. Cohn distinguishes two classes of them present in the ferments of putrescence, also a color-producing class and a disease are decing class.

and a disease-producing class.

The term "microbes," as used in our literature of water

analysis, includes both the micro-algæ and micro-fungi.

The biological investigations of public water-supplies includes the study of the characteristics of the microbes and of their effects when introduced into the human sys-

Among the lowest forms of aquatic animal life the spongilla has proved most offensive in the odors of our natural lake and impounded waters.

The tiny infusoria and polyps sometimes develop in superabundance and in their decay we have an objection-

able water pollution.

The pollution most apparent to the naked eye other than mineral sediments are the washings of forest and field, and the pollutions harboring most dangers are the several classes of sewage in process of dissolution and in solution.

Dilutions, but humanity has counteracted the remedy where it has built its gardens, factories, and towns more numerous and dense as the water grows slacker along its

course through the valleys to the sea.

The remedy which has been most extensively tried and most discussed in these meetings is sand filtration, and you are familiar with the construction of sand-filters. Among their best surfacing materials are fine-grained silicates of soda, alumina, potash, lime, etc., and with these are mixed at times granular iron and especially the magnetic carbide of iron and charcoal, and also prepared charcoal plates have been used.

These filters do excellent service if they are cleaned as

often as excellent service demands, which is very often for a turbid water, and if not duly cleaned they may clarify for a time, in lessening degree, until so foul with inter-cepted matter as to finally pollute the flowing water. Uncleaned and unaerated filters, public or private, are an abomination and a danger.

Sand-filters for public supplies require about four-tenths

of an acre of surface for each million of gallons per diem, and cost from fifty to eighty thousand dollars per acre for

original construction.

In the Northern cities the formation of anchor-ice on the surface of the sand and ice on the surface of the water interferes with the use of such open filters, and under favorable conditions the cost of filtration of turbid waters will not be much less than \$2.50 per million gallons of water

not be much less than \$2.50 per million gallons of water filtered.

The water ought, if possible, to be prepared for either public or private filtration by sedimentation if it carries much sand or coarse sediment, and by precipitation if it carries much fine clay or organic matter in suspension, mineral or organic matter in solution, or contains undue proportions of aquatic life, so that the filter may be relieved of excessive work of excessive clagging and pollution and of excessive work, of excessive clogging and pollution, and

of excessive work, of excessive clogging and pollution, and may be more easily cleaned.

Various precipitants are familiarly known and used in the processes of the arts, including salts of many of the metals; for instance, the sulphates and persulphates of iron, copper, manganese, zinc, aluminum, potassa, lime, and the chlorides and perchlorides of iron, tin, aluminum, mangangium calcium etc.

magnesium, calcium, etc.

Hydrated aluminum chloride and alumino-ferric compounds have had large application, and iron in filings, scraps and bundles of wire have been used in the purification of water polluted with vegetable organic matter in process of dissolution. Alum, lime, and iron have long been used for precipitants by families whose household supplies of water came from the clay-carrying rivers or the The sulphates of metals should, however, be cautiously

used where they are liable to contact with organic solutions, as they may be converted into soluable sulphides and dis-

used where they are liable to contact with organic solutions, as they may be converted into soluable sulphides and disengage sulphuretted hydrogen.

For the water-supply of a large city natural sedimentation, by rest of the water in settling basins, is a slow process, excepting for the coarse sands and heavier sediments, and requires large and costly basins in which to give the water six to twelve days rest before it is passed into the distribution system. With the proper and continuous use of precipitants as much may be accomplished in the same number of hours with great saving in cost of settling basins. Some of the precipitants have such affinities for organic matters in solution, and clays in suspension, that they almost instantly unite with them in coagulated flocculent masses, and are so concentrated that they have sufficient specific gravities to promptly start downward to the basin floor. In this movement of the flocculent material clarifying the water, the micro-organisms whose homes are in the midst of the organic pollutions are largely caught and borne downward also. In the coagulations are caught much of the impalpably fine organic matter and also the microscopic plants that give color or opaquenes or turbidness to the water.

At the same time the dissolving organic matters that are thrown down to await the periodical cleaning of the basin floor are rendered less soluble by their contact with the metallic salts which with exclusion from the air hinders their further dissolution.

The basin floors ought to have frequent and thorough

their further dissolution.

The basin floors ought to have frequent and thorough

cleanings.

Those pollutions in the waters that incline to resist precipitation are common salt, urea, ammoniacal salts. the alkaline earths, oils and refuse similar to that from gas-works.

As nitrates and nitrites are not fully controlled by the precipitants economically available, it is evident that precipitation is not a permanent guarantee against later putre-faction in the water if it is afterwards exposed to light and warmths of the summer sun, but the tendency is reduced by reduction of its cause.

Limy waters are alkaline, and there is more tendency to

active putrefaction in alkaline than in neutral or acidulated

Then we are to observe that the salts of iron if used in excess give colors to the water ranging from a greenish yellow to black; for instance, contact of iron with sulphur

gives a very dark from instance, contact of from with sulphur gives a very dark brown tint.

For water-supply clarification purposes, solutions of iron, aluminum, and calcium are the precipitants most economically and commercially available, and they are used alone or in varied combinations according to the characters of the sediments and pollutions to be acted

Very small proportions, comparatively, are effective, and the precipitants themselves are so completely carried down with the precipitated matters that bare traces of them remain in solution in the water.

Precipitation is an intermediate treatment between the

more common process of sedimentation and filtration, and it reduces materially the cost and time of unaided settle-

ment and of area of settling basins.

The precipitants are easily introduced, for they may flow from the faucets of one or more small tanks placed above the inlet stream of the settling basin, and thus be intimately intermingled with the waters.

In preparing an iron solution for clarifying the muddy water of the Mississippi at New Orleans our honored Ex-President has treated red hematite iron ore with hydro-President has treated red hematite iron ore with hydro-chloric acid, bringing it to 1.5 specific gravity, and his experiments showed that one part in twenty thousand parts clarified the muddiest water of the river, and neither hardened the water or left any trace of iron therein.

In every case where filtration is desirable preliminary preparation by precipitation is important, and in very many cases where sand filtration on the older system is, for financial or other reasons impossible pregipitation

many cases where sand filtration on the older system is, for financial or other reasons, impossible, precipitation will greatly improve the water-supply, and private filters on the services of such as can afford them can complete the process in the portion of their waters that are devoted to culinary and drinking purposes. With precipitation most waters will be fully fitted to enter the distribution-pipes.

After precipitation or filtration the waters should be kept well covered, and it is advisable that they be not kept on

^{*} Paper read before the Convention of the American Water-Works Association at Cleveland, O., April 17.

storage long enough for the slight remaining organic matters to again reach a condition approaching objectionable

Aeration, which will restore to the water an abundance of oxygen, is a most excellent treatment and antiseptic after precipitation and filtration. This is simply accomplished by forcing air into the pumping-main, or letting it be drawn into the suction-chamber of the pump, or into the supply-main from the reservoir.

Protection of Sources of Water-Supply.—Glancing over a map of the water-courses of our country we observe that a map of the water-courses of our country we observe that the towns and cities designated thereon are generally on the shores of these streams where the water-powers en-courage their growth or facilities for commerce will in-crease their wealth. The streams are the natural sewage channels of their water-sheds, and the water-supplies taken therefrom suffer according to the densities of the popula-tions and the extent of the manufactures along their

To prevent the establishment of mills, with their accompanying villages and gardens, along the rivers will to some extent interfere with local and national prosperities, and to entirely prevent the sewage of the upper villages from flowing down to the cities of the lowlands will to some extent interfere with natural laws.

we are not adequately handling our water-supplies by simply filtering out such pollutions as may chance to come down to us, but ought to begin our purification by attacking the pollutions at their origin, and providing that the sewage pollutions shall, so far as possible, be first spread broadly on the lands and there clarified by nature's pro-

Except in the bituminous districts and alkali plains we need rarely fear the mineral impregnations that nature sends down to our water-supplies. It is the decaying sends down to our water-supplies. It is the decaying vegetable organic, and especially the sewage organic matters that we have most to fear, and these multiply as the populations increase. It is in the midst of these that the disease-inducing germs chiefly generate. The desmids and bacteria of the purer waters, though frequently abundant, are not proved, nor yet fairly accused of endangering human constitutions, though absorbed through the medium

of water-supply.

The United States have now a total population of about sixty million people. Our past rates of decennial gain have

1840 to 1850, 35.81 per cent. 1850 to 1860, 35.57 1860 to 1870, 22.62 1870 to 1880, 30.07

The increase is most rapid in the towns and cities where the systems of water supply must be public in their char-

Eighty per cent. of the population of the State of Massachusetts, for instance, is already so grouped as to be pro-

vided with public water-supplies.

The rapid gain in population, the concentration of the people in towns, the increase in number of towns and in people in towns, the increase in number of towns and in new water-supply systems, all significantly suggest a united action looking to the matter of protection of the sources of additional water supplies for the existing towns, and of new supplies for future towns. This is a question that seems to loom up before us as though it might soon assume even national importance, and may, in the early future, tax the highest statesmanship and the most exalted wisdom.

The matter is worthy the earnest consideration of the American Water-Works Association.

QUESTIONS PREPARED FOR THE ASSOCIATION.*

I. WHAT warrant, based on just treatment of the public at large, is there for making a lesser rate for power than for consumption? For elevators and mechanical use than

for culinary purposes?

Mr. Ayres—We can pump and sell 1,000,000 gallons cheaper than 500,000 gallons.

Mr. Denman-In some cities discrimination is made in the price of the same amounts of water used for elevator

and hotel purposes.

Mr. Richards—With us every consumer has a meter and pays the same rate. Small consumers are no better able to

pay than wholesalers.

Mr. Troy—We have adopted a sliding scale, reducing

Mr. Troy—We have adopted a sliding scale, reducing for wholesalers.

Mr. Tubbs—The prime motive of water franchises is to insure the provision of a supply for sanitary and domestic purposes, not for hydraulic canals or manufactories.

The price should not be reduced for elevators or mechanical purposes, but on the contrary, any benefit of low rates should be secured to the householder.

Water companies are usually allowed to take water from private sources, often damaging the property and allowing them to become hydraulic suppliers is an injustice to riparian owners.

mr. Denman read a list of three classified rates from many cities showing a discrimination in favor of large consumers.

Mr. Decker was opposed to differences in price and instanced several cases where elevators used less water than domestic consumers and paid about 25 per cent.

less.

Mr. Dunham—Charge might be made according to service rendered; for example, discriminate between a livery stable that is benefited by a high pressure and a boiler that is not.

* Discussion before the eighth annual meeting of the American Water-Works Association at Cleveland, April 18, 1888.

In a certain city there are two systems, one of high and the other of low pressure service.

Elevators use from the former and discharge into the

latter system and are charged only two-thirds the amount they would be if they discharged into the sewers.

Some further discussion followed on this question and was concluded by the suggestion that if manufacturers were charged a price higher than the cost of pumping for themselves would amount to, they would not lend any support, and that the water-works would be worse off than if they had reduced their rates enough to secure their cus-

tom.

II. Where water is sold by meter under a schedule of rates, has a consumer a right to sell to his neighbor without consent from the company?

Mr. Decker—No; the company has an exclusive franchise and the consumer buys only for specific purposes.

Mr. Richards—We allow several consumers to use the

same meter, for which a certain minimum rate is charged. Mr. Dunham thought it fair if a certain minimum rate was maintained.

President Fanning suggested a comparison of the rules of different companies.

Mr. Troy—We give no water except on the presentation of a permit from the water-works superintendent.

Mr. Denman—If I buy water and pay for it, it is mine and I have the right to use it as I please; but if a man is using water at the maximum rate, and supplies his neighbor and divides the bills with him, he drops to a smaller rate. Is this right?

Mr. Garrison—We have the gravity system and were not allowed to introduce meters when we tried to do so. Motors, engines, etc., received special rates, but brewers were driven entirely out of business. When meters are used special contracts should be made

on sliding scales and consumers allowed to resell if they

choose.

Mr. Young—The question is one of private property, bought for specific use from which it cannot be diverted.

Mr. Allen-Such retail business by consumers interferes with the company's franchise.

Mr. Troy—We had a case of a man using water through

which he supplied his neighbors free of charge. He refused to stop when notified to do so, but the matter being arbitrated was decided against him.

Mr. Molis—We allow any number of consumers to use

the same hydrant and decrease the individual rate as their number increases. This greatly stimulates the use of water and is a popular measure; in a year or two the joint con-sumers apply for separate hydrants and we make money by

it. Our net income is about \$12,000 a year.

III. In case of contract to furnish water for a specified sum per annum, the maximum amount of water permitted to be used being also defined, has the consumer the right to sell or dispose of the unconsumed balance? This question was considered too much like No. II to merit discussion in the limited time available

ONE PHASE OF THE PROBLEM.*

THE problem is to supply pure water. The phase presented is from a point of view which is not elevated nor lighted up by much wisdom.

Water, not as rivers furnish it, which in many places is through pipes as it has been for hundreds of years 'for all purposes.' To purify the water for a great city is a very difficult matter.

There is no need to remind you that we all look to the

people for support and assistance in these important questions of method and expenditure. Their opinion and action

In the last few years, during which so much has been discovered that calls for prompt and decided effort, the impression that water is free and not a salable article has been largely removed, but in its place we have the no less dangerous notion that in all places a certain definite sum of money should pay for a certain definite quantity of some kind of water

Men have sought for an "average rate," as if it were a lucky number that once known would secure permanent happiness. Men have pointed with pride to the low rates in their cities when those rates should have been looked upon as a disgrace. Councilmen and others with the interest of the people at heart have assumed in establishing rates that unless the rate was as low as in some neighborrates that unless the rate was as low as in some neighboring city—where the conditions were entirely different—people would be driven away from their town or not be attracted to it, and to-day such notions are common.

They are all wrong. We might as well stop the trans-

attracted to it, and to-day such notions are common.

They are all wrong. We might as well stop the transportation of grain, and then, by means of adulteration, make the price of flour uniform all over the country, the same in New York and Minnesota.

Wholesome water should be made the one and only basis, and the rate charged should be determined by the cost of procuring it, and there is no city in our country where cannot afford to pay that rate better than they can

afford to pay any rate for unwholesome water.

We have an illustration in our midst. Six thousand families in Cleveland are using well-water where wholesome water is convenient. But how was it found out that there are six thousand? Why is the fact published and known all over the country? Why are steps being taken to make that number less? It is simply because the intel-

*Abstract of paper read by Member H. F. Dunham before the convention of the American Water-Works Association at Cleveland, O., April 17, 1888.

ligence of the present is demanding that after the best has been provided it shall be accepted in order to preserve To demand that the best possible shall be provided for the same purpose is no less a duty.

THE KANSAS CITY QUESTION.

MR. A. N. DENMAN, of Des Moines, Iowa, defined the subject as relating to the rights of plumbers to tap watermains, and read a clipping from a Kansas City newspaper of a decision in an injunction suit in which a water-works company enjoined a firm from touching or repairing the plumbing used in the system for the distribution of water about Kansas City without a license from the water-works. The judge decided that the water-works company had no right to compel a plumber to be licensed by them to repair any plumbing work in private property, but decided that a plumber would have no right to repair any mains or pipes in the streets. The injunction was denied.

Mr. Denman had secured the opinion of two attorneys

on the decision, which was to the effect that under the ruling plumbers could not tap water-mains without the permission of the water company. Plumbers were required to observe all reasonable regulations. Mr. Denman discussed the legal phases of the problem, and expressed the belief that the code of morals concerning water was different from all others. He considered the Kansas City decision of interest, because it was probably the first on record concerning the relations between plumbers and water companies.

The water company should know in advance of contem-The water company should know in advance of contemplated connections and the required service. It should be able to make suitable preparations for it, and provision that existing requirements should not be injuriously, affected by new and arbitrary ones, and it should always know what service was performed by every connection from the mains. These things were impossible if every one might have unrestricted license in the use and connections of every branch taken from the mains. But on the other hand the piping and fixtures in a man's own house are his private property, and it seems as if he should have the right to arrange them to suit himself.

Q. Would not the difficulty be met by requiring applications from property-owners for the water connections?

A. Yes; but the cost would be excessive, and the rates

in our town being fixed by law cannot be raised to cover

the expense.
Q. Why not make special contracts with each consumer, and permit no one but water-works employees to tap the

A. We have no trouble with our taps, only with extensions. Consumers are frequently irresponsible, and often Q. Can you not then prosecute them for tampering with

the water-works?

A. Yes; but the cost will be excessive, as in all these cases, where we should have to pay fees of \$25 to recover damages not above \$3 or \$4, and would be laughed out of

FEED-WATER HEATERS AND CONDENSERS.

My experience is that an economy of about one per cent. My experience is that an economy of about one per term, of the fuel used is gained for each 10° that the feed-water is heated. Condensers should be run pretty cool. If we sacrifice economy of engines to economy of hollers we can spare a few inches of vacuum. Under proper conditions a feed-water heater is beneficial between the low-pressure cylinder and condenser, and a second heater for exhaust-steam from pumps, etc., would give best results. It is questionable whether condensers are beneficial for pump-ing-engines of a million gallons capacity or less, but for engines of three million gallons capacity and upwards independent condensers and attached air-pumps are desir-

I prefer attached air-pumps, especially for reservoir

Surface condensers should be used on high-service plants where water has been once pumped; it can be advantageously placed in the suction-main, where it becomes simply a chamber full of steam-pipes, and has the use of all the water without any cost or waste. I have seen it so placed produce a vacuum of 28 inches; then by heating the feed-water the most beneficial results are gained.

The use of surface condensers often causes trouble in the boilers with cylinder oil, which cakes and produces bagging of sheets. This is easily avoided by straining feed-water

The use of high-class machinery and competent engineers and attendance will always be found most econom-

DISCUSSION.

Mr. Decker — Assuming a 1,000,000 gallon engine, steam-pressure of 75 to 80 pounds, etc., should we for reservoir service use a condenser?

Mr. Hague—Yes; but I referred to direct service.
Mr. Decker—In pumping lime and alkaline water would

advantages of evaporation overcome loss of heat?

Mr. Hague—I would condense and heat both, having a direct acting feed-pump, but would hesitate to sacrifice the vacuum to heating feed-water.

^{*} Discussion at the eighth annual meeting of the American Water-Works Association at Cleveland, April 18, 1888.

† Abstract of informal paper read at Cleveland April 19 before the eighth annual meeting of the American Water-Works Association by Member Charles A. Hague.

Mr. Richards—How is the oil-strainer made? Mr. Hague—In many simple ways, as by filling a vessel with straw

Mr. Dunham—Is there any way to prevent the noise made by free exhaust-steam except by use of a condenser?

Mr. Hague—No.
Mr. Gerecke—Atlantic steamers use an apparatus for removing oil from exhaust-steam before it leaves the condenser.

Exhaust-steam injectors are now used for returning it in high-pressure engines to feed the boilers. The arrangement works nicely and obviates noise and trouble.

Mr. Hague—I think its success would be doubtful

with low-pressure engines.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, penng governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

BALANCED LOW-PRESSURE CRANE.

In this crane it will be observed that the bar on which the trolley travels has a vertical motion giving the desired lift, and that it is supported by four chains, two at each end, leading over sheaves to the pressure-cylinder at the back of the crane-post. The cylinder and trolley-bar thus counterbalance each other, so that all the pressure is utilized in lifting the load, and the four chains not only give at all times a square pull on the cylinder, but prevent any material damage from the breaking of any one chain.

The cylinder is guided by the stationary piston-rod, which is made hollow, and serves to admit to the cylinder the pressure which is conveyed to the crane through a hollow gudgeon at its foot provided with a stuffing-box; the supply-pipe and operating valve are shown in the foreground. Connection can also be made through a short length of pressure-hose, but in that case the crane cannot be turned more than one revolution in the same direction.

When pressure is admitted it acts on the lower head of the cylinder to force it down, thus raising the trolley-bar with its attached load; when released the load preponderates or the bar can be weighted to descend unloaded.

If through lack of head-room or other cause it is necessary to have the trolley-bar descend nearly to the floor, it can be accomplished by sinking the lower part of the cranepost in a pit or by attaching sheaves to the top of the cylinder, which doubles the travel of the trolley-bar.

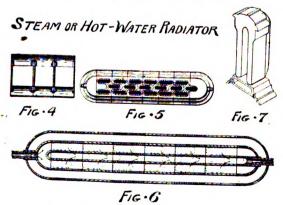

Steam-pressure can be used direct or through the medium of some liquid on which, in an intermediate chamber, the steam presses, the liquid returning to the chamber when the steam escapes.

Petroleum forced by compressed air has worked very well. The advantage of fluid-pressure is its steadiness and of course where hydraulic power is available it can be used direct.

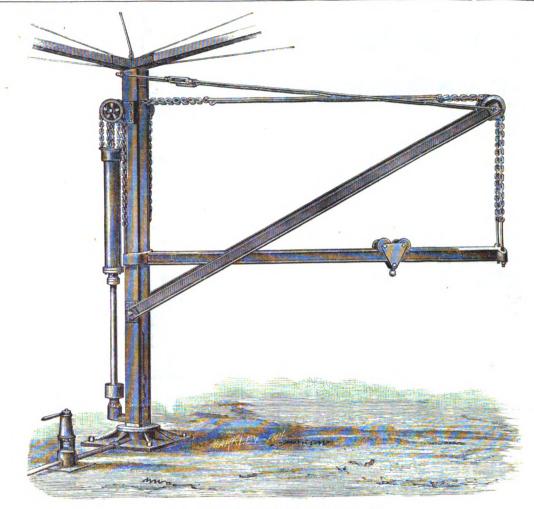

These cranes are made by Craig Ridgway & Son, of Coatesville, Pa.

A SECTIONAL STEAM OR HOT-WATER RADIATOR.

THIS radiator is composed of separate transverse sections, of which any number may be connected together that may be necessary to give the desired size.

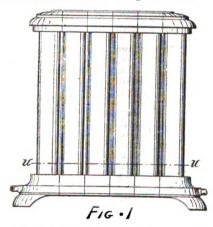

Fach section, Fig. 7, is a single casting composed of a portion of the base and a flattened three-lobed radiating tube, as shown in Fig. 5, which is a section on line u u, Fig. 1. The hot water ascends through the outer lobes and descends through the inner one, which projects between the outer lobes of the adjacent section, by which arrangement it is claimed that the radiator is rendered more

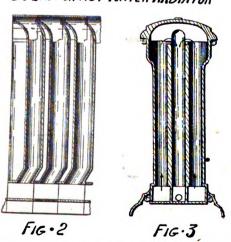

BALANCED LOW-PRESSURE CRANE.

compact while at the same time the radiating surface is increased.

A side view of the complete radiator is shown in Fig. 1, while Fig. 4 is bottom view of three sections, showing method of bolting together. Figures 3 and 2 are transverse and partial longitudinal sections respectively, while Fig. 6 is a horizontal section through the base.

STEAM OR HOT-WATER RADIATOR

The direction of the hot-water circulation is shown by the arrows. When used for steam all the internal divisions are omitted, and the three passages in the tubes are thrown

The patentee is Alfred Catchpole, of Geneva, N. Y.

REVISED ESTIMATES FOR PROPOSED BROOK-I.YN BRIDGE TERMINALS.

MR. A. M. WELLINGTON having assailed in the public prints the estimates submitted by Mr. C. C. Martin, Chief Engineer of the Brooklyn Bridge, which the Committee on Terminal Facilities referred to in their report printed in our issue of April 21, these estimates have been revised by Mr. G. Leverich, one of the engineers of the bridge, with the following results: Real estate, \$2,698,000; stations, \$2,720,600; cable-driving plant, \$482,100; rolling stock, \$522,000; storage platforms, \$143,750.

The amount of the approximate estimate presented April 7 last is \$6,602,250, or \$36,400 greater than that of this estimate as revised: the difference consists of an increase in the items for cable-driving plant of \$7,000, for rolling stock of \$3,200, and for storage platforms of \$8,750; and a decrease in the items, for real estate storage yard of \$4,250, and for stations of \$80,000. These changes are due to a more careful examination into the probable costs than could be made when the first estimate was prepared.

In submitting these estimates Mr. Martin states that he considers the "total amount quite too small." He states that the original estimates were made reluctantly, as the engineers were convinced that as an engineering device the "'simple circulating system' was both unsafe and impracticable." Regarding the estimate for real estate to be acquired, which it has been alleged was extravagant, it should be said that the estimate was made by Mr. T. H. Terry, a real estate agent and professional valuer, of New York City, who was especially employed for this purpose.

THE WASTE OF CROTON WATER.

AT a recent meeting of the Board of Aldermen of New York City a communication was received from Mr. Samuel A. Strang, of that city, recommanding the use of the Deacon water-waste detector, which he estimated would save the city \$100,000 a year, and enclosing a circular descriptive of its use and efficiency.

The communication was referred to the Committee on Public Works, who were authorized to investigate the waste of Croton water and the proposed remedy therefor.

NEW YORK MUNICIPAL BUILDINGS COMPE-TITION.

MESSRS. R. M. HUNT, Prof. W. R. Ware, and Richand Upjohn have been selected as the expert advisers to the Sinking Fund Commissioners on the award of prizes for plans submitted in competition.

PLANT OF THE BOSTON HEATING COMPANY No. II.

(Continued from page 316.)

REFERENCE to the accompanying illustration, Fig. 1, may aid an understanding of our system. At a central station a number of boilers are located, exemplified in the illustration at A. From the boiler, A, proceeds a pipe, C', to a pump B. This pipe is attached to the suction end of the pump, and consequently the action of the pump withdraws the water from the boiler. Proceeding from the discharge end of the pump a pipe, C, extends through the streets and, returning to the central station, enters the boiler at C". As soon as the pump is set in operation the water flows out of the boiler by the suction-pipe C, and is forced around through the streets and back again into the boiler by the pump. If, during its passage, no water is taken from the main every stroke of the pump, withdraws from the boiler and returns to it again an equal quantity of water. In reality, the office of the pump, B, is simply to sustain a continuous circulation through the hot-water

Directly beneath the hot-water main, C, there will be seen a pipe, D, which, in the station, terminates in the tank, D'. This second main collects the water as fast as it is used and cooled and returns it to the station, from which function it derives the name of the return main. As the return main empties into the tank, D', all the water cooled and carried back to the station is delivered into this tank, from which a second pump, D', draws the water and forces it back into the boiler again, to receive a fresh quantity of heat and be ready for another journey through the supply main. (The actual arrangement of the central station is shown in Fig. 2.)

From point to point along the main small pipes, c', extend to the curbstone and terminate in the service-box. N. The pipe in the service-box is so arranged so as to enable a single box to supply three houses. This is accomplished by capping the end of the pipe with the three-way tee, to which are attached three asbestos cocks. From this tee in the service-box small copper pipes, O, extend into the adjacent houses, furnishing them with a supply of water. Directly beneath the supply-pipe, c', is a similar though larger pipe, d', to collect the cooled water from the houses and conduct it to the return main. This pipe, d', also enters the service-box, and there, by a similar arrangement of tees and cocks, is enabled to receive the water from the three buildings which the hot-water pipe directly above

During the past three months we have excavated a trench some two and a half or three feet wide, and varying from two and a half to seven or eight feet, having an average depth of four feet. The trench has been excavated between the street corners. Along the bottom of the trench we have spread a uniform layer of concrete eight inches in thickness, made of one part of cement, two parts sand, and two parts broken stone thoroughly rammed into place. Once in about fifteen feet a brick pier has been introduced into the concrete and solidly embedded therein. On this brick pier has been placed an iron construction called a bracket. (See section of conduit, Fig. 3.)

The bracket consists of a solid, arch-shaped casting, supporting a roller covered by a cap. The office of this roller is to carry the four-inch supply-pipe and allow it sufficient ease of motion so that it may readily expand and contract under the variations of temperature, while the cap surrounding the whole confines the pipe sufficiently in its place so as to maintain it in a fairly straight line and prevent it from becoming in any way displaced. The whole bracket stands on top of the brick pier, while directly underneath the arch of the bracket a second roller, placed on a small iron stand, is seen, the office of which is to support in a similar manner the eight-inch return pipe, and to permit of perfect freedom for expansion.]

It would seem that there was quite a disproportion between the supply and return pipes. The supply pumps at the station taking their suction from the boiler are able to maintain through the small supply pipe a rapid current.

We expect to carry a circulation, depending on the demand on the system, of from five to ten feet a second. By means of the pumps this forced circulation is easily accomplished. While a small pipe for the supply adds to the frictional resistance offered to the pumps, the radiating surface is largely diminished, the cost of the pipe is much decreased, and the ease of construction is greatly facilitated. In the return pipe, when the water is to come back to the station by gravitation alone, it is necessary to decrease the frictional resistance as much as possible to afford an abundant chance for the water to run back easily and freely, no matter whether the discharge from the houses is regular or irregular. So we have for the return pipe an eight-inch pipe, and for the supply pipe a four-inch.

DOMESTIC ENGINEERING, ETC., IN THE CEN-TRAL TRUST COMPANY'S BUILDING, NEW YORK CITY.

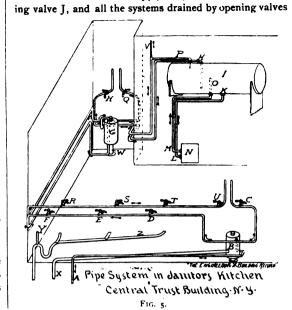

No. II.

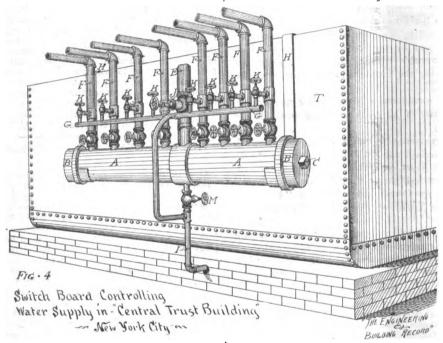

(Continued from page 317.) PLUMBING.

ALL the water-pipes are brass, tinned inside, and polished or tinned outside, and all their metal connections and fixtures are brass or copper of approved design, in accordance [with the general plans. Among the special features of interest in this work a very convenient one is the switch-board controlling the water-supply to the faucets in the offices and other apartments. These faucets are arranged on the different floors so as to be in nearly the same vertical planes, each of which forms a separate system supplied by one line of 1-inch pipe.

Figure 4 shows the ingenious device by which water may be admitted to or excluded from any one of these systems independently of the rest.

The arrangement is located in the basement near the engine-room, and is conveniently suspended by hooks H H from the engine tank T, of which, however, it is entirely independent.

The water is pumped directly from the cellar tank or street main to the gravity tank near the roof (see Fig. 3, page 317), and thence brought by pipe E to the barrel A A, which is made from 8-inch galvanized-iron pipe closed by 8-inch caps B B, that are furnished with the square bosses C C, to provide hold for wrenches to screw them up. F F, etc., are the pipes supplying the different lines. G is a drip-pipe draining them; I is a drip-pipe draining the L L, etc. If repairs or any other consideration require the exclusion of water from any room or fixture, the linepipe F, to which it is connected, is shut off by closing its valve K, and drained by opening L, without interfering with any other line.

Fig. 5 is a diagram of water-pipes in janitor's kitchen, which was originally designed for use as the kitchen of an employees' restaurant.

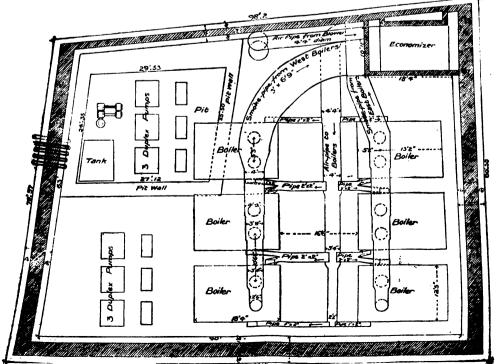

FIG. 2.—PLAN OF THE CENTRAL STATION, BOSTON HEATING COMPANY.

The cold water enters at A, passes through grease-trap B, and branches to supply sink-faucet C, while the main pipe supplies wash-tub faucets D, E and F; then crosses the side wall of the room and passes through grease-trap G, and, branching to sink-faucet H, is continued to J, where it enters the boiler I, and, leaving it at K, is admitted at L, to the water-back N, where it is heated, and. rising through pipe M, re-enters I at O and is drawn off through pipe P, which branches to sink-faucet Q, and thence continues behind trap G across the side wall and to the wash-tub faucets R, S and T and the sink-faucet U. V is a pipe connecting with the roof tank. Z is the waste-pipe for wash-tubs, and is vented by pipe Y. X is the waste from trap B, and W is that from trap G. The next article of this series will show the special fittings of this kitchen.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

LEAD BURNING VERTICAL SEAMS.

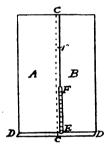

APPLETON, WIS., March 30, 1888.

SIR: I am a subscriber to your paper and would be signal to get a little instruction from some one of our practical lead burners in regard to burning upright seams, as I find it a rather difficult job to do. I have a machine for that work and can burn the flat seams satisfactorily, but the upright seams are what bother me. Any information in regard to the some would be thankfully received.

Yours truly, H. N., Plumber.

[In reply to the recently published inquiry from "H. N." as to how upright seams should be burned, we have received the following communication from a practical lead burner, who is especially experienced in the matter

It requires experience and skill to burn vertical seams. Allow the tank sheets to lap about one inchand clean the inside one at least half an inch back from the edge of the outside sheet. Clean the outside sheet or lap the same

distance from the edge on both sides. Then commence at the bottom of the tank and burn upwards, using the outside lap for material to build up the seam. In the sketch A is the outside sheet from which the seam is to be built, B the inside sheet, D D is the lap at the bottom of the tank. The dotted line C C shows the edge of inside plate B, and E F is a completed portion of the burned seam, commenced at E.]

WHO SELLS CLAMOND OR WELSBACH IN-CANDESCENT GAS-BURNERS?

NEW YORK, April 27, 1888.

SIR: In answer to the above inquiry in your issue of April 21, I would respectfully refer you to the Welsbach Incandescent Gas-Light Company of Pennsylvania, 122 South Twelfth Street, Philadelphia.

Yours respectfully, W. S. BACOT.

PATENTS ON GREASE-SEPARATORS.

St. Paul, Minn., April 30, 1888.

St. Paul, Minn., April 30, 1888.

Sir: On page 224 of your "Steam-Heating Problems" you say: "On page 171 will be found a description of an apparatus used to separate oil from exhaust-steam, and which may be used by any one, as it is not patented."

We have a party in this city who claims a patent on this: are we safe in putting in same, as you describe, in our steam plant without regard to him? Yours truly,

ECONOMY STEAM-HEAT CO.

[The apparatus as shown on page 171 of "Steam-Heating Problems" was designed by Mr. William J. Baldwin, M. E., for the Manhattan Company's and Merchants' Bank Building in New York, and was never patented by him. What the claims of patentees are in the matter of separation of oil from steam we do not know, and would suggest that you consult a patent attorney as to the risks you might run. There are several recent patents on grease-separators.]

THE INDIRECT INCOME OF WATER-SUPPLIES.*

ALL time saved from hard labor is a gain. The convenience in cities and towns is a great advantage. In estimating the returns to be secured from a water-supply for a place consideration must be had for items not appearing on the company's books, but which have a value inestimable in dollars. These are:

on the company's books, but which have a value inestimable in dollars. These are:

First—Promotion of health. Water from a supply system averages much purer than from wells. It is stated that typhold fever has practically become a country disease. In certain New England counties the lowest average mortality is in districts where there are many cities and towns, most of which have water-supplies and sewerage systems. The highest mortality is in sparsely-settled towns having no public works of this nature. Without a water-supply we can scarcely have any sewerage system. The sprinkling of streets and decrease of repairs on gravel and macadamized reads are worthy items.

Second—By saving property. A supply of water for fire purposes can best be provided in connection with the domestic supply, and the power to prevent a widespread conflagration lies usually in the proper arrangement of the water-supply system where the hydrants should not be located too near large wooden buildings.

Third—By reducing insurance. The insurance companies of New England are always ready to recognize the introduction of water by a very substantial reduction of their relative generally from twenty to fefty near contributions.

introduction of water by a very substantial reduction of their rates, generally from twenty to fifty per cent.

Fourth—By encouraging manufactuers. Many mills have private fire appliances, but all need external protection, and a reliable water-supply and a consideration of its provisions and the consequent insurance rates often determines the location of great manufactories.

President Fanning stated that he had found that for five years after the water-supply was introduced in a certain city the saving in insurance over the rates that prevailed before had been greater than the cost of the supply during

PUMPING ENGINES.+

MR. GERECKE made some remarks about the Chicago pumping engines, where great trouble had been experienced from air in the cylinders, which were introduced to secure back-pressure on the valves. This should never be resorted to. The valves should be made smaller and heavier and no trouble would arise.

In Chicago a vertical engine pumps water for flushing

For six months in 1886 the cost of coal as a fuel for this engine was carefully computed and then for six months in 1887 that of oil. It was found that there was a difference of twenty-two cents per hour, or of \$885, for the six months in favor of coal, but the bill was reduced so as to make the cost about the same for the city. The evaporation by oil was greater than that by coal, and if account had been taken of the labor saved the oil would probably have appeared most economical; as it was, a certain number of men were kept continually, and the use of oil simply gave them so much more idle time.

Q. What difference was perceptible in the wear and tear with the different fuels?

A. None; but I believe oil to be less injurious. It gave more uniform pressure and there were no accidents of any kind connected with its use.

Q. Were there any offensive fumes?

A. Never from the chimneys or outside of the house; of course the oil itself has some odor.

of course the oil itself has some odor.

Mr. Priddy—We are using a good deal of oil for fuel among the hills. It is used from tanks and the only accident that has occurred was directly due to the carelessness of the engineer.

HYDRANT JACKETS.+

A SHORT volunteer paper was presented describing some experiments made by the author to determine the value of cloth jackets for fire-hydrants. During last January, when the weather was exceptionally cold, two self-registering thermometers were placed inside the barrel of a hydrant at a distance of I foot, and 4 feet 6 inches below the surface of the ground. These recorded minimum temperatures of 31° and 26° respectively, and conbelow the surface of the ground. These recorded minimum temperatures of 31° and 36° respectively, and confirmed the theory that warm air and gas is being constantly disengaged and forms an upward current that is diffused through the hydrant and adjacent ground, and will always prevent freezing, thus making any jacket protection superfluous tection superfluous.

WESTERN GAS ASSOCIATION.

THE 11th annual meeting of this association will be held at Chicago May 9, 10, and 11.

The following papers will be presented:

"Fuel Gas," by Walton Clark; "Half-Depth Regenerative Furnaces," by Frank Bierce; "Inclined Retorts." by Henry Pratt; "Gas Company Accounts," by J. D. Thompson; "The Cost of Electric (Arc) Lighting," by

*Abstract of paper read at Cleveland, April 18, before the eighth annual meeting of the American Water-Works Association, by Member F. L. Fuller.

†Discussion at Cleveland, April 19, before the 8th annual meeting of the American Water-Works Association.

‡ Paper read April 18, at Cleveland, before the eighth annual meeting of the American Water Works Association, by Associate Member A. Beaumont.

C. M. Keller; "The Maximum Service that Should be Required for the Various Standard Sizes of Meters," by William McDonald; "Purification in Closed Vessels," by Frederic Egner; "Incandescent Gas-Burners," by Edward Lindsley; "A Paradoxical Box," by B. E. Chollar; "Observations: Gaseous and Otherwise," by George Shepard Page.

Professor T. C. Mendenhall, President of the Rose Polytechnic Institute, Terre Haute, Ind., will lecture on "Photometric Standards and Processes," and Mr. Frederic Egner will tell of "The American Gas Institute."

The Committee of Arragements are Messrs. Henry Pratt, George C. Hicks, E. H. B. Twining, Frederick R. Persons, and John Stout. Mr. A. W. Littleton, of Quincy, Ill., is the secretary of the association.

Members of kindred societies are invited to be present and take part.

THE AMERICAN SOCIETY OF CIVIL ENGI-NEERS.

A REGULAR meeting was held May 2, Vice-President J. J. R. Croes presiding. After the usual order of business the secretary stated that the last week in June had been selected for the date of the annual convention and that the excursion would be via the Michigan Central Railroad, from Buffalo to Milwaukee.

Members intending to present papers at this meeting are urgently requested by the committee to prepare them early enough to enable advance copies to be printed and distributed among the members for preparation of discussions.

The bequest was announced from the late member, Mr. Sullivan Haslett, of all his engineering books to the society's library.

The secretary read a rejoinder from John W. Hill, Mem. Am. Soc. C. E., to Mr. Howell's discussion of the former's recent paper on "The Test of an Edison Incandescent Electric-Lighting Plant," and extracts from a communication by Joseph Nimmo, Jr., on "Fertilizing Material of New York and Brooklyn in its Relation to Transportation."

The report of the tellers appointed for the membership ballot was then received and the meeting adjourned.

The following candidates were elected:

As Members .- Kenneth Allen, in charge of preliminary location Kansas City, Lawrence and Nebraska Railway, also Consulting Engineer Greenleaf, Kan., Water-Works, Kansas City, Mo.; Latham Anderson, Civil and Sanitary Engineer, Cincinnati, O.; Thomas Aspinwall, in charge surveys and construction West End Land Co.'s Improvements at Boston, Mass.; Robert Bassel, Technical Attache Imperial German Legation, Washington, D. C.; Harry Dean Bush, Superintendent Lachine Works Dominion Bridge Co., Montreal, Can.; Clarence Allen Carpenter, Division Engineer Kansas City from Marion, Iowa, to Kansas City, Mo., C. M. & St. P. Ry. Chillicothe, Mo.; George Edwin Evans, Engineer Water-Works, Helena, Mont.; Francis Davis Fisher, Resident Engineer Suburban Rapid Transit Co., New York City.; Arthur Hodges, Chief Engineer Johnson Steel Street Rail Co., Johnstown, Pa.; George Washington Howell, engaged in miscellaneous engineering, and Bridge Engineering for Morris County, Morristown, N. J.; Everett Wilson Lew's, Assistant Engineer in charge of Spokane and Palouse Railway, Belmont, Wash. T.; Emile Low, Division Engineer Clinch Valley Division Norfolk and Western Railroad, Cedar Bluff, Va.; Harry Irving Miller, Engineer Maintenance of Way, Chicago, St. Louis and Pittsburg Railroad, Richmond, Ind.; Arthur Lorenzo Mills, Chief Engineer Toledo, St. Louis and Kansas City Railroad, Mills, Chief Engineer 101edo, St. Louis and Kansas City Kauroad, Toledo, O.; Edmund Trowbridge Dana Myers, General Superin endent Richmond, Fredericksburg and Potomac Railroad, Richmond, Va.; Philip M. Price, Instructor of Practical Military Engineers mond, Va.; Philip M. Price, Instructor of Practical Military Engineering at Military Academy in Command Co. E Battalion of Engineers, and in charge of the Water-Supply of West Point, N. Y.; Beverley Strother Randolph, Mining Superintendent Consolidation Coal Company of Maryland, Frostburg, Md.; Thomas Pearman Shanks, Chief Engineer Little Falls Water Power Co. of Minnesota, Snanks, Chief Engineer Little Falls Water Power Co. of Minnesota, residence, Louisville, Ky.; George Morris Tompson, Chief Engineer Boston and Lowell Railroad, also in charge of construction of Central Mass. Railroad, Boston, Mass.; Thomas Delano Whistler, recently Division Engineer New York Steam Co., New York City.

As Associate. - James Breckenridge Speed, General Manager Louisville Cement Co., Louisville, Ky. As Juniors .- James Hillhouse Fuertes, with Chief Engineer As Juniors.— James Hillhouse Fuertes, with Chief Engineer Wichita Land Company, Wichita, Kan.; William Gray, engaged on New Crotca Aqueduct, Tarrytown, N. Y.; Horace Joseph Howet Assistant to Roadmaster, Susquehanna Division New York, Lake Eric and Western Railroad, Elmira, N.Y.; Edmund Trowbridge Dana Myers, Jr., Assistant City Engineer, Richmond, Va.; John Edwin Ostrander, engaged on enlargement of Locks, Eric Canal, Macedon, N. Y.; Charles Bradley Rowland, engaged with Continental Iron-Works, Greenpoint, N. Y.; Eugene Raymond Smith, engaged in Works, Greenpoint, N. Y.; Eugene Kaymond Smith, engaged in general engineering and surveying, Islip, N. Y.; William Helland Stair, Superintendent of Construction at Fort Riley, Kan.; George Atwater Tibbals, engaged in Machine Shops of Continental Iron-Works, Brooklyn, N. Y.; Samuel Gaylord Tibbals, engaged in Machine Shop Continental Iron-Works. Brooklyn, N. Y.; Herbert Waldo York, engaged in general civil and mechanical engineering, New York City New York City.

AMERICAN GAS-LIGHT ASSOCIATION.

THE sixteenth annual meeting of this association will be held in Toronto, October 17, 18 and 19, when a prize of £5 will be awarded for the best paper on "Naphthaline." The Research Committee is now fully organized and ready for business: Chairman, Colonel Frederick S. Benson, Engineer of the Nassau Gas Company, Brooklyn, N. Y.; Secretary, Charles F. Prichard, Superintendent of the Lynn (Mass.) Gas Company; other members, A. E. Boardman, Macon, Ga.; T. Littlehales, Hamilton, Canada; J. B. Crockett, San Francisco, Cal.; James Somerville, Indianapolis, Ind., and William J. Fay, Denver, Col. If any member of the association has a problem which he wishes the committee to assist him in solving, he has THE sixteenth annual meeting of this association will

he wishes the committee to assist him in solving, he has only to call on the member of the committee in his district, and he can, if necessary, secure the assistance of the entire committee. The chairman of the committee will be glad to give members any desired information in regard to its methods. Mr. C. J. R. Humphreys, of Lawrence, Mass., is the Secretary of the Association.

ENGINEERS' CLUB OF PHILADELPHIA.

A REGULAR meeting was held April 21, 1888, President Joseph M. Wilson in the chair, Howard Murphy, Secre-: 30 members and I visitor present.

The secretary announced the gift, by Mr. John S. Naylor, of Van Nostrand's Engineering Magazine, 1869 to 1886, bound in half morocco, for which a vote of thanks

was returned.

Mr. L. F Rondinella presented a series of "Steam Formulæ" for the Reference Book; Mr. William Sellers a paper upon the "Manufacture of Eye Bars for Pin-Connected Structures," illustrated by full-size test specimen, etc. Mr. John L. Gill, Jr., discussed the desirability of expanding in, and of beading over, boiler-tubes, and raised the point as to whether beading over was not, in some cases, unnecessary or even injurious.

The president as to whether beading over was not, in some cases, unnecessary or even injurious.

The president announced the following as the committee to recommend a practical method of testing cements. Messrs. Arthur Marichal, Herbert Bamber, Professor L. M. Haupt, Rudolph Hering, and John C. Trautwine, Jr.

THE UNCERTAINTIES OF UNDERGROUND WORK.

ONE of the curious facts in connection with the construction of the flushing tunnel at Milwaukee is the struction of the flushing tunnel at Milwaukee is the ease of excavation at the river and lake ends, where it was generally expected that, despite the protection of cofferdams, great trouble would be experienced from percolating water, while in the middle section—about equi-distant from lake and river—water and quicksand have made the progress of the work very slow. Recently a spring was struck that welled up so copiously from a hole made by a workman's pick that the discoverer could hardly get away from it in time to avoid injury. Since then the pump has been kept at work night and day to keep the big bore from being flooded.

from being flooded.

The experience of the tunnel contractors is an illustration of the risks which bidders for underground public work run in making contracts. There is no telling what one will meet in burrowing in the bowels of the earth. Test bores may be never so favorable, yet the ground may prove to be a bed of quicksand with intervals of solid earth into which the bore of the testers has, unfortunately for the contractor, struck in every instance.

The man who digs tunnels by contract is virtually investing in the lottery of fate—he may make and he may break.

SHOCK IN PIPES.

SHOCK IN PIPES.

The sudden stoppage of flow in pipes produces forces, due to the sudden change of momentum, which are often considerable. Lead pipes, for instance, are often gradually expanded and then burst by the shock produced by taps which suddenly close. Mr. Binnie experimented on a case of this kind. A lead pipe, ¾ of an inch in diamter and 114 feet long, was connected with a 3-inch main and fitted at the other end with a plug-cock having a waterway of 0.152 of a square inch only. At a pressure-gauge near the cock the pressure was 125 pounds per square inch before the cock was opened, 20 pounds when the cock was opened, and 550 pounds when the cock was suddenly closed, the pressure falling back after a series of oscillations to 125 pounds. Even at the inlet of the lead suddenly closed, the pressure falling back after a series of oscillations to 125 pounds. Even at the inlet of the lead pipe from the main the effect of the shock was felt, the pressure rising to 220 pounds when the plug-cock was closed. It is to avoid danger from shock that screw-down valves, which close slowly, are in some towns insisted on —From lecture on "Hydraulics for Architects," by Prof. Merwin in London "Builder."

THE builders of Syracuse, N. Y., have organized "The Master Builders' Association." Thomas Talbot, Jr., James E. Baker, William Crabtree, and others, trustees

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

TRADE CATALOGUES.

THE Composite Iron-Works Co., 83 Reade Street, New York, has issued a pamphlet illustrating and describing the Bostwick patent folding-gate for a variety of purposes, which will be sent free on application. will be sent free on application.

WE have received from the Portland Stone Ware Co., Portland, Me., and 42 Oliver Street, Boston, Mass., their illustrated catalogue and price-list of fire-brick, tiles, sewer-pipe, terracotta vases, etc., manufactured by them.

ARCHITECTURAL COMPETITIONS.

LAS ANIMAS, Col.—Hospital.—Plans are wanted, until May 12, for a County Hospital Building, to consist of basement, first and second stories. For circular of instructions, etc., address G. M. Hill, County Clerk, Bent County, as above.

DELPHOS, O.—Town Hall.—Plans are wanted here, until May 12, for a town hall, to cost \$15,000. For details address J. M. Kollsmith, as above.

SEYMOUR, IND.—Church.—Plans are wanted here for a church edifice, to cost \$100,000. No date specified. For details address the Rev. P. Schmidt, of the German Lutheran Congregation.

COLUMBUS, O.—Ground Improvement.—Plans are wanted here, until May 15, for complete plans for the improvement of the grounds known as Franklin Park, plans to show roads, drives, walks, and the exact location of all other artificial structures necessary. A premium of \$300 is offered for the best and accepted plans. For circular of instructions address George Donaldson, Secretary of the above institution, as above.

For works for which proposals are requested see also the "Proposal Column," pages i-vii-yiii-332-ix.

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, waill be liberally paid for.

WATER, SEWERAGE, ETC.

SALT LAKE CITY, UTAH.—Water and Sewers,—The officials of this city are considering plans for improving the water-works plant and extending, etc., the sewerage system. It is probable that conclusive steps will soon be taken and that plans will be adopted. Details can be obtained from Mayor Armstrong.

FULTON, N. Y.—Sewers.—Several blocks of additional sewers are to be laid here.

KNOXVILLE, TENN.—Sewers.—The election to decide for or against sewerage for this city, held here April 28, decided against the proposition. It is claimed that the taxpayers favor establishing a sewerage system, but were opposed to the particular method proposed. Another election will probably be held.

Geneva, N. Y.—Water.—Our correspondent writes: "The Geneva Water-Works Company has closed a contract with the village for 75 hydrants, or more, as may be ordered by the trustees. They will put down about four miles of o and 8 inch pipe, which will make its system 12 miles long. Contracts for the proposed work will be made as soon as plans and specifications can be perfected."

LIGONIER, IND.—Water.—P. V. Hoffman, Town Attorney at this place, writes as follows: "Our town will elect water-works trustees May 7. Any time after that they will be ready to examine any system or plans proposed. They have not yet adopted any plans or any known kind of system."

ORLEANS, NEB.—Water.—J. O. Stromburg, City Clerk here, writes us under date of April 24, as follows: "At the election held here yesterday the water bonds carried by a large majority. The work is to commence within five days after the first delivery of the pipes, and the entire works specified to be completed on or before thirty days from such date. A. A. Richardson is the engineer, from Lincoln, Neb."

PAVONIA, N. J.—The time for opening bids for erecting a stand-pipe has been extended to May 9. For details address Robert L. Barker, Chairman Water Committee, Camden, N. J.

BURLINGTON, VT.—Water.—A new reservoir will probably be built here at a cost of about \$25,000. Other im provements will also be made to the water-works \$95\$=tem.

WALDOBOROUGH, MB.—Water.—Regarding water-works matters here, our correspondent writes as followers: "There has been a charter obtained from the legislature, but as yet no company organized under it. The ctown at its last annual meeting voted to approprie atte \$600 per year for the term of ten years. I under the term of ten years. I under a tand it their report is favorable a company will be accided at once."

Hamilton, Ont.—Water.—It is proposed to expend about \$10,000 in laying additional water-mains in this place, and proposals will soon be wanted for the work. The Water-Works Committee can furnish details.

BURRILLYILLE, R. I.—Water,—The taxpayers of this place will hold an election May 5 to settle the question of appropriating \$4,000 per year for a water-supply. An offer has been made to provide the place with an abundant supply of water, to furnish 12s hydrants, two hose carriages with hose, public drinking and display fountains, free water for street sprinking, churches, schools, and other advantages. The system can be purchased by the town at any time. It is thought that the measure will carry.

ONEIDA, N. Y.—Sewers.—At a special election neld here April 27 to decide whether the village would issue bonds in the sum of \$80,000 to construct a system of sewerage, the project was defeated by a large majority. It is said that the taxpayers favor establishing a sewerage system, but as many individual preferences existed concerning the amount to be expended, etc., the measure was lost. It is thought, however, that the matter will be compromised and the project carried at another election to be held at an early day. The Village Clerk can furnish details.

PHILADELPHIA, PA.—Water.—The Water Committee of the City Councils have been requested to grant authority to the Disston and Holmsburg Water Companies, both places suburbs of this city, to lay pipes under the streets and supply the inhabitants with water until such time as the mains of the city works are extended to these localities. At a meeting of the above committee, held May 1, the matter was referred to the Committee on Works, with instructions to report regarding the feasibility of the undertaking at the next regular meeting.

WINCHESTER, Kv.—Water.—Reports say that the people of this place have decided in favor of water-works.

PULASKI, TENN.—Water.—It is reported that a system of water-works is to be established here and that the Mayor can furnish details.

Dybrsburg, Tenn.—The water-works question is being agitated here.

PARIS, Kv.—Sewers.—The sewerage question which has been discussed for a long time by the taxpayers of this place is to be settled at a public election to be held shortly, and it is thought probable that a system will be established.

AUBURN, ME.—Water.—Regarding the report that a water-works system was to be established here City Clerk J. W. Mitchell writes as follows: "We have a system of water-works in this city which has been in operation for several years, and I am not aware of any steps being taken to organize any other."

GRAND JUNCTION, Col.—Water.—The water-works project at this place is to be settled at a public election to be held this spring. It is thought that a favorable result will be had.

NRVADA, Mo.—Water.—The Nevada Water-Works Company will expend \$50,000 on improvements.

VALENTINE, NEB.—Water.—It is reported that this place is considering a water-works project

CATOONA SPRINGS, GA.—Water.—It is reported that a system of water-works is to be established here.

MALONE, N. Y.—Water.—Regarding the report that a system of water-works to cost \$00,000 was to be erected here, George Sabin, Superintendent of the Water-Works Company, writes us, under date of May 2, as follows: "Held our annual meeting this day. Had election of officers, Shall be ready to receive proposals soon, and shall push things with all possible speed."

CLAYTON, PA.—Water.—It is reported that the citizens of this place have decided in favor of water-works

ASOTIN, W. T.—Water.—The Asotin Water-Works Company has been incorporated here. For details address E. Baumeister, as above.

PHILADELPHIA, PA.—Water.—The Duquesne Water Company has been incorporated here with a capital of \$10,000. Details can be had by addressing William Lawler, as above.

EURBKA, KAN.—Water.—This city advertises for bids for doing the work necessary, etc., in the completion of a system of water-works. J. W. Nier, C. E., of Kansas City, Mo., prepared the plans and specifications. For further details see our Proposal Column.

Flushing, N. Y.—Sewers.—The officials of "this place have decided to extend the sewerage system into several new streets, and bids for the work will soon be wanted. For details address W. H. D. Nimmo, Village Clerk, as above.

"New Brunswick, N. J. — Water. — The Board of Water Commissioners has decided to extend the watermains through several additional streets of this place during the summer. The Clerk of the Board can furnish details.

BRUNSWICK, GA.—Sewers.—Mayor D. T. Dunn writes us as follows: "A survey of the entire city is now being made with a view to sewering this fall and winter."

Marion, Ala.—Water.—It is reported that the re-cent water-works agitation here will result in the con-struction of the system at an early day. Details can be had of the Town Clerk.

Newhall, Cal.,—Water.—The Newhall Tunnel and Water Company has been incorporated here, with a capital of \$500,000. John Robinson and others are the directors.

LEXINGTON, VA.—Water.—The water company at this place has decided to enlarge its system. Informa-tion can be obtained by addressing the Mayor, as above.

WATER-WORKS.—See our Proposal Column for information regarding water-works and water-works supplies at the following places: Atlanta, Ga., Aberdeen, Dak., Willimantic, Counc., Plattsmouth, Neb., Colman P. O., East Toronto, E ireka, Kan.

BRIDGES.

SAN MIGUEL, CAL.—Our correspondent writes as follows regarding the bridge project here: "An election has been carried to raise a tax of \$10,000 for the purpose of building a bridge across the Salinos River at this place. The tax will not be collected and will not be available until January, 1889."

BINCROFT, MASS.—Regarding the report that a bridge was to be erected here our correspondent writes: "The towns of Middlefield and Beckett have contracted with the Berlin Iroa Bridge Co., East Berlin, Conn., to build their bridge."

SEATTLE, W. T.—The Elliott Bay Bridge and Pile Company has been incorporated with a capital of \$60,-000. Thomas A. Jones and others are at its head.

RANDOLPH, KAN.—It is reported that the County Commissioners will construct a pontoon bridge across the Missouri River at this place, to cost \$0,000. For details address T. B. Bullene, No. 700 Main Street, Kansas City, Mo.

SAN ANGELO, TEX.—It is reported that the County Commissioners will place an iron bridge over the Concho River at this place. Address them as above.

MONTERBY, CAL.—It is reported that the County commissioners will erect several bridges in Monterey

CUTTINGSVILLE, VT .- An iron bridge is to be erected

POCOPSON, PA .- The County Commissioners are, it is reported, to build a bridge here.

I) WATRACE, TENN.—A bridge is to be built over Watrace Creek, at this place, by the Nashville & Knoxville Railroad Co. The company's office is at Nashville, where details can be obtained.

BRIDGES.—See our Proposal Column for information regarding bridge construction at the following places: Gadsden, Ala., Franklin, Pa., Yankton, Dak., Fort Gaines, Ga.

GAS AND ELECTRIC-LIGHTING.

SIOUX CITY, IOWA.—The Sioux City Electric Light Company proposes to erect a new power house, 50x100 feet, two stories high, with engine power to amount to 200 horse-power; and to add a Westinghouse incandescent electric light plant with a capacity for 650 lights.

EL PASO, TEX.—The El Paso Gas, Coke and Coal o. will erect an electric light plant here.

BARTOW, FLA.—The Brush Electric Light and Power ompany will erect an electric light plant here.

PITTSTON, PA,-The Citizens' Electric Illuminating Co. will erect a \$40,000 plant here. Details will be furnished by K. J. Ross of the above company.

FORT WORTH, TEX.—The Fort Worth Gas and Electric Light Company will expend about \$300,000 enlarging its plant. Besides adding to the gas-works, an electric light plant, for arc and incandescent lighting, will be built.

LAURENCE, KAN.—An electric light company has been organized here with J. D. Bowersock at its head, A \$30,000 plant is to be established, to include two engines of 200 horse-power each, and a dynamo, capacity of 70 arc and 1,000 alternating incandescent lights. The Thomson-Houston system will be used.

CONGAREE, S. C.—The Congaree Gas and Electric Company will establish an electric-light plant here. J. T. Sloan can furnish particulars.

GLOUCESTER, MASS.—The Gloucester Electric Light Company, capital \$20,000, will establish a plant here. For details address William A. Jordan.

CHRISTIANSBURG, VA.—An incandescent electric-light plant is to be established here. For details ad-dress C. P. Poole, Lynchburg, W. Va.

MIDDLEBORO, MASS.—An electric-light plant is to be erected here. Address George A. Cox.

ELYRIA, O.—An electric-light plant is to be estab-lished here. F. A. Beckwith can give information.

CATLETTSBURG, Ky.—An electric-light plant is to be established here.

RAILROADS.

BROCKTON, MASS.—A street railroad is to be built ere. For details address E. L. Brown, engineer, as here. above.

ALTON, ILL.-A street railway is to be built here.

MURPRESSOROUGH, TENN.—The officials of this place have granted a charter for a street railway, which is to be built as soon as the details can be effected.

BIRMINGHAM, ALA.—The Georgia Pacific Railway will lay 134 miles of track. Complete details can be found in our Proposal Columns.

LAWRENCE, KAN.—A project is on foot to build a street railroad from this place to West Lawrence. Kansas City capitalists are at the head of the scheme, and a charter will probably be granted at the next meeting of the City Council.

SMITHWOOD, TRNN.—Surveys are being made by the Knoxyille and Fountain Head Railroad Co. for an electrical railroad, to be about four miles in length. The president of the above can furnish details.

HUNTINGTON, W. VA.—An electrical street railroad about four miles in length is to be built here, to be in operation by July z. Centre-bearing rail is to be used. J. L. Young can furnish complete information.

ENTERPRISE, FLA.—A project is on hand to build a street railroad here.

BIDS OPENED.

RALEIGH, N. C.—Sewers.—J. L. Ludlow, C. E., sends us the following communication: "All bids for the Raleigh sewerage system construction received April 16 were unsatisfactory and all rejected. Construction is postponed, but propositions to construct the work will be received and considered at any time by the committee."

TILBURY CENTRE, ONT.—Water-Works.—The following bids for constructing a system of water-works for this place were opened April 25, by A. A. Wilson, Village Cierk · Fluke & Bohack, Windsor and Chathams, Ontario, \$12,356. John Carril & Co., London, Ontario, \$10,200; Miles, Hunting & Co., Hamilton, Ontario, \$44,846. Six other tenders were received for parts of the work. The contract was awarded to John Carril & Co.

PITTSBURG, PA.—Bridges.—The following bids for the erection of eleven new county bridges were opened April 27 by the County Commissioners:

The lowest bids for bridge masonry were as follows:
Long Run Bridge, Charles J. Lindquist, \$6.15 per cubic yard; Pine Creek Bridge, Eli Crum, \$5,74; Robinson's Run Bridge, M. Sweeney, \$6.60; Bull Creek Bridge, M. Sweeney, \$6.50; Bull Creek Bridge, M. Sweeney, \$6.75; Peter's Creek Bridge, Jacob Friday, \$7.50 per cubic yard for masonry, and 25 cents per lineal foot for piles and capping; Little Pine Creek Bridge, C. M. Driver, \$7.48; Shoop's Run Bridge, M. Sweeney, \$6.90; Burls Run Bridge, M. Sweeney, \$5.00; Sawmill Run Bridge, M. Sweeney, \$6.90; bridge across the back channel of the Ohio River to Neville Island, Jacob Friday, \$8.50 per cubic yard for masonry, \$4.75 per cubic yard for concrete, 25 cents per lineal foot for piles and capping and \$17 per 1,000 feet for timber.

The bids for the iron superstructures for the ten first named bridges are as follows: Pittsburg Bridge Company, \$11,400; J. M. Walker, \$11,600, and Keystone Bridge Company, \$12,508.

The Pittsburg Bridge Company received the total award.

Ottawa, Kan.—Sewers.—I. B. Jenkins & Co., o

OTTAWA, KAN.—Sewers.—J. B. Jenkins & Co., o Fort Scott, have received the contract to build the main sewers of a sewerage system for this city. The mains will cost \$50,000 and the laterals \$60,000.

MILWAUKER, WIS.—Sewers.—The contract for building a sewer in North Avenue has been let to Oscar Knie, at \$23,888.07.

BOSTON, MASS.—Sea Wall.—Proposals were received May 1, by the Charles River Embankment Co., for building 800 feet of sea wall on Charles River, but owing to the absence of the President they were not opened.

opened.

ALLEGHENY, PA.—Pumping Engines.—The following bids for furnishing two separate engines, of 36 and 48 inch stroke respectively, were opened April 2 by the Water Committee: Wilson, Snyder & Co., \$42,000 and \$45,000; the George F. Blake Manufacturing Company, \$43,450 and \$54,600; Henry R. Worthington, York, \$58,600 and \$42,000 nt wo patterns of 36 inch stroke and \$46,000 for the 48 inch. The same firm put in a bid for sets of steam pipe, valves, etc., for \$2,875. The Gordon, Maxwell Company, one bid on 36 inch, \$40,000. The Holly Manufacturing Company, Lockport, N. Y., three bids, all on 36 inch, for \$70,000, 348,000, and \$56,000, the specifications describing the classes to account for the discrepancies. The bids were referred to the Machinery Committee.

classes to account for the discrepancies. The bids were reterred to the Machinery Committee.

Toronto, Canada.—Water-Works Supplies.—The following awards have been recommended by the Committee on Water-Works, furnishing supplies required by the Water Department during the year:

St. Laurence Foundry Company, Toronto, pipe, 3 inch, per ton, \$44.80; 6 inch, \$38; 12 inch, \$37.50; Treloar, Blashford & Co., Toronto, special castings, per 100 pounds, \$2.25. Charles Smith & Co., Toronto, hydrants, 126, 50; 12 inch valves, each, \$0; 6 inch valves, \$16.50; 12 inch valves, \$39.50. Stevenson, Toronto and Montreal, lead pipe, \$4, \$6. \$4, \$6, \$7. \$1 inch, per 100 pounds, \$3.80; James Robertson & Co., Toronto, wooden stop cock boxes and nipple blocks, double boxes, each, 20 cents, single, 25 cents, nipple blocks, each, 12 cents; Thomas W. Self, brick meter chambers, per 1, coo bricks, \$15.90; Burns & McCormack, Toronto, pipe laying according to specifications, \$3,850; F. W. Unitt, Toronto, general stores, according to specifications, \$3,865; St. Laurence Foundry Co., purchase of scrap iron at engine house, cast iron, per ton, \$14.50, wrought, \$11.95.

GOVERNMENT WORK.

GOVERNMENT WORK.

MOBILE, ALA.—Channel.—The following bids for constructing Lock No. 1 and the excavation of a channel below in the Warrior River were opened April 23 by A. N. Damrell, Major of Engineers, U. S. A.: L. M. Pettidider, Cincinnati, O., \$161,448.75; J. A. J. Smith, Cincinnati, O., \$172,061.87; Reilly & Gude, Atlanta, Ga., \$162,557.85. The following bid, with no signature or bidder's bond, was received from Birmingham, Ala.: \$97,610.80.

DETROIT, MICH.—Dredging.—General Poe, of the United States Engineer's Office, has recently let the contract for dredging the harbor at Cheboygan to Chauncey E. Mitchell, at 144 cents per cubic yard. He has also let the contract for drilling and blasting

in the Soo Canal to Hickler & Green. The specifica-tions call for the removal of all the rock for a distance of 700 feet above the movable dam, to a uniform depth of at least 21 feet. It will require the drilling of 2,000 holes 6½ feet deep and about 2 inches in diameter. The contractors furnish everything and get \$4.47 per hole for the drilling and blasting.

PHILADELPHIA, PA.—Delaware River Improvement.
—The following bids for furnishing and depositing stone in constructing a dike in the Delaware River, near Mifflin Bar, opened April 27, by Lieut.—Col. Henry M. Robert, Corps of Engineers: John Satterlee, Englewood, N. J. per cubic yard, \$1.93; Brandywine Granite Co., Wilmington, Del., \$1.75; George R. Stephenson, Lapidum, Md., \$2.10; James E. Spencer and W. W. Virdin, Lapidum, Md., \$2.05; James H. Ward, Ridley Park, Pa., \$1.19; John A. Bowker, New York City, \$1.65.

The bids of George R. Stephenson, James H. Ward and John A. Bowker were informal.

The following bids for constructing a dike in the Delaware River from the lower end of Reedy Island were opened on the above date by Lieutenant.—Col. Henry M. Robeit, Corps of Engineers: Approximate quantities, 4,000 cubic yards of brush mattress; 20,000 cubic yards stone. Bidders—John Satterlee, Engelwood, N. J., \$43.160; John A. Howker, New York City, \$4*,800; John C. Churchill, Jr., Burlington, Vt., \$42.360; Ira Lunt, New Castle, Del., \$37,760; Brandywine Granite Co., Wilmington, Del., \$35,200. The bid of the last-named firm was recommended for ac ceptance. The bid of John A. Bowker was informal.

TERRE HAUTE, Ind.—Post-Office.—The following TERRE HAUTE, Ind.—Post-Office.—The following bids for the interior finish, including iron statist, lichtwell finish, lathing and plastering, marble work finished floors, joining, glass, hardware, painting, and polishing for post-office were opened May 1 by the Supervising Architect of the Treasury Department: Colins & Ohm, \$22,000, \$31,600 omitting attic floor; Robinson Planing Mill Co., \$31,451; John Mitchell, \$32,928.60; John O'Connor, \$27,000; Robert Mitchell Fur. Co., \$36.276.74; Shover & Christian, \$31,372; McCarthy & Baldwin, \$31,074; George W. Corbett, \$31,500.

WASHINGTON, D. C.—Torpedo Boat.—The opening bids for the construction of a submarine torpedo boat which was to have taken place May r, was post-poned until May 3.

WASHINGTON, D. C.—Removal of Wrecks.—The following bids for the removal of three wrecks in Mattaponi River, Va., between Ayleits and Walkerton, were opened April 28, by Col. Abert: John L. Johnson, Fulton, N. V., \$7,500; Thomas P. Morgan, Washington, D. C., \$4,500; William H. French, Berkley, Va., \$1,800.

GALVESTON, TEX. -- Court-Honse.—The following proposals for the erection, etc., of the court-house, etc., at this place, were opened May 2, by the Supervising Architect of the Treasury Department:
Colins McK Grant, \$139,000; Charles S. Ott, red stone, \$142,300, red stone and terra cotta, \$170,603; Samuel W. Swift, \$139,000; Charles Lundberg & Co., portico entry with Linden stone trimmings \$118,506, with Bedford limestone throughout, \$108,506; McCarthy & Baldwin, Texas stone and Galveston pressed brick, \$131,930, Texas stone and Galveston pressed brick, \$131,235, portico entry and St. Louis pressed brick, \$141,245, portico entry and St. Louis pressed brick, \$145,007, red.granite and St. Louis pressed brick, \$157,696.

CARSON CITY, NEV.—Court House.—The following bids for the erection of a court house, etc., were opened May 1 by the Supervising Architect of the Treasury Department; Henderson & Haliday, \$102,900; James H. Coster, \$6,5,44; John O'Connor, \$105,000; George D. Nagle, \$80,000.

Building Intelligence.

PROPOSALS.

(Continued from page viii.)

ROAD, Lexington, Ky.—Proposals are wanted, until May 19, for building 2½ miles of turnpike road. Address J. W. McCann, as above.

CHURCH, Springfield, O.—Proposals are wanted until May 17 for erecting a new church for the trustees of the Congregational Church. Address C. H. Pierce, President, as above.

REBUILDING STEAMER, New York City.—Proposals are wanted until May 11 for rebuilding the hull, 1 iner work, etc., of the steamer 'Minnahanonck.' Address the Department of Public Charities and Corrections, 66 Third Avenue, as above.

OPERA HOUSE, McPherson, Kan—Proposals are wanted until May 15 for completion of the McPherson Opera House above the foundations. Address E. G. Clarke, Chairman Building Committee, as above.

HIGHWAY. East Hartford, Conn.—Proposals are wanted until May 12 for building either the whole or any section of a highway recently laid out in said town, extending from Main Streett ot the Old Mill Road. Address John Kennedy, of the Board of Selectmen, as above.

RAILROAD, Birmingham Ala. — Proposals are wanted until May 12, for the graduation, trestles (framed and on piles), and cross ties necessary for the construction of one single track railroad from Columbus, Miss., to Johnsonville, Miss., a distance of 124 miles. Address Chief Engineer Georgia Pacific Railway, as above, or John W. Johnston, President.

SCHOOL, Milwaukee, Wis.—Proposals are wanted until May 11, for the erection of a primary school building. Address the Board of Public Works, as above.

WATER PIPE, Colman P. O., East Toronto.— Proposals are wanted until May 15 for the supply of cast-iron pipes, 10 and 6 inch, free on board cars at York Station, G. T. R. Address R. Luttrell, Chair-man Water and Light Committee, as above.

RAILROAD TRACK MATERIAL, Washington, D. C.—Proposals are wanted, until May 8, for a quantity of the above, according to specifications. Address James Fulton, Paymaster General, U. S. N., Navy Department, as above.

PROPOSALS.

IRON WORK, Toronto, Can. - Proposals are wanted until May 17 for sundry wrought and cast in work required for the Parliament Buildings. Address C. F. Frazer, Commissioner Department of Public Works for Ontario, as above.

GAS LIGHTING, Boston, Mass.—Proposals are wanted until May to for lighting the streets, etc. of the city proper for a period of five years. Address Hugh T Toland, Superintendent of Lamps, as sixte.

WATER-WORKS, Eureka, Kan.—Proposals are wanied until May 3tfor doing all the work necessar-to the completion of a system of water-works, acord-ing to specifications. Address Mayor H. G. Jooes. 8

SCHOOL, Yankton, Dak.—Proposals are wanted until May 11 for the erection of a brick and size school edifice. Address J. D. Stay, Secretary boars of Education, as above.

CHURCH, Kittanning, Pa.--Proposals are warted ntil May 15 for the erection of a stone church be 2until May 15 for the erection of a stone church be ing for the First Presbyterian Church. Address Geo. T. Crawford, Secretary, as above.

CITY BUILDING, Eric, Pa,—Proposals are wasted until May 20 for the carpenter and wood work, 172, cut stone, cells, vaults, fire-proofing, plastering, thes, marble mantels, steam-heating, plumbing, gas-firing, etc., etc., necessary to finish the basement and firstory of the City Building at this place, including the department of the Mayor, Treasurer, Solicitic, Water Commissioners, Controller, Engineer, Health Office, Supervisors and Police. Bids will be taken for the whole or any part of the work at the Mayor's off-For details address John C. Brady, of the Building Committee, as above.

CUT STONE, New York City.— Proposals in-wanted, until May 10, for furnishing and deliver of cut stone at the reservoir at High Bridge. Adding the Department of Public Works, as above.

GRADING, MASONRY, AND BRIDGING Gadsden, Ala—Proposals are wanted, until May is for the above work on the unfinished portion of 0.2 Road, a distance of 36 miles, between Gadsden and Guntersville; also another contract for 40 miles. Address E. A. Quintard, President Tennessee and Cook Railroad Co., 69 Wall Street, New York City.

VITRIFIED PIPE AND RUBBLE STONE. Atlanta, Ga — Proposals are wanted, until June 6, or furnishing all rubble stone and vitrified pipe require by the Chain Gang Committee in 1888. Address lear T. Cooper, Clerk Commisssioners of Roads and keyenue, Fulton County, as above.

GAS, Philadelphia, Pa.—Proposals are wanted and June 5 for the manufacture and delivery into the hoseers of the above city of illuminating gas. Address the Bureau of Gas, 20 South Seventh Street, as above.

STOP-COCKS, HYDRANTS, ETC., New Yest City.—Proposals are wanted until May 10 for furnishing and delivering stop-cocks, hydrants, wooden hydrant-boxes, and cast-iron stop-cock boxes. Address the Department of Public Works, as above.

STEAM-HEATING, New York City.—Proposis are wanted until May 11 for steam-heating, etc., a priviou (almshouse) on Blackwell's Island, New York Address the Department of Public Charities and Correction, 66 Third Avenue, as above. BUILDING, New York City.—Proposals are wanted until May to for furnishing materials and performs, the work of building a house for storage of coal on the lot between Ninety-sixth and Ninety-sixenth Streets, and a wagon platform. Address the Department of Public Works, as above.

GRADING, Columbus, O.—Proposals are wanted until May 18, for grading the roadway of the Gram is road east of Alum Creek. Address Frank J. Rembard, County Auditor, as above.

SCHOOL, Ludlow Grove, O.—Proposals are wanted until May 15, for doing the brick, carpenter and plattering work, also roofing of the addition to thence school here. Address William Schulhuf, Clerk School Board, as above.

STONE ABUTMENTS, Franklin, Pa.—Proposis are wanted until May 8, for furnishing the material and constructing two stone abutments, according to specifications. Address William A. Maitland, County Commissioner, as above.

COURT HOUSE, Lincoln, Neb.—Proposals are wanted until May 17, for the erection of a court house according to specifications. Address O. C. Bell, County Clerk, as above.

PAVING, Tolede, O.—Proposals are wanted util May 14, for paving certain streets of this city. Address G. H. Cole, City Clerk, as above. BRIDGE, Yankton, Dak.—Proposals are wanted until May 24, for the construction of an iron bridge across Clay Creek at Valus Station, in Yankton County. Address William H. Edmunds, Chairman, Board of County Commissioners, as above.

IRON BRIDGES, Franklin, Pa.—Proposals are wanted here until May 15, for furnishing material and erecting three iron bridges according to specification. Address William A. Maitland, County Commission:

BRIDGE.—INDEPENDENCE, MO.—Proposala are wanted, until May 7, for constructing an incebridge, 165 feet span, over the Bik Blue River at Machester. Address P. H. Ginter, County Surveyor, as

REPAIRING BRIDGE, Fort Gaines, Ga.—Pro-osals are wanted until May 16 for repairing the Chat-ahoochee River bridge. Address Mayor S. D. Co-nan, as above.

SEWERAGE SYSTEM, Aberdeen, Dak.—Proposals are wanted until May 21 for a sewerage system for this place. Address W. F. Lange, Deputy, City Auditor's Office, as above.

SEWERS, Willimantic, Conn.—Proposals are wanted until May 14 for constructing several hundred feet of sewers and doing other detail work here. Address John M. Hall, Chairman Special Sewer Committee, as above.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 24.

PUBLISHED EVERY SATURDAY.

NEW YORK, MAY 12, 1888.

THE NEW YORK LEGISLATURE AND THE QUAKER BRIDGE RESERVOIR.

In the last hours of the session of the Legislature an effort is being made to postpone for another year the completion of the work necessary to increase the water-supply of the city. It can have no other object than to extend the official life and consequently the salaries of the politicians whose present means of support is dependent on the continuance of the existence of the complex organization which controls the construction of the work. It is true that this obstruction is adroitly advocated on the ground of public policy and safe provision of possible economy to be secured by more thorough investigation of the problems to be solved. But this is only a trick, and so transparent a one that it is a wonder that the apparent prime mover in the matter does not see that he is being made a tool of by a set of crafty schemers who, to promote their own private ends, are availing themselves of his well-known obstinacy in supporting his fanatical ideas.

The gentleman who is so prominently advocating before the Legislative Committees the bill ordering the postponement of all action in the direction of constructing the Quaker Bridge Reservoir until next year is undoubtedly firmly convinced in his own mind that he has right and reason on his side, but that is no reason why the time of the Legislature should be taken up with listening to him or that his project should be entertained for an instant. The testimony of all the civil engineers of standing and of experience in watersupply on a large scale who have examined and reported on this problem is unanimously and overwhelmingly in favor of the plan which has now been under consideration for several years, and of which the construction of the great reservoir at Quaker Bridge is an essential feature. Indeed, without this reservoir the whole scheme would be an absurdity.

Against this preponderating unity of opinion among the men who have made such subjects the study of their lives is offered the opinion of one man whose success in another line of business requiring shrewdness and pluck, but no previous training or study, has inspired him with the idea that his own "horse sense" is worth more than the accumulated knowledge and experience of generations of engineers, and who has the boldness to openly and persistently advocate his opinions at all times and in all places. From his point of view he may be right, but it is an outrage on the public that he should be permitted to consume the time of public officers in listening to his appeals to delay the execution of the one part of the great water-supply scheme which is essential to its completeness, until, forsooth, the opinions of some more experts can be obtained, in the hope that some hitherto undiscovered expert may be found or made to order who will differ from those who have already spoken. This is worse than folly; it is silliness; it is criminal trifling.

There is not a single civil engineer in America who has had the experience, the scientific training, and the familiarity with great hydraulic works which the eminent men possess who have put themselves on record in favor of the Quaker Bridge Reservoir. A half a hundred smaller fry might perhaps be induced, for a consideration, to give "expert" opinions against it, but they would be worth nothing, and they would effect

nothing except the delay which place-holders desire and their tools, either designedly or ignorantly, ask for.

THE FACTS ABOUT THE BAD WORK ON THE NEW CROTON AQUEDUCT.

THE accounts recently published of bad work on the new Croton Aqueduct, and the reports that the Comptroller had sent his engineer to examine the work and report on its condition before any more money would be paid to the contractors, have alarmed the public, who, very naturally, have concluded that the discovery of this work was the result of the recent legislative inquiry and that the end was not yet. And the daily papers have concluded that the three commissioners appointed by the last Legislature were in a measure responsible for it. If this were so it would at once suggest itself to our readers that the engineers and inspectors on the work were grossly inefficient and corrupt in not calling attention to it. It is gratifying, therefore, to be able to print the following report by Chief Engineer B. S. Church and Deport of the state o uty Chief Engineer George S. Rice, by which it will be seen that the engineers have done their duty, and have been fully sustained by all the commissioners when they were made acquainted with the facts; and since so much has been said about O'Brien & Clark in the daily papers, it is only fair to call attention to the fact that this firm have done their work well, and when defects have been pointed out have promptly and cheerfully done all in their power to meet the demands of the engineers. Engineers Church and Rice, under date of May 9, say:

Hon. James C. Spencer, Chairman of the Aqueduct Com-

missioners:

DEAR SIR—In accordance with your request, we respectfully make the following report on the "bad work" found on the line of the new aqueduct.

The new aqueduct, from Croton Lake to One Hundred and Thirty-fifth Street in New York, consists of over thirty miles of aqueduct, mostly in tunnel, and the work has been let in fifteen different sections to six firms of contractors—viz.: Smith & Brown, Brown, Howard & Co., O'Brien & Clark, Heman Clark, John Brunton & Co., and R. A. Malone.

O'Brien & Clark, Heman Clark, John Brunton & Co., and R. A. Malone.

This work is in charge of five Division Engineers, and no serious trouble was had until about the early part of October, 1887, when the engineer in charge of the First Division made frequent reports that the work on his division, done by Brown, Howard & Co., was being slighted.

The Chief Engineer delegated the Deputy Chief Engineer to look into this matter, and he found that there was apparently an organized attempt to construct the rubble masonry backing in an imperfect and unsatisfactory manner, and he so reported to the Chief Engineer.

Work was constantly being condemned and torn down, but on account of the general bad character of this rubble masonry, it was suspected that a large amount of work must be bad and unacceptable.

On November 17, 1887, the Chief Engineer notified Brown, Howard & Co. that if the "bad work" was not stopped he would refer the matter to the Aqueduct Commissioners. No attention was paid to the order as far as the quality of the work was concerned, and the Chief Engineer reported to the Committee on Construction on January 4, 1888, that Brown, Howard & Co. were dis obeying the orders of the engineers and allowing unsatis factory work to be done.

An amount of over \$20.000 was deducted from the esti-

obeying the orders of the engineers and allowing unsatis factory work to be done.

An amount of over \$20,000 was deducted from the estimates for Sections 2 and 3 for the months of December, 1887, and January, 1888, and the Committee on Construction passed a resolution on January 9, 1888, approving of the course pursued by the Chief Engineer.

On January 16, 1888, the Committee on Construction received several communications from Brown, Howard & Co., stating that they were not being treated fairly and requesting a hearing.

The Committee authorized such a hearing and referred the matter to the Chief Engineer, Deputy Chief Engineer,

and Principal Assistant Engineer, with instructions that the Deputy Chief and Principal Assistant should conduct the hearing and report to the Chief Engineer without recommendation, after which the Chief Engineer should

recommendation, after which the Chief Engineer should report to the Committee on Construction.

Fourteen meetings were held in Tarrytown, N. Y., commencing January 23, 1888, and ending March 6, 1888. It soon became apparent that Brown, Howard & Co. were intentionally prolonging the taking of testimony, and on February 20, 1888, at the request of the Chief Engineer, the Committee on Construction authorized the cutting of holes into the mason work, and the suspected "bad work" was discovered on March 5, 1888.

On March 14, 1888, the Chief Engineer reported that contractors Brown, Howard & Co. were executing their contract for Sections 2 and 3 in bad faith and that he suspected the work on Sections 4 and 5 was not good.

pected the work on Sections 4 and 5 was not good.
On March 20, 1888, the Committee notified Brown,
Howard & Co. to appear before them on March 22, 1888, and show cause why the contract for Section 2 should not be taken from them.

On April 10, 1888, the Chief Engineer reported to the Committee that Brown, Howard & Co. had signed a document offering to make good, at their own expense, the defective work on Section 2.

On April 17, 1888, the repairing of the bad work was commenced and the work has continued to date.

commenced and the work has continued to date

An examination of the whole line of the Aqueduct has been commenced, and some holes have been cut on Divisions 3 and 4, and will soon be cut on Division 2.

As most of the masonry work has been done under-ground, both day and night, it has been a serious matter to stop bad work, and a large amount of trouble has been occasioned by poor inspectors, who have been discharged as soon as found incompetent and unreliable; twenty six have been discharged or suspended since November 16, 1887

Outside of Brown, Howard & Co.'s contracts, the amount of bad work discovered has been small, less than \$5,000 in value, and where any bad work has been found there has been an earnest effort to repair it immediately.

No final estimate has been made on the 15 Sections, and before any of them are made the work will be

thoroughly inspected. Yours truly,
B. S. CHURCH, Chief Engineer.
GEORGE S. RICE, Deputy Chief Engineer.

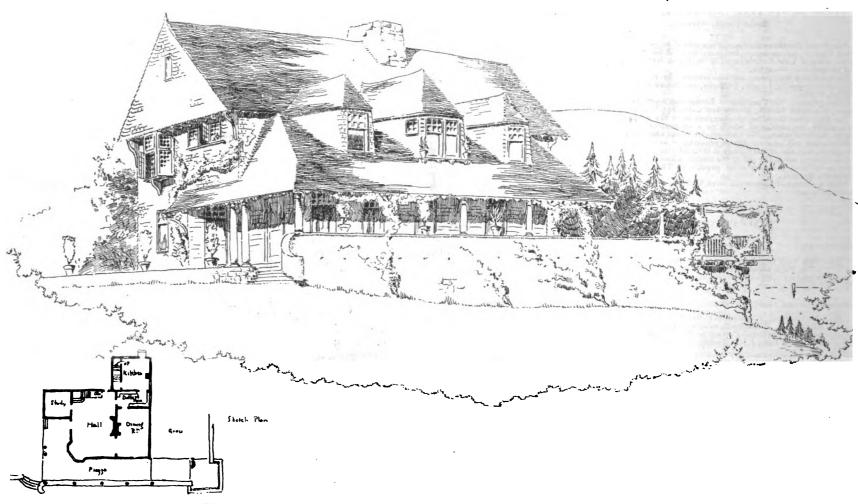

It will be noticed that there has been great difficulty in securing enough good inspectors and that twenty-six have been discharged since November, 1887.

The inspectors, under the law, are appointed by the Commission after a Civil Service exami-

ASPHALT PAVEMENTS IN NEW YORK AT COST OF PROPERTY OWNERS.

WE have frequently urged the trial of asphalt pavements properly put down on some of the residential streets of New York, pointing out the advantages of this noiseless and cleanly pavement as recorded in the experience of other cities. It was with considerable satisfaction, therefore, that we noticed in a recent ride on the west side in this city, where so much building has been in progress, that on West End Avenue and Seventy-second Street the enterprising property owners had contracted with a responsible company who had laid this pavement. quiry we learned that some thirty different owners have co-operated in this matter, Messrs. W. E. D. Stokes and W. J. Merrill, who own a number of buildings in the locality, having been the active promoters of the movement.

The excellent appearance of the street will doubtless enhance the value of their houses more than it has cost the owners. We hope the

COTTAGE ON LAKE GEORGE FOR E. LUTHER HAMILTON, ESQ.-J. D. HUNTER, ARCHITECT, N. Y.

On Section 2 about 500 holes have been cut through the brick and rubble masonry and about 80 per cent. of them have shown bad work.

From what has been disclosed by the examination the

city has been fully protected by the amounts kept back on the estimates, as will be seen by the following:

SECTIONS 2 AND 3, NEW AQUEDUCT.

	Ten per cent. retained as per contract.	Additional amount re- tained for bad work.	Total amount retained.	
October 31, 1887	\$324,304.88	\$1,610.00	\$325,914.88	
November 30, 1887		20,293.50		
December 31, 1887		21,025.00	395.552.73	
January 31, 1888	398,899.41	22,377.50		
February 29, 1888 March 31, 1888	No estimate.		627,069.51 760 ,8 95.71	

From the above it will be seen that as soon as bad work was discovered the estimates for February and March were withheld, and on March 31, 1888, the actual amount withheld from Brown, Howard & Co., on their contracts, was \$1.041.614.41.

nation, which is of little value in determining the capability or honesty of an inspector of masonry, and which in this case has often resulted in delays in securing inspectors when needed. Frequently the force of inspectors has been inadequate, and the engineers have been assigned to temporary duty as inspectors to tide over Many men who would make good emergencies. inspectors of masonry cannot pass the city Civil Service examinations, while it is a fact that men have passed who knew nothing of masonry. Inspectors, we learn, are now examined also by the engineers, and in view of what has transpired we apprehend no more bad work, since the action of the Commission in supporting their engineers and not yielding to pressure to remove them or change their stations has had and will have a wholesome effect in maintaining discipline and efficiency.

fact may speedily be demonstrated so that the example they have set may be followed else-

PARK COMMISSIONER TOWLE.

THE appointment by Mayor Hewitt of Stevenson Towle, Mem. Am. Soc. C. E., as a Park Commissioner of this city is to be thoroughly commended. Mr. Towle was for many years Chief Engineer of the Department of Sewers. He resigned when Mr. Squire was Commissioner of Public Works. For a number of months he has been traveling abroad investigating municipal engineering methods. His training, experience and character will make him a useful

RESIDENCE OF ULYSSES D. EDDY, ESQ., MAMARONECK-ON-THE-SOUND, N. Y.

ERRORS IN CONSTRUCTION.*

I HESITATED to address the League on the subject I am about to present, but in considering my experience in the bureau, the difficulties I must continually grapple with, and the extra amount of labor devolving upon and required of the employes of the department, through want of knowledge of the laws of construction on the part of architects, I concluded to present my case and hope my proposed remedy will meet with your approval.

My connection with the bureau dates back to February, 1885, and in the three years which have passed since

then, 12,921 applications, representing an estimated value of \$191,105,440, have been submitted for action. The great majority of these have passed directly through my hands, and fully seventy-five per cent. thereof were disap-proved, many for defective and unintelligible drawings, more for defective forms of construction. In presenting some of these defects it would be well to group them in accordance with the materials in which they occur and in the order of their frequency. The greatest number of errors were found in iron constructions, then follow those in wood, and finally those in masonry.

The number of dangerous and remarkable constructions

The number of dangerous and remarkable constructions is legion. I regret extremely not to have kept a record of these matters, and to be obliged, therefore, to draw upon my memory for particulars. Numerous defects are due to unfamiliarity with the requirements of the building law and do not fall within the scope of this paper. Such errors are, as a rule, easily remedied.

Taking the first group, we have those in iron. The engineer's device, the I-beam, is often unscientifically employed the various tables furnished by the iron mills

oyed, the various tables furnished by the iron mills becoming as poison in the hands of children. Again and again girders made of exactly the same beams are specified to carry loads varying by thousands of pounds, at other times like beams are loaded with like loads—some uniformly distributed, some concentrated at the centre; the fact that a beam if loaded at the centre will carry but half as much as if uniformly distributed being seemingly unknown to the designers. I have half a dozen cases in mind where brick partition walls over halls were to be carried by iron beams, the loads being directly at the centre, and the required amendment read: "Use twice as many iron beams as shown." In one case the builder coolly omitted the iron beams and carried a 12-inch brick wall 40 feet high in the centre of a 38-foot house on wooden cantilevers.

Again, some weeks ago, a set of plans was submitted showing a girder made of two 15-inch heavy beams, to carry in turn one made of two 12½-inch beams, the load on the latter to be transferred to the 15-inch beams at a point some three feet from the wall. The 15-inch girder was exactly sufficient, yet it was the intention of the architect to frame the 12½-inch beams into the 15-inch girder, so that but one of the beams composing the same would have carried. Only a week ago plans were filed for a large and costly building, in which it was intended to carry the walls of the front on iron columns and girders. Some of the openings required girders 15 inches high, so the architect concluded to use 15-inch beams for all the openings, thus showing a uniform height of girders at the front. Three 15-inch beams being unnecessarily large for the smaller openings, the girders were made of one 15-inch beam and 10½-inch and 12½-inch beams. To subject the iron in the different members of these girders to the same uniform strain would be impossible, and a failure would certainly have taken place in the course of time. Often extra light and deep beams have been proposed for very short spans instead of heavy shallow beams.

Numerous examples of defective plate-girder construc-

Numerous examples of defective plate-girder construction can be found in the archives of the bureau, the defects generally consisting in improperly disposed stiffeners, too great a pitch of rivets, no allowance for punching, heavy webs, light cover-plates, etc. I call to mind a double web plate girder submitted last week. It is to carry quite an ordinary load on a span of some 18 feet, yet the webs are specified % of an inch thick each, when 3% of an inch would be ample. I shall not take the trouble to bring this to the architect's attention, as on a previous occasion a similar suggestion elicited the unscientrouble to bring this to the architect's attention, as on a previous occasion a similar suggestion elicited the unscientific answer that it was desired to be entirely sure of the girder's capacity. Through the ignorance of the designer the client was therefore subjected to an unnecessary expense. Another case: a large plate-girder was lately submitted where the load upon it subjected the iron to a fiber strain of 30,000 pounds, so that the construction would surely have failed.

The use of the I-beam in the shape of cantilevers is less frequent, but I have a number of such constructions in my mind which, if allowed, would have brought about

less frequent, but I have a number of such constructions in my mind which, if allowed, would have brought about serious accidents. On one occasion the architect was requested to state the size of the beams he proposed to use, to which he replied "that that was a matter for the iron man and the iron inspector, and the neglect to furnish the data at that time should not be a reason for refusing approval." Last fall I pointed out to another architect the fact that the girder he proposed using was insufficient to carry the imposed load, and when convinced of the correctness of the bureau's position he proposed to build in an iron beam in the story above, quite forgetting that this single beam would have been subjected to a breaking strain, and that the original load would again that this single beam would have been subjected to a breaking strain, and that the original load would again rest on the girder below. In very many instances iron columns of insufficient diameter and thickness of metal are proposed, but I believe these errors are rather due to the fact that the designer has assumed a lighter load than permitted by law, than to a wrong application, of the tables and formulas for iron columns. Iron roofconstructions, true subjects for the engineer, rarely show

Since last July the building law requires that all lightshafts be constructed of fire-proof materials. They are therefore generally constructed of fire-proof blocks, sometimes starting on foundation walls, but more generally on iron beams. These shafts, located with reference to the sanitary arrangements of the building, frequently bring about quite complicated systems of framing and loading, and the bureau is again and again called upon to suggest the size and weight of the iron beams.

the size and weight of the iron beams.

Leaving the iron constructions, let us pass to the second group—constructions in wood. Beams and girders are generally of ample size. Columns, on the other hand, are rarely too large, generally too small. Curious errors are made in them, showing a lack of knowledge on the part of the designer as to the strength of the materials and as to the factors of safety demanded by law and practice. The most common error is the one of making the lower columns too small, the upper ones too large. What excuse on the score of strength can there be, for instance, for columns too small, the upper ones too large. What excuse on the score of strength can there be, for instance, for making the columns of the same size in several superjacent stories? And yet such cases are not infrequent. Constructions are occasionally proposed where yellow pine posts would have been subjected to a pressure of over 2,000 pounds to the square inch.

Although permission has several times been asked, no permit has been issued to allow the placing of iron columns over wooden ones. How many such constructions have been carried out in former years I do not know, but I believe there are many. This method was employed in a certain school building, the iron columns in the first story resting on the wooden ones in the cellar—the latter columns reaching below the cellar floor. In the course of time the foot of one of the wooden columns had so thoroughly rotted as to let the iron column next above settle sufficiently to sever its connection entirely with the girder over it, a position it retained but for a few moments, and then came toppling over, causing a panic in a crowded room, but, fortunately, killing no one.

Large roof constructions are not attempted, as a rule, by any but competent men, and yet examples of dangerous constructions are not wanting. A tie-rod or a strut will be forgotten, a member introduced to take a thrust where a pull only will be possible, etc. Trusses have been submitted where the strength of the same depended upon the stiffness of the joints. Take, for instance, the truss which recognizes of the plant at the presenting of the plant. mitted where the strength of the same depended upon the stiffness of the joints. Take, for instance, the truss which spans the proscenium opening of the old Union Square Theatre. Here is a queen-post truss with the struts omitted. One might say of this truss that it is in a sort of unstable equilibrium, and in danger of collapsing in case of unequal pressure.

Plans for a building were once filed where the clear span between bearings was sixty feet. The roof-trusses over this room were each to be made of two main rafters, a tie-beam, two struts, and a king-bolt. The architect not being sure of his ground, gladly accepted the bureau's suggestions and constructed a substantial truss. In a hospital building fault was found with the size of the floor-beams for the proposed span, to remedy which the architect specified a lattice-girder four feet deep—strong enough, to be sure, a girder 14 inches deep only being

required.

We now reach the last group—constructions in masonry. In the thickness of walls many errors are made, but I attribute these to a want of knowledge of the requirements of the Building Act. Not so with piers, in the design of which many, very many errors are committed. Piers with battering sides are submitted tor approval with insufficient area at the top and excessive area at the bottom, piers with plumb sides of sufficient area capped with granite with plumb sides of sufficient area capped with granite cap-stones of smaller area, and piers of ill proportion between height and thickness, the development of bending moments being quite forgotten. These and many other errors are of daily occurrence. Application was made in the month of March to remove a fore-and-aft partition-wall and repiace the same by piers, columns and girders. The columns and girders were found ot ample size; not so the piers in the cellar, which were specified to be 16 x 16 inches. The first story columns were to be of iron and of sufficient size to carry 125 tons. If these piers had been built of the best of brick in Portland cement they would have crumbled under the excessive load. Piers 36 inches square were required and accepted without remonstrance. The error of not properly proportioning the area of the base to the area not properly proportioning the area of the base to the area of the pier is a common one. The law provides that the base course must project at least 12 inches on all sides beyond the various faces of the piers, and in certain cases double base courses are required. Now, one architect invariably puts down two courses of stone, each course 10 inches thick, with a projection of 12 inches on all sides. Here is a waste of material. A few others project each course 12 inches, an error in itself, bringing about so excessive a spread of base as to prevent a uniform settlement of the

walls and piers.

When I took charge of the bureau, it was the general custom to make use of the running foundation walls for taking the concentrated loads carried by iron columns. Such walls are generally built of stone, and, as you all know, are hardly better than a very coarse concrete. I therefore insisted upon piers under all points where concentrated loads were to be supported, such piers to be built of brick or dressed stone. I desire to interpolate here, however, that if stone piers are proposed in the cellars or subcellars of buildings, I request that they be built of brick that the entire building may not be let down in case of fire, endangering the lives of the firemen, many of whom have been maimed and killed through such collapse. Brick piers under concentrated loads are now quite

the rule, and I believe fewer serious settlements will hereafter be recorded. In building piers under concentrated loads the mistake is frequently made of not properly centering the iron columns over the piers.

It would seem that every architect of our generation should know that piles must be cut off below the level of low water, and timbers, where used in the foundations, continually submerged, if permanent stability of the structure is aimed at. But the defective constructions of this class, proposed and executed, are so many that we are ever on the *qui vive* at the bureau. Two weeks ago an application was made for a two-story office building. In the rear was a solitary 6-inch diameter locust post supporting an area of some 300 square feet of floor and a like amount of roof area. Under this insufficient post a 2'8"x2'8" brick pier was proposed. The disproportion is too evident for comment comment

The arch, in its fullest development, is a pretty well neglected element of construction with us, but I believe and hope it is coming into favor again. The number of errors noticed are comparatively few. One gentleman who practices our noble profession answered, when asked who practices our noble profession answered, when asked how he proposed overcoming the thrust of his arch, "by increasing the number of rowlocks." An example of some large arches was submitted the past winter where no provision had been made for the balancing of the thrusts—at least the drawings revealed none. Upon calling attention to this fact the architect explained that he intended placing girders over the arches and when asked to specify their size he selected insufficient beams. I objected and argued that they would bend and break, being entirely inadequate, while he contended that the girders would help the arches and the arches the girders. He had forgotten that the strength of a chain is measured by the strength of its weakest link.

Finally, I desire to tell of a remarkable proposition made Finally, I desire to tell of a remarkable proposition made to me some two years ago. A permit was issued for the erection of a two-story factory, the outside walls being resolved into isolated piers, these piers carrying in part the upper walls, the second-story floor and the roof. The piers measured 20x36 inches and were of sufficient size. Work was commenced and duly carried forward, and when the second story had been finished the owner decided and the property and made application accordingly. The add another story and made application accordingly. The request was denied. Convinced of an injustice being done request was defined. Convinced of an injustice being done him, he left the office in a highly excited state of mind and proceeded to his architect. After a week or so he returned with a formidable set of calculations and proceeded to demonstrate my error. I question whether any one could guess his results. It was a revelation to me. The piers guess his results. It was a revelation to me. were built of brick, with bluestone binders and granite caps, and he assumed for their safe compressive strains

caps, and he assumed for their safe compressive strains per square inch 200 pounds for brick and 2,000 pounds each for bluestone and granite. Then the area of the piers being 720 square inches the brick would carry 144,000 pounds, the bluestone 1,440,000 pounds, and the granite likewise 1,440,000 pounds—ergo, each pier would carry their sum total amounting to 3,024,000 pounds!

At the beginning of this paper I made the statement that fully 75 per cent. of the various applications filed at the bureau were disapproved. Now this means that about 3,000 applications were found defective and required amending in the course of each year, and in the time that I have been connected with the bureau the number of these defective plans and specifications has quired amending in the course of each year, and in the time that I have been connected with the bureau the number of these defective plans and specifications has reached the large figure of 10,000. That the examination of so many plans represents a great deal of labor goes without saying. If now 75 per cent. of such plans are defective, you more than double the labor of the bureau. This would certainly not be so were ell the applicants competent men. But under our laws no restraint is placed upon those who desire to parade themselves as architects. Anybody may sign himself as such and begin the construction of a building, unconcerned whether the lives of human beings are thereby imperilled or not.

The number of defective constructions submitted instead of being as rare as the oases of the desert are as common as its sands. The large majority of plans are not presented by our prominent and capable architects, with whose work little, if any, fault can be found, but by men who know something of drawing and less of construction.

I think the days have passed when the rendering of a drawing is all that is required of an architect. We are of an era in which buildings are erected, the intricacy of which in former times no one dreamed of. The most economic use of materials is demanded, and the strains to which they may be subjected are carried to the utmost limit.

which they may be subjected are carried to the utmost limit. It is my idea that laws should be passed aiming at the control of this dangerous liberty—in short, licensing of architects. Why if physicians are licensed should not architects and engineers be subject to similar laws? I know I will be met with the assertion that we suffer from know I will be met with the assertion that we suffer from too many laws already, but I contend that as of a good thing we cannot have too much, so of good laws a people can never have too many. The subject is receiving much attention in England, a lead we will sooner or later be forced to follow. Responsibility ought certainly be centered somewhere, and the architect, as the designer, is the one who should be held to account if an accident occurs. I also believe that the men who design a building should superintend its erection.

The capable architect need surely not fear restrictive measures; such measures should be on the statute book, and the League should draft and present them to the Legislature at the opening of the next session. To the architects belongs the initiative in this subject, and if they

and the League should draft and present them to the Legislature at the opening of the next session. To the architects belongs the initiative in this subject, and if they should decide upon some such course of action as is here outlined the profession and the country would be the

BUILDERS' AND CONTRACTORS' ENGINEER-ING AND PLANT.

No. XXXIII.
(Continued from page 324.)
ERECTION OF POUGHKEEPSIE BRIDGE.—No. 3.*

FALSE-WORK.

In the stone-yard on shore an efficient arrangement was resorted to by the contractor to avoid the necessity of a very large derrick. A platform about 40x60 feet was framed of heavy timber mounted on trucks and provided with a tramway the whole length of the yard; a mast and boom derrick in the middle of the platform bed had a swing reaching beyond each side, and could raise material at any point, pile up a large quantity on deck, and then run over to any other place and unload it. This arrangement

proved satisfactory and economical.

When the masonry had been completed the erection of the iron-work required a most lofty, extensive and elaborate system of false work, whose most notable features only are here outlined. The huge frame-work of beams, columns, and braces rises more than 130 feet above the water and is over 500 feet long and 100 feet wide at the base, presenting a most imposing appearance, both from a distance and when inspected from the top of the 100-foot traveler which surmounts it. The arrangement, proportions, and details are carefully designed and well carried out and the determination to secure absolute solidity is apparent and successful.

The requirements of the design necessitate false work to support all the trusses of the superstructure except the three large cantilever spans, which are self-sustaining during erection.

Braced timber trestles were accordingly erected for the 201 foot shore spans, which were built and anchored. Then false work was put in between piers 2 and 3 and the triangular truss span of 525 feet erected upon it. Then the 548-foot cantilever span between piers 1 and 2 was built out and connected up. The false work is now being removed and re-erected between piers 4 and 5 so that span can be built and the remaining two cantilever spans completed, forming the whole superstructure.

Figures 12 and 13 show a section of this main false work, which contains about 2,000,000 feet B. M. of first quality hemlock timber and plank.

The weight it had to carry was about 4,000,000 pounds of the superstructure, to which may be added 300,000 pounds for approximate weight of travelers, engines, tools, etc, besides its own weight estimated at 10,000,000 pounds.

The false work was required to sustain this load (the highest point of which was nearly 250 feet above the water), to resist swaying, lateral motion, and the racking and concentrated strains of hoisting 70,000 pounds at one point, to have stability against wind-pressure and the force of the current, sometimes swift, swollen by tides and freshets, and likely to carry ice, rafts, etc., and to remain practically inflexible, not settling enough to cause much displacement when the distortion should be multiplied by the height of the structure.

The cross-section of the channel shows first about 50 feet depth of water, then 20 feet of mud, 45 feet of clay and fine sand, 17 feet of sand and gravel, and then rock. Two 60-foot piles, 15 inches in diameter, were spliced and driven nearly to the water's edge in transverse rows of 24 each; these were tied with horizontal stringers just below the water-level and by a double cap on top and cross-braced between. The bents were connected by similar longitudinal bracing at their ends. On top of the caps the trestle bents of eight batter posts each were raised in

five tiers to a height of 120 feet and securely connected with horizontal stringers and cross-bracing in every panel transversely, and in most panels longitudinally. Each batter post was supported by a group of three piles, and the lower chord of the truss was supported at each point by three batter posts, one of which, together with outside batter post, supported the traveler-track. The timbers were all fastened with $\frac{1}{2}$ bolts driven into $\frac{1}{2}$ -inch holes. The posts were all spliced with side plates. Figures 15 and 16 show special framing of bents that rest on the piers.

Figure 14 is a cross-section of false work under east shore cantilever span; the lower sill is supported on the ground and the bents are left in after the erection of the truss span until it receives stability by connection with the rest of the structure.

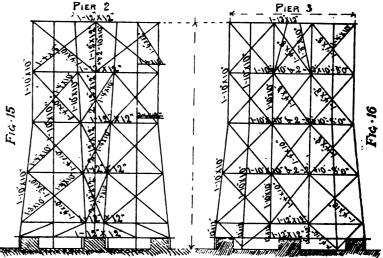

(To BE CONTINUED.)

STREET-WASHING MACHINE.

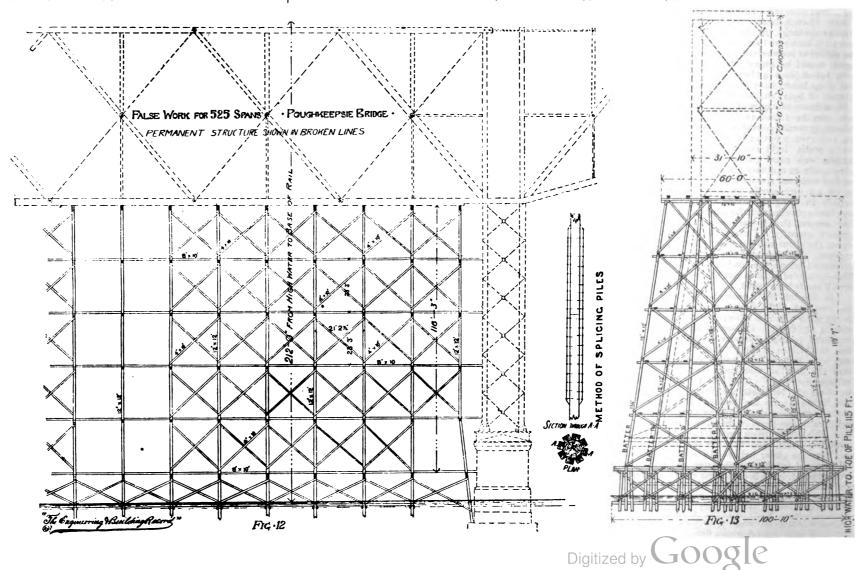

A RECENT number of *Uhland's Technische Rudschan* contains an illustrated description of the street-washing machine of A. Hentschel, of Berlin. It is a combined sprinkler and sweeper, drawn by two horses. The sprinkler

is in front and at the rear is a revolving brush or cleaner.

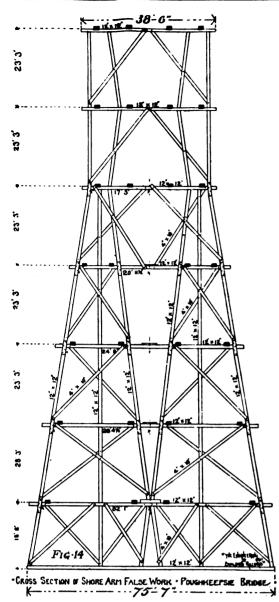

It suggests incidentally that the Berlin pavements must be in very good condition, as such a machine would otherwise be of very little use.

ABSTRACT OF PAPER ON STAND PIPES FOR WATER-WORKS.*

HAMMERING impairs the tensile strength of metal and changes its structure.

Crystallization of iron or steel in a stand pipe may be

caused by the perpetual vibration and silent hammer-blows of the moving water, and an unusual strain will cause sudden rupture

So far as known there are 282 stand pipes and water-works tanks in the United States.

A stand pipe on a hill may economically store water for high service, but for both low pressure domestic use, and high pressure fire service, a tall stand pipe of smaller cliameter, constantly filled, is more economical and effec-

For supplying 10,000 inhabitants an open stand pipe, furnishing a water-cushion to pump against, is better than a direct pressure system, and if the water in the lower half of the pipe is not good for much else it makes excellent ballast.

It is practicable to build stand pipes 350 feet high, and they should be self-supporting and maintain their position by their own inherent strength.

Practical Suggestions.

Stand pipes should be near the pumps. They should not have cast-iron nor steel bottoms, nor steel angles nor rivets. They should have wrought-iron bottoms with brackets riveted to outside lower courses.

The best width of plates is that giving 5-foot courses. The thickness and length of plates should vary with the diameter and height of the tower, and be proportioned so as to make an increase in its height permissible.

All holes should be drilled perfectly true.

Where three plates join the overlap must be scarfed down hot, and no fulling tool allowed at such points.

The manhole cover and frame should be of wrought-

iron in the most convenient position on the side.

The inlet and outflow should, when possible, be through

The inlet and outflow should, when possible, be through the same pipe.

The inside of the stand pipe should be kept free and clean of all obstructions and accumulations.

Anchors and guys are unnecessary. The material should be first-class iron, with liberal amount of angle iron.

A conical galvanized iron cover is unobjectionable if provision is made for circulation of air.

Freezing is prevented by air-spaces above and below, made tight by grouting the floors.

made tight by grouting the floors.

Frequent pumping and changing the water at intervals of 8 or 10 hours is a certain preventative of freezing in the severest cold.

Asphaltum paint is the best.

Aspnaltum paint is the best.

Even with the clearest water large quantities of sediment accumulates in the bottom of the pipe and should be cleaned out. Its removal by hand is difficult, slow and expensive, and the necessary emptying of the pipe is very hazardous. The author has patented and used for several rears a device for cleaning out the sediment while the years a device for cleaning out the sediment while the

pipe is full of water.

A horizontal sediment pipe reaches from the centre of the tank, through the side near the bottom, to any convenient drain or sewer. The pipe is provided with a valve, and the inner end bends vertically downwards and valve, and the inner end bends vertically downwards and terminates in a large conical mouth, very flaring, whose serrated edges are close to the bottom plate of the tank. The tank being full of water it will rush out with great violence as soon as the valve in the sediment pipe is opened, and as it enters under the cone the current stirs up and sucks in the sediment and carries it all out in 5 or 10 minutes. This arrangement is cheap and effectual, and has given complete satisfaction:

DESTRUCTION OF STAND PIPES

Lexington, Miss.—Collapsed June 22, 1885; 365,000 gallon stand pipe, 22 feet diameter by 152 feet high, made of 1/2-inch iron, supported by 10 cast-iron columns, 40 inches diameter, 50 feet high. Supplied the city for several weeks and burst when full, scattering material as if exploded.

Victoria, Tex.—16 feet diameter and 100 feet high

Victoria, Tex.—16 feet diameter and 100 feet high; lower 70 feet ½-inch iron, remaining 30 feet ¾-inch thick. When containing 70 feet of water was struck by a tornado blowing 80 miles an hour, which caused an oscillation, buckling and collapse of the 30 feet of empty tank. Gravesend, N. Y.—(Described on page 404, Vol. XIV.) Newport, Ark.—Wooden tank burst with great damage. Caldwell, Kan.—Collapsed while being built in 1887; was 12 feet 6 inches diameter by 150 feet high; it doubled over about midway, breaking part of foundation like the uprooting of a tree.

while empty, March, 1887.
Cincinnati, O.—Steel too light and it burst; a total

Belleville, N. J .- 100 feet high by 6 feet diameter, and

's-inch thick.

Franklin, Mass.—(Described on page 643, Vol. XVI.)

Seneca Falls, N. Y.—(Described on page 683, Vol. XVI.)

Thomasville, Ga.—Collapsed, December 10, 1887, before completion. Erection scaffolding had been built to serve as a brace between solid brick centre pier 6 feet in diameter, and outer walls. In hoisting brick to top of

tower the pier was swayed and overthrown.

Houston, Tex.—Circular foundation wall with crosssections settled under pipe, 20 feet diameter by 74 feet

Kankakee, Ill.—Steel, 20 feet diameter by 120 feet Collapsed and blew over, breaking off anchor

DISCUSSION OF PAPER ON STAND PIPES

Did not the conical reduction of the Gravesend stand pipe effect its destruction?

Mr. Stephens—No, sir; it was well braced and riveted. Q. Was it not on account of the upward turning of the bottom at the outer edge that the braces were put on?
Mr. Stephens—They were put on on account of a little

tremulousness in the structure, and because of the appearance of an opening large enough to insert a knife blade in.

The braces were placed at the cone, and at the bottom from the base up to the second and third courses.

Q. Were these braces beneficial? I think that the

pressure on them might prevent the distribution of strains

pressure on them might prevent the distribution of strains and defeat their purpose.

Q. How was this stand pipe erected?

Mr. Stephens—By a scaffold. There has been much recent improvement in building stand pipes. At first one staging cost \$800; now they are erected from an interior cage that costs \$30.

Mr. C. A. Judson—We lately built one at Sandusky, using an inside platform that floated on the water pumped in as fast as the sides rose.

fast as the sides rose

e have a double stand pipe providing simultaneously for fire and domestic supply. It consists of two concentric cylinders, the outer one 25 feet by 180 feet, and the inner one 3 feet by 225 feet, giving about 100 pounds pressure when full.

Both pipes are without bottoms, their lower edges being fitted to the solid limestone rock to which they are anchored by outside bolts. The inside pipe is braced to the outer one, and has a check valve preventing the escape of water into the large pipe. When necessary the ice around the small pipe is melted by a steam pipe.

PRACTICAL RESULTS OF MECHANICAL FILTRATION.*

BY W. G. RICHARDS.

THE filter plant at the Atlanta Water Works consists twelve Hyatt filters ten feet in diameter, thirteen feet th. The filters are cylindrical, and are placed on end in two rows, the main supply-pipe passing between them,

the centre of the pipe being eight inches below the centre of the filters, or about five feet above the pavement of the

The filters are divided into two compartments or sections; the lower section is the filter proper, the upper section being used for the purpose of washing the filter-ing material, which is sand and coke, in the proportion of

about three parts sand to one part coke. In the proportion of about three parts sand to one part coke.

The sand used is of a good sharp quartz, and the coke is the ordinary coke that is taken from the smoke-box of a locomotive, and passed through a sieve of about a quarterinch mesh. The depth of the filter-bed is kept at about

The material of which the filters are constructed is The material of which the filters are constructed is ordinary boiler-plate, the lower section $\frac{1}{16}$ -inch thick, and the upper section $\frac{1}{16}$ -inch thick. The heads, or, more properly speaking, the bottom and the partition in which the valves between the upper and lower sections are placed, are $\frac{1}{16}$ of an inch thick.

The water flows from the impounding reservoir, through

the filters, to a clear water-basin, by gravity; the surface of the water in the reservoir being nineteen feet above the top of the sand and coke in the filters. Within twenty feet of the filters is situated the clear-water basin, into which the water passes from the filters. The average height of the surface of the water in this reservoir is on a level with the bottom of the filters.

The situation of the impounding reservoir in this in-stance was rather favorable for the introduction of a filter The situation of the impounding reservoir in this instance was rather favorable for the introduction of a filter of this description, the pumps being about twenty-four feet below the surface of the water. The suction pipe was cut and a tee inserted, diverting the water by an arrangement of valves from its direct passage to the pumps, through a twenty-inch pipe, and thence, by means of branch pipes six inches in diameter, it is distributed to the various filters. The water in its passage, and before it reaches the filters, passes a twenty-inch valve, which is closed enough to somewhat impede the flow, and cause a diversion of a portion of this water through a ¾-inch pipe to the bottom of an iron reservoir, holding about eight cubic feet of alum in solution. There is another ¾-inch pipe passing from this alum-tank to the other side of the 20-inch valve, where it enters a brass pipe one inch in diameter placed across the 20-inch supply-pipe horizontally and vertically; this cross pipe has a number of holes, $\frac{1}{18}$ of an inch in diameter, through which the solution of alum is discharged into the moving column of water on its way to the filter-beds, so that the water reaches the filters impregnated with the coagulant. After passing through the filterthe filter-beds, so that the water reaches the filters impregnated with the coagulant. After passing through the filter-bed the water enters a number of small copper saucers which are attached to the end of pipes and are filled with copper shot about a tenth of an inch in diameter; the saucers are covered with a piece of sheet copper punctured from the inside with small holes not large enough to allow the shot to pass through. Gate-valves are attached to the inlet and outlet pipes, so arranged that the current may be reversed when the sand and coke are being discharged into the upper chamber for washing. In the top head or partition of the filter are seven 2-inch pipes extending to nearly the bottom of the filter, through which the coke and nearly the bottom of the hiter, through which the coke and sand is thrown into the wash-chamber; there are other valves arranged around these pipes in the partition to admit the coke and sand to the filter-chamber after it has been washed. The clear water is discharged through 6-inch pipes into a 30-inch pipe, which conveys it to the clear-water basin. The filters are operated from a floor which is within four feet of the upper edge of the filters. and the work is performed by two men, one at a time, day and night. The subject assigned me on the programme is "Practical Results of Mechanical Filtration," but, as I am neither an engineer nor scientist, my subject would perhaps have been better stated if transposed, being "Mechanical Results of Practical Filtration." Our impounding reservoir covers an area of fifty-two acres, and the ing reservoir covers an area of fifty-two acres, and the banks are just as nature left them, except that about three-fourths of the timber has been cleared off. The washings are for the most part red clay which is held in suspension to the extent that the water is never clear, its condition being either muddy or very muddy. On the water-shed, which covers an area of at least five square miles, are numerous dwellings, whose washings, notwithstanding they are watched closely by the sanitary force under the direction of the board of health, find their way into the reservoir, so that the water before filtering is very rarely sufficiently clear for bathing or laundry uses. After passing into the clear-water basin small objects are plainly seen through it at a depth of twenty feet, and the bottom is plainly seen by moonlight. I quote from the report of our board of health:

"The sanguine expectations have been fully realized. The clear, sparkling water which has recently supplanted the muddy liquid to which we had become accustomed attests the completeness and value of the work done by the Newark company. The accompanying analysis, made by Mr. John M. McCandless, shows the quality of the water now received after passing through the filters to be unexceptionable. Grains per U. S. gallon: total solids, 3.60; sodium chloride, 0.76; oxygen absorbed, 0.03. Parts per million: free ammonia, 0.08; albuminoid ammonia, 0.03. It is important to understand that the large proportion of free ammonia detected in the specimen is due to the fact that a small quantity of alum is used in this system of filtration as a coagulant. Ammonia is frequently employed in the manufacture of alum as a substitute for potassium; hence, it becomes one of the bases of this salt, and ammonia is liberated when the alum, the sulphate of aluminum and ammonia is decomposed in the Warklyn process of analysis." I personally know but The sanguine expectations have been fully realized

^{*} Abstract of paper read before the convention of the American Water-Works at Cleveland, O., April 17, 1888.

little of the scientific results. This I know: that it was muddy and now it is clear. The capacity is three million gallons in twenty-four hours. The cost of twelve filters, including the house over them, was \$56,200; filters and clear-water basin was \$55,000; house over filters, \$1,200. We are now filtering an average of about two million gallons per day, at a cost of \$8 for alum and \$2.50 for labor. The quantity of alum required is contingent upon the quality of the water, and as the water contains more mud during the season of heavy rains, we have used perhaps the maximum, as the filters have only been in use since last November. I do not anticipate that the average for a year will be as much as the filter company allows, which is one grain to the gallon. There is but a small percentage of waste of sand and coke in washing, and of this I have made no estimate. I have found but one class of persons, and not many of those, who object to the Hyati filters; these are among the users of steam, who complain that the alum leaves a deposit in the boilers; but they found fault when they were compelled to take out the handhole plates once a week and even oftener, if possible to do so, to remove the mud, and now they find fault if they capacity in always without any trouble to themselves.

oannot run always without any trouble to themselves.

Our engineer at the works has found no fault, and, on the contrary, is much pleased with the water so far. As a matter of course if there be alum, or any other substance in the water, it would necessarily be deposited in a boiler. I am not prepared to say that there is not a small percentage of the alum left in the water after it has passed through the filter-beds; but as the alum is used to coagulate the mud, the greater portion will be found with the

mud, coagulated.

If the water flowing from the filters to the basin were not clear then we might expect with the coloring matter a percentage of alum.

DISCUSSION.

After the reading of this paper the following discussion

Q. Is the full head of 18 feet used on the filter? A. Yes. Q. Would not the water contain more organic matter in the summer? A. Yes. Q. What percentage of the water filtered is used for washing the filter? A. We do not use filtered water, and I do not know how much is required. Q. Does any vegetable growth form on the sides of the impounding-reservoir. A. No. Q. Does ice ever form in the basin? A. No. Q. Is the cost of power for operating the filter included in your estimate? A. No; it operates by gravity, but we lose 19 feet head, and have not estimated that. Q. Has there been an analysis made of the water prior to filtration? A. Yes; it shows much benefit from filtering. Q. What is the use of the copper saucers in the filters? A. They are solely to prevent loss of the filtering material.

THE MUNICIPAL ENGINEER AND THE MANAGEMENT OF HIS OFFICE.*

As CIVIL engineers who have spent their past at railroad work, or some special branch of civil engineering other than city engineering, often find opportunity to enter the municipal service, which will prove a new field to them, the varied knowledge of such of their colleagues as have had experience for years in this special branch of engineering may be of some service. This is the motive for this paper. Another object in view is to induce municipal engineers to communicate their experience to the profession.

The municipal engineer—"city engineer, city surveyor"—is either appointed by the city council, or he is elected by the citizens. In some instances the appointment rests with the Mayor of the city, which appointment is usually subject to the approval of the council, but in most cases the duration of the appointment is limited to too short a space of time to give the engineer the necessary opportunity to so organize and conduct the technical service of the city government as to give the most efficient results. But, be this as it may, his position is much the same, partly that of a counsellor to the city council—consulting engineer—and partly as the chief of the technical branch of the city government—resident engineer. This dual capacity makes it his duty to advise the council and its individual members as to necessary work, contracts, prospective improvements, etc., and upon municipal legislation in regard to such. And it is his further duty to organize and conduct the service of his office so as to facilitate systematic and efficient work in the field and in the office; to make or revise all plans, calculations, estimates, and specifications, and to arrange and direct all the plotting and map work.

and direct all the plotting and map work.

The engineer should never forget that he is not a clerk of the corporation government, but its adviser; that his office is executive as well as initiative, and that his position charges him with greater responsibilities and demands higher abilities than are required of any other officer of the municipal household. While the city attorney, by means of his legal learning, sparkling rhetoric, and shrewdness in managing juries may defeat litigations against the city, the engineer's judgment, based on knowledge and experience, will prevent them; by far the cheaper and wiser modus operandi; and he can do more toward a real growth, proper development and neat appearance of a city than any combination of real estate speculators, city boomers, and party pushers will ever be able to accomplish.

As efficient work can only be expected or made possible through an intelligent arrangement of the entire office and field-work, and the records thereof, it is plain that manifold records are required. In the first place, the engineer must be fully posted as to the laws, ordinances and resolutions having any bearing to the work of his office. Therefore he should keep a record of them, stating at the head of each law, ordinance, etc., the book and page of original record, and giving date of its passage, and a complete and accurate index must be appended. An office day book is another necessary record in which all ordinances and resolutions ordering work done, are entered, giving a short synopsis of what is required; and after the order is executed there should be made an entry on the opposite page, stating all necessary particulars. The engineer should keep a diary in which he should enter every day's doings, peculiar observations, meterological notations, etc. For special work particular records will be required, such as an assessment record for entering each individual assessment against property for improvements, with such general notes as are deemed necessary, estimate book, material register, cement tests register, etc.

It is essential to have a "map" of the municipal territory, showing the government survey, with monuments and references to them, with the subsequent divisions and subdivisions into acre tracts and roads according to the deeds, with short memoranda as to book and page of deed record or road records, monuments, witnesses to them, distances and bearing of boundary lines, etc., and every difference in measurements found—either surplus or shortage—fully marked. In connection with this map, government monuments should be preserved and brought in measurable relations with easily discernible, permanent, objects, and all the old evidence obtainable, as records, statements of witnesses, should be gathered and kept with the map. Another map which is necessary, is a plan of all the additions and subdivisions with the undivided property—corporation land—showing blocks, lots, streets, public squares, parks, and alleys, with numbers and sizes, the names or designation of additions, etc. streets and public places plainly inscribed. The different additions and subdivisions can be made more plainly visible by bordering same with brush lines of different colors, while public land, railroad land, etc., can be made easily discernible by coloring with a definite shade of water color. A scale of 400 or 500 feet to one inch will prove most satisfactory. A copy of the foregoing described plat or map, with the horizontal contour lines accurately entered, will give a reliable topographical map, necessary in considering surface and underground drainage.

In connection with these maps there should be detail maps, say on a scale of 200 feet to one inch, made either in quarter sections (which I found the most convenient) or in consecutive sections of streets, giving additions, blocks, and lots, with names, numbers, and dimensions of same, as also the names of streets, public grounds, etc. These maps are very useful for tax assessors, as well as for special assessments, street improvements, sewers, etc., and the graphical record of public improvements and works.

For the convenience of establishing street grades, of questions as to grading of streets, calculation of approximate quantities, etc., the profile of every street should be entered on a profile book of ruled profile paper. The scale should be large enough to allow figures for elevations, quantities, etc., and for references to the respective level books.

To simplify the work, and still to keep a thoroughly reliable and efficient record of work and results, the level books and different kinds of note books (field books) should be classified by capital letters (A, B, etc.), and each kind should consecutively be numbered each year, commencing with No. 1; and each book should be paged and fully and accurately indexed, so that in entering surveys on maps it will only be necessary to refer to the original record (as, for instance, B., 15, 1886). And each entry in a level book or in any kind of note book should be headed with the date, with a short description of the work as to location and nature, and such observations as may seem likely to be of service.

These suggestions are mainly adapted to the necessities of an engineer's office of small compass—where no board of public works is supporting the engineer, though it is hoped that some of the suggestions in this paper will be of interest to engineers of larger cities, and to members of boards of public works.

[Other maps will also suggest themselves to our readers as of much importance in the office of the municipal engineer, such as a grade map showing in figures the elevation of all street intersections as they are to be and of all changes of grade between them, or still better, the elevation of all curb corners and of all summits or valleys between them. present elevations of the surface at the same points being given in a different colored ink. This can be made with much less labor than the contour line map mentioned in the paper, and will answer the same purpose reasonably well until the latter can be completed, and for some purposes will be even more convenient. There should also be a sewer map showing all mains, laterals, and catchbasins, and a pipe map giving location and size of all water-pipes with stop-gates, hydrants, blow-offs, airvalves, etc. A map showing extent, character, and condition of paving would also be desirable.

Notes of the exact location of all undergrou it work of every kind should be very carefully made as it rogresses, as it is of course very difficult and expensive to the precise location of such work after it is covered, and yet in designing or constructing other undergound work it is often of the greatest importance to know ust where the existing work is. All underground work, we ether public or private, should be carefully recorded at mapped. These records will be increasingly valuable until before long the municipal engineer would rather lose all his other maps than this, which alone cannot be duplicated. Such a map of the underground work of a large city would be almost priceless if complete und accurate, and it can only be made so by commencing it when the city is very small.]

TWENTY-FIRST ANNUAL REPORT (F THE CITY ENGINEER OF BOSTON.

WE have received from Mr. William Jackson is annual report as City Engineer of Boston for the year 1387. He divides his duties under four heads—viz.: Bridg :s, waterworks, sewerage, and parks.

Boston has, perhaps, more bridges than any ity in the Union, no less than 93 of these structures com ng under Mr. Jackson's supervision, of which the city w folly supports 39 and partially 19, while 35 belong to various railroads. Even so far north as Boston 18 piles in a ne bridge were seriously weakened by the Limnoria tere rans and had to be replaced.

The monthly consumption of water has averaged 37,481,000 gallons, varying from 43,176,200 gallons in January to 32,525,300 gallons in April, giving an average daily supply to each individual of 79 gallons.

Here follows a description of the Fisher Hill Reservoir, which we hope to give separately in a subsequent issue.

The Cochituate distribution has been greatly improved by removing the tubercles from the old 6-inch and 12-inch mains by means of the Sweeney pipe-scraper. There were cleaned during the year 40,932 feet of 6-inch and 20,280 feet of 12-inch pipe, at an average cost of 13.7 cents per foot for the 6-inch, and of 20 cents per foot for the 12-inch. The cost per ton of cast-iron pipe has been \$35 for 24-inch, \$34.50 for 30-inch, and \$30.69 for 16 and 30 inch.

The main drainage works, put in operation January, 1884, continue to accomplish all that was expected of them. The daily averages of gallons of sewage pumped were as follows: In 1885, 33.874.575 gallons; in 1886, 36.866,129 gallons, and in 1887, 43.630,657 gallons, varying from 60,612,617 for February, 1886, to 26.625,076 gallons for June of the same year. In 1887 the amount for single days varied from 116,972,611 gallons to 27,796,176 gallons.

The cost per million gallons lifted one foot high was \$0.0585 and the total cost \$32,166.70, of which \$17,334.96 was for labor and \$8,687.48 for coal. A total amount of 15,906,146,275 gallons has been pumped in 1887 to an average height of 34.53 feet by the combustion per 3,444 gallons of one pound of coal containing 11.7 per cent. of ashes and clinkers. The average duty of the engines in foot-pounds per 100 pounds of coal was 99,560,914, varying from 93,782,861 in January to 105,005,278 in April. It is noted that the copper roofs of the drainage buildings have been so corroded by gases from the sewage as to require protection by painting.

A large amount of work has been done in removing from the sewers deposits of gravel and scraping from the side walls accumulations of grease.

PREPARATION OF PARK ROADS.

The following are the methods used in preparing park roads. In the Park Way on the Back Bay Fens the roadways have been constructed in the following manner: The roadbed was carefully graded to 8 inches below the surface of the finished road and thoroughly rolled. The curbstones were first set; the gutters were paved with rectangular granite blocks, for a width generally of 4 feet, the blocks being laid in rows at right angles to the line of curb; the surface of the paving at the curb is 7 inches below the top of the curb, and rises 2 inches in the width of 4 feet. The roadway was then covered with broken stone; the stone was broken to sizes about as follows: for the first 4 inches in depth about 4 inches in diameter; then 3 inches in depth 2½ inches in diameter; then 1 inch in depth about 1 inch in diameter; then a layer of screened gravel or fine stone screenings from the crushers was spread on top; each layer was watered and rolled with a 2½-ton sectional grooved roller. The surface of the roadway has a fall from the centre to the gutter of 1 to 30. The above-described method of road construction is cheaper and less substantial than would be desirable if the conditions were different. It must be understood, however, that the land upon which the roads are built has been but recently filled, and the filling is

^{*}Abstract of paper read before the Western Society of Engineers by B. Schreiner, and published in the Journal of the Association of Engineering Societies.

still settling, and will continue to do so for some still settling, and will continue to do so for some years. A roadway prepared as this has been will last until the filling has reached a firm bearing, when it will be necessary to regrade the surface, and a more enduring foundation can be laid if desired. There is, on the other hand, this to be said in favor of a cheap method of construction in this locality—that the filling being of loose gravel and the surface of the roadway being at all points several feet above the level of the ground water, the subsoil will be well drained, and a light covering of road metal will wear much better than it would under less favorable conditions. Nearly all of the stone used has been purchased by con-Nearly all of the stone used has been purchased by contract, and of such a size as could be received by a stonecrusher. It was suggested at the beginning of the season that the amount of stone received could be more accurately

that the amount of stone received could be more accurately ascertained if it was purchased by weight instead of by the more usual method of measurement in carts. Experience has confirmed this opinion. Scales were set up, and all stone purchased has been weighed.

A stone-crushing plant was purchased and set up near the same point, and the stone has been crushed at a less price than the same could have been purchased, and the rate of crushing has been controlled to suit the work in hand better than if it had been done by private parties.

In the Arnold Arboretum the drive was constructed in the following manner: The roadway was sub-graded so as to allow a depth of one foot for stone, the surface having a pitch of 1 in 20 from the centre to the gutter.

Catch-basins were built on each side of the roadway about 300 feet apart, with outlets on the side hill below the driveway. Tile drains were laid on each side of the driveway, for draining the subsoil; the one on the up-hill side was on the outer line of the sidewalk, while the drain on the down-hill side was on the line of the gutter; these drains were laid at a depth of 2 feet 6 inches below the surface, and they discharge into the catch-basins.

The gutters were then excavated 6 inches below the subgrade of the roadway, and filled with screened gravel as a foundation for paying. The gutters are 2 feet wide, of

The gutters were then excavated 6 inches below the subgrade of the roadway, and filled with screened gravel as a foundation for paving. The gutters are 3 feet wide, of cobblestones which were picked out of the excavation. A stone foundation 0 inches in thickness was laid on the roadway. After breaking down all unevennesses of these stones they were covered with 3 inches of crushed stone from 2½ to 1½ inches in diameter, well rolled, and this was then covered with screened gravel or stone dust thoroughly watered and rolled to a hard surface. The walks are separated from the gutters by a border of loam walks are separated from the gutters by a border of loam 2 feet wide and 1½ feet deep. The walks have a fall of one-half inch to a foot, from the outer edge to the loam border. They are constructed of 6 inches of crushed stone, covered with stone dust well compacted by watering and rolling.

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly anderstood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

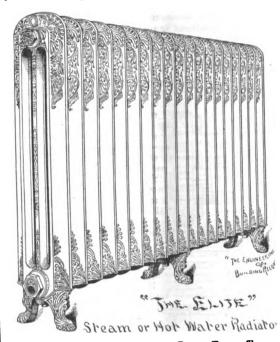

STEAM AND HOT-WATER RADIATOR.

THE accompanying cuts show a new cast-iron radiator that is about to be introduced by the A. A. Griffing Iron Co., of Jersey City, N. J., and to which they have given the name of the "Bundy Elite" to distinguish it from their other heaters.

The upper cut shows the radiator as it will appear when set up and in use, and the detail cut at the bottom shows a cross-section through the loops at half their height. It is a radiator without a base or entablature,

and is made up of a number of elements that are exactly alike in every respect. They are joined to each other at the lower end by ordinary 2-inch close taper nipples, and are not put together until they reach the positions they are to occupy. When used for steam the bottom nipple only is used, but when used for hot water an upper connection between sections is also provided.

They are made to meet that trade where a stock of radiators can be kept on hand and made up during the summer and used when required, without regard to fixed sizes, as any number of sections may be taken from stock and screwed together to make the length of radiator required to fit any place.

The legs are a separate part that will fit any section, as all are identically alike. They may be used on the outer sections or in threes, as shown in cut, or as taste may dictate, on the second or third sections from the end, so as to give an overhang. The legs are attached to the bottoms of the sections by ordinary tap-bolts, the bottom being thickened so the bolts will not go through. Eccentric bushings and plugs of similar ornamental design with the sections complete the radiator on the ends and prepare them for the steam connections, etc.

The principal feature of the Bundy "Elite" radiator section is its three tube loop-one centre one and two outside, the centre one being the shorter and the first to take steam; the course of circulation while filling being up in the centre and down through the outside tubes.

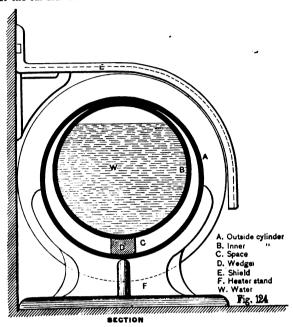

The sections are three inches from centre to centre in

the length of the radiator and eight inches wide, and contain about 51/2 square feet of surface each, when 36 inches high. At the heads of the sections there are slight projections on either sides that make a convenient lock to keep them in line when secured together.

NOTES ON WARMING RAILROAD CARS BY STEAM.*

BY WILLIAM J. BALDWIN.

DURING December, 1887, the writer was engaged in making experiments on the Long Island Railroad for the purpose of determining the probable amount of steam required for the warming of a train or car, and also to ascertain the length of time one of Gold's storage car-heaters would maintain the heat of a car after steam was shut off or the car side tracked and the becometing removed. or the car side-tracked and the locomotive removed.

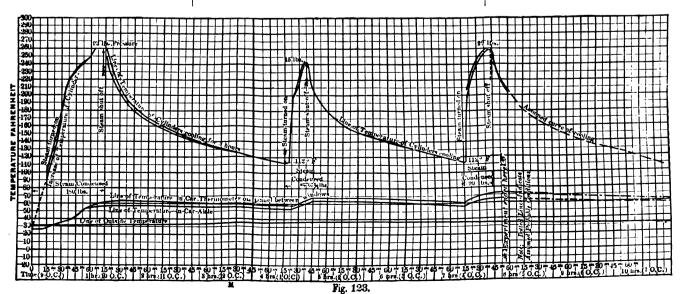

The better to record the experiments, a diagram was made of the day's observations, a copy of which is hereto appended (Fig. 123).

The line of figures at the bottom reading from left to right shows the time. The line of figures at the left reading upward shows the temperature in degrees Fahrenheit. The ordinates of the lower irregular line show the temperature of the air outside the car. The ordinates of the next two lines show the temperature maintained inside the car by two thermometers placed at different positions, and the ordinates of the upper two lines show the temperatures of the surface of the outside cylinders. The points at which steam was turned on and shut off are noted and the amount of steam, in pounds weight, condensed, as found by the

steam was turned on and shut off are noted and the amount of steam, in pounds weight, condensed, as found by the water condensed, is also shown.

Before going any further, however, explanation will be given in detail as to what the storage heater consists of. Fig. 124 shows it in cross section as applied to car 190 of the Long Island Railroad. A is a 5-inch diameter boiler tube of any required length (18 or 20 feet), with a cap on each end; B is a similar tube 4 ¼ inches in diameter with welded ends, seven-eighths filled with water and a solution of common salt; C is a steam-space between the outer and inner tubes; D is a block of iron to hold the inner cylinder against the internal top of the outer cylinder; E a shield and foot-guard, and F a cast-iron stand or leg fastened to floor of car.

* Paper read at the convention of the American Society of Mechanical Engineers at Nashville, Tenn., May, 1888.

Digitized by Google

In reference to the measurements, capacity, etc., of the warming cylinders each .764 running foot has one square foot of heating surface; (2) one running foot of length of cylinder has 1.309 square feet of surface; (3) a running foot of the inside cylinder contains 7.303 pounds of water, when seven-eighths full; (4) one running foot of the inside cylinder and one running foot of the outside cylinder weigh together 13.4 pounds; and assuming that the water is put into the cylinders at 62° Fah., the iron of both cylinders has a storage capacity equal to 1.5247 pounds of water at 62°; and (5) a running foot of the heater (including cylinders and water) has a heat-storage capacity equal to 8.8277 pounds of water.

The manipulation and operation of the heaters is as follows: Steam is admitted to the space C the same as to any radiator. The heat of the steam is at once apparent in the car through the wall of the outer cylinder A, while at the same time it commences to heat the water in the inner cylinder. When the steam is on for a sufficient time, the water in the inner cylinder becomes practically as hot as the steam itself, and remains so until the supply of steam is cut off, when it begins to give off its heat by radiation, etc., to the walls of the outer cylinder.

The diagram shows the result in a manner more obvious than I can explain, and therefore I will only point to questions which may appear to require an explanation or to draw deductions

When steam was first turned on, it was unsatisfactory and low, the pressure being but ten pounds at the regulator. It gradually increased, however, to twenty-five pounds at the regulator and twenty-three pounds at the gauge within the car. At 10 A. M. the steam was shut off and remained so for three hours, or until 1 P. M. The whole steam condensed for this time (4½ hours) was 180 pounds weight, which was condensed between 8:45 and 10 A. M., or 42.35 pounds per hour.

or 42.35 pounds per hour.

During the first hour and a quarter the car was warmed from 27° Fah. to 61° Fah. After steam was shut off the temperature of the car advanced about one degree. Then its rate of cooling was about two degrees per hour.

its rate of cooling was about two degrees per hour.

At I P. M. steam was turned on again and kept on for twenty minutes. The condensation was 67½ pounds, and it restored the heat to the cylinders for three hours longer, or until 4 P. M., and sent the temperature of the car up to 69° Fah. This required less than twenty-three pounds weight of steam per hour to maintain the heat of the car for the time.

Steam was turned on again at 4 P. M. and kept on for thirty minutes. The condensation was then ninety pounds, and it is reasonable to assume it would have kept the car warm for four hours from the time of turning on. This is an average of thirty-three pounds of steam per hour for all day or say one horse-power per car per hour.

During the high temperatures on the outer cylinder, it is very likely the water is not as warm as shown, and during the process of cooling below 212° (or after condensation ceases), the inner cylinder must be the hotter. Of course, this is to be expected when steam is on for a short time only.

only.

The total heat of the steam and the total heat of the cylinders, assuming them to be seven-eighths filled with water, in the second stage of the diagram show this. Take for instance the total heat of the steam for the second stage of the diagram, and it is about 67,500 heat units. Then take the water or its equivalent for 78 feet lineal of cylinders and it is 688.5 lbs., apparently cooled from 243° Fah. to 112° Fah. or 131°, equal to 71,593 heat units (or apparently more than was in the steam). The heat of the iron connections, etc., is not taken into consideration, but if it was, it would only slightly increase the apparent gain and add to the apparent discrepancy.

gain and add to the apparent discrepancy.

The difference, however, is not so very great, but I consider it necessary to point it out, to prevent any misconception in the matter.

In the first stages of the diagrams where the steam has been on for an hour or so this is reversed, as should be expected, and somewhat more heat is found in the steam used than in the cylinders.

Take for instance the 180 lbs. of steam, condensed in the first stage of diagram. This is equivalent say to 180,000 heat units; as the water of condensation was somewhat cooled before the water in the inside cylinders heated. Then take 588.5 lbs. of water or its equivalent warmed from 27° Fah. to 260° Fah. and we have but 170,410 heat units.

The deductions to be drawn from the experiment in general are (1) that two square feet of surface per running foot of car is more than ample for warming; (2) that each square foot of surface requires heat equivalent to about 2 heat units for each degree the air is colder than the heater.

PLANT OF THE BOSTON HEATING COMPANY.

No. III.

(Continued from page 328.)

In actual steam practice it is found absolutely essential wherever there occurs any change in direction of the pipeline to introduce some means to provide for the expansion which is due to the variation between the temperature at which the pipe is laid and that which it attains as soon as circulation takes place. Experiments on various mechanical contrivances have convinced us that the best joint to be used for our purpose is the telescope expansion joint.

The expansion joint, Fig. 7, consists of a large casting having two longitudinal holes, into which the ends of the

supply and return mains are introduced. At one end of the casting these holes are supplied with threads E', and the ends of the pipes are screwed into them. By this means, as the expansion joint is firmly bolted to the masonry foundation, the joint forms an anchorage, so that one end of the section of pipe to which the joint is attached is firmly fixed and held in its place. At the opposite end of the joint from the screw threads the casting is enlarged so as to receive two sleeves of phospor-bronze, K, containing a large percentage of aluminum. These sleeves form the movable part of the joint, and, after being introduced into the casting, are carefully packed with a rope made of asbestos fiber, impregnated with black lead. This packing is introduced between the casting and the phosphor-bronze sleeve in the same manner as ordinary packing is introduced into stuffing-boxes; and the gland. E, is firmly fastened on top of the packing. The outside end of the phosphor-bronze sleeve is furnished with a screw thread, C, to which the end of the pipe is attached, so that when the pipe expands or contracts the phosphorbronze sleeve moves in and out of the casting and accommodates itself to the varying length of the pipe. By means of the gland in the stuffing-box and a ring, ϵ' , on the inside of the casting the phosphor-bronze sleeve is very carefully aligned, so that its motion in and out is in a straight line. In the joints which we have introduced here the sleeve of the supply main is long enough to give a motion of twelve inches, while that of the return main is about eight inches. Inasmuch as these joints are placed, on an average, as often as once in 100 or 150 feet, and the maximum motion for which they will have to provide is only from four to six inches, it will be seen that there is an abundant margin to prevent any possible cramping.

Last spring we built an experimental joint of this kind, and, setting it up in our shop in New York, put on a steam pressure of 450 pounds to the square inch, and, attaching a lever to the sleeve, worked the joint to and fro several thousan! times, corresponding to several thousand

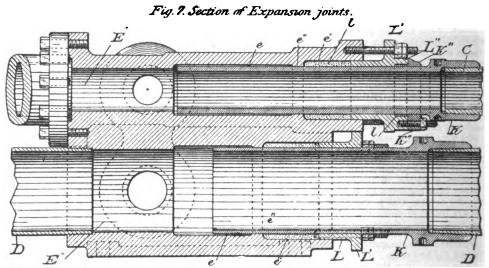

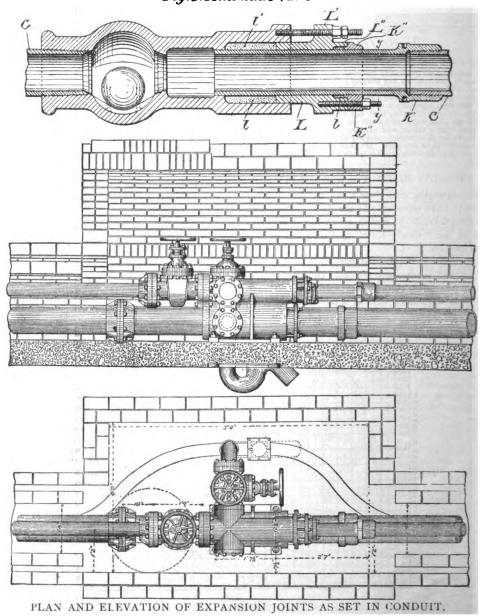

Fig. 8. Automatic Valve

expansions and contractions of the pipe. At the end the joint was as tight as it was in the beginning, not leaking

Each one of the expansion joints is placed in a manhole, so that it is perfectly accessible for inspection and repairs. On the fixed end of the expansion joint there is a valve, and in the casting of the expansion joint is a side outlet also provided with a valve. In the growth of the system it will soon be necessary to introduce cross pipes extending between the main supply-pipes passing through the side streets so as to give a hot-water supply to the intervening buildings. For example, there is a manhole at the corner of Devonshire and Franklin Streets and one at the corner of Franklin and Congress. At each of these manholes occurs an expansion joint. It is simply necessary to conneet the valve at Congress Street with the corresponding one at Devonshire Street, and then opening the valves a stream of hot water would flow between the two streets, making a cross connection from which the buildings on Franklin Street could be supplied.

When it becomes necessary to repack the expansion joints-though to the best of our belief the packing will last a long time-it is only necessary to shut off the valve at one manhole and a corresponding valve at the next to cut a section of the main out of the circuit; and, by opening a side valve, we can discharge the water contained in the main into the conduit which is provided with a drain for this purpose, and then, by blowing a stream of air into the manhole, cool it off sufficiently so that the workman can open the gland and introduce a new packing-all in the course of a tew hours. It could easily be done at night time when the demand for heat was a minimum.

Many questions have been asked as to the safety of this system; pertinent questions, too, because exaggerated statements have been current as to the pressure which we propose to carry.

The supply-pipe is made of what is called "extra heavy" pipe, the bursting strain of which is 12,000 pounds to the square inch, as we have ascertained by testing a number of samples to destruction. Every piece of pipe that has gone into the streets has been tested to 4,000 pounds to the square inch as a proof test. After the main is laid in place, every section-that is, the distance from one expansion joint to the next one-including all screw threads, all of the packing of the expansion joints, and all joints, has been tested to 1,500 pounds, and now that the main is completed we are, at the present time, making a test of the whole main up to 1,500 pounds from the station round back to the station again. So when the main is completed and ready for use it will have received, first, a test at the mill of 4,000 pounds; second, a test, by sections, of 1,500 pounds; and third, a test of the main, as a whole, of 1,500 pounds-all being pressures per square inch.

As an additional precaution we have, once in every section, a check-valve so arranged as to shut off automatically each section of the main in case of any accident. Malicious injuries might occur, for it is conceivable that in time of strikes men might dig up the main or drive a pick into it. The illustration, Fig. 8, is a section of this check-valve, shown in connection with an expansion joint. It will be seen that on the left-hand side of the joint the casting is enlarged so as to form a spherical cavity into which one end of the pipe, D, is screwed. The spherical cavity contains a ball, supported on two ribs so planned as to allow the ball, when at rest, to remain at the bottom of the cavity. The end of the pipe, C, is chamfered so as to form a valve seat. Under ordinary circumstances, the ball remains at rest on the ribs. The forces keeping the ball in equilibrium are its weight, acting downwards, and keeping it in place, and the friction of the water-current tending to force it up the inclined ribs and seat itself against either of the sides of the spherical cavity; so, by varying the weight of the ball, the valve can be adjusted so as to close with almost any desired velocity of current. Under maximum demands we can use a current of ten or fifteen feet a second, and the ball is so weighted as to close at a velocity of twenty feet a second. Should a rupture in the pipe occur, giving a velocity of twenty feet a second, the ball will leave its place, and, rushing up, close the end of the pipe and shut off the rest of the main. This is not simply theory, but is practice to the extent that we have made a number of these valves, and after experiment have found them to work very accurately.

Should any accident occur, either malicious or otnerwise, to rupture the main, it is obvious that only the

quantity of water contained between two check-valves should escape from such a break. As these valves are placed at intervals of about one hundred feet, the amount escaping would not exceed twenty cubic feet. The volume of the conduit is so large that should this entire quantity of water be discharged, the steam formed therefrom would be quickly dissipated through the length of the conduit without producing sufficient pressure to do anv damage.

The conditions which surround a pipe in the street are so different from those to which boilers are subjected, that a little consideration will show an explosion of the pipe to be an impossibility. A boiler, with its setting of masonry and bed of incandescent coal, is encompassed with a highly heated atmosphere, which constantly tends to supply it with more and more heat. The street pipe, on the other hand, is hotter than its surroundings. On the occurrence of a slight rupture or tear in the shell of a boiler, the pressure is relieved form the large mass of water therein contained, and an outflow of the boiler contents established through the incipient opening. The large diameter of the boiler-shell permits the molecules of water flowing toward the incipient rupture to attain, before reaching it, a very high velocity, while the hot masonry surroundings, and especially the glowing coals and incandescent gases of the furnace, furnish the water continuous supplies of heat, maintaining the pressure and accelerating the rushing molecules. So, in far less time than it has taken to describe this action, the current of steam and water has obtained such velocity that its impact has been sufficient to rend the boiler, and perhaps overthrowing the masonry, hurl it hundreds of feet from its original location. In the street pipe the comparatively small diameter precludes the possibility of a high velocity in the water-current even should an opening occur. Furthermore, as no supply of heat is furnished to the water, the pipe being surrounded by the comparatively cold conduit, every unit of steam formed abstracts and renders latent the heat from five units of water. Thus, even if a rupture occurred in the pipe no disastrous explosive action would follow, a simple tear through which the water would escape slowly into the conduit being the only result.

(To BE CONTINUED.)

PLUMBING IN THE CENTRAL TRUST COM-PANY'S BUILDING, NEW YORK CITY.

THE illustrated description of the plumbing work in the Central Trust Company's Building, New York, will be resumed in our next issue.

EXPLOSION OF A DOMESTIC HOT-WATER BOILER.

In our issue of Dec. 10 last we referred to an explosion of a domestic boiler in a hotel in Milwaukee which resulted in the loss of one life and injury to a number of persons, Every winter a number of these accidents have to be recorded, and every year we have pointed out in these columns the causes and the necessary safeguards to be adopted to prevent these disasters. The following account, which we take from the Locomotive, a little paper published by the Hartford Steam Boiler Inspection and Insurance Co., doubtless refers to the Milwaukee incident, although no name is given. At any rate, it explains the cause of water-back explosions when pipes are frozen, and points out the remedy so clearly that any plumber's apprentice ought to be able to understand it. We therefore reproduce it:

Explosions of domestic hot-water boilers attached to Explosions of domestic not-water boilers attached to cooking ranges, water-backs in ranges, etc., through freezing up of the pipes in cold weather, are becoming so frequent that it may not be out of place to give an account of one of the most destructive ones that has

account of one of the most destructive ones that has occurred recently, and point out its cause.

The boiler in question was used in a hotel in a large city in one of the Northwestern States, where the temperature is very low at times. It was connected to the kitchen range; the range was a large one, and the heating surface was furnished by a coil of 1½-inch pipe placed near the top, instead of the cast-iron front or back such as is commonly used in the smaller ranges in private dwellings. The connections to the boiler were made in the usual manner; the accompanying cut shows its essential

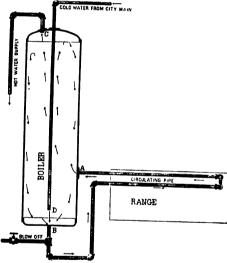

he operation of all boilers of this sort is as follows: The connections being made as shown in cut, the water is turned on from the main supply and the entire system is filled with water. When it is filled and all outlets are closed, it is evident that no more water can run in, although the boiler is in free connection with and is subjected to the full pressure of the source of supply.

a fire is started in the range, and the water in the circulating pipes or water-back is heated, the water expands, is consequently lighter, and flows out through the pipe into the boiler at A, as this connection is placed higher up than the one at B; this starts the circulation, and the water as it becomes heated constantly flows into the boiler at A and rises to the upper part of the boiler, while the at A, and rises to the upper part of the boiler, while the cooler water at the bottom of the boiler flows out into the cooler water at the bottom of the boiler flows out into the circulating pipes at B, and if no water is drawn a slow circulating goes on, as heat is radiated from the boiler, in the direction indicated by the arrows, the water at the top of the boiler always being much hotter than at the bottom. When the hot-water cock is opened, cold water instantly begins to flow into the boiler at D, by reason of the pressure on the city main and forces but water out of the pressure on the city main, and forces hot water out of the boiler at C. Thus it will be seen that hot water can-not be drawn unless the cold-water inlet is free, and it is equally evident that cold water cannot enter the boiler unless the hot-water cock or some other outlet is open.

unless the hot-water cock or some other outlet is open.

The above points being understood, we are in a position to investigate the cause of the explosion referred to, which killed one person and badly injured twelve or thirteen others, besides badly damaging the building.

On the morning of the explosion fire was started as usual in the range at 4 o'clock A. M. It was found on trying to draw water that none could be had from either cold or hot water pines: it was rightly indeed that the trying to draw water that none could be had from either cold or hot water pipes; it was rightly judged that the pipes were frozen. The fire was continued in the range, however, and the breakfast prepared as best it could be, and a plumber sent for to thaw out the pipes. He arrived on the premises about 7 o'clock, as would naturally be the case. He opened both hot and cold water cocks, and, acting neither steam nor water confuded these was and ease. The opened both not and cold water cours, and, getting neither steam nor water, concluded there was no danger, and proceeded to thaw out some pipes in the laundry department first. About an hour afterward the and the main portion of the boiler shot upward like a rocket through the four stories of the hotel and out through

The coroner held an inquest on the remains of the person killed, and some of the testimony given, as reported in a local paper, would be amusing were it not for the tragic nature of the affair which called it out. The usual rience, was there, and swore positively to statements which a ten-year-old boy who had been a week in the which a ten-year-old boy who had been a week in the business ought to be ashamed to make. He had examined the wreck with a view to solving the mystery (?) The matter was as much of a mystery now as on the day of the explosion. His theories were exploded as fast as he presented them. The boiler must have been empty. If it had been full of water it could not possibly have exploded, etc., etc. And then a lot more nonsense about the "peculiar" construction of the boiler. As a matter of fact, there was nothing peculiar about the boiler or its connections. Everything was precisely like all boilers of connections. Everything was precisely like all boilers of this class, of which there are probably hundreds of thousands in daily operation throughout the country, and moreover they were all right.

Now let us inquire what caused the explosion. Every-

Now let us inquire what caused the explosion. Everything was all right at 8 o'clock the previous evening, for water was drawn at that time. The fire was built in the range at 4 o'clock A. M. It is admitted that the coldwater supply pipes were frozen, for no water could be had for kitchen use. It is also proved absolutely that the hot-water supply was frozen or otherwise stopped up, by the fact that at 7 o'clock the plumber who came to thaw out the plumber who came to thaw out the plumber who came and got "neither the plumber opened the hot-water cook and got." The liber the pipes opened the hot-water cock and got "neither water nor steam." Here was his opportunity to prevent any trouble, but he let it pass. Any one who understood his business would have known that there must have been a tremendous pressure in the boiler at this time, as the range had been fired steadily for three hours; there were about eight square feet of heating surface exposed to the about eight square teet of nearing surface exposed to the fire by the circulating pipe in the range, and there had been no outlet for the great pressure which must have been generated during this three hours' firing. The blow-off cock should have been tried at one; if this were clear,

aitized by

and the probability is, from its proximity to the range, that it was clear, the pressure could have been relieved and the disaster averted. If the blow-off proved to be stopped up, then the fire should have been at once taken out of the range. At the time the plumber opened the cocks connecting with the boiler, it probably was under a press-ure of four or five hundred pounds per square inch. An ordinary cast-iron water-back, such as is used in small ranges in private houses, would have exploded shortly after the fire was built, but it will be noticed that the heating surface in this case was furnished by a coil of 1½ inch pipe; this was very strong, and the boiler was the first thing to give way, simply because it was the weakest

Accidents of this sort can be easily avoided by exercising a little intelligence and care. The hot-water cock should always be opened the first thing on entering the kitchen every cold morning. If the water flows freely, fire may then be started in the range without danger. If it does not flow freely, don't build a fire until it does.

Correspondence.

AN ADDRESS WANTED.

DEPOT QUARTERMASTER'S OFFICE, DAVID'S ISLAND, N. Y. H., April 19, 1888.

SIR: Please give me the address of the manufacturer of the dish-washing machine illustrated in your issue of March 31, 1888. I wrote to J. Haskins, Chicago, Ill., but the letter was returned. I wish to get particulars and price of the machine.
Yours truly,

GEORGE H. COOK. Capt. and Asst. Quartermaster, U. S. Army. [Referred to our readers.]

ON PROPRIETY OF OMITTING TRAP FROM HOUSE DRAIN CONNECTED WITH SMALL PIPE-SEWERS.

OFFICE OF CORNING WATER-WORKS, HEERMANS & LAWRENCE, PROP'S.
NO. 9 WEST MARKET STREET,
CORNING, NEW YORK, May 4, 1888.

SIR: The village of Corning last year constructed a system of sewers on the "separate" plan and house-connections are now being made therewith. The Sewer Commissioners, acting upon the advice of their engineer, have missioners, acting upon the advice of their engineer, have adopted rules and regulations for laying house-drains. They recommend that the vitrified pipe portion of the drain terminate within three feet of the cellar wall and iron pipe of diameter equal to that of the drain be extended full size, thence unobstructed through the cellar wall and to the roof. No trap to be used on the main drain, but all fixtures to be trapped and vented.

Is this the best practice? We have been regular readers of your paper since its first number and believe that your opinion in this matter will settle a question that good subbridies differ on.

authorities differ on. Yours, etc.,

HEERMANS & LAWRENCE. The omission of the trap on the main drain is one of the features of the system patented by Col. Geo. E. Waring, and put in by him at Memphis, the house soil-pipe being relied on for ventilation of the sewers. The propriety of omitting the main trap from a house-drain we have always considered depended on the maintenance and condition of the sewers and soundness of the work within the houses. When that cannot be depended on to be in ideal condition. we have preferred the obstruction of the trap on the main drain, with, of course, the fresh-air inlet, as the lesser evil. You do not give us all the details of your sewer system, as to number of manholes, distance apart, means of flushing, etc., consequently we cannot give a definite answer on your particular problem. As a general proposition, we think the local authorities should provide sewer ventilation independent of the co-operation of householders.]

EFFECT OF GALVANIZED IRON PIPE ON

ASHTABULA, O., April 30, 1888.

SIR: Please will you reply at once and state to me if there is any poison or bad effects apt to cause trouble from the use of galvanized pipe? Is the black iron pipe any better for family use than the galvanized? P. E. HALL, JR. Yours respectfully,

[With ordinarily pure water there is no danger to health in the use of cisterns or pipes of galvanized iron. All drinking-water will dissolve zinc from the interior of galvanized pipes, but under no circumstances will enough of the salts of the metal be dissolved to exercise any harmful effects on the human body without making the water so milky and giving it such a strong metallic taste that no one would use it.]

GENERAL GEORGE S. GREENE. 125 WILLOW STREET,

MINNEAPOLIS, Minn., May 7, 1888.

SIR: Could you without much trouble give the address of Gen. Geo. S. Greene? I notice his name frequently in

connection with A. S. C. Engineers. He must be a very old man. I was his rodman in 1836 on what is now the Boston and Maine Railroad, Mass., in its earliest history. Judging from my own age (which is seventy), he must in the vicinity of eighty-five or ninety. I would like I would like to communicate with him.

Very truly yours

GEO. T. CLARK.

[We do not know Gen. Geo. S. Greene's age, but he is as active as a man of fifty. His address is 38 Union Square (East), New York.

A PROBLEM IN SANITARY ENGINEERING.

STAUNTON, VA., April 26, 1888.

SIR: We have a creek running through our city into which our sewers empty, and as there is not enough water to keep the creek clean we are thinking of putting in auto-matic flood-gates. Will you kindly inform me whom to write to for information or refer me to any work on the subject?

C. BARGAMIN.

[An open sewer in a thickly-settled district is an abomination that should not be tolerated at all. That is what you have made of your creek, and no number of automatic flushing contrivances can do more than mitigate the nuisance; they cannot remove it.

We are glad, however, to see that you appreciate the importance of seeking some further information as to what should be done, and you will find in our advertising columns, under the heading "Professional," the cards of a number of competent sanitary engineers, to whom you can confidently apply for such advice as you may need.]

HYDRAULIC RAMS.

ARK. IND. UNIVERSITY. FAYETTEVILLE, ARK., May 2, 1888.

SIR: I am a Senior civil engineering student of this university, and am at present studying up the subject of "hydraulic rams." If you could give me any information on it, such as references, etc., I shall be grateful to you.

Very respectfully, George C. Schoff.

[An elementary description of the hydraulic ram was given in a lecture before the plumbing class of the New York Trade School, published in our issue of April 21.

The handbooks of Trautwine, Molesworth and Nystrom each give some space to it, and Ewbank's Hydraulics has several pages on the subject. Doubtless the manufacturers of hydraulic rams would be glad to furnish you all the information you desire.]

COLONEL R. T. AUCHMUTY'S OFFER TO DO-NATE \$9,000 TOWARDS THE ESTAB. LISHMENT OF A PHILADELPHIA TRADE SCHOOL.

(From our Correspondent.)

PHILADELPHIA, May 9, 1888.

THE Master Builders' Exchange of Philadelphia, at a special meeting on May 8, agreed to establish a trade school in the city of Philadelphia under the auspices of the Exchange, which will be modeled after the New York

The inception of the project was a letter received in The inception of the project was a letter received in this city, and read at the meeting of the Board of Directors of the Exchange some few weeks ago, from Col. Richard T. Auchmuty, of the New York Trade School, in which he offered, if a school was started in Philadelphia under the auspices of the Exchange, to contribute the sum of three thousand dollars per annum for three years towards the support of the school.

The letter was referred to a special committee to visit New York and have an interview with Colonal Auchman.

The letter was referred to a special committee to visit New York and have an interview with Colonel Auchmuty on the subject, and to examine the workings of the New York school. The Committee of Eleven, of the most prominent men in the Exchange, representing nearly all the trades in the building fraternity, went to New York on April 26, visited the school, had an interview with Colonel Auchmuty, and came back highly pleased with what they saw and heard, and, as a result, agreed to recommend to the Exchange the acceptance of Colonel Auchmuty's offer, and that a committee be appointed to Auchmuty's offer, and that a committee be appointed to make a move towards the consummation of the project.

In accordance, at a special meeting of the Exchange on May 8, Mr. William Harkness reported the visit to New York, and, after discussion, Mr. John J. Weaver offered

the following preamble and resolutions:
"Whereas, If we desire skilled American journeymen in the future we must instruct the boys of to-day, and as the apprentice system, especially in large cities, is practically obsolete, and, from the good results already shown, we welcome the mechanical trade school as its worthy successor; and
"Whereas, Col. Richard T. Auchmuty, the founder of

the New York Trade Schools, has generously offered to contribute the sum of \$3,000 per year for three years toward the support of a mechanical trade school in this city, if under the auspices of this Master Builders' Ex-

change, therefore be it

"Resolved, First.—That the very generous offer of Col.
Auchmuty is hereby accepted with thanks.

" Second,-That a mechanical Trade School Committee of three members of the Exchange be appointed from each of the following trades: Bricklaying, carpentry, stone cutting, blacksmithing, painting, plastering, plumbing, and such other trades connected with building as necessity may arise, for the purpose of establishing a school in which instruction shall be given in each of the above-named trades.

' Third.—That a subscription list be started at once, and not only the various trades, but citizens generally who may wish to aid in this good work of enabling the boys to secure a trade and thus earn an honest living with their hands, are hereby invited to contribute to a fund for the establishment of this the Builders' Exchange Mechanical

Trade School.

"Fourth.—That the Treasurer is hereby authorized to receive contributions for the above fund and instructed to

open a separate account for the same."

The resolutions were adopted and the committee will shortly be announced.

ARCHITECTURAL LEAGUE OF NEW YORK.

THE regular reunion and dinner of the League was held 1 HE regular reunion and dinner of the League was held at Morello's on the 7th inst., when a paper on "Errors in Construction," given elsewhere in this issue, was read by Mr. A. F. D'Oench. There was also an exhibition of the architectural efforts of the pupils of the technical classes of the Metropolitan Museum of Art, the School of Mines. Columbia College, and the architectural department of Cornell University.

Johnstone Norman, Esq., of England, showed the design of Alma Tadema, R. A., for the piano and other furniture for the music-room of Henry G. Marquand's

New York residence.

The resignation of Mr. Charles I. Berg, who had been the secretary of the League from its formation in 1881, was regretfully accepted.

The following resolution was unanimously adopted:
"The members of the Architectural League learn with
regret of the resignation of their esteemed Secretary, Mr. Charles I. Berg, and desire to express their appreciation of his long and faithful services, which have continued without interruption since its formation in 1881, and that they heartily and unanimously extend to him their sincere thanks for the very able and conscientious discharge of his arduous duties, which have been of inestimable value to this organization."

Mr. W. C. Hazlett, from the Committee on Medal

Mr. W. C. Hazlett, from the Committee on Medal Design, reported the acceptance of the design submitted by Mr. Blashfield.

The following members were elected to the League, which now numbers 152 practitioners.

Residents: C. L. W. Eidlitz, Maurice Fornachon, Hughson Hawley, E. A. Sargent, A. P. Ryder, W. A. Coffin, Thomas Hastings, E. B. Rutledge, C. D. Marvin, G. L. Hines, Alvan C. Nye, Julius Harder, Robert W. Gibson. Non-residents: Prof. Charles Francis Osborne, Cornell University; James G. Cutter, Rochester, N. Y.; Ed. I. Nickerson, Providence, R. I.; William Whitney Lewis, Boston; Leoni W. Robinson, New Haven, Conn.

AMERICAN SOCIETY OF MECHANICAL EN-GINEERS.

THIS society held its annual convention in Nashville. Tenn., commencing on the 8th inst.

Tenn., commencing on the 8th inst.

The programme as announced promised much pleasure and profit to those who attended, and we expect in our next issue to give a report of the proceedings from our representative. One of the papers read appears elsewhere in this issue.

PERSONAL.

STEVENSON TOWLE, Mem. Am. Soc. C. E., has been appointed Park Commissioner of New York.

MR. COLEMAN SELLERS, mechanical engineer, of Philadelphia, has been appointed to the new Chair of Engineering Practice at the Stevens Institute of Technology.

THE Humane Society of the Commonwealth of Massachusetts has selected the design of Mr. Frank E. Wallis, an architect of New York, for a large solid silver memorial

DR, GEORGE F, SHRADY, Editor of the Medical Record. has been confirmed by the New York State Senate as successor to the late Dr. C. R. Agnew in the Board of Trustees of the Hudson River Hospital for the Insane.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

TRADE CATALOGUES.

WE have received the new catalogue of the Pond Engineering Co., of 707-709 Market Street, St. Louis, Mo., illustrating their steam and hydraulic machinery and specialties for steam users. The catalogue contains a con-siderable amount of data on steam and hy-draulic engineering, and will be sent free to interested parties on application.

TO WATER-WORKS ENGINEERS.

TO WATER-WORKS ENGINEERS.

The King of the Belgians has instituted an international competition in which a purse of 25,000 francs is to be given for the best essay on the most economical method of piocuring for large cities, and especially Brussels and its suburbs, an abundance of the best quality of potable water, due provision being made for the national increase of population.

Essays may be either printed or in manuscript.

A new addition of a published work will be considered only as to additions and improvements that may have been made in other works during the period of competition—thatis in, the years 1889, 1890, 1891 or 1892.

The works may be written in French, Flemish, English, German, Italian or Spanish. Foreigners who desire to compete for the prize must send their essays by January 1, 1893, to the Minister of Agriculture, Industry and Public Works, at Brussels.

The work that receives the prize will be published during the following year.

The judgment as to the competing works shall rest with a jury of seven members, three of whom shall be Belgians, and the other four foreigners from different nationalities to be nominated by the King.

ARCHITECTURAL COMPETITIONS.

BRIDGETON, PA.—Church.—Plans are wanted for a church edifice to be erected here by the Fourth Methodist Episcopal Church. No date specified. The committee on plans consists of Corstant Albertson, Eli Loper and George W. McCowan.

DETROIT, MICH.—Church.—Plans are wanted for a \$35,000 church edifice, to be in the Romanesque style of architecture. No date specified. Address: Rev. Mr. Hamilton, No. 1106, Woodward Avenue, as above.

orks for which proposals are requested see also e "Proposal Column," pages i-vii-viii-344

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

CRESTON, IOWA.—Water.—A system of water-works to be constructed here at an estimated cost of \$80,
50. For particulars address Mr. Rudegar.

Oco. For particulars address Mr. Rudegar.

Newark, N. J.—Water.—The Water Commissioners have recommended that proposals be solicited for an additional pump at the Clifton Avenue house, an additional boiler at Belleville, an extension to the boiler house there, and an extension to the engine room at Clifton Avenue. The pump desired at Clifton Avenue is a 5,000,000 gallon one for the High Service system. The Mechanical and Civil Engineers of the Board have been instructed to formulate plans and specifications for the new pump, and after they have been accepted by the Executive Committee bids will be advertised for. Bids for the supply of water at Belleville are also soon to be advertised for. Commissioner Wismer can furnish details.

See our Proposal Column on page 344 for advertisement for bids on the pumping engine.

Newark, Del.—Water.—The town council of this

NEWARK, DBL.—Water.—The town council of this place have appointed May 19 for an election to be held for or against a system of water-supply and sewerage, the proposed system to cost \$25,000. A public meeting is to be held on the evening preceding the election, when the system of water-supply will be explained by expert engineers. It is thought that the measure will carry.

CHADRON, NEB.—Water.—Our correspondent writes:
"A. A. Richardson, C. E., of Lincoln, Neb., is preparing plans and specifications for a system of waterworks to be constructed here at a cost of \$40,000." Address him for details.

FREEHOLD, N. J.—Water.—Concerning the report that the water-works question was to be settled at a public election, James S. Yard, Chief Commissioner, writes us as follows, under date of May 8: "The matter has been under discussion some time. At the annual charter election held yesterday, a resolution directing the Board of Town Commissioners to submit the question, according to law, to a vote of the people at a special election, failed to obtain a majority of the votes cast."

SYLACAUGA, ALA.—Water.—Regarding the water-works project here, J. K. Lanning, Eq., city editor of the Argus, writes as follows: "There has been a good deal of talk about water-works, but nothing has been done as yet."

LEOTI, KAN.—Water.—It is reported that a \$15,000 system of water-works is to be established here.

Winchester, Ky. — Water. — Our correspondent writes: "No steps have been taken so far to enter into any contract for water-works. A committee has been appointed, but has not reported as yet. That the town will have water-works is a certainty but, the plan to be adopted has not yet been decided on. We have two plans offered: one to bring water from the Kentucky, the other to build artificial lake, and don't know what plan will be adopted."

MARION, ALA.—Water.—Concerning the report that water-works were to be erected here, Mayor J. A. Moore writes as follows: "Nothing definite; only a newspaper agitation so far, and no individual or well-directed effort."

GADSDEN, ALA.—Sewers.—Our correspondent writes:
"This city will establish a system of sewerage. Maps, plans and specifications will be ready before long. Bonds will be issued to cover cost, perhaps \$50.000." For complete details address John H. Disque, Attorney at Law, as above.

LANSINGBURG, N. Y.—Water.—It is reported that the taxpayers of this place will decide the question of building a \$25,000 storage reservoir, at the polls on May 22.

RED BLUFF, CAL. - Water. — The Antelope Creek and Red Bluff Water Company has been incorporated here, with a capital of \$200,000. Peter Deekee can furnish details.

Wichita, Kan.—Water.—The Fairmount Water Company has been organized here, with a capital stock of \$50,000. George C. Strong and others are interested.

BIRMINGHAM, ALABAMA. — Water. — The stock-holders of the Elyton Land Company have authorized the directors to begin work at once on an aqueduct to supply the city with water from the Cohaba River.

OSTEGO, MICH.—Water.—It is reported that a water-works company is to be established here.

ST. PETER, MINN.—Water.—It is reported that the question of appropriating the sum of \$32,000 for a system of water-works is to be settled at a special election to be held soon.

tion to be held soon.

ABINGTON, MASS.—Water.—Regarding the report that extensions were to be made to the water-works system here, J. W. Synod. the Town Clerk, writes us as follows: "The works contemplated, extension of about four miles, have been contracted for, and the men are now at work and have been for a month. There is no new extension that I am aware of."

WATER-WORKS.—See our Proposal Column for information regarding water-works and water-works supplies at the following places: New Brunswick, N. J., David's Island, N. Y., Milwaukee, Wis, Newark, N. J.

BRIDGES.

REPUBLIC, MICH.—It is reported that the bridge over the Michigamme River, near this place, on the line of the Milwaukee and Northern Railroad, has been totally destroyed by the floods. The dispatches say that high water undermined the structure, causing its destruc-tion.

WELLINGTON, KAN.—The County Commissioners have decided to erect five iron bridges at different points near this place. The contracts will be advertised as soon as specifications can be prepared. For details address George Camp, Chairman of the Board.

CANFIELD, MINN.—An iron bridge is to be erected here. For details address the County Commissioners.

KASSON, MINN.—The County Commissioners will rect two bridges at this place.

MANTORVILLE, MINN.—A bridge is to be erected here. For details address the County Commissioners.

JAMESTOWN, N. Y.—Press dispatches state that a \$75,000 bridge belonging to the Eric Railway at this place has been destroyed by fire.

piace has been destroyed by fire.

Montreal, Canada.—Henri Malingre, architect, has forwarded to the Railway Commission at Ottawa the plans he had been requested to prepare by the Town Council of Longueuil for the proposed bridge across the river opposite the city. If a favorable opinion is received from the Commission a joint stock company will be formed for the construction of the bridge. According to the plans, the structure will cost \$2,000,000. It will begin on this side of the river at Point St. Charles, and, with a gradual descent, will span the main channel sixty feet above the low-water level, and, with a gradual descent, will cross St. Helen's Island, ending on the Government Common on the south shore above the town of Longueuil. It will be constructed of iron. Upon it will pass the cars of the South Shore lines, street-railway cars, vehicles, and persons on foot.

Wauwatosa, Wis.—The Board of Supervisors of

WAUWATOSA, WIS.—The Board of Supervisors of Milwaukee County will erect a bridge across the Menomonee River in the town of Wauwatosa.

BRIDGES.—See our Proposal Columns for informa-on regarding bridge construction at Cuming Co., Neb.

BARTON, N. Y.—It is reported that the Highway commissioners of this place will erect an iron bridge at

GAS AND ELECTRIC-LIGHTING.

DOVER, N. J.-This place is to be lighted with electricity.

tricity.

MILWAUKEE, WIS.—The Milwaukee Gas Light Co. has made a proposition to renew its contract with the city, which expires July 1, at \$23.00 per lamp instead of \$30.00. This will save the city \$16,000 per year. The matter is in the hands of the Gas Committee.

RAILROADS, CANALS, ETC.

PATCHOGUE, L. I.—The project of building a street railroad here is being agitated, and a petition asking the Legislature to grant the Patchogue Ranway Company a franchise has already been sent to Albany. It is not as yet decided whether horses or electricity will be used. The Town Clerk can furnish details.

DAVENPORT, IOWA.—An electric railroad is to be built here as soon as preliminaries can be arranged.

MINNEAPOLIS, MINN.—Application has been made for a franchise for the Enos Electric Elevated Railway to run to St. Paul as well as in this city.

MILWAUKEB, Wis.—The Whitefish Bay Dummy Line, of this city, will run a street car line on North Street from the lake to the western city limits, about three mules.

BLACK RIVER FALLS, WIS.—The Chicago, Milwau-kee and St. Paul RR.Co. will build an extension from Black River Falls to Sperbeck, Wis.

ST. PAUL, MINN.—Another scheme is on foot to build an elevated railway between this city and Minneapolis. The capital stock is \$2,000,000. A. H. Wilder, Wm. Dawson, Jr., St. Paul, are leading incorporators.

BIDS OPENED.

BIDS OPENED.

Denver, Col.—Capitol Building.—The following bids for the completion of the State Capitol Building at this place were opened May 1 by the Board of State Capitol Managers.

For the entire structure complete: J. A. Moross & Son, \$1,213,225; The E. F. Hallack Company, \$1,278,885; Gumry, \$1,452,000.

For cast and wrought iron work, including vault work: P. E. Lane, Chicago, \$517,442; Colorado Iron Works, Denver, \$267,442; Clark & Co., \$281,632.

For all stone and brick work for a finished and complete job: Geddis & Seerie, Denver, \$679,000.

For all brick work required; R. P. McDonald, \$118,-956; Benjamin Brenn, \$184,475; C. Y. Smith and Ashland, \$146,968.

For plastering, plan and ornamental stucco work:

fand, \$146,968.

For plastering, plain and ornamental stucco work:
M. D. Currigan, \$68,785; Charles McCabe, \$72,898;
C. W. Lawrence, \$79,885.

For painting, glazing and glass: J. B. Sullivan & Broa., Chicago, \$42,744.

For painting and graining: Charles L. Dow, \$14,-

For painting and graining: chances 2. 2007, vol.

447.

For all plumbing, sewerage and gas-fitting: C. J.
Reilly, \$13,747; E. H. Cook Co., of Rochester, \$39,750;
Suess Brothers, \$22,500.

For steam work, plumbing, sewerage and gas-fitting:
Samuel I. Pope & Co., Chicago, \$40,994.

For marble steps, tiles, etc.: Pickel Marble Co.,
Chicago, \$36,165. (The amount of \$6,335 will be deducted from their bid if encaustic tile is used in place of marble.)

For galvanized iron work, copper work, zinc work

of marble.)
For galvanized iron work, copper work, zinc work and corrugated work: James J. Walter, \$64,000; another bid, \$83,938.
For vault doors: Hall Safe and Lock Co, \$4,600; George H. Bushnell & Co., \$1,474.
Miscellaneous: Two hydraulic elevators, \$9,900; steel covering of dome. \$10,386; statuary, Ed. P. Gau-phin. \$2,000.

phin, \$7,000.

The bids have all been turned over to Mr. Meyer, the architect of the building, for his investigation.

PHILADELPHIA, PA.—Schools.—The following proposals for erecting school buildings were opened May 4, by the Board of Education: School-house at 8th and Wo.f. Sts., 1st Section, Chas. McCaul, \$58,480, and C. O'Neil, \$57,591. School-house at Richmond and Jenks Sts., Bridesburg, Chas. McCaul, \$58,000, J. Wenzelberger, \$63,480. School at 16th and Moore Sts., the bidders for the different sizes of schools proposed, they being of 15, 18 and 21 division capacity, were James Bradley, \$58,000, \$64,050 and \$70, too; Charles McCaul, \$56,800, \$62,300, \$67,800; C. U'Neil, \$55,991 and \$62,639, for the two smaller. School at 13th and Tremont, S. H. Jordan, \$71,773; Chas. McCaul, \$61,514.

ALLEGHENY, PA.—Pumping-Engines.—The following bids for furnishing two horizontal plunger pumping-engines, outside packet, each with a capacity of delivering 5,000,000 gallons of water 250 feet high, with a piston speed not exceeding 100 feet per minute, the same to be without foundations, were opened May

2 by Comptroller James Brown: Wilson Snyder Manufacturing Co., Pittsburg, Pa., two bids, \$45,000 and \$42,000; George F. Blake Manufacturing Co., New York City, two bids, \$43,450 and \$54,600; Holly Manufacturing Co., Lockport, N. Y., two bids, \$38,000 and \$36,000; Henry R. Worthington, New York, \$50,000 and \$42,000; Gordon & Maxwell Co., Hamilton, O., \$40,000. All the proposals were referred to the sub-committee.

ALLEGHENY, PA.—Stop-Gates.—The following proposals for furnishing a quantity of stop-gates were opened May 2 by James Brown, Comptroller: Union Foundry, Allegheny, Pa., 4-inch, each, \$7.80; 6-inch, 12.35; 16-inch, \$60; J. R. Richardson, Allegheny, Pa., \$10, \$14, \$08; Kelly & Jones Co. Pittsburg, Pa., \$8, \$12.25; \$72; Bailey, Farrell & Co., Pittsburg, Pa., \$8.40, \$13.50, \$60; Atwood & McCaffrey, Pittsburg, Pa., \$8.65, \$13.47, \$74.93.

STAMFORD, CONN.—Bridge.—The Berlin Iron Bridge Company, of East Berlin, have been awarded a contract to construct, etc., an iron bridge over Mill River, at this place, at a cost of \$10,627.

at this place, at a cost of \$10,027.

New York City.—The following bids for electric street lighting for the city, for the year beginning May 1, 1888, were opened May 9, by the Gas Commission: The Brush and United States companies, 441 lights each, at 35 cents a night; East River Company, 493 lights, at 35 cents; Mount Morris Company, 361 lights, from 17½ cents to 40 cents, according to locality. The North New York Company, 228 lights, at 35 cents; the Ball Company, 499 lights, from 26 cents; Harlem Lighting Company, 459 lights, from 26 cents to 60 cents. The bids were referred to Secretary McCormack for tabulation.

tabulation.

Contracts were awarded to six of the gas companies for street lighting, as follows: Equitable, \$12 a year for each lamp; New York Mutual and Consolidated, \$17.50; Central (in Twenty-third Ward), \$28; Northern and Yonkers (in Twenty-fourth Ward), \$29;

ern and Yonkers (in Twenty-fourth Ward), \$29.

Boston, Mass.—Stony Brook Improvement.—The Superintendent of Sewers has received proposals for building Set tion 4 of the Stony Brook sewer. The specifications called for 12,300 cubic yards earth excavation, 200 cubic yards rock excavation, 450 yards concrete, 900 cubic yards rubble stone, 1,900 cubic yards brick masonry, 50 yards brick masonry in Portland cement, five cubic yards dimension stone, 100,000 feet B.M. lumber and 1,406 spruce piles. William Whattaker bid 80c., 30c., \$4.75, \$5.50, \$12.50, \$21.50, \$21.450, \$40, \$25, \$3-total, \$48,365.50. Thomas A. Rowe, 70c., \$1, \$5, \$5, \$5, \$13, \$14, \$30, \$25, \$2.25-total, \$47,48. Solomon Sanborn, 80c., \$1, \$4, \$0, \$6, \$14, \$15, \$20, \$26, \$3-total, \$51,517. A. Saucier, 75c., 25c., \$6, \$5.40, \$13, \$15, \$25, \$26.40, \$3-total, \$49,331. Charles Linnehan, 90c., \$3, \$4.60, \$4.60, \$12.75, \$14, \$15, \$23, \$2.35, \$2.10, \$11.85, \$23, \$24.50, \$3.44.50, \$3.24.50, \$3.50-total, \$49,777.50. Awarded to Mr. Cram.

EAST LIVERPOOL, O.—Sewers.—The following pro-

50c., \$4.50, \$5.10, \$11.85, \$12.85, \$23, \$24, \$24, \$0, \$3.50—total, \$47,177.50. Awarded to Mr. Cram.

EAST LIVERPOOL, O.—Sewers.—The following proposals for constructing sewers at this place were opened April 24 by the Board of Sewer Commissioners: Frank Riley and James F. Kuntz, Cleveland, U., \$23,920; Thomas Connell, Youngstown, O., \$24,030; Coon & Co., Washington, Pa., \$30,520.50; W. M. Chisholm, East Liverpool, O., \$28,155; J C Murray, Newark, U., \$49,400; Allen & Franklin, Buffalo, N. Y., \$35,069.38; J. J. Everson & James Christie, Jr., Akron, U., \$30,030,50; H. C. Howard & Co., Pittsburg, Pa., \$64,773.50; T. C. Brooks & Co., Detroit, Mich., \$41,309.50; C. H. Vonte, Toledo, O., \$33,007. Richard Dickson, Sault Ste. Marie, Mich., \$38,199. The bid of J. C. Murray was not considered.

The following contracts were awarded: Construction, Thomas Connell, Youngstown, O.; sewer pipe and specials, Knowles, Taylor & Anderson, East Liverpool, at 55 per cent. off list, delivered on line of trenches; cast-iron pipe and specials, Andrew J. Boyce, East Liverpool, \$20.70 per ton, specials 2% cents per pound; Portland cement, Miller & Sons,

ST. PAUL, MINN.—The St Paul Park Improvement Co has sold too lots to a Chicago syndicate, represented by J C Cramer of that city, the conditions being that houses shall be erected thereon. About \$60,000 will be expended this year.

A B Wilgus will build 20 houses and flats on Ram-ey Hill, and 40 smaller houses in other parts of the

ALBERT LEA, MINN.—A \$20,000 hall is being talked of for Albert Lea College.

LA CROSSE, WIS.—W H Parker, superintendent of the new Government building, has received plats and advertised for bids, which will be received dur-ing May.

JERSEY CITY, N. J.—A new church edifice is to be erected by the society of St Mark's Church; cost, \$50,000.

CINCINNATI, O.—A \$100,000 armory building is to be erected here for the Ohio National Guard. S. Hannaford & Sons, of this city, are the architects, and none of the contracts have been let.

FINDLAY, O.—The Findlay Opera House Company has engaged Architect DS Shureman, of Cincinnat, to have charge of the erection of their new edifice to be built here at a cost of \$75,000. Address him at No 227 Main Street, as above, for details.

OAKLAND, CAL.—The Trustees of Mills College will erect a new building at a cost of \$13,000. For details address President Stratton.

PETERBORO, N. H.—An \$18,000 school building is to be erected here.

MANKATO, MINN.-Mr Saulpaugh will build a \$28,000 hotel nere. MINNEAPOLIS, MINN.—W E Steele is to erect a ten-story building on Third Street North; cost, \$75.

LS Buffington, architect, has just completed plans for handsome residence for LB Hart.

-Mr De Camp will build WA Barnes, will erect seven two-story houses, none less than \$3,000.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 25.

PUBLISHED EVERY SATURDAY.

NEW YORK, MAY 19, 1888.

LONDON, JUNE 2, 1888.

SINGLE COPIES, TEN CENTS. Subscription, \$4.00 per year in advance, po SINGLE COPIES, SIXPENCE. Subscription, 20s. per annum in advance, post paid.

IN AMERICA IN GREAT BRITAIN.

THE ENGINEERING & BUILDING RECORD, conducted by HENRY C. MRYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

> OFFICE IN GREAT BRITAIN, 92 & 93 FLEET ST., LONDO

TERMS, 201, PER YEAR, IN ADVANCE. Partage Paid.

Eq., Querstrasse 29, Leipzic, Germany, and Asiker & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

Subscribers will please notify us *promptly* of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to The Engineering & Building Record.

When a change of address is desired, both the old and new addresses should be given.

THE ASSEMBLY CHAMBER CEILING.

Our issue of May 5 contained the report of the Expert Commission appointed to examine the condition of the ceiling of the Assembly Chamber of the New York State Capitol, and on another column of this number will be found a communication to the Speaker of the Assembly from the architects, Messrs. Eidlitz, Richardson & Co.

It will be remembered that the Commission found the ceiling to be in a dangerous condition and recommended its immediate removal, together with that of some adjacent portions of the building, amounting altogether to over 3,000 tons, in order to relieve the foundations, which were said to be overloaded. They also gave it as their opinion that the ceiling should be replaced by a much lighter structure of wood or metal, which for acoustic reasons they suggested should be flat.

As to the dangerous condition of the ceiling, and the necessity for the removal of at least the three central vaults, the architects do not differ from the Commission, but they do object on architectural and economical grounds to the replacement of the vaulting by a ceiling of wood or metal.

Provided that the acoustic question is not serious, about which there seems to be room for some difference of opinion, and that the foundations are not materially overloaded, which the statement of the Commission that their "settlement had been slight and not very irregular' would seem to indicate, or if the weight on them can be reduced to safe limits by the removal of other loads, such as the Commission suggest, it would seem as if the proposition to reconstruct rather than remove the vaulted ceiling was not unreasonable.

The difference of opinion on this point between the Commission and the architects probably arises from the fact that in reconstruction they do not have in mind exactly the same thing. The Commission charge, perhaps with justice, that "the ruin of the vaulted ceiling is due to the * * * design and method of construction and loading," and are naturally indisposed to countenance a repetition of the same errors with presumably the same results. On the other hand, it is not to be supposed that the architects have learned nothing by this extended and costly experience, and merely propose to "set 'em up again," trusting to better luck next time. They undoubtedly fully realize the defects of the present structure,

and would take pains to prevent their repetition.
Those who have carefully studied the description of this structure, given elsewhere in this issue, and the causes suggested for its failure, may perhaps agree with us that if the vaults are rebuilt as urged by the architects they could in two respects at least be made more stable. First, the vaulting instead of having its continuous joints horizontal, as now, should be composed of vertical rings or arches, of which a sufficient number at suitable intervals should be of such depth that the lines of pressures could be certainly contained in their "middle thirds." In other words, they would give stiffness to the vaulting, while the intermediate segments could be made enough thinner to keep the entire weight no greater than at present. Second, each arch or segment of the vaulting should set squarely on skewbacks formed on the main ribs, whereby all sliding or wedging and the distortions thereby produced would be absolutely avoided.

With these and perhaps other precautions that may be suggested, it would seem as if the defective vaults could be safely rebuilt, and to abandon them as beyond the resources of engineering skill is a confession of limitation in which neither engineers nor architects will readily concur.

The reconstruction with vaults of such design and with the provisos before stated we hardly think would be objected to by the Commission if the proposition were before them; and, if permitted, the result could not fail to be much more satisfactory, both from an architectural and engineering point of view, than would be likely to be the case with any cheaper substitutes.

QUARANTINE AND PUBLIC HEALTH.

IT seems that yellow fever has been lingering on throughout the winter in certain small towns in Florida, that it has been concealed and called something else, that no effort has been made to get rid of it, and that now it is to be used for a scare—Senator Call having introduced a joint resolution to give the Surgeon-General of the Marine Hospital Service one hundred thousand dollars to extirpate the fever, "provided that any exercise of power under this act in the interior of the State shall be done under the authority of the laws of the State and of the officers of the State properly charged with such duty." This means, of course, that because of the want of proper laws and legal authorities in Florida a conflagration has been started there which threatens to invade neighboring States, and that Florida is willing to put out the fire if the United States will pay her officials for doing so, but that she does not propose to have any outside authority interfering.

We have been hearing a good deal about the remarkable efficiency of the quarantines of North America recently. The merits of the present New Orleans system of disinfecting vessels, etc., have formed the subject of many laudatory editorials; the New York Quarantine, though somewhat damaged in reputation, is still supposed to be equal to any emergency, and now Dr. Montalembert brings out his report of the Grosse Isle Quarantine Station on the St. Lawrence, in which he tells us that "the season of 1887 marks the commencement of an entirely new era in the history of the quarantine system of the St Lawrence. * * * Canada has, for of the St. Lawrence. Canada has, for the first time, the assurance that every vessel from outside her boundaries which enters by the St. Lawrence will be inspected by a medical officer, responsible to the Government and to the country, before it is permitted to pass the Quarantine Station, etc.'

The St. Lawrence Quarantine is to be managed on very advanced principles. Not only are cases of measles, scarlet fever, and diphtheria to be quarantined, but Dr. Montalembert appears to be thinking about stopping cases of whooping cough. It seems that the St. Lawrence Quarantine has not yet got a wharf or a satisfactory dis-infecting establishment, and they need a new inspecting steamer and some more men, having at present only seventeen on the quarantine staff, nevertheless great improvements have been made and for these our Canadian friends deserve due credit. We need some repairs to our quarantine establishment of this city, and therefore do not feel like being very critical about those of others.

If every maritime quarantine establishment of the country were turned over to the United States, who should manage the business, pay the bills, collect the dues, and be responsible for the results, it would probably be the best settlement that can be made. No quarantine will permanently keep small-pox and yellow fever out of the United States—its adges are too big and ragged—but they may be deferred a long time, and this is worth doing. But if the United States pays the money, do not let it be paid to State officials.

THE POSITION OF RAIN-GAUGES.

MR. H. HELM CLAYTON, in a letter to Science, says of rain-gauges exposed on the roofs of houses: "The amount of rain caught becomes a function of the wind-velocity, a function of the wind-direction, and a function of other variants and variables, not least among which is a not uncommon change in the position of the gauge itself. Numerous experimental observations have shown that gauges exposed on roofs catch more rain when exposed on the side opposite to the direction from which the wind blows, and less rain when exposed on the same side from which the wind blows." *

For several years the rain-gauge of the Signal-Service Station at Boston has reported less than the normal rainfall and less than that given by other gauges in the immediate vicinity. This deficiency has been noticed since the gauge was removed from the roof of the Equitable Building to the top of a high tower on the Post-Office.

Mr. Clayton suggests no explanation further than the statement that "the amount of rainfall caught is evidently a function of the wind-velocity, and decreases with increased velocity of the wind." But it seems not impossible that the increased elevation of the gauge may have something to do with it, as all rain formed or moisture condensed on the falling drops below the gauge cannot be recorded by it.

THE ASPHALT PAVEMENTS OF BERLIN.

THE annual reports published by the municipality of Berlin afford some interesting reading with regard to the cost, etc., of the asphalt paving in that city since its introduction. The first experiments with Val de Travers asphalt were made in 1873. These proving satisfactory, a commencement on a small scale was made in 1877, when 2,556 square metres were laid down. From that year the extension of asphalt pavement grew rapidly. At the end of 1878, 23,586 square metres of the public streets of Berlin were paved with asphalt; at the close of 1879, 63,258 square metres; 1880, 106,223 square metres; 1881, 125,034 square metres. By April 1, 1883, 187,672 square metres of asphalt pavement had been laid down; at the same date in 1884, 253,586 square metres; in 1885, 322,042 square metres; in 1886, 359,409 square metres; in 1887, about 412,000 square metres. At present the superficies of asphalt paving in Berlin is about 470,000 square metres, and further 76,000 square metres have been ordered to be executed. The above figures show that asphalt pavement, notwithstanding its reported disadvantages, is in great favor at Berlin, at any rate. As to expenses, according to the Builder, a square metre of asphalt paving costs there on an average, 17 marks 50 pfennigs (17s. 6d.), while the cost of maintenance for twenty years, by contract, is 7 marks 50 pfennigs (7s. 6d.). The total cost per square metre of asphalt pavement for twenty years is, therefore, 25 marks (£1 5s). This is only 75 pfennigs (9d.) more per square metre than the cost of granite pavement. From the report of the municipality of Berlin, it appears that the complaints with regard to the slippery condition of asphalt pavement are gradually disappearing. On the one hand, great improvements, by the light of experience, have been introduced in the treatment of the asphalt; on the other hand, both "drivers and horses are getting more and more used to the new pavement." The cleansing of the pavement also leaves little to be desired, although only forty-five boys are engaged in the work of cleaning nearly 500,000 square metres.

A MAN in Leicester, England, was fined by the magistrate 40 shillings and costs for wasting water by allowing his water-closet cistern to leak water in the water-closet basin. If every one guilty of a like offense in this country was treated in the same way an enormous waste would be prevented.

NEW YORK STATE SIGNAL SERVICE.

THE bill establishing a State Weather Bureau has passed the Legislature and will probably become a law. It appropriates \$4.500 annually for the purchase and repair of apparatus and the dissemination of reports. It is proposed to have a signal station in every important town, usually in some school building, and to have every post-office supplied with bulletins.

The headquarters of the Bureau will be at Cornell University in charge of three commissioners, the Professor of Civil Engineering at Cornell, the State Superintendent of Public Instruction, and a third to be appointed by the Governor, all of whom, as well as the observers, are to serve without salaries. An officer from the U. S. Signal Service will be detailed to organize the Bureau and to have immediate charge of the central station.

There are similar bureaus already established in 30 other States and doing very valuable work in supplementing the national observations and reports and utilizing them for special localities.

HYDRAULIC POWER IN LONDON BUILDINGS.

HYDRAULIC power supplied from a central station is used in several London buildings. In the Hotel Metropole no less than seventeen hydraulic lifts are in use, working day and night.

Each of the seventy houses composing Kensington Court is fitted with a hydraulic lift, which takes the place of a back staircase. Altogether in London there are over 400 lifts which are worked from the mains, and a saving which is about 30 per cent. is said to be effected over steam-pumping. Next to lifts the power is mostly used for cranes and hoists along the riverside and in city warehouses. It is also used in London for pumping water for domestic use from the underlying chalk.

The power is supplied through mains under a pressure of 700 pounds per square inch. The water is kept at a temperature of between 60° and 85° throughout the year. Nearly 27 miles of mains have been laid. The charges vary from 2s. to 8s. per 1,000 gallons, according as the power is more or less continuously used. About 650 machines are worked in London by the hydraulic power.

THE EAST RIVER BRIDGE LIGHTS COM-PLAINED OF.

COMPLAINT has been made by pilots and shipmasters to the Lighthouse Board at Washington that the electriclights on the East River Bridge are so dazzling as to prevent them from clearly discovering the lights on other vessels or to judge of their distance.

Mr. C. C. Martin, the Superintendent of the Bridge, proposes to use screens or reflectors to confine the light as far as possible to the roadway.

SUNDAY LABOR IN GAS-WORKS.

THE London Journal of Gas-Lighting calls attention to the fact that the force employed during the day time on Sundays in the gas-works at Belfast had been reduced fifty per cent., and that a still further reduction was contemplated. One of the Gas Committee of the town had visited Glasgow, Preston, Manchester, Liverpool, Birmingham, and London, and reported that in five of these places there is a fifteen-hours' stoppage on Sundays, with the exception of about fifteen or sixteen days in each year. In the other towns, as in Belfast, there is simply a reduction of the force. The ability to stop work on Sunday of course depends on the storage capacity of the works.

M. A. DURAND-CLAYE.

La Nature of May 5 announces the death of M. A. Durand-Claye in the latter part of April last, at the age of forty-six years, after a short illness. He was a professor at l'Ecole des Beaux-Arts and at l'Ecole des Ponts et Chaussées, and an officer of the Legion of Honor. The establishment of the sewage farm at Gennevilliers was largely due to his labors. His numerous writings, in which are given the results of irrigation at Gennevilliers, his studies of the sewerage systems of Paris and other cities of Europe, are well known to our readers.

OUR ARCHITECTURAL ILLUSTRATION.

RESIDENCE OF MRS. SKINNER, BOSTON.—SHAW & HUNNEWELL, ARCHITECTS.

THE ASSEMBLY CHAMBER CEILING IN THE NEW YORK STATE CAPITOL.

THE ceiling of the Assembly Chamber of the Capitol at Albany is composed, as shown in the general plan, Fig. 1, of eleven groined vaults of various sizes. The central vault is 55x41 feet from centre to centre of the four main columns E E, which support its entire weight and from a half to a fourth of the weight of the eight vaults immediately adjacent to it, and is considerably larger than any similar structure that has yet been built.

The construction of these vaults is sufficiently indicated by the word "groined," but for those who may not be familiar with the term it should be said that each vault rests on two arched ribs springing diagonally from corner to corner and intersecting at an annular keystone in the centre through the opening in which the chandelier is suspended. A section of the ribs is shown in Fig. 4. The molded side is of course underneath and on the seats or offsets F F the vaulting N N is supported, which is cylindrical in shape (except the longitudinal arch of the main vault, which is curved in the direction of its length as well—see Fig. 2), and its horizontal joints are shown by the lines at N N, Fig. I. The square part of the rib projects up through the vaulting as shown in the plan.

Figure 2 is a longitudinal section on X X, Fig. 1. It gives an elevation of the wall K, and in connection with Fig. 3, which is a transverse section at Y Y, Fig. 1, shows the general arrangement of a system of wrought-iron ties designed to relieve the building of lateral thrust from the vaults and arched walls. Referring to Fig. 3 it will be seen that the thrust of the central arch is resisted by that of two half arches concealed in the wall and tied together at their crowns by the rods A A. The thrust of the small side arches is taken by the rods B D, B D, whose downward pull is resisted by suitable plates at B B. By this arrangement it is calculated that all of the wall above D D would be carried safely on the columns at E E, even if the side walls below D D were removed. A similar arrangement is shown in dotted lines in Fig. 2 at M L, L M, though not so necessary here, as the building might be supposed to be strong enough in the direction of its length to safely resist the arch thrusts, and for this reason the rods to support the small arches are omitted.

All these rods are intended to have such an initial tension put on them that they shall never, even when at their highest temperature and under their greatest strain, cease to compress the masonry which they embrace, and which, it will be noticed, has no openings in the line of the rods. This will prevent the rods from undergoing any change of length (relative to the masonry), and it is claimed that the only effect of possible changes of temperature will be to alter their tension within certain safe limits.

The external dimensions of the main ribs are 16x36 inches, and the vaulting varies from about 14 inches thick at the spring to about 10 inches at the crown of the main vault, and from 12 to 8 inches in the smaller ones. The pockets at the corners were filled up for some distance with concrete, but all above that point depended for its stability on its own equilibrium, with what assistance it might receive from the enclosing walls,

It is manifest that in a structure of this kind, whose tensile strength is very small and not to be counted on as affording any assistance, the location of the material and of the lines of pressure must very closely coincide, since if the lines of pressure get outside of the "middle third" of the thickness there will be trouble, and if outside of the thickness, ruin.

The vaults had not been long left to their own support before they began to show disturbed equilibrium in the opening of joints in the ribs, which in the main vault showed a tendency to open the inner joints a little above the haunches, to correct which, and the crushing of the edges of some of the outer joints observed some time later, a load was placed upon the crown of the vault with some success.

Just what caused this disturbance it is exceedingly difficult to say. As shown above, the line of pressure in the main rib could not vary safely more than six inches from a central position, and in some parts of the vaulting less than an inch and a half, and variations in the density of the stone and in its thickness, as the back was left rough, might cause material variations from their calculated position. The pressure lines would also be more or less disturbed by any settlement, compression, or shrinkage of the surrounding or supporting masonry. It is worth noting, however, that in these vaults, as in all sim-

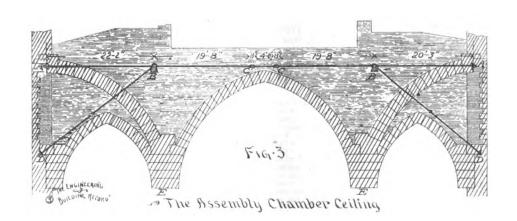

^{*} Due probably to the upward air-current on the windward side of the building.—E.D.

SHAW & HUNNEWELL, ARCHITECTS.

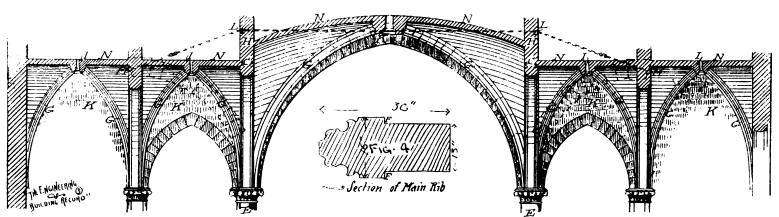

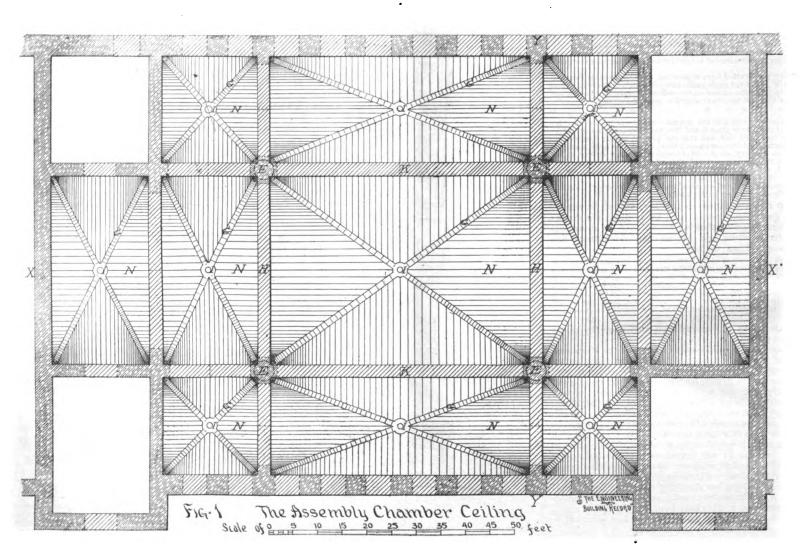

Fig. 2 The Assembly Chamber Ceiling

Digitized by

ilar structures heretofore built, the ribs are of uniform section, with no transverse offsets or projections of any kind to prevent the vaulting from sliding longitudinally upon them, as gravity would naturally cause it to do, and this sliding tendency is resisted solely by the cement and the friction. If such sliding did take place, some of the vaulting would soon become wedged between the ribs and the enclosing walls, and the horizontal reactions thus produced would tend to cause just such a deformation as has been described in the case of the main ribs. It will be noted, also, that the arches are pointed at the crown, and therefore, if not loaded at that point, are especially liable to this deformation.

STATEMENTS OF THE ARCHITECTS IN REGARD TO THE ASSEMBLY CHAMBER CEILING.

To the Honorable the Speaker of the Assembly of the State of New York :

The undersigned, in the interest of the State and of the architecture of the Capitol, which has received recognition as an advancement in the art of building and in justice to their professional reputation, respectfully represent that the defects of the Assembly Chamber ceiling at the present time are mainly due to neglect of recommendations made in 1882, and often repeated since, and that the proper course to be pursued at this time is to restore it to a safe and permanent condition. We are distinctly of opinion that this should be done both on architectural and on economical grounds, and submit the following reasons for this opinion:

The stability of this vaulted ceiling was carefully and scientifically examined by a commission appointed by Governor Cornell in 1882, in consequence of the fracture of a stone in one of the ribs of the main vault. Its conclusions are given in the following extracts from its

report:

"Immediately upon the organization of the commission we proceeded to get as correct an idea of the present condition of the Capitol as could be acquired from, first, an examination of the building; and the explanations of Major J. W. Eaton, the local Superintendent, who has been in charge of the work almost from its commencement, and a careful study of such drawings as were in his possession; second, from reports of sundry surveys and levels taken at various times by Mr. R. H. Bingham, City Surveyor; third, from the explanations of Mr. Leopold Eidlitz, who represented the architects in charge of the work.

"As to the result of these investigations, we find that the materials and workmanship of the building in general are exceptionally good; and we discover no defects worthy of special consideration other than those appearing in the Assembly Chamber and the portions of the building immediately above and below it. We have consequently confined our subsequent labors to a very careful, and, we believe, thorough examination of these defects, to an analysis of their causes, and to a consideration of their bearing upon the ultimate stability of the structure. To this end we caused a new set of levels to be taken, from which it appears that although no very unusual amount of settlement has occurred, the settlement has not been uniform."

"We have had the entire vaulting, with its supports and backing, measured, and their weights carefully computed, as a check to the accuracy of the quantities furnished to us by the architect, and we find that his calculations are substantially correct."

"We have critically examined the plans of Mr. Leopold Enditz, architect, for the construction of the Assembly Chamber and the work connected with it, and have given due consideration to his very full and clear explanations of his computations and methods of construction.

"If we could be sure that the unequal settlement of the foundations had permanently ceased, and that they were capable of safely bearing an increased load, and that the present mixed construction of flying arches and iron rods would always hold the arch springers with absolute rigidity, we should recommend that the ceiling of the Assembly Chamber be recentered, that all broken or defective stones be replaced, and the main side vaults brought into stability by rebuilding or readjustment of loads."

'The cracks in the 'red corridor' under the Assembly Chamber are no evidence of danger to the building.

In our communication to the Governor of November 17, 1882 (hereto annexed in full), we resolved the doubts of the Commission by showing clearly that the abutments were perfectly secure, and that no unequal settlement had taken place. Hence we said:

"We find in the report of the Commission no warrant for any further recommendation, except that the fractured stone still remaining in the main vault be replaced; that the work be properly pointed, and that the equilibrium of all the vaults be reviewed, and, if need be, corrected. Nor can we find in the report warrant for any other opinion than that when these slight repairs are made the vaulted ceiling of the Assembly Chamber will be a perfectly sound and permanent structure."

Since the above recommendation was made by us six years have passed

The theoretical proof presented by us that the abutments are secure has been confirmed by a recent examination, and the conviction expressed that the differences of level of the bases of the granite columns are due to irregularities in building and not to an unequal settlement, is now proven practically by a recent report of Mr. Bingham, which shows that the relation of the levels of the two columns in question remains the same as it was in 1882.

It will be seen that the statements of the Commission of 1882 as to what it would recommend could it be satisfied as to the security of the abutments and foundations is substantially identical with our own recommendations of what should be done. This recommendation was not carried out and nothing has since that time been done in pur-suance of it. The present condition of the vaulting differs from its condition in 1882 only by the deterioration consequent upon this neglect. The neglect has occurred in

spite of our urgent and repeated appeals to the Commis sioners of the Capitol and the Superintendent of Public Buildings, who severally explained that they had no power in the premises. These appeals being without result, we finally addressed, May 25, 1887, the following letter to the Trustees of Public Buildings:

To Hon. David B. Hill, Hon. Edward F. Jones, Hon. James W. Husted, Trustees of Public Buildings, and Hon. Charles B. Andrews, Superintendent of Public Buildings.

During the past eight years various communications made by us to the present Commissioner of the Capitol and to his immediate predecessors, relating to the completion of the Assembly Chamber vaults, to the regulating of their equilibrium and to repairing injuries done by the long neglect in doing this necessary work, have not been acted upon. The reason these communications were not acted upon is, we are assured by the Commissioner, that he has no power in the premises by reason of Chapter 205 of the Laws of 1882, which withdrew the Assembly Chamber, together with other parts of the building (by that law declared to be completed), from the care and supervision of the Capito Commissioners and placed them in the hands of the Clerks of the Senate and Assembly and other State officers, and by reason of Chapter 249 of the Laws of 1883, which created the Trustees of Public Buildings, who are now entrusted with the care of the so-called completed portions of the Capitol.

Being left without power or authority to carry out the work which we deem absolutely necessary for the preservation of the Assembly to exhaust the last possible resource left open to us whereby our recommendation in the premises may be officially recognized.

We herewith repeat the request heretofore made of the Commissioner of the Capitol that you appoint one or more competent persons

sioner of the Capitol that you appoint one or more competent persons conversant with the theory of arches, who shall in connection with

us examine the vault of the Assembly Chamber, which upon its condition and recommend such repairs as all perfect its construction. "The Assembly Chamber," we say in our last report missioner of the Capitol, "should not be given up should its reputation be permitted to be assailed for walligent and authoritative expression of opinion as to its tion, or for want of the necessary funds to complete it and keep it in repair."

Our professional reputation should not be permitted not should we be held responsible for the integrity of our recommendation, to do necessary work for its complencessary repairs for its maintenance are not acted upon Submitting all this to your favorable consideration that you will take such action as the case deserves, we Yours very respectfully, EIDLITZ, RICHARI The Commission appointed by the Assembly luring the

The Commission appointed by the Assembly present session, whose report of April 26, 18 before us, sums up the defects of the Assemb by the statement that

"The ruin of the vaulted ceiling is due to the fact the and method of construction and the loading of these archas been such as to give pressures which have resulted the design togration of the structure."

This means that these vaults are either not a equilibrium or that they have been out of equilibrium: and that the injury done at that time has not becorepaired, or both, and this conforms to our own concl sions and

those of the Commission of 1862.

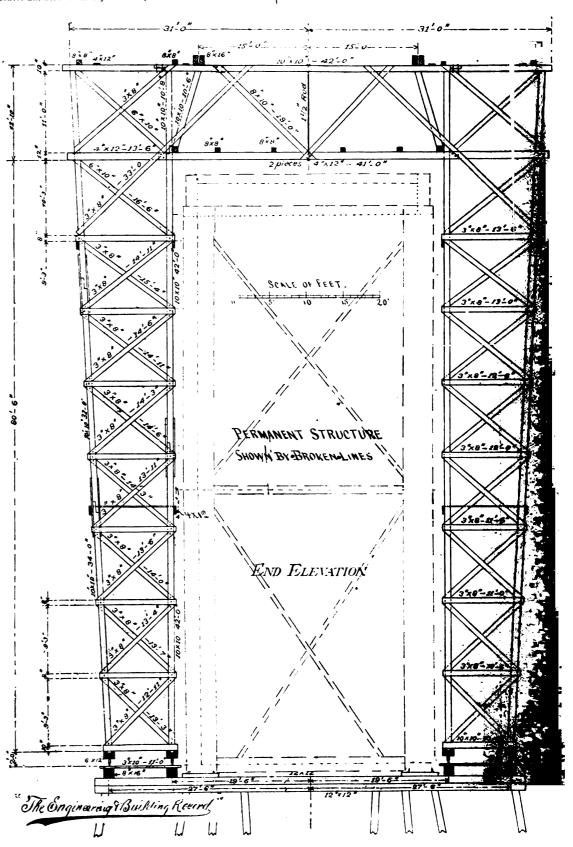

The present Commission nevertheless recon nends the demolition of the vaults and of various other masses of

hall report

be assailed, work while

Chamber

POUGHKEEPSIE BRIDGE. FIGURE 22.

masonry, and the substitution of wood, metal and slate, in order "not to throw lateral pressure on the outer wails, and so as to load the supporting walls below the Assembly Chamber as little as possible." Inasmuch, however, as in fact the present ceiling throws no lateral pressure on as in fact the present centing throws no fateral presented the outer walls, as the supporting walls below the Assembly Chamber are not overloaded, and as the Commission itself reports that "the settlement of the foundations has been slight and not very irregular," * thus showing that they are not overloaded, the extensive demolition proposed seems to be quite unnecessary. The deterioration, the cause of which we have already explained, has advanced so far since 1882 that in place of the "slight repairs" we then recommended it may now be necessary to reconstruct the three central vaults; but we can see no reason, engineering, architectural or economical, why the vaulting should be replaced by "a ceiling of wood or of metal." If it would be discreditable to the State that the vaulted ceiling should fail, through unscientific construction or through neglect, it would not be less discreditable to the State that it should be superseded for insufficient reasons. All of which is respectfully submitted.

EIDLITZ, RICHARDSON & CO.

Note.—This paper being confined to the question whether the vaulted ceiling of the Assembly Chamber's ould be repaired or superseded, only incidental mention is made in it of those findings and recommendations of the Commission which do not relate directly to that question. It is not, however, to be interred that the architects assemt to these

BUILDERS' AND CONTRACTORS' ENGINEER-ING AND PLANT.

No. XXXIV.

(Continued from page 336.)

ERECTION OF POUGHKEEPSIE BRIDGE.—NO. 4.1

TRAVELERS

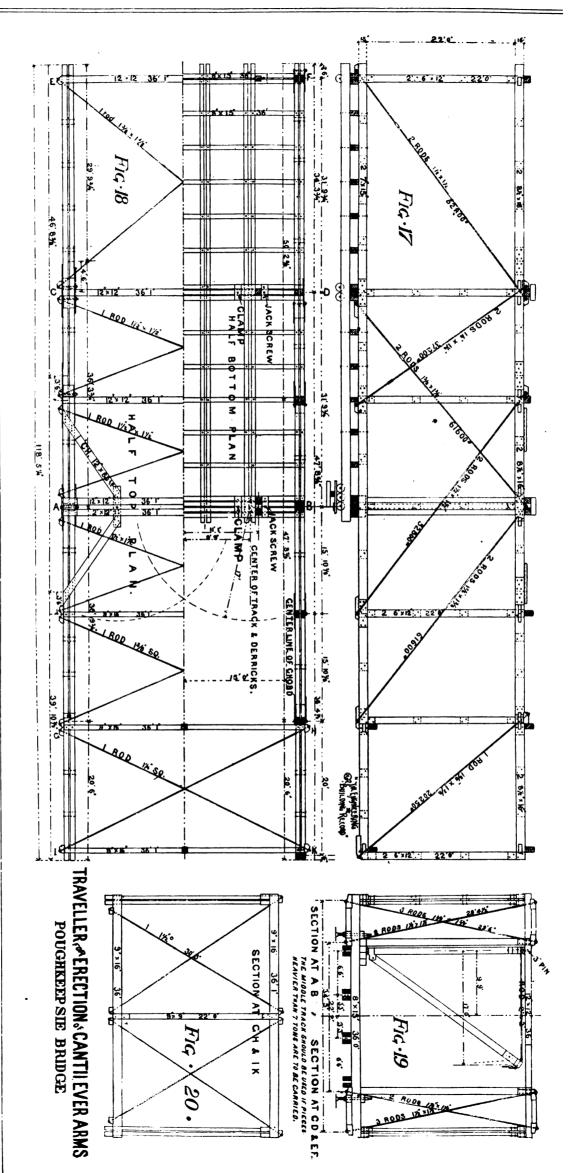

FIGURE 21 is a transverse, and 22 a longitudinal view of the traveler designed to erect the 525-foot spans. It is nearly 70 feet long by 100 feet high, and 60 feet wide on top. The posts and transverse bracing are of timber, and the longitudinal tie-rods of iron. It is carried by 16 double-flanged wheels on four rails. There are two working platforms at convenient heights for making connections in top and intermediate planes of lateral bracing. On top, over the centres of the chord lines, are longitudinal girders, to which hoisting tackle may be attached at any convenient point.

The traveler clears the completed permanent structure, and is thus able to run back and forth over it in either direction at any time.

This is one of the largest and tallest travelers ever used and its erection on top of the 130-foot false work was a somewhat difficult feat. The timbers having been duly framed, one bent (as seen in Fig. 21), 100 feet high, was put together in a horizontal position on the tops of the caps of the false work. Hoisting ropes and back guys were then attached to the top and at two intermediate points part way down on each side. The heel was placed square, abutting against foot blocks and lashed securely. The upper end of the bent was then blocked up a few feet, and Mr. Robert Baird directed the pull on the hoisting ropes with tackles to the drums of the hoisting-engine. The strain was so carefully and evenly applied that the timber frame slowly revolved into a vertical position without crippling or seriously buckling. It was rigidly guyed and the other bents readily hoisted by tackles led from the top of the first one. This traveler is equipped with ten sets of tackle having 16' double and triple blocks and 11/2 rope, and is capable of hoisting simultaneously two of the heaviest chord pieces, having a total weight of 68,000 pounds. To move it lines are simply led from it to the drum of the stationary hoisting-engine, no purchase being required.

Figs. 17, 18, 19 and 20 show the overlanging derrick by which the cantilever arms are erected. It is essentially an uneven paneled Whipple truss, with iron rods for diagonal ties and the other members of timber. It is 20 feet deep and nearly 120 feet long, moving on four rails, each of which supports six wheels in three groups. The overhang is about 50 feet, sufficient to reach over two panels of the cantilever arm. It has transverse girders at each of the three panel points of top chord, from which are hung snatch-blocks to lead the hoist-lines as required. Swinging platforms, not shown in figure, are hung by hookbolts from lower chord of overhang, and from there the connections of permanent structure are conveniently made.

⁺No. 1 of these articles, containing the General Description and an account of submerged work, appeared in our issue of March 3; No. 2, Masonry, issue of May 5; No. 3, False Work, issue of May 12.

Digitized by

^{*} Not at all irregular would have been a more fitting term in the light of recent surveys.

The following end of the traveler is rigidly constructed with double vertical posts six feet apart transversely, with diagonal ties between. There are in the floor system, besides the lower chords, four lines of double longitudinal stringers, together with transverse beams, floor joists, and heavy planking, all thoroughly bolted together. At the point of beginning of overhang extra heavy transverse beams are put in top and bottom and stiffly knee-braced in horizontal plane. Fixed between these beams, 20 feet apart, are two derricks with 27-foot booms with a swing of 270 degrees each. The forward roller wheels, in groups of three, are nearly under the derrick foot-blocks, and afford direct bearing for transmission of their loads to the supporting truss. Adjacent to the two forward sets of roller wheels, jack-screws and clamps are fixed to the transverse beams, the former to remove the bearing at will from the wheels, and the latter to grip the truss beneath and thus securely anchor the traveler for the duty of hoisting heavy members at its outer extremity.

The rear part of this traveler is floored and partly housed in. It carries a 6-spool hoisting-engine, with boiler, pump, and necessary tools and equipment, while ten or twelve sets of tackle, besides hand lines, single blocks, etc., are required on the overhang. The traveler is moved by fixing a line to the most advanced part of the finished work, and winding up to it, without additional purchase on the spool of the hoisting-engine.

(TO BE CONTINUED.)

THE BROOKLYN BRIDGE TERMINAL QUESTION.

THE following report, which we take from the Brooklyn Eagle, of the remarks of Mr. T. C. Clarke, M. Am. Soc. C. E., and the expert member of Committee on Terminal Facilities of the Trustees of the Brooklyn Bridge, and the action thereon, is of interest to our readers. A motion to reopen the matter was under consideration .

Trustee Clarke asked the privilege of making a personal explanation. He said his action had been assailed and he desired to defend himself. He also opposed reconsidering the vote. "If we go on and continue this examination what will we have to do next?" he queried. If the trustees had done what Wellington accused them of having done, Mr. Clarke said, they would have been fools. Without taking into account the great amount of land required by Wellington's plan it would not have been wise to adopt it,

As the proposed system had been misunderstood by many, Mr. Clarke thought it best to explain it. No defense had hitherto been made, but he proposed to undertake it. In order to be placed on record correctly he had prepared a statement. This he proceeded to read. It was as follows:

The board is asked to reconsider its action at its last meeting by which it adopted several terminal plans. If this can be shown to be for the public good I shall vote for it. At present I can see no reason for questioning the wisdom of the course adopted on the 17th of April.

for questioning the wiscom of the course adopted on the 17th of April.

It has been publicly stated that the estimates of the Chief Engineer were falsifications of fact and were intended to deceive the Board by exaggerating the cost of a certain patented plan in order to prevent its adoption, the inference being that if this gross charge were true we should hasten to reconsider our action and adopt that rejected plan as the best that could be devised. Moreover, in order to strengthen this position, I, as an expert member of the late Terminal Committee, am misrepresented as saying that I amin favor of this patented circulating 18-car plan with its manifest absurdities and dangers. I deny this. I look upon it with the utmost distrust. What I did say and do now report is that I amin favor of a circulating

system which will do away with locomotives. So far I agree with the late Board of Experts. What that circulating system is I will explain

The statement then goes on to say:

I he statement then goes on to say:

The rejected patent system is most dangerous for the reasons given by our Chief Engineer in his letter of April 10. Can saything be more dangerous than to have a train of eighteen cars full of passengers running down a grade of 175 feet per mile with another similar train standing only 352 feet in front of it? Should the grip fail to let go or the brakes fail to work, the heavy eighteen-car trains standing on the main track could not be got out or the wav in time to prevent a disaster too s hocking to contemplate. This Board, I am proud to say, has always placed safety in working as the first, the last, the only consideration, and the results so far have justified the wisdom of this a tion. I for one do not intend to leave the path of safety.

last, the only consuceration, and the actual state of the path of safety.

About a year ago when it became evident that means should be taken to increase the traffic facilities a plan was presented to you by an engineer of the highest standing, Mr. C. E. Emery. Mr. Fmery proposed to lay two distinct sets of rails all over the bridge, which at the end stations should diverge into two parallel tracks with plainforms between. So far this plan was entirely safe, but he also proposed to take trains out in face of, and crossing incoming trains. This was undeniably dangerous, and, therefore, his plan was not adopted. Mr. Emery, however, is a gentleman, and did not think it necessary to accuse the Chief Engineer and this Board of ignorance, mecompetency and fraud because they did not adopt his plans.

The statement summarizes the advantages of the plan

The statement summarizes the advantages of the plan adopted as follows:

adopted as follows:

The plan adopted by you at the last meeting is like Ergery's as to bringing in the trains. To take them to the outbound tack it continues the long-used and safe practice of tail switching. It is absolutely safe. No full trains cross each other, and if an incoming train runs away there is always an empty track for it run upon.

What future improvements can be made in this? Not to make it safer, for this cannot be done. But instead of switching the trains by locomotives, which are very expensive and noisy, it is possible to bring the trains around curves in the rear of the platforms. This can be done by auxiliary cables. By this double system a capacity greater than that claimed for the rejected patent system can be attained.

You will ask why was not this system (the auxiliary cable) recommended for adoption by the Terminal Committee? It is the circulating system that we approve of. It is absolutely safe. It gives the greatest possible number of cars per hour and it does away with locomotives.

the greatest possible number of cars per hour and it does away with locomotives.

The answer is its enoimous cost, chiefly owing to the great amount of new land required. Here you have a complete answer to the attacks upon us of exaggeration and falsification. Why should we wish to exaggerate the cost of a system that we would like to adopt? The charge is as absurd as it is scandalous. We said in the report of April 17: "In this age of inventions there is no knowing what the next seven years will produce."

What we had in mind was that the same ingenuity which has enabled trains of five cars to go around curves of ninety feet radius on elevated roads, instead of 240 feet radius—the least previously known—may be trusted in the future to devise methods of modifying our cars, their track and wheels, and possibly the curved rails, so as to enable them to run around curves of much less than ninety feet radius. If this can be done the way to future enlargement is clear. Take out the rear switching-track and connect the platform tracks by curves of as small radius as possible, which will require comparatively little more lands and station space than we now have. Until this is done we will use the plan adopted at last meeting.

At the conclusion of the reading of Mr. Clarke's state-

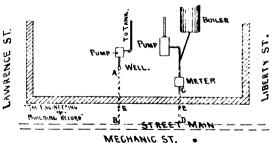

At the conclusion of the reading of Mr. Clarke's statement Mr. Higgins again took the floor, an I while he did not agree with Trustee Bush that Wellington had forfeited all claims to consideration, he admitted that "Weitington has assailed the honor of every member of the board in sending us the communication that has been received." He asked, however, if Wellington was not a reputable man, and Mr. Bush retorted that he was not in the habit of attacking such people. The latter did not propose to stultify himself by acknowledging that Wellington's

charges had anything to stand on.

By a yea-and-nay vote Mr. Bush's motion to lay the matter on the table was carried, Mr. Higgins voting against it and his dozen associates indorsing Mr. Bush.

A DEVICE FOR EVADING A WATER-METER.

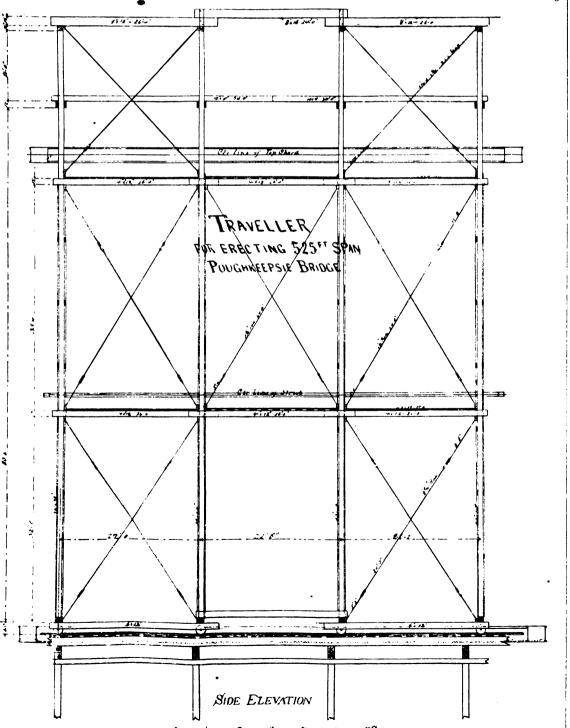

In December, 1882, the Newark Aqueduct Board placed a meter in the corset manufacturing shop of Heilner & Straus, Newark, N. J. On January 26, 1883, when the February bills were made out, the meter showed that 31,500 feet had already been used. The next quarterly reading of meter showed only about 14,000 feet for a full three months' use, the diminished rate being explained as due to the use of an additional supply from a driven well from which they were pumping. This seemed plausible, and no

suspicions were entertained until recently a discharged employee of the corset company revenged himself by informing the Aqueduct Board that the company were drawing water from the street main through a secret pipe. An investigation showed the arrangement represented in the diagram.

D C is the legitimate branch from the main, passing through the meter and supplying boiler, etc.

A B is a concealed pipe, one inch in diameter, that is hidden under the floor, and connects with the suction-pipe of a rotary pump by means of a tee some distance below its entrance into the well, A. E and E are stop-cocks in the branches.

POUGHKEEPSIE BRIDGE. FIGURE 22.

Digitized by GOOGLE

The well-hole at A is only two inches in diameter and twenty-eight feet deep, and is found to yield little or no

The pump, apparently drawing from the well, is really fed by branch A B, and delivers to a roof-tank which supplies all the closets, basins and other domestic requirements of the building.

Estimates are being made of the probable amount of water abstracted, and the value, which may amount to \$1,000 or more, will be collected by the Aqueduct Board.

For the sketch from which the diagram is copied and the facts here recited our representative was indebted to Mr. George R. Gray, Superintendent of the Aqueduct

AMERICAN SOCIETY OF CIVIL ENGINEERS.

A REGULAR meeting was held Wednesday evening, May 16. Vice-President I. I. R. Croes presided, and a large attendance of members and guests was present. The loss by death was announced of Henry F. Walling, Mem. Am. Soc, C. E., and the appointment of a committee was authorized to prepare a memoir.

The paper of the evening on "High Walls or Dams to Resist the Pressure of Water,"* by James B. Francis, Past President Am. Soc. C. E., was read by the author and discussed by Messrs. W. W. Maclay, F. Collingwood, J. P. -Frizell, General G. S. Greene, A. Fteley, Theodore Cooper, C. E. Emery, B. S. Church, and Mr. Wegeman. Further discussion of the paper is promised at the next meeting and at the annual convention.

He commenced by deducing from some experiments by Gen. Gillmore on the crushing strength of stone, in which that strength per square inch increased with the cross section of the specimen, the conclusion that the resistance of the material to crushing was not uniform, but increased with the distance from the perimeter, and illustrated the principle by reference to the supposed condition of rocks at great depths, and to observations on the behavior of the clay through which the Chicago water tunnels were constructed.

He then investigated the conditions of stability of a dam of right angled triangular section under three different conditions-first, when the resultant of water-pressure and weight of dam passes through the down-stream toe; second, when the resultant passes through the down-stream boundary of the middle third of the base, and in the third case the resultant passed through the same point; but the assumption was made of a lifting pressure, due to water-filled seams in the underlying rock, uniformly diminishing from full head at the up-stream toe to nothing at the down-stream one.

The height of the dam being equal to the depth of water and taken as I, the width of base for specific gravities of materials of 21/4 and 21/2, respectively, are found to be as follows: in the first case 0.4714 and 0.4472; in the second 0.6666 and 0.6325, and in the third 0.8944 and 0.8165.

In the first case the factor of safety was o and in the second and third cases it was said to be 2, which seemed to be considered sufficient. Owing to the irregularity of the horizontal joints it was concluded that in a dam proportioned to be safe against overturning there was no danger of failure by sliding.

In regard to failure by crushing, it was concluded that in accordance with the principle deduced at the opening of the paper the maximum pressure would not be outside of the middle third of the base and would probably not exceed the average pressure by 30 per cent., and that therefore no danger from that cause was to be apprehended.

Then followed a record of some experiments made to determine whether the upward pressure from water-filled seams in the underlying rock would extend beyond the parts of the masonry immediately in contact with the seams, the conclusion being that an upward pressure may be transmitted through the mortar to the entire base.

BOSTON SOCIETY OF CIVIL ENGINEERS. CONSTRUCTION AND VENTILATION OF SMALL PIPE-SEWERS.

REGULAR meeting of the Boston Society of Civil Engineers was held May 16, President Desmond Fitz Gerald in the chair

Mr. William E. McClintock, City Engineer of Chelsea, read a paper entitled "Construction and Ventilation of

* As the rules of the society do not permit the publication of papers in full in advance of their publication in the proceedings, and as Mr. Francis' paper was too concise to be materially excised or condensed without mutilation, we give nothing more than an outline at present, proposing, as soon as we are at liberty to do so, to give it in full, with the discussion thereon.

Mr. F. P. Stearns, Chief Engineer of the State Board of Health, read a paper and discussion on the same sub-

Written discussions on the subject by Messrs. F. Floyd Weld, City Engineer, Waterbury, Conn.; G. T. Nelles, City Engineer, Leavenworth, Kan.; George A. Kimble, Somerville, Mass.; William P. Pierce, Borough Engineer, Stamford, Conn.; A. R. Sweet, Engineer and Super-intendent of Sewers, Pawtucket, R. I.

A general discussion followed among the members, by Messrs. E. C. Clark, F. P. Stearns, Henry Manley, D. Fitz Gerald, H. H. Carter, S. Smith, O. F. Clapp. Fiftynine members and seventeen visitors present.

ENGINEERS' CLUB OF ST. LOUIS.

THE club met May 2, 1888, President Holman in the chair. William H. Bryan, Secretary, thirty-four members and three visitors present. Prof. A. E. Phillips was elected a member.

Prof. Nipher, chairman of the committee to which was referred the communications on national asked the members to present any information they might have on the subject.

Prof. Johnson, librarian, reported the completion of an

index of the club's books and pamphlets.

Mr. Wheeler read the action of the Engineers' Club of Kansas City on the subject of improvements in highway bridges. The St. Louis Club was asked to co-operate in securing needful legislation. The matter was referred to a committee consisting of H. A. Wheeler, C. H. Sharman and M. G. Schinke.

J. A. Ockerson resigned the office of vice-president on account of continued absence from the city. Col. E. D. Meier and J. A. Seddon were nominated to fill the vacancy, the latter withdrawing his name; the election is

to be by letter ballot, to be reported at next meeting.

Col. E. D. Meier then read a paper on "The Prall
System of Distributing Heat and Power from Central
Stations." He called attention to the low efficiency of
methods heretofore employed, and gave a detailed description of the Prall system, which he believed offered a solu-tion of many of the difficult problems involved. Water was heated to a high temperature and then pumped through the pipe system at greatly increased pressure. At certain points it was converted into steam or water at

lower pressures for heating, power, cooking or other uses.

The subject proved of very general interest, and was discussed by Messrs. Wheeler, Nipher, Blaisdell, Woodward, Jones, Seddon, Gale and White. The practical trial of the system at Boston* during the past winter had resulted favorably, and extensions were now being planned.

Mr. White's paper was made the special order for the next meeting, May 16.

ENGINEERS' CLUB OF KANSAS CITY.

A REGULAR meeting was held May 7, 1888. The following were declared elected as members: Daniel Bontecon, O. B. Gunn, E. J. Farnsworth, Alexander Potter, M. N. Wells, William B. Upton. As associate members: H. F. Hill, F. C. Florance.

The Secretary read two communications from Mr. B. The Secretary read two communications from Mr. B. W. DeCourcy, of Independence, Kan., describing some piers and abutments recently erected in Montgomery Co., Kan., which had failed or were considered unsafe, also a bowstring girder in the same condition, stating that the county had lost considerable money in neglecting to procure professional advice. The Secretary presented for Mr. DeCourcy two photographs of the work with specimens of the stone. The Secretary made a few remarks on the above masonry which he had been called upon to inspect, and presented results of tests of the stone made by spect, and presented results of tests of the stone made by Prof. J. B. Johnson of St. Louis.

Mr. Donnelly being unable to present his paper on "Kansas City Pavements," Mr. Mason gave a brief description of those in use here, and especially of the Trinidad asphalt pavings, a specimen of which from one of the Omaha streets he presented to the club. Mr. Mason believed that asphalt would eventually be the principal paving material used here on account of its durability, the ease with which it could be kept drained, and as it is found to be serviceable on grades as steep as eight per cent.

Correspondence.

THE NEED OF GOOD INSPECTORS OF MASONRY.

16 LAFAYETTE AVENUE, BROOKLYN, N. Y., May 15, 1888.

SIR: The bad work in the masonry lining of the Croton Aqueduct conduit, which is the subject of the report of Messrs. Church and Rice, published in the last number of THE ENGINEERING AND BUILDING RECORD, recalls an experience of mine some 20 years ago that illustrates the absolute need in all such contract work of inspectors-and of good inspectors-men who know good work from bad, and who cannot be hoodwinked or bought up by the contractors. In the case of the aqueduct it may be possible

*A description of the "Plant of the Boston Heating Company" was commenced in our issue of April 28.

by sounding to detect the bad work and have it all taken out and properly reconstructed, though there is always some uncertainty whether more or less of it may not have been undiscovered; but in larger masses of masonry it is quite impossible, if there has been no competent inspector, to know what may be the condition of the interior of the work after its completion.

At the time alluded to I had charge as engineer of the masonry of various kinds--arched bridges, culverts, bridge piers, etc., which were being substituted for trestle work over some 200 miles of road in operation in Western Pennsylvania and Ohio, as well as new brick round-houses and considerable other work. I had no assistant, and the management was altogether too parsimonious to allow anything so superfluous, in their estimation, as inspectors constantly on the work. I was unable to be present on any one piece of work more than two or three hours in a week.

For the piers and abutments of a three-span Howe truss, the c ntractors had purchased the stone of some old canal locks. Those that I allowed them to use were of very good material, as some 30 or 40 years of exposure in the locks had demonstrated, and the beds and joints were all exceedingly well dressed-much better than the general run of railroad masonry in that region, admitting of much closer mortar joints. Unfortunately for one of the piers, the dressed stone as delivered would not, with a certain number of courses and with proper beds of mortar, quite reach up to the bridge seat, lacking perhaps three or four inches. The foreman did not want the trouble or expense of cutting one or two new courses, and so made up the needed height by putting in heavy beds of mortar and driving with a free hand barrel staves into the joints to keep the stone up. The joints were all carefully pointed to hide the staves; but on one of my weekly visits, the joints striking me as being pretty heavy, a little scraping and examining revealed the end of one of the staves, and the trick was fortunately discovered. Of course, the whole pier had to come down; but with the little time I had to devote to each piece of work, and the joints that were allowable in the class of masonry called for by the contract, it would not have been surprising if this flagrant attempt at deception had succeeded, the piers had been accepted and paid for, and the weight of the trusses and J. FOSTER FLAGG. trains transferred to them.

REPORT OF EXPERIMENTS ON BUILDING MATERIALS AT WATERTOWN ARSENAL.

COLUMBUS, O., May 14, 1888.

SIR: Please inform me how or where I can obtain a copy of the report of "Experiments on Building Materials," made at the Watertown Arsenal and referred to in an artiindee at the waterload Also and the referred to main after the on "Strength of Cement Mortars," in The ENGINEER-ING AND BUILDING RECORD of May 5, 1888, and oblige, Yours respectfully, F. W. FAY.

[We presume it is a public document and can be obtained through your Congressman; if not, we suggest you address the U.S. A. officer in charge of the arsenal.-ED.]

Novelties.

Under this heading we propose to describe and illustrate appliances of probable interest to our several classes of readers. The selection will be made without reference to the wishes of agents or patentees, oeing governed solely by considerations of novelty, ingenuity, and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and it is to be distinctly understood that a notice does not imply approval. No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.

AN ELECTRIC RESERVOIR GAUGE.

AT Bridgeton, N. J., the necessities of the high service require the water in the reservoir to be kept as near the top of the bank as possible, which, as the pumping station is half a mile away, requires much care to avoid an over-flow such as recently occurred with considerable damage to the bank.

Superintendent Timothy Woodruff has, with the assistance of Mr. Samuel Mayers, an electrican, devised and erected, at an expense of \$75, an electric water-guage which indicates at the pumping station by sight and sound the water-level for every six inches of the upper four feet of its range, which is expected to obviate all further

A FLOATING BRICK-KILN.

J. C. Anderson, of Highland Park, Ill., has patented a scow arranged to receive brick from the brick machine, and provided with a kiln in which the bricks are burned while being transported to market without further hand-

DOMESTIC ENGINEERING, ETC., IN THE CENTRAL TRUST COMPANY'S BUILDING, NEW YORK CITY.

(Continued from page 329.)*
PLUMBING.

THE office wash-stands are uniform throughout the building, as shown in Fig. 8, where the wall panel, sides, and safes are of Italian marble and the pipes, fixtures, and legs of polished brass. The table is in one heavy slab, with molded edges, and has a large oval porcelain bowl.

modious wash-stand at the right has a large oval porcelain basin, supplied with cold water; its table and facing are marble, and the floor beneath it, as well as that in the closet, are of marble. An inclined marble safe is beneath the urinal, and the remainder of the floor, as shown, is of small white ceramic tiles, neatly edged with a narrow brown border of the same material. The closet cistern is enclosed with marble panels and carried at one end in the wall and at the other by suspension rods from the ceiling.

The pipes and all the fixtures are of polished brass.

The appointments of the kitchen in the janitor's apartments are unusually handsome and complete, as shown by the accompanying sketches.

The kitchen is spacious and lighted by two windows and as many handsome electroliers.

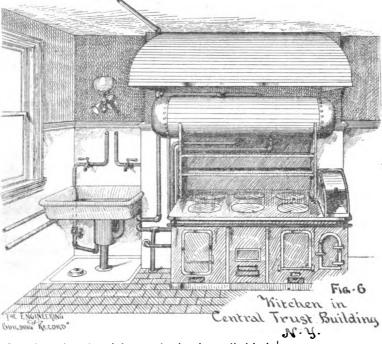

A high wainscot of Italian marble surrounds the room and is surmounted by a molded cap. The walls and ceiling are kalsomined and the window and door trimmings of grained ash. The floor is of dark red tiles, except under the sinks, where marble safes are placed.

The pipes are polished brass, arranged as shown in diagram (Fig. 5, page 329).

The range-boiler (Fig. 6) is made of burnished copper and set horizontally in the extended sides of the range underneath the hood. A galvanized-iron slop-sink is set in a recess beside the chimney, and underneath it is a brass cap closing handhole by which access is had to the wastepipe trap. Fig. 7 shows the butler's tinned copper sink and the three porcelain wash-tubs, with ash tables.

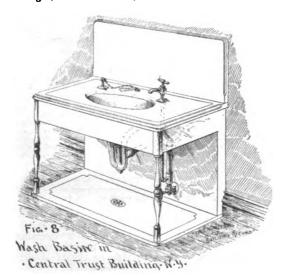

THE Philadelphia Master Plumbers' Association on Thursday, May 10, elected the following delegation to represent them in the National Association meeting:

William M. Wright, William Harkness, Jr., John J. Weaver, Enoch Remick, Albert M. Hicks, William H. Doyle, William McCoach, George Uber, John E. Eyanson, F. P. Brown, A. J. Bond, and as alternate, Wm. S. Clark.

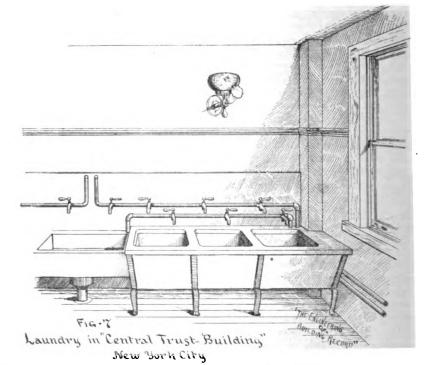

Just above the valve of the supply-pipe is a cylindrical vertical air-chamber (shown underneath, at the right in illustration). A strainer-plate underneath the waste-trap drains any leakage into the drip-pipe under the safe.

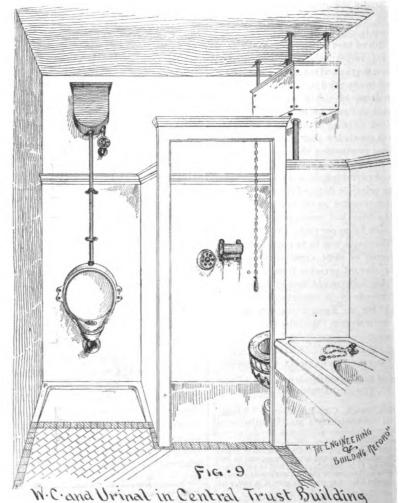

Figure 9 is a sketch of one of two toilet-rooms on the sixth floor, its adjacent companion being entirely similar, but larger, with two closets, etc.

The ceiling and side wall, a small portion of which is shown at the extreme left, are finished in plain white kalsomining; the remaining walls and partitions are of Italian marble, with molded cap of the same. No wood-work appears except the oak door and casing (the former a half-length screen, removed in sketch to show interior of closet), and the cherry closet seat and back. The com-

*In article No. II. of this series the valves L referred to are next the barrel A, and the lowest valves on the pipes F F, etc. In the text the letters K and L are accidentally transposed; to correct it read K wherever L is printed, and vice versa.

PLANT OF THE BOSTON HEATING COMPANY. No. IV

(Continued from page 341.) HOUSE-CONNECTION COUPLINGS.

BEFORE passing to the house-connections between the main and the buildings, allow me to call your attention to the special screw-thread which we have used in making the joints in the street with the twofold object of securing extra strength and greater tightness.

Ordinarily, a screw-thread, as is well known, reduces the strength of the pipe or rod on which it is cut about thirty per cent. In Fig. 9 the special thread used in our plant is exemplified. The coupling joining the ends of the pipes B and C is made considerably longer than is customary in ordinary pipe fittings. For a little ways the end of the coupling is bored out so as to be a fairly accurate fit on the end of the pipe. This greatly improves the joint, as the overlapping end of the coupling tends to strengthen and support the pipe that is introduced into it.

The special peculiarity of the thread to which I wish to call your attention, however, is that portion between the points b b' and c c'. It will be seen that the top of the thread is in a straight line with the outside of the pipe, while the bottom of the thread between the points b b' and c c' is inclined to the axis of the pipe at a considerable angle, so as to cause it to run out or vanish at b' or c'. By this means the weakening of the pipe caused by the cutting of the thread is spread out and diffused over a considerable length; and, by proportioning this vanishing of the thread in a proper manner, experiment has shown that it has been possible to preserve 97 per cent. of the full strength of the pipe. In addition, this vanishing of the thread produces a long and very tapering cone which may be forced into the coupling by means of the pipe-tongs in such a way as to actually bed the metal of the pipe into that of the surrounding coupling and make a joint which is absolutely tight. This same result is attained in a less degree with the ordinary pipe thread; but, inasmuch as the cone produced by our special thread is a very much smaller angle than that used by standard pipe-fittings, the pressure of the tongs in making up the joint causes it to bed more firmly into the metal of the coupling. The rolling mill supplies pipe in lengths of about twenty feet, so that the necessity of securing a perfectly tight connection between each length is very apparent. With this form of thread our experience has demonstrated that, even under 1,500 pounds, it is perfectly possible to secure absolutely tight joints. In testing the sections we have never found a leak when the joints were properly made up.

Each coupling also forms an opportunity for a house connection. On either side of the coupling a boss is cast. For the house supply inch pipe is used, and for the return 2-inch pipe, which extends from the main to the sidewalk on either side of the street, passing through a box made of creosoted yellow pine. At the sidewalk a servicebox, Fig. 11, is situated. The supply pipe may be seen at c', while the return pipe is indicated at d'. These pipes, A and B, enter the box and there terminate in a three-way tee provided with asbestos cocks, by means of which the supply from either branch of the tee can be at pleasure controlled. By means of this three-way tee and its asbestos cocks, each service-box is enabled to supply three houses. From the service-box to the inside of the house wall—usually a distance of not more than eight feet copper pipe is employed in preference to iron pipe. The advantage of copper pipe in this location is very obvious when it is considered that, owing to the ductility of this metal, the pipe can be bent in any desired shape without the necessity of special fittings involving the construction and maintenance of a large number of joints.

The size which we most frequently use is 1/4-inch, which is amply sufficient to supply ordinary buildings. In the case of large stores or warehouses $\frac{1}{4}$ or $\frac{1}{4}$ inch is employed. While, where it is desired to supply power to an engine of 25 or more horse-power, $\frac{1}{4}$ or $\frac{1}{4}$ -inch pipe is employed. A 1-inch pipe would be ample to supply so large a building as the Post Office. All of this copper pipe is tested to over 6,000 pounds.

(To be continued,)

A MOVEMENT for the establishment of a Builders' Exchange in Wilmington, Del., has been on foot for some time, and on May 2 a delegation of the Philadelphia Exchange, on invitation, visited that city and held a conference with a number of the builders of that city, and the result indicates there will shortly be an Exchange established there similar to the one now in operation in Philadelphia.

CAUSE OF WATER-BACK EXPLOSIONS.

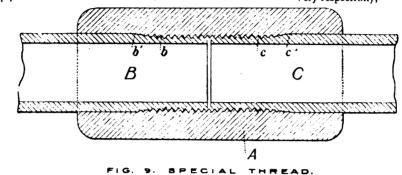

NEW YORK, May 14, 1888.

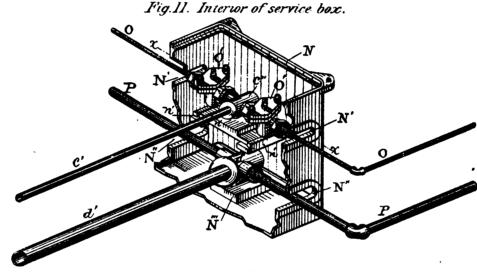

SIR: In your issue of May 12 I notice an article in reference to boiler explosions, cause of same, and how to guard against them, etc., quoted from the Locomotive. Whoever wrote the article can learn a little more on the subject, as I will take the liberty of pointing out a great error which might in future cause as sad a catastrophe as the one in

He suggests on entering a cold kitchen to open hotwater faucet; if water runs through same all is right. This is a mistake, as you will readily see, as you are under those circumstances liable to an explosion if even water runs through hot faucet. I have met several similar instances during my experience where explosions would have taken place were the connections of wrought-iron pipe, as in the foregoing instance. Fortunately, for many persons, the connections generally will not resist pressure to the extent of the one alluded to. As a general rule in this city the connecting pipes with water-back are lead, soldered to

brass couplings on water-back, often not the heaviest lead either, which also is fortunate on many occasions. Now, to get to my point, water may run through hot-water faucet, and the connections between range and boiler may be frozen; when such is the case you will have an explosion shortly after fire is lighted if the lead pipes referred to don't melt or burst, as all communication for expansion

I have thought over this matter many times, and must say it is fortunate there are not more accidents than we have. You will see, in order to avoid same, that it is have. You will see, in order to avoid same, that it is necessary to advise through your valuable paper that it is necessary for all owners or proprietors of houses where they have ranges with water-backs or pipes in them to see that their piping, etc., is kept warm, should it be necessary to keep fire up all night to do so. The proper thing to do is to have their kitchens and cellars underneath same protected so as pipes with not freeze. As a rule I find that protected so as pipes will not freeze. As a rule I find that where such accidents occur are cheap houses or carelessness on part of the occupant or owner in some instances. Very respectfully, JOHN RENEHAN.

TWENTY YEARS' EXPERIENCE IN STEEL-MAKING.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.

THE Engineers' Society of Western Pennsylvania held their regular monthly meeting May 15. Mr. George W. Kettridge was elected to membership. The paper of the evening was read by Mr. Koch, the present Superintendent of the Spang Steel and Iron Co., of Pittsburg. The subject was "Twenty Years' Experience in Steel Making." The paper was a record of actual experience. He was for a number of years connected with the steel works at Landore in South Wales. He first narrated the difficulties Landore in South Wales. He first narrated the difficulties encountered in the making of open-hearth steel, such as the proper bottom of furnace, the proper material for the lining, the proper style of furnace, the repairs necessary, etc. He stated that whereas it was now possible to obtain 500 to 600 heats from a furnace without repairs, in the "good old days" they were satisfied if six could be obtained without the need of repairs to the furnace. Then there was the difficulty in obtaining proper materials; that whereas in the one case of ferro-managanese, it was that whereas in the one case of ferro-manganese, it was now possible to obtain an 80 per cent. metal, then they were satisfied with 22 per cent. That after many experiments their first success with the open-hearth process was when they made their mixture two-third pig and one-third Scrap and then "finishing" with ore.

He then went on to describe their first great success in

the changing of iron rails into steel, the mixture consisting of three tons of pig iron (hematite) and 4½ tons of iron rails. The rails analyzed .20 to .25 per cent. carbon, sulphur about .16 per cent., phosphorus up to .25 per cent., and manganese .125 per cent. These rails were made as heavy as 90 pounds per yard and to the ordinary lengths

Mr. Koch then went on to describe the other articles manufactured at the works at I andore, such as axles, ties, weldless rings, gun-barrels, forgings, shapes for vessels, boiler and ship plates of all descriptions. He gave the average analysis of each of the several articles, mentioning in particular that in the matter of axles the English specifications called for a much higher steel (in carbon) than the American, while in tires the reverse was the case. He also went very fully into the tests required for forgings, shapes and plates. He said that the most interesting part of his whole experience to him had been in the manufactory. ture of plates, and he described the different modes of producing—that is, either from the hammered slab, by cogging or by rolling direct from the ingot. He stated the first two methods were more generally employed in England, while the latter was the one most in use in this country. From his own experience in all three he believed the American method the best adapted for producing the better grade of plates and claimed that under this process, right in Pittsburg, just as fine and as good steel is being made as any place in the world.

He drew a comparison between the plates made under

the three processes above mentioned, taking as his basis the three processes above mentioned, taking as fits basis %-inch plates, carbon .14 to .21 per cent. Under the Eng-lish process the steel divides, as it were, from .14 to .19 carbon, running in tensile strength from 60,000 to 65,000 pounds, with an elongation of 25 to 33 per cent. in eight inches. From 19 to 21 per cent, the steel runs to 70,000 pounds, with 22 per cent, elongation.

pounds, with 22 per cent. elongation.

In this country under our practice steel of .14 carbon will not run over 60,000 pounds, with 28 to 30 per cent. elongation and 55 to 60 per cent. reduction of area. Steel .17 to .18 carbon will run from 58,000 to 65,000 pounds, with 25 to 28 per cent. elongation, while steel .20 to .21 per cent. carbon will run 62,000 to 67,000 pounds in ultimate, with 26 to 27 per cent. elongation, and he asked that the matter be discussed to ascertain how this difference occurred.

asked that the matter be discussed to ascertain now this difference occurred.

He also gave interesting figures relative to quenching tests of steel used by the English Government with and without annealing. He believed the process of rolling direct from the ingot on a three-high mill the correct one, and stated that he had actually been asked by a large English manufacturer to have him sent drawings of such

Captain Hunt stated that in the matter of analyses his experience largely agreed with that of Mr. Koch. In answer to his question as to the difference between the English and American steels he thought that the finishing of the plates and the heat at which they were rolled might account for it to some extent, and, secondly, that, as is well known, the hammering of slabs has the effect of hardening steel, and as the English process is largely hammering

this would account for it.

Further discussion of the paper was postponed until the next meeting, when, having been printed and the figures being before the society, the paper could be acted upon more intelligently.

Mr. Brashear presented to the society some samples of aluminum (containing 08 per cent. of the pure metal) and Mr. Metcalf gave a brief description of the process of making the alloy of aluminum, after which the society

A CORRECTION.

In the notice in our last issue of the report of the City Engineer of Boston attention is called to the ravages of the Limnoria terebrans as far north as Boston. It would have been about correct to have said south, for Cape Cod is usually considered to be the southern limit of the habitat if the Limnoria, although traces of its presence have been found in New York Harbor. THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS.

THE attendance at the Nashville meeting of this society, convened on May 8, was smaller than at any meeting which has been held for some time. The membership in the South is as yet small, and the distance and time required to make the trip had a tendency to keep Northern and Eastern members at home.

The society was well received, being welcomed to Tennessee by Governor Taylor, and to Nashville by Mayor

The society was well received, being welcomed to Tennessee by Governor Taylor, and to Nashville by Mayor McCarver, and every opportunity was offered to see the institutions and places of interest.

The society was called to order by President Horace See, of Philadelphia, Professor F. R. Hutton, of Columbia College, Secretary.

The members present were:

E. S. Cobb, Terre Haute, Ind.; A. T. Woods, Champaign, Ill.; H. G. Hammett, Troy, N. Y.; Peter H. Kirkvaog, Youngstown, O.; P. J. Fickinger, Beaver Falls, Pa.; William A. Foster, Corning, N. Y.; Horace B. Gale, St. Louis; C. M. Woodward, St. Louis; T. H. Stillman, New York City; Joseph Lem Gabrille, Cleveland; Edward S. Dent, Washington; Charles W. Livermore, New York; John C. O'Connell, Montgomery, Ala.; William Watson, Boston, Mass; Henry H. Suplee, Philadelphia; S. Tompkins, Crozet, Va.; John W. Weston, Chicago, Ill.; Henry J. Snell, Philadelphia; W. R. Warner, Cleveland, Ohio; E. H. Parks, G. E. Whitehead, Providence, R. I.; S. Ashton Hand, Toughkenamon; F. F. Hennaway, H. B. Parsons, Lewis C. Dawes, New York; O. A. Lanphear, H. P. Minott, Columbus, O.; Jacob Reese, Pittsburg; George M. Bond, Hartford; George R. Stetson, New Bedford, Mass.; B. H. Warren, Boston; John E. Sweet, Syracuse; Joe F. Fireston, J. Wendell Cole, Columbus, O.; S. W. Baldwin, New York; Frank E. Kirby, W. S. Rayner, Cincinnati; John F. Wilcox, Pittsburg; George H. Barrus, Boston; Joel Sharp, Salem, O.; William T. Magruder, Vanderbilt; William Miller, Pittsburg; Samuel A. Parker, Massachusetts; Alfred Pritt, Washington, Del.; William Kent, New York; T. H. Roberts, Detroit.

The secretary reported that there were received during the past year 45 members, 2 associates, and 11 junior

New York; T. H. Roberts, Detroit.

The secretary reported that there were received during the past year 45 members, 2 associates, and 11 junior members, making a total membership of 858.

The following papers were read: On "Heating Railway Cars by Steam From the Locomotive," Henry R. Towne, of Stratford, Conn., and "Notes on Warming Railroad Cars by Steam," by W. J. Baldwin, of New York, given in our issue of May 12.

John T. Hawkins, of Taunton, Mass., read a paper on steam-heating apparatus for buildings, and another entitled

John 1. Hawkins, of Taunton, Mass., read a paper on steam-heating apparatus for buildings, and another entitled "A Plea for the Printing Press in Mechanical Engineering Schools." Mr. George L. Fowler submitted a paper on "Estimating the Cost of Foundry Work," and Mr. H. L. Binsse one on "A Short Way to Keep Time and Cost."

The following questions were discussed: "What is the most economical speed of cable in tele-dynamic trans-

The following questions were discussed: "What is the most economical speed of cable in tele-dynamic transmissions for high and low power?" Second, "What data have you for design of hemp-rope transmissions especially where several parallel ropes replace a flat belt?"

In the afternoon the party took a run on the railroad in special coaches to Fisk University, and inspected the grounds and buildings. Jubilee songs were rendered by the students in fine style and were loudly applauded. The party then proceeded to West Nashville and visited the new furnaces of the Standard Charcoal, Iron and Chemical Company.

Company.

The evening session was well attended by both ladies and gentlemen. Upon the stage were seated Governor Taylor, Mayor McCarver, Professor Woodward, of St. Louis; Chancellor Garland, of Vanderbilt; General Thurston, Judge Reese, President See, and Secretary

General Thurston introduced Governor Taylor, who delivered an address of welcome to the visiting society.

Mayor McCarver was then introduced and addressed the

On behalf of the association President See returned its thanks to the speakers for their welcome.

Professor C. M. Woodward, of St. Louis, the speaker

of the occasion, was introduced by Mr. See and addressed the audience on the "Coming Engineer." At the conclusion of the address a brief reception was

At the following morning session a large number of

papers were read and discussed with interest.

The session adjourned at 12 o'clock and again assembled

(informally) at 1:30 P. M. and went in a body to pay their respects to Mrs. James K. Polk. They then proceeded to Glendale Park.

A stop was made at the new reservoir, which was very thoroughly investigated, after which refreshments were

The train next stopped opposite the residence of Dr. H. M. Pierce, where the ladies of the train boarded it. Mrs. H. M. Pierce and daughter had very kindly and hospitably entertained the visiting ladies of the society at their resi-

In the evening a number of papers were read and dis-

The convention adjourned to meet in Scranton, Pa., early in October next

F. W. Dean presented a paper on "The Distribution of Steam in the Strong Locomotive," in which he made comparisons unfavorable to the Stevenson link, and practically condemned the use of balanced valves. Discussed y Messrs. Barrus and Coon.
In discussing John T. Hawkins' paper, "A Plea for

the Printing Press in Mechanical Engineering Schools," Professor Sweet told the members who had been iscussing why the printing press did not find room in technical schools, and those who had been listening to these discussions, that while he was at Cornell University they had one large and two small presses, and studied and used them to advantage, but since that time they had been thrown out. thrown out.

Mr. Hawkins also presented another paper relating to heating by hot water, in discussing which the curicus fact appeared to be brought out that nine-tenths of the heating in Montreal, where the climate is very severe, is cone by hot water, and about three-fourths of the heating it Washington, where the climate is very mild.

In discussing the paper presented by L. S. Raudolph, on "Strains in Locomotive Boilers," Mr. Middl:ton, of the Louisville and Nashville Railroad, said that th: use of the Belpaire boiler did away, to a large extent, vith the breaking of stay-bolts.

In discussing the paper, "The Effect of Circulation in Steam-Boilers on the Quality of the Steam," Mr. Whitaker instanced a case of priming of the boilers of the U.S. steamship "Galena." The priming in this case was stopped by removing some of the tubes under the smoke-

Stopped by removing some of the tubes under the Sinoke-stack and substituting bolts.

During the discussion of a paper on "Origin and Nature of the Surface Condenser," Secretary Hutton exhibited some brass tubes used for condensing the vapors in reining sugar, which appeared to show that the vapors had destroyed the zinc in the metal, eating the tubes entirely through in spots.

THE PITTSBURG ALUMNI ASSOCIATION OF THE RENSSELAER POLYTECHNIC INSTITUTE.

ABOUT 50 graduates of the Rensselaer Polytechnic Institute live in or near Pittsburg, of whom some 20 met in that city on the 11th inst. and organized the above-named association.

Edmund Vardley was elected President: William Metcalf. F. L. Clark, F. C. Osborn, and I. V. W. Rynders. Vice-Presidents; G. S. Davison, Secretary; and A. B. Starr, Treasurer,

The following gentlemen joined the association: Edmund Vardley, class of '56; A. B. Starr, '69; George S. Davison, '78; W. G. Wilkins, '79; F. C. Osborn, '30; F. L. Clark, '80; G. W. Ferris, '80; H. W. Verner, '81; C. H. Davis, '83; H. M. Wilson, '84; James Wetzel. '85; A. C. Cunningham, '85; S. L. Tone, '86; J. V. W. Rynders, '86; P. H. Easley, '86; Stewart Johnston, '87; Thomas Earle, '87, and J. D. Hailman, '87.

It was resolved to invite the general Alumni Association to hold their annual banquet and meeting next winter in Pittsburg, instead of in New York, as heretofore.

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

COUNCIL BLUFFS, lowA.—School.—Plans are wanted by the Board of Education for a \$40,000 public school edifice. No date specified. For circular of instruc-tions address the Public School Board, as above.

BOSTON, MASS.—Messrs. Longfellow, Alden & Har-ow, architects, of this city, have won the competition low, architects, of this city, nator the Cambridge City Hall.

MILWAUKER, Wis.—Temple. - Plans are wanted here, until June to, for a temple, by the Board of Construction of the Wisconsin Consistory. For circu'ar of instructions, etc., address David C. Green, Secretary of the Board, Room 69, New Insurance Building, as above.

For works for which proposals are requested see also the "Proposal Column," pages i-vii-viii-356

Persons who make any use of the information they find in these columns we trust will not omit to mention The Engineering & Building Record as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

GRAND JUNCTION, COL.—Water.—C. W. Baldwin, Town Recorder, writes from here as follows: "The town has just voted a franchise to Krusen & Co. for water-works (pumping-works), taking water from Gunnison River. It is understood that the works are to be put in immediately, to cost about \$60,000."

PARIS, Ky.—Sewerage.—C. F. Levy, Town Clerk here, writes: "As yet no steps have been taken in re-gard to sewerage."

LEOTI, KAN.—Water.—Owen Clark, City Clerk, writes us from this place, May 7, as follows: "The only step taken at present is a call for a board election and our water-works depend entirely on the result of this election, which we think favorable."

BIR MINGHAM, ALA.—Water.—The following communication from J. S. Walker, Mem. Am. Soc. C. E., engineer in charge at the Birmingham Water-Works, turnishes interesting details concerning the water-works project here: "The Birmingham (Ala.) Water-Works Company is making surveys for an additional supply to be taken from the Cahaba River. The pumping station will be located on the Cahaba River. The pumping station will be located on the Cahaba River, and the water will have to be pumped over 400 feet. There will be about 30,000 feet of 30-inch pipe and 8,300 feet of 24-inch pipe. Two mountain ranges will be crossed, on one of which will be located a reservoir of 100,000,000 gallons capacity; the other range will be tunneled for a distance of about 2,300 feet. The tunnel, pipe, valves, specials, and pumping machinery will be let by contract, the rest of the work will be done by company force. It is expected to begin work as soon as surveys are completed. When location and plans are perfected more definite information will be given. Major W. J. Milner is superintendent."

TOLEDO, O.—Sewers.—A cylindrical brick sewer is to be constructed here, also several hundred feet of brick sewers. See our Proposal Columns for details.

ST. LOUIS, Mo.—Water.—Several thousand feet of water—pipe will be laid here at once, a new boiler house to be erected, and other improvements will take place. Complete information in our Proposal Columns.

WHITESTONE, L. I.—Water.—It is probable that conclusive steps will soon be taken in the water-works project which has been agitated here for some time.

DETROIT, MICH.—Water.—Iron water-pipes are to be laid through numerous streets of the city which have heretofore been without the water supply.

SIDNEY, O.—Water.—Our correspondent writes:
"Mr. George Hornung of Cincinnati, O., has been engaged as Consulting Engineer by the Water-Works Trustees of this place for the extension of their works, and is now engaged upon the plans, specifications, etc., of the work, comprising a power house with duplicate set of machinery, stand pipe, and a mechanical filtering plant. Proposals for constructing the work will shortly be solicited.

BURLINGTON, VT.—Water.—At a meeting of the city officials, held May 8, it was decided to construct at once a reservoir to cost \$25,000, and the City Council received authority to borrow the amount of money required to do the work. For details address City Clerk Allen.

BAKER CITY. ORE.—Water.—It is reported that water-works are contemplated at this place.

WALDOBORO, ME.—Water.—An appropriation for the construction of a system of water-works has been made, and it is probable that a plant will soon be established.

BARRINGTON, R. I.—Water.—The Drownville Water Company has been organized here with a capital stock of \$10,000. William Lawler is at its head.

LONOKE, ARK.—Water.—It is reported that the Mayor can furnish details of a proposed water-works system for this place.

ABILENE, TEX.—Water.—It is reported that the ater-works here are to undergo extensive improve-

ST. PETER, MINN.—Water.—The city has voted to ssue bonds for \$32,000 to construct a system of water-

GALLITZIN, PA.—Water.—It is reported that details of an extensive pipe-laying project can be had by addressing Thomas Bradley, of the Tunnel Hill Water Co., at this place.

ASHLAND, Wis.—Sewers.—The sewerage system of this city is to be extended at once.

NEW ROCHELLE, N. Y.—Governor Hill, of New York, has signed the bills giving the State Board of Health power to stop the Mount Vernon sewage dischalge into East Chester Creek in case such discharge shall constitute a public nuisance, and providing for the construction of a system of sewerage at this place

LITLE VALLEY, N. Y.—Water.—Town Clerk S. F.
Sweetland writes from here as follows: "We recently
voted in this village to expend a sum not exceeding
\$15,000. We are to have spring water brought 2½
miles in a 4-inch wrought-iron pipe to a 15,000-barrel
reservoir, 175 feet above our village. From this we are
to have a six-inch pipe. The spring is 300 feet above
our village. Work will begin on the trenches the 21st
inst."

NEW YORK CITY.—Water.—The Department of Public Charities and Correction of this city advertises for a quantity of cast-iron water-pipe, also sewer pipe and other supplies and furnishings. For details see our Proposal Columns.

MT. VERNON, N. Y.—Sewers.—In view of the \$150, 000 appropriation for a sewerage system for this place the Village Trustees at a recent meeting employed C. S. McClelland to purchase the necessary right of way along the proposed route, and put the engiteering work in charge of W. E. Worthen, of New York City.

EAGLESMERE, PA.—Sewers.—The Eaglesmere Drainage and Sewerage Association has been organized here for the purpose of providing a complete system of drainage, sewerage, etc., for the town. Arrangements are to be made at once for pushing the work. The president of the above can furnish details.

MONONGAHELA CITY, PA.—Water.—Work is shortly to be commenced on the water-works system for this place, and bids will soon be wanted for the completion of the same. For details address S. H. Fox, Secretary of the Kittanning Consolidated Natural Gas Co., Kittanning, Pa.

WATER-WORKS.—See our Proposal Columns for information regarding water-works and water-works material at the following places: Meyersdale Pa., Eureka, Kan., Brooklyn, N. Y., New York City, St. Louis, Mo., Toledo, Ohio, Cedar Falls, Iowa.

BRIDGES.

LEAVENWORTH, KAN.—County Clerk Niehaus, at this place, advertises for proposals for the erection of several bridges. For details see our Proposal Columns.

INDEPENDENCE, Mo.—An iron bridge is to be erected over Little Blue River at this place. For details see our Proposal Columns.

ST. PAUL, MINN.—At the recent city election bonds to the amount of \$200,000 were voted to build a bridge across the Mississippi at Broadway. Bonds will be across the Mississued at once.

SMYDERTOWN, PA.—It is reported that a bridge is to be erected here by the County Commissioners and that John B. Wagner can furnish details.

SUDBURY, PA.—It is reported that the County Commissioners will erect a bridge here.

BRIDGES.—See our Proposal Columns for information regarding bridge construction at the following places: Bradford, Pa., Leavenworth, Kan.

RAILROADS, CANALS, ETC.

VICTORIA, TEX.—It is probable that a street railroad will be built here as soon as details can be arranged. For information address C. L. Thurmond, as above.

HAWKINSVILLE, GA.—A street railway is to be established here by the Hawkinsville and Waycross R. R. Co.

BEATRICE, NEB.—The Union Pacific Railway Co. has awarded the contract for the construction of its line between Plainville, Rooks Co., and Colby, Thomas Co., Kan., a distance of 110 miles, to Kilpatrick Bros. and Collins of this place.

STREET-WORK AND PAVING.

St. Louis, Mo.—The Aldermen of this city want proposals for furnishing a large quantity of macadam, also for doing street work. See our Proposal Columns

HUNTSVILLE, Mo.—Several miles of rock roads are to be made here this summer.

SIOUX FALLS, DAK.—Many of the principal avenues of this place are to be paved at once.

FLUSHING, L. I.—The trustees of this place have been authorized to expend the sum of \$20,000 in improving the public streets, by macadamizing and otherwise.

ASHLAND, WIS.—City Engineer Carrington has submitted his estimate of timber to be used in planking new streets to be graded, it being 2,632,570 feet.

HAMILTON, ONT.—Several streets of this place are be repaved and other street improvements will be

GAS AND ELECTRIC-LIGHTING.

EASTHAMPTON, MASS.—The Easthampton Electric Company has been incorporated here with a capital of \$10,000. J. E. Clark, and others, incorporators.

MIDDLETON, MASS.—It is reported that an electric light plant is to be established here.

THE ENGINEERING & BUILDING RECORD

THE SANITARY ENGINEER.

A JOURNAL FOR THE ARCHITECT, ENGINEER, MECHANIC, AND MUNICIPAL OFFICER.

Entered according to Act of Congress in the year 1888, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

VOLUME 17. NUMBER 26.

PUBLISHED EVERY SATURDAY

NEW YORK, MAY 26, 1888.

LONDON, JUNE 9, 1888.

SINGLE COPIES, TEN CENTS. Subscription, \$4.00 per year in advance, post paid. SINGLE COPIES, SIXPENCE. Subscription, 20s. per annum in advance, post paid.

In America

THE ENGINEERING & BUILDING RECORD. conducted by HENRY C. MEYER, is published every Saturday at 82 & 84 Fulton Street, New York. (P. O. Box 3037). Its opinions upon all technical subjects are either prepared or revised by specialists.

TERMS, \$4 PER YEAR, IN ADVANCE. Postage Paid.

OFFICE IN GREAT BRITAIN. 92 & 93 FLEET ST., LONDON

TERMS, 201. PER YEAR, IN ADVANCE. Postage Paid. SINGLE COPIES, SIXPENCE.

and crossed — & Co.

Continental subscriptions are also received by F. A BROCKHAUS,
Esq., Questrasse 99, Leipzic, Germany, and ASHER & Co., Unter den
Linden. Revlin.

Eag., Querstrasse so, Leipzic, Germany, and ASHER & Co., Unter den Linden, Berlin.

Subscriptions to the Continent of Europe and Australia, \$5; China, Japan, Sandwich Islands, Mexico and Cuba, \$5; South America, \$5.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested. Subscribers will please notify us *promptly* of any failure to receive the paper, and also of any change in their address.

Remittances are at the risk of the sender, unless made by registered letter or by check or money order payable to The Engineering & Building Record.

When a change of address is desired both the old and new addresses.

When a change of address is desired, both the old and new addresses should be given.

A DEMAND FOR IMPROVED HOUSE-TOPS.

In a recent number of the Medical Record, Dr. Gouverneur M. Smith has published a paper under the title "Wasted Sunbeams-Unused House-Tops," in which he urges that the roofs of city houses be so constructed as to afford play and sun rooms. It is not altogether a new idea, as Dr. Smith points out, for it is common enough in Oriental towns to make great use of the roofs as a lounging-place or promenade, and he might have quoted the customs of our own Pueblo Indians to the same effect. Some years ago the superiority of the roof to other parts of a house in a sanitary point of view was discussed in the public press, and after it was shown that the reception-room, the dining-room, the library, the nursery, and the kitchen would each be much healthier and more attractive if placed on the roof and encased in glass, the subject seemed to lose interest and was soon forgotten.

This is not due to mechanical difficulties in the way of construction, for although these would be considerable, and involve additional cost to that now incurred for roof-work, yet the resources of the modern architect and engineer are quite sufficient to overcome such obstacles.

The greatest of these would be due to the great differences in height between adjacent buildings, so that the occupants of a house-top would be liable to be either looked down upon and deprived of privacy, or to be supplied with foul air from their neighbors on a lower level. In avoiding these difficulties the result would, in most cases, be equivalent to adding to the house another story of the nature of a photograph gallery, with an increase of cost of annual repairs, and therefore of rent, which would greatly limit the demand for such dwellings if popular opinion on the subject remains what it is at present.

We can, however, safely premise that if Dr. Smith, and those who think with him, can succeed in creating among the average householders of New York such a demand for the use of the house-tops that they are willing to pay from two to five hundred dollars per annum for it in addition to the present rents, the architects and builders will provide for the asphalt roofs, the glass-enclosed cupolas, the perpetually-burning gas-jets in the tops of the soil-pipes, the police watch-towers, and the many other adjustments needed to make the new plan work satisfactorily in a city like this.

THE HEALTHFULNESS OF NEW YORK CITY.

THE letter of Dr. Tracy, published in the City Record of April 26, 1888, comparing the mortality statistics of London with those of New York for the last twenty years, contains matter of permanent interest, which ought to be published where it would be more readily accessible than it can be in the files of the City Record, the official journal of the city of New York, a newspaper little known beyong this city, and not easy to procure. After pointing out that the annual death-rate of London is about 20 per 1,000, while that of New York is about 26 per 1,000, Dr. Tracy gives some tables which have been compiled to show how far the excessive death-rate in New York is due to particular forms of disease. From these it appears that the excess of mortality in this city is due to diphtheria and croup, diarrhoeal diseases, phthisis,

and kidney diseases. Most of these are what are called preventable diseases—that is, they are due to causes which may be more or less done away with.

Dr. Tracy concludes "that the overcrowding in New York (16.37 persons to a dwelling in 1880, as compared with 7.8 in 1881 in London) and the trying climatic conditions make it very improbable that the death-rate of this city can ever be reduced as low as that of London.

We also think it improbable, but for somewhat different reasons, among which is our form of municipal government and the peculiar relations which ward politics occasionally bear to municipal sanitary engineering work. The excess of deaths in New York appears to be largely due to diarrheal diseases and probably occurs chiefly among the infants of the tenement-house population during the summer months. Dr. Tracy has not attempted to compare the death-rates of the slums of East London with those of the tenement-house region of New York, but it is probable that these do not differ much except as indicated above.

So far as climatic conditions are concerned, it is doubtful whether either city has any marked advantage, and the fact that New York is much more overcrowded than London is not a thing independent of municipal sanitation, but a part of it, and shows that we are more in need than our neighbors of improvement in this matter.

A CITY ENGINEER'S FEES.

THERE seems to be some dissatisfaction in San Diego, Cal., with the charges made by the City Engineer for street improvements which are assessed directly upon the property benefited.

According to the San Diego Union, the City Engineer receives a salary of \$200 per month, and in making preliminary surveys and establishing street lines and grades the time of his assistants is charged to the city at their actual wages of from \$2.50 to \$5 per day, but in laying out, superintending and estimating improvements in progress he appears to be employed by the contractor, and though his own services do not seem to be charged for, those of the same assistants are, and at the rate of from \$10 to \$12.50 per day, and these charges are included in the contractor's bill and assessed upon the benefited property.

This practice does not seem to be authorized by the law, which merely fixes the monthly salary of the City Engineer, and the property-owners are becoming uneasy at what they consider an unnecessary expense.

While it is difficult to see any good reason for making such a distinction in methods of charging for work done by the same men on the same improvement, it does not follow that the City Engineer is overpaid; a good city engineer rarely Usually it would be cheaper for the city to employ him at almost any price than to try and get along without him, but it would be certainly much more satisfactory for all parties to have a definite and uniform system of charges agreed upon and established by law.

There is probably much diversity in the methods adopted by different municipalities for paying their engineers, and we should be glad to hear of those that have given satisfaction, and perhaps even of some that have not, if the objections are pointed out and the remedy suggested.

THE IMPORTANCE OF MANUAL TRAINING.

CERTAIN young Englishmen have recently come to America to find business as electricians. They are well educated in the books, but have no knowledge of handicraft. Herein is a vital mistake. There is no place here for such men, either in our electrical establishments or in any of our industrial enterprises. To secure a place for one's self the young man must be able to do with his own hands the work he is to direct others in doing. Educational systems are more and more taking this into account on this side of the

SANITARY INSPECTION.

This is the time of year when health inspectors ought to be at work in all the smaller towns and villages making a systematic house-to-house inspection, and seeing for themselves what the condition of cellars, outhouses, privy-vaults, etc., etc., really is.

It educates the public, calls the attention of householders to dangers and nuisances which they would otherwise overlook, and many of which they will gladly abate when they are pointed out, and is in many respects among the most useful work which a health department can perform.

We are glad to see that this fact is recognized in the last quarterly report of the Illinois State Board of Health, and that local health boards are urged to again push the work. It is a great error to suppose that it is only the tenement-house district of a large city that needs regularly repeated examinations from a sanitary point of view; there is not a village in this country that would not be the better for them at least once a year.

FALLING FLOORS IN A HALF-DEMOLISHED BUILDING.

On the 23d inst, the floors of a brick building that was being taken down on the corner of Broadway and John Street, New York City, fell, causing the death of one of the workmen and the injury of several others.

The accident appears to have been due to an excessive accumulation on the upper floors of bricks and other rubbish from the walls that were being removed.

It does not seem as if it ought to be necessary to tell those engaged in such work that after the building has been stripped of its trimmings and before the walls are touched, all the floor-boards should be removed from all the floors so that all bricks can fall through to the cellar, and no dangerous accumulations on the floors be possible.

THEATRE CONSTRUCTION IN RUSSIA.

ACCORDING to a correspondent of Indian Engineering. the Russian seems to have sounder notions about the building of a model theatre than his English critics. One such Thespian temple was opened at Odessa last December. In fifteen seconds the body of this theatre can be altogether separated from the stage by the drop of an iron curtain. The auditorium is heated with hot air; all the rest of the building with hot water. The electric is the only light used; dynamos and engines for its generation being located a mile away from the premises. Water is laid on all over the theatre. In the lower parts it is supplied direct from the town reservoirs, and in the upper parts from three iron tanks on the roof, fed by a steam-pump. The stage is not only separated from the auditorium by the iron curtain, but also from the back premises by automatic iron doors leading into fire-proof corridors, which in their turn are divided from the dressing-rooms by iron doors. The flooring of the whole building is made of iron.

CLASSIFIED INDEX OF PATENTS.

THE Franklin Institute of Philadelphia has adopted the following very proper resolution:

"Resolved, That the Franklin Institute earnestly recommends and urges upon the representatives in Congress to give operative effect to the recommendation of the Commissioner of Patents by enacting promply such laws as will secure the preparation, by persons of competent skill and knowledge, of concise and thoroughly indexed classified abridgements of patents for invention, and the publication thereof, and the placing of such publications on sale at moderate charges, and accessible to the public in libraries for the better diffusion of knowledge on such subjects."

SINKING PILES IN QUICKSAND.

THE following methods of piling for the false work of bridge spans were used by Mr. R. Fulmer, then with the King Bridge Company, in the erection of work over the Brazos River, Tex., where the bottom was a quicksand that had given great trouble with ordinary supports. Near Hempstead one 220 feet and one 175 feet highway spans were carried over an elevation of 45 feet above the water, which was about 8 feet deep.

Cottonwood piles 60 feet long and up to 20 inches in diameter were procured and sharpened at their butts.

A beam projecting forward first from the pier and afterwards from the bents already set served to swing the piles into place. A scow whose width corresponded to the required distance between bents was moved to the pier or last-erected bent, and men on deck with levers capstanwise twisted each pile around its vertical axis and it rapidly sank 12 or 15 feet, and when released was held firmly by the skin friction of the sand, fully answering all requirements. In this way a gang of 10 men set 80 piles a day at a cost of not more than \$25.

At the Granburg crossing of three 175 feet spans at a height of 40 fect, a device similar to the grillage of the Hanover Pond trestle illustrated in our issue of December 24 was effectively employed.

Trestle bents of the required height and 25 feet wide were framed, the posts were cut square at the foot and on their lower ends two 3x12-inch planks 18 feet long were spiked flatwise against the end surface so as to form a shoe projecting about 5 feet beyond the trestle on each side, the two planks lapping 2 feet at the centre where they were spiked together. These bents were then floated out, raised up and braced in position and proved firm and solid. When taken down to move forward to the next span the shoe plank usually became loosened and floated off, but this only occasioned a little trouble in spiking them on again.

A SANITARY CONFERENCE IN MINNESOTA.

THERE will be a sanitary conference held in Rochester,

THERE will be a sanitary conference need in Kochester, Minn., May 20 to 31, inclusive. The programme is: Tuesday, May 20.—Reception of conference by city authorities, with an address by the Mayor and other prominent citizens; paper, "The Relation of Citizens to the Official Administration of Public Health—State and Municipal," Professor W. W. Folwell, of the State University.

Wednesday, May 30.—General subject is: "The Orof Local Boards of Health; "Water-Supply for Families and Communities, its Sources and Dangers;" reports of delegates on local water-supply; existing legislation for the protection of public and private water-supply; demonstrations of methods of water analysis available for local boards and health officers; paper, "The Relation of the Citizen and the Home to the Health Officer and His Duties," Dr. A. T. Conley, Health Officer of Cannon Falls; paper, "The Duties of the Citizen as Respects Vaccination, and Other Means for Prevention of Infectious Diseases," Dr. W. A. Hunt, Health Officer of Northfield

Thursday, May 31.—General subject: The disposal of and garbage and control of offensive trades. Papers and discussions by Secretary State Board of Health, Dr. Staples, Health Officer of Winona, and delegates generally. Second subject: Preventable diseases of men and animals; papers by Dr. E. J. Davis, State Board of Health; Dr. G. A. Hanson, Leper Hospital, Bergen, Norway; Dr. Bowers, Superintendent Second Hospital for the Insane, and others

A PROPOSED BRIDGE TO EAST BOSTON.

THE necessity for some more direct communication between Boston and East Boston than that supplied by the ferry has become increasingly apparent, and some time since a committee of the Board of Aldermen advised the construction of a tunnel. The committee of the Common Council, however, to whom their recommendation was referred, think that a bridge would be preferable, though they are yet undecided as to whether "a surface or an elevated bridge would be more desirable," meaning, we presume, either a pile or short-span bridge with a draw or one sufficiently high to dispense with such an arrange-

The latter committee seem to have investigated the matter pretty thoroughly, having visited Chicago, Cincinnati, Covington, New York, and Brooklyn, and their report includes a brief description of the Washington and La Salle Street tunnels at Chicago, the two bridges at Cincinnati, and the yet unfinished Manhattan Bridge over the Harlem River in New York City.

ONE or two of the earliest locomotives were designed to be propelled by legs arranged to kick out behind, and now a Camden inventor, whose name we considerately withhold, has patented the same thing as a "motor for street-railways."

A C. O. D. GAS-METER.

THE Indian Colonial and Foreign Engineer and Builder says the preference of the poor for kerosene oil a pears to be largely due to the fact that it can be purchased in small quantities—whereas the use of gas results in fermidable quarterly bills. Several attempts have been mad: to meet small consumers in this matter; and the corporation of Birmingham (England) is now about to institute an entirely new departure in the sale of gas by the use of "pay-before delivery" meters, devised by Mr. Brownhills. One or more pennies are dropped into an opening, and the regulating apparatus of the meter liberates a quantity of gas of corresponding value—after which it stops, awaiting the advent of fresh pence. The coins accumulate in a locked receptacle, and are removed by the collector at intervals.

PUMPING BY ELECTRICITY.

MESSRS, IMMISCH & Co., of Kentish Town, London, have designed and erected an electric pumping-plant for the St. John's Colliery of Messrs. Locke & Co., Normanton, Eng., which is described in the Electrician as being very successful.

It raises the water at one lift of 900 feet at the rate of 7,200 gallons per hour. The pumps are differential, with two 6-inch and two 41/4-inch rams running at a speed of 25 revolutions per minute, against a pressure of 400 pounds per square inch.

The actual power expended on the water is 33 horsepower, and that exerted by the dynamo is 53 horse-power. showing a utilization of about 62 per cent.

OAKLAND SEWER SYSTEM.

FROM the reports of the discussion at the meeting of the Oakland, Cal., Board of Health, it would seem that the sewerage system of that city is defective and inadequate. The attempt, however, of different members to improve the system by proposing to authorize the construction of certain sewers is a mistaken one. The true way to find out what is needed is to have the City Engineer authorized to retain as consulting engineer a gentleman who has made a specialty of this matter, and who. with the data in the possession of the City Engineer, could recommend a comprehensive and intelligent system. To build a sewer here and there, as each member of the board thinks is necessary, is a very unsatisfactory way of dealing with a problem of this sort.

LOUISVILLE CANAL.

THE Kentucky Legislature surrendered the Louisville Canal to the U. S. Government. The city of Louisville has since desired the privilege of discharging their sewage into it. This was objected to by Major Stickney, U.S. Engineer's office, and now the Secretary of War has made a report sustaining the objection. The result will probably be an intercepting sewer. Whether the Government or the city of Louisville is to pay for it is now the matter under consideration.

ARCHITECTS may be interested in knowing that it is reported that Cornelius Vanderbilt has offered to erect for the Union Club of this city, on four lots owned by him on Fifth Avenue, such a club-house as they desire, furnishing all the money needed, the club to pay four per cent. per annum on the amount.

PRESS dispatches state that a syndicate has been formed to tunnel the Detroit River at Detroit. It is composed of D. O. Mills and George Bliss of New York, Mr. Laidlaw of the Bank of California, and several officials of the Michigan Central Railroad.

THE Indian Engineer, published in Calcutta, announces that it will hereafter appear weekly instead of fortnightly as heretofore, the subscription price remaining unchanged. We are pleased to note what we presume may be considered an evidence of prosperity and an increased demand for engineering literature.

ERECTION OF POUGHKEEPSIE BRIDGE.—NO. 5.*

RIVETING TRAVELER, DERRICK, AND GENERAL PLANT.

FIGURE 23 shows the general design and arrangement of the riveting-traveler, which is a novel device built expressly for this work, where it has proved of great value and convenience.

Longitudinal girders L L support the pairs I, J and K of braced posts that carry platform M M, in the centre of which a pivot and track receives turntable G, which revolves freely with its platform N N.

Over this upper platform are carried a special engine E and its boiler, and a Blake pump P which delivers into

*No. 1 of these articles, containing the General Description and an account of submerged work, appeared in our issue of March 3; No. 2, Masonry, issue of May 5; No. 3, False Work, issue of May 12; No. 4, Travelers, issue of May 10.

In our mention, in the introductory article of this series, of the persons connected with this interesting work, we accidentally omitted to say that the drawings loaned us by Mr. J. F. O'Rourke were, many of them, prepared by him to accompany his paper on the Poughkeepsie Bridge that was presented at the last convention of the American Society of Civil Engineers.

cylinder S, where pressure is maintained by weight W, which is guided in braced frame U.

D D are projecting beams, with track upon which truck Y runs, and in turn carries trolley G through a fixed nut, in which a threaded rod T passes. The revolution of T by chain and sprocket-wheel H gives transverse motion to G, and the longitudinal motion is easily obtained by a slight pull in the plane of D.

An hydraulic-riveter R (Tweddell system) is suspended by differential hoist from G, and thus has a universal adjustment, permitting it to easily reach any rivet in the lower part of the bridge.

Z Z is the flexible hose bringing water under pressure from S.

B is a Sturtevant blower, furnishing blast for rivet-furnace F. C is a hand shears for cutting rivets, etc.

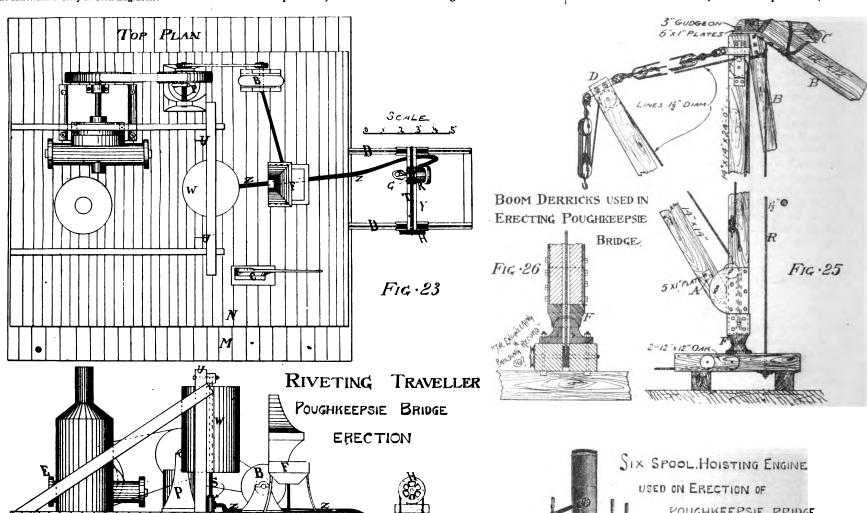

Figures 25 and 26 show the details of boom-derrick, designed and used by Mr. Baird. It has a special footblock at F, a reinforced bearing at A, and link connections at D, designed so as to weaken the timber very little and obviate cross strains. B B are braces across whose tops a saddle-block C is lashed and tightly anchored down by rod R, screwed up under the foot-block, thus preventing any possibility of the derricks "kicking" when the boom is

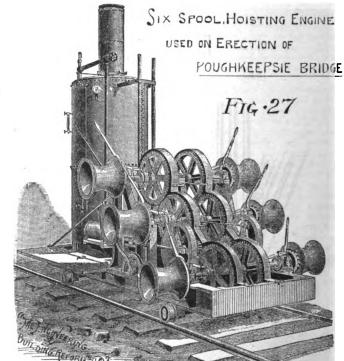

swung out from B B. Several of these derricks have been placed on top of the false work and in other places and have proved efficient and satisfactory in severe and constant

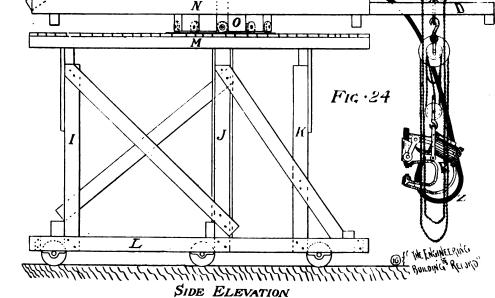

Figure 27 is Baird's improved hoisting-engine, built by J. S. Mundy, of Newark, N. J. It is of 20 horse-power, with double cylinders 7x12 inches. The 6-inch heads have separate clutches and gearing, enabling each one to hoist, lower, or hold on independently of all the rest. By a simple arrangement the track-wheels can also be quickly and easily thrown into gear and the engine transformed into a locomotive able to travel ten miles an hour. Three of these machines are used on this erection and have become almost indispensable.

The erection plant for this work is very complete and well chosen. A great part of it is new and much of special and improved design, and all is strong and serviceable. The magnitude of the work requires a large outfit, some of the principal items of which have been 2 dredges, 8 hoisting-engines, 2 pile-drivers, 14 scows, 3 steamboats at different times, and one ferry launch continually, besides the machines and structures described above, and many car loads of small tools and necessaries.

There were more than 40 sets of triple tackle, with

patent 16-inch sheaves, and 2,500 feet each of best Manilla line. 11/2 inches diameter. For erection of iron-work a force of 130 to 140 men was required; masons and other workmen would raise the total force to about 350 men, employed at the busiest time. After the completion of the false work the progress of erection depends upon the supply of iron, and when that is in readiness it has been very rapid. Mr. Baird estimates that with all the material at hand he could raise, connect, and swing one 525-foot span in 12 days.

In one day a 125-foot section of the tower on pier No. 2 was raised and connected.

In another day 108 lineal feet of the truss was raised 130 feet and connected complete. The duty of the hoisting-engines has been very severe, 34 tons at a single lift having been raised by one engine and the 100-foot trav-

The plan of erection, as previously outlined, is very simple. The shore-arm spans were first erected, all material being hoisted from the water's edge and placed in position by the traveler at one operation; connections were then made and the rivets driven by hand. The 525-foot span between piers 2 and 3 followed next; timber, supplies and some iron was raised by a boom-derrick placed at the west end of the false work, but most of the members were brought in large lots by scows to foot of piers 2 or 3, the erecting traveler moved out to end of false work, directly above, and the pieces raised by its mast and boomderricks delivered by them to trucks running through the traveler, and by them distributed in required positions. The traveler was then run over the work, and, lifting the truss members for a panel, held them until connected and self-sustaining, at any convenient time after which the riveting-traveler ran along through the trusses and under the erecting-traveler and drove all field rivets, except occasional ones that could only be reached by hand. After this span was completed the cantilever-span between piers I and 2 was erected in the same way as the shore-arms had been, and the centre connection was made Jan. 2, 1888.

The danger from ice in the river delayed the false work for the span between piers 4 and 5, but it is now being put up, and the completion of that span and the remaining cantilever-arms will probably be rapidly accomplished. (TO BE CONTINUED.)

PAVEMENTS AND STREET RAILROADS. No. XXX.

(Continued from page 281.)

ASPHALT PAVEMENTS IN THE UNITED STATES.

AT a recent meeting of the Board of Improvements of Cleveland, O., City Engineer Walter P. Rice made the following report of his investigations of asphalt pave-

"The best material for pavement purposes seems to be the Trinidad asphalt, which is controlled by the following companies: Barber Asphalt Paving Company, Warren-Scharf Asphalt Paving Company, and National Vulcanite Company. The latter company is able to command asphalt only for laying pavement other than the Barber, while the two former lay pavement under the same specifications, but in separate territory. There can therefore be no competition and but one bid can be received under the same specification, and to all practical intents cities or individuals using the street pavements are subject to such dictation as may be imposed as to cost of all repairs and resur-

examined over twenty streets in Washington, D. C. paved with asphalt, vulcanite, and coal-tar distillate. The age of these pavements ranges from five to fourteen years. In general they are in good condition, show frequent re-pairs, and are subject to light traffic. Pennsylvania Avenue and K Street are typical respectively of heavy and light travel. Pennsylvania Avenue, the pavement of which is part Trinidad and part Neufchatel rock asphalt, is about part Frindad and part Neutchatel rock asphalt, is about 105 feet between curb lines, age 12 years, never resurfaced, about 10 per cent. of wearing surface gone, largely patched in places, lack of uniformity, some ruts. In K Street the pavement is vulcanite, 50 feet between curb lines, age 14 years, never resurfaced or patched, condition almost perfect. K Street is used as a standard of comparison in all vulcanite specifications vulcanite specifications.

The Buffalo pavements with a few exceptions are not yet of sufficient age to justify the formation of any opinion except in case of early failure, as on Broadway, paved three years ago, resurfaced once and giving out again in places. Franklin Avenue, paved with asphalt nine years ago, is the oldest exception and without repairs, is in excellent condition. Cottage and Bryant Streets, paved eight years ago, are in good condition.
"The reduced formula for asphalt is: Asphalt, 13.16

to 15.78; heavy petroleum oil, 1.84 to 2.21; fine sand, 70.00 to 65.00; pulverized carbonate lime, 15.00 to 17.00. There is little or no bond between the base and wearing

"The reduced formula for vulcanite is: Asphalt, 4.4 per cent.; coal-tar distillate, 13.4 per cent.; clean sand, 53.6 per cent.; pulverized stone, 26.8 per cent.; hydraulic scement, 1.2 per cent.; flour sulphur, .14 per cent; air-slaked lime, .28 per cent.

"The main differences are the percentages of asphalt

and the value of coal-tar distillate versus petroleum. vulcanite is the cheaper as regards first cost, although costing slightly more for maintenance.

"Asphalt pavements are liable to the following defects: First, the formation of 'wave surface, especially on grades (probably due to lack of cohesion between the wearing surface and base). Second, the formation of transverse cracks, more ant to occur in wide roads and intersections and un doubtedly due to contraction and expansion caused by variations of temperature. Third, a rot or disintegration variations of conference in the gutters and necessitates the use of stone or a coating of coal-tar; this does not seem to be the case with vulcanite. Vulcanite or coal-tar distillate pavements:
First, are affected at a lower temperature than asphalt, and ometimes present evidence of a flow of material toward the gutters during warm weather, often rising nearly to the top of the curb and necessitating a cutting away of the material. This is not observable in the asphalt. Second, vulcanite is not so liable to transverse cracks (the forerun vuicante is not so habit to transverse cracks (the forerun-ners of repairs), or to wave surfaces as the asphalt on account of greater longitudinal strength due to a closer union of base and wearing surface. On the other hand, in making repairs the wearing surface of asphalt can be easily removed and renewed, while in the vulcanite no such separation can be made and in resurfacing it is necessary to overlay the whole surface. This slightly affects the grade of the street by raising the same above the curb grade. Third, vulcanite has a more granular surface than he asphalt.

"Sheet pavements are sightly, pleasant to drive over, and easy to clean; but if not cleaned, as might be the case in this city, any accumulation of material would from the nature of the surface be ground to an impalpable powder unpleasant to travelers and detrimental to lawns, the fine dust being blown into houses and stores. Such pavements would undoubtedly on business streets attract travel from parallel routes, thereby compelling the pavement of the latter with the same material as a matter of self-defense no The mixture has to be nicely tempered, requires the satisfying of many conditions and expert manipulation. It is largely affected by temperature and climatic conditions. In extreme cold the surface cracks and becomes friable in extreme heat the surface rolls or creeps under traffic presenting a wave surface uncomfortable to travel over In this connection I would state that the temperature at Washington ranges from 150° above zero insummer to 10° below in winter, or 160° Fah., and Captain Griffin, United States Corps of Engineers, of that city, is authority for the statement that the Washington pavements suffer more during the three months of winter than during the remaining nine months of the year.

The expense of laying foundations for street pave ments is a large part of the total cost, and when the paving is worn out, or a city is tired of repairing the same, then the expense of removing the foundation will be large, as it is too near the established grade or curb grade to lay stone or other than sheet pavement on. It cannot be laid next to street-railway tracks, as it will not stand the shearing action of wheels. The science of laying sheet pave-ments is still to a large extent tentative. That good ones can be laid has been proven, but there is no certainty that the standard can be reached on any particular street. Two separate batches of material mixed under the same formula and specification may be totally unlike as regards durability. In discussing sheet pavements a standard of comparison might be outlined as follows: First, moderate first cost; second, durability; third, minimum resistance to traction; fourth, secure foothold for horses; fifth, healthfulness; sixth, noiselessness.

"First, sheet pavements do not satisfy the first requirement much better than dressed block; second, I should give dressed block the preference as regards durability and ultimate cost; third, the resistance to traction is undoubt edly less on sheet pavements; fourth, such few experi-ments as have been made indicate fewer accidents to horses on sheet pavements than granite, but do not think it would hold good for Medina; fifth, both sheet pavements and dressed block are healthy, and the asphalt filling of the latter sufficiently fulfills all sanitary requirements; sixth, sheet pavements perhaps fulfill the last requirement better than stone, but there is the sharp click and ring of the horses' hoof, although the vehicle itself makes little noise. In making repairs in the case of a stone pavement 50 to 75 per cent. of the old material can be used over again; it is worthless in the case of a sheet

" Finally, I consider sheet pavements a luxury, rendering any city attractive where successfully laid and main-tained. Their introduction should be simultaneous with tained. Their introduction should be simultaneous with the adoption of a continual repair system to secure the best results. There is small choice between the asphalt and vulcanite pavements. I would advise against laying asphalt or vulcanite pavements on any of the thoroughfares of this city, and would further advise that the city should consider its introduction as an original pavement and only consider its introduction as an original pavement and not on the repaying of any street. Further, if property-owners are desirous of obtaining these pavements, the city should, in my estimation, demand not less than ten years' guarantee, the pavement to be turned over in good condition at the expiration of that period."

THE USE OF SALT-GLAZED VITRIFIED PIPE IN WATER-WORKS CONDUITS.*

IT having been my lot to construct two quite extensive systems of gravity water-works within the last six years, one at Amsterdam, N. Y., costing \$285,000, and the other at Little Falls, N. Y., on which I am now engaged, costing \$300,000, and in both cases the source of supply being so far distant that the use of cast-iron pipes for conduits would have rendered the construction on the gravity plan almost practically prohibitory, as the additional cost would have placed too heavy a burden on the taxpayers—at least they would have fancied so—my attention was called to the use of salt glazed vitrified pipe as a substitute for iron; as also in rebuilding the conduit at Johnstown, N. Y., which was done during the time stated. nduit at In each case I have successfully constructed the conduit of vitrified pipe, and all of them to this date have not required one dollar's repairs, but are actually in the same condition as when laid, all having been in constant use from date of completion.

I have therefore thought that a paper descriptive of the method of construction might be of service to some of the members of this association should they be called upon to design a conduit in similar localities.

I will first give a brief description of the alignment and grades of the Amsterdam and the Little Falls conduits.

DESCRIPTION OF AMSTERDAM CONDUIT.

The water-supply at Amsterdam is six miles distant and consists of three small mountain streams, which I successfully diverted by vitrified-pipe conduits and open channels into one. From this point I brought them across the country to the channel of a summer dry stream, upon which, at a point near the city, I built a combined storage and distribution reservoir. The three mountain streams and distribution reservoir. The three mountain streams were known as the McQueen and Rogers streams, and the dry stream as the Bunn Creek. There are two intervening ridges, or divides, between McQueen and Bunn Creeks, necessitating heavy cutting to divert the water.

McQueen Creek is dammed by a substantial masonry structure at a point just below the junction with the West Branch, the dam being four feet high; its channel was widened and deepened for about 1,000 feet back, a new open channel or reservoir was excavated in the direction of Bunn Creek for about 800 feet, and until the excavation gave a cut of seven feet, to allow a sufficient depth of soil cover the conduit and protect the same from frosts. At this point of termination of open channel a substantial masonry inlet-chamber was designed and constructed, having suitable iron racks and fine screens, with bulkhead gate to shut down the water. From this point a nead gate to shut down the water. From this point a vitrified salt-glazed pipe conduit, 18 inches in internal diameter, has been laid to a suitable point to empty the water of Rogers, West Branch and McQueen Creeks into Bunn Creek. The pipe is of the pattern known as hub and spigot, and is laid with Portland cement joints. The conduit is laid upon the true hydraulic grade line, excepting two or three points of depression, where it has been necessary to depress from one to two feet to admit of sufficient covering of soil over the pipe without changing or embanking up above the original surface of the ground.
The conduit is laid to a grade with a total fall of 18.14 feet for 10,361 feet. From this point the surface of the ground is precipitous in direction of Bunn Creek, having passed now through the second divide, and a 12-inch vitrified conduit is laid down to the channel of Bunn Creek with a fall of 38 feet in 1,000 feet. The conduit has a capacity when running full of 2,851,300 gallons per diem, being in excess of the amount which may be expected from the Rogers, West Branch and McQueen Creeks. Rogers Creek is dammed by a similar masonry structure four feet high; the water is then diverted and carried east-erly in an open channel through about 1,000 feet of low undulating ground to the west edge of a road. At this undulating ground to the west edge of a road. At this point a masonry inlet-chamber, similar to the one on McQueen Creek, is constructed, and the water is passed through a 15-inch vitrified salt-glazed pipe conduit 1,500 feet long, emptying into an open water-channel of the West Branch, and both empty into McQueen Creek at a point above the dam upon the same. From the end of vitrified-pipe conduit on Bunn Creek two miles to the storage channel of Bunn Creek two miles to the storage and distribution reservoir of 100,000,000 gallons capacity.

DESCRIPTION OF LITTLE FALLS CONDUIT.

The conduit at Little Falls is a much more elaborate affair. The water-supply is a mountain stream known as Beaver Creek. It lies due north from the village of Little Falls, and is distant about eleven miles.

Beaver, as well as Spruce Creek, into which it empties near the point of diversion, is a tributary of East Canada Creek: the line of Beaver Creek runs about due east. The ground lying between Beaver and Spruce Creeks and Little Falls is depressed by two streams, Gillett and Cathaticane, or Crum Creek, both running south-easterly, Gillett Creek emptying into East Canada and Cathaticane, or Crum Creek, into the Mohawk River, and dividing the interven-ing ground about equally into four sections, or two divides and two basins or depressions.

and two basins or depressions.

I have utilized vitrified salt-glazed stoneware pipe wherever I could locate the lines to a hydraulic grade line or line of no pressure, and in the two depressions or valleys where the conduit is under pressure, substituted castiron pipe, carrying the same up to the grade called for by hydraulic grade line.

Digitized by

^{*}Paper by Stephen E. Babcock, read at the convention of the American Water-Works Association at Cleveland, O., April 17, 1888.

Beaver Creek is dammed by a substantial masonry structure at the point of divergence. The dam has a spill-way to feet wide and floods 0.75 of an acre. The dam is six feet high; the south abutment of the dam is formed into a receiving chamber and inlet of conduit line, and is provided with a movable inlet weir, which may be raised or lowered to allow any quantity of water up to capacity of flow into the chamber and thence into the conduit; the saddle of the dam is two feet above the top of conduit. The water starts off from the receiving chamber in a 20-inch iron conduit pipe for 50 feet, to take the first shock of the water while acquiring its velocity; it is thence con-tinued with 20-inch vitrified salt-glazed stoneware pipe for 10,000 feet, grade 8 feet to the mile, the line following the contour of the ground required to give the necessary fill on top of pipe to protect the same, and to insure its lying in natural and not artificial ground. Here a heavy sand cut is encountered for about 1,000 feet. From this point, as a heavier grade can now be given, 18-inch vitrified pipe begins and continues 9,400 feet, grade 13 feet to the mile, to the edge of the basin of Gillett Creek; from here the line is continued with an 18 inch cost ince here the line is continued with an 18-inch cast-iron pipe 6,200 feet long, which follows along surface or contour of the depression of Gillett Creek, rises up to the southerly side of said depression, and enters at a point at which the hydraulic grade line produced would give natural ground to start off with vitrified pipe again. Vitrified pipe starts here, 18 inches diameter, and is

carried along on the hydraulic line to the beginning of the depression of Cathaticane, or Crum Creek, 9,100 feet. From this point 16-inch iron pipe, 9,400 feet long, grade 32 feet to the mile, is used across the depression and up to the top of the divide, the southern shed of which runs to the village of Little Falls. From this point 15-inch vitrified pipe is again used for 900 feet, grade 79 feet to the mile; then 12-inch vitrified pipe is used for 1,000 feet, grade 105 feet to the mile; the conduit proper stops here, giving a total distance of 8.72 miles.

SPECIFICATIONS FOR PIPE.

The essential points in the specifications for the salt-glazed pipe which I adopted are as follows for the Little Falls Water-Works:

The pipe shall all be of the best quality of salt-glazed vitrified stoneware pipe. All shall be of the kind known as "hub and spigot."

The pipe shall have a thickness of one-twelfth the diameter of the pipe. (This, it will be observed, is heavier than the ordinary commercial pipe.)

The hubs shall be three inches deep to the main pipe.

(At Amsterdam I used the ordinary depth of hub, which is two and one quarter inches, but at Little Falls increased the depth to three inches, my experience convincing me that the increase would make easier and more satisfactory work.) All hubs must be of sufficient diameter to receive to their full depth the spigot end of the next following pipe, without any chipping of either pipe, and shall have a space or joint room of not less than three-eighths of an inch in width all around for the cement mortar joint.

All pipes supplied shall be molded under pressure, and the hub of every pipe shall be pressed on or formed with the body of the pipe, and care shall be taken that the hubs are truly concentric with the pipes. Five per cent. will be the allowable inspection divergence of the greatest from the least internal diameter, in departing from a true cylindrical cross section.

The pipes shall be well glazed all over. All pipes not

well or uniformly glazed will be rejected. All pipes not perfectly burned will be rejected. All pipes having any fire cracks which the engineer shall consider injurious shall be conderaned.

All pipes having transportation cracks shall be peremptorily rejected.

All pipes having blisters which the engineer shall con-

sider injurious shall be condemned.

All pipes having excrescences or iron pimples in the in-

terior of the pipe which in the opinion of the engineer may impede the flow of the water shall be rejected.

All pipe not thoroughly vitrified or fused, or which betrays the use of improper materials or methods in its manufacture, shall be rejected.

manufacture, shall be rejected.

If a piece be broken out of the rim forming the hub of a pipe it shall be rejected if the length of said broken piece is greater than one-tenth of the diameter of the pipe,

piece is greater than one-tenth of the diameter of the pipe, measured on the inside face of the hub or socket.

If a piece be broken out of the hub end of a pipe which shall extend over one inch into body of pipe, or shall be greater in length than one-tenth of the diameter of the ipe, the pipe shall be rejected, and two or more such reaks, either of hub or spigot, shall condemn such pipe, even if both are under the area designated.

SPECIFICATIONS FOR PIPE-LAYING.

The conduit will be laid to true grade from end to end of each section of vitrified pipe. The cast-iron portion of conduit shall be laid to conform to the contour of the ground where laid, and the trench shall be of such depth to require a back-fill of 31/2 feet on top of pipe when

The joints of the vitrified pipes shall be made of Portland cement mortar, in combinations with gaskets of clean, sound hemp yarn or jute, braided or twisted, and tightly driven, as follows:

Each length or strand of the jute shall be of a diameter to loosely fill the width of joint, and shall be thoroughly soaked in a Portland cement mortar, made of a thick paste of clean cement and water, and shall be of a length to go once around the circumference of the pipe and lap over two or three inches. This shall be driven home with calking

tools, and shall be succeeded by a sufficient number of strands to fill the joint-room to within one-half an inch of the outside of hub, breaking joints with the laps. driven home and thoroughly joined together. The j driven home and thoroughly joined together. The joint shall then be finished by filling the remaining one-half inch of joint-room with a clear Portland cement mortar, the joint-room when finished being completely filled all around the pipe to the outside lines of the hub.

The contractor will furnish a bag, stuffed with shawings or hay, of a size sufficient to fit the pipe, rather tightly, with a rope about ten yards in length fastened to the mouth of the bag.

mouth of the bag.

The bag must be placed in the first pipe, the rope passing through each pipe as it is laid down. After the joints are made, the bag is then to be drawn forward at such times before the cement has set as to smooth off and produce a such control of the contr duce a true surface at each cement joint and a continuous thin coating of cement on the lower half of the pipe.

In refilling the trenches, the earth shall be carefully packed and rammed. Care shall be taken to give the pipe a proper bearing throughout the entire length. The earth filling above the pipe shall be sufficiently packed and rammed to prevent after-settlement, and puddled to the satisfaction of the engineer when so directed.

In rock excavation the back-filled material around the

pipe and for 1½ feet above the same shall be earth, free from stone or rock fragments. The balance of the trench may be filled with such portion of the rock excavation as shall measure not more than one cubic foot, provided a sufficient amount of earth be mixed with the same to bond it together like a mortar, and if necessary suitable material satisfactory to the engineer shall be borrowed to make said filling.

From the first hundred feet from the receiving chamber the pipe shall be bedded in a wall of mortar extending all the bottom of the trench and extending up to pass the centre of the pipe, filling the trench completely up to this point. The object and intent of this being to prevent an under leakage at the beginning or receiving chamber end of the conduit.

In order to secure a natural bed for each pipe, the con tractor will cause the trench to be excavated down to such

depth as the engineer shall direct, by the regular trench depth as the engineer shall direct, by the regular trench gang, to be followed up by a trained gang to dig the additional depth just to grade as fast as the pipe is laid.

Having now in detail described the method of laying out and constructing the vitrified-pipe conduits, I submit the following remarks on the durability and cost as compared with a cast-iron conduit of equal capacity, using the Little Falls conduit as the basis of comparison that being the Falls conduit as the basis of comparison, that being the more elaborate and difficult construction, as also introducing the feature of substituting cast-iron pipe in the intermediate sections where pressure in the pipe is encountered.

DURABILITY OF VITRIFIED PIPE.

That sound vitrified pipe is itself durable would seem hardly worth devoting much time to demonstrate. Sewers built of it have been unearthed in the excavations of Pom-

peii and Herculaneum, which cities were destroyed by an eruption of Vesuvius, A. D. 79.

Rev. F. S. De Hass, late U. S. Consul to Jerusalem, Palestine, writes: "Vitrified clay is among the most durable mercials have a While the palest and the part of the palest and the palest able materials known. While the marble palaces, temples, and tombs of Rome and other ancient cities have crumbled to dust, those built of brick remain almost perfect. The use of terra-cotta for images, ornaments, drain-pipes, coffins and vessels of different kinds dates back to the remote ages. Sewers, and tiling used in construction. the remote ages. Sewers, and tiling used in construction, have been found in Pompeii, Troy and Nineveh, also in Ur of the Chaldees, the home of Abraham, and the oldest cities in the world. Here it was in general use, and the tombs are drained with clay pipes as sound as when laid in the ground to content of the content

in the ground 4,000 years ago.

"The coffins also are of the same material, and of different shapes, some like caskets with lids and others round like bottles, which were sealed up after the corpse was in-serted; and there they are by thousands at the present ime, sound as when they came from the potters' Nothing is now known more lasting than terra-cotta.

Whether the ancients used salt to glaze their pipes with does not appear, but that it adds to the durability of the pipe the following description of the process of glazing will

Salt-glazed pipes are necessarily made from good clay, which will stand a great degree of heat. The pipes after being made and dried, are placed in a close kiln and grad-ually subjected to an intense heat. When this heat is of sufficient intensity, coarse salt is thrown upon the fire in small quantities; a portion of the salt vaporizes, which vapor, combining with the silica of the clay, produces a soda-salt or glass, which is a glaze and is a part of the body of the pipe. It requires good clay to endure heat of suffi-cient intensity to vaporize the salt, and this heat is so great that the pipes are thoroughly vitrified and very hard, and glazed inside and out.

DURABILITY OF CONDUIT AS LAID.

As the conduit as laid upon my plan-i. e., laying the pipe to the hydraulic grade line required to discharge the amount of water needed—will always be a line of no pressure, conditions precisely similar to the ordinary sewer as laid, there can be no tendency to rupture or break of any kind due to the water passing through the conduit, and the only danger to be apprehended is from an external pressure crushing the pipe, or to an unequal bearing or settlement of the conduit. The following tests show the strength of the pipe to resist external pressure:

Tests made by Mr. A. V. Abbott, engineer, New York. A wooden box was made large enough to receive the pipe

and allow from two to three inches of sand to be packed in at the sides, giving the pipe, as near as possible, the posi-tion it would occupy when laid in the earth. The pressure tion it would occupy when laid in the earth. The pressure was then put on top of the pipe, with the following results, average of two pieces each size—each piece being twenty-four inches long: Diameter, 18 inches; thickness, 1½ inches; crushed at 14,233 pounds; diameter, 15 inches; thickness, 1¼ inches; crushed at 24,030 pounds; diameter, 12 inches; thickness, 1 inch; crushed at 11,540 pounds; diameter, 6 inches; thickness, ½ of an inch; crushed at 28,065 pounds

crushed at 28,065 pounds.

Again, the fact is that in deep cuts the filling over the pipe is partially supported by the sides of the cut, the angle of support or repose of the back-filling being at an angle of 45° with a horizontal at the top level of the pipe, the earth or back-filling forms an arch from this point up, so that the only point to be carefully guarded is to see that the back-filling immediately surrounding the pipe is carefully put in, and that the pipe is laid on the natural ground, so that there may be no undue, unequal settlement; and in places where the ground is soft and yielding, to build up with concrete.

RESULTS AT AMSTERDAM AND LITTLE FALLS.

That the results of construction bear me out in this. I have the proof in the actual working of both the Amsterdam and the Little Falls conduits. The Amsterdam conduit is laid generally in very heavy cuts, ranging from 12 to 22 feet. At Little Falls, one heavy cut for 1,000 feet is in the deepest point 32 feet; and yet, Mr. A. H. Del-graff, Superintendent at Amsterdam, writes in every report to date, that there have been no repairs on the conduit.

His last, the sixth report on the works, 1887, says:

"Conduit Lines.—The conduit lines still continue to do
the work assigned them in a satisfactory manner, and no
moneys have been spent in repairs during the year."

At Little Falls the upper half of the conduit to Gillett

Creek has been in use two years, and the whole since July last, and as yet there has not been one dollar's repairs, although on the iron portion we have had three breaks. If the proof of the pudding is chewing the string, I think these two conduits have demonstrated their durability. The same thing holds true of the Johnstown work.

The conduit at Johnstown is about one mile long, fifteen inches in diameter, and similar in construction to the Amsterdam conduit. It has now been in use four years without any repairs.

CONTINUITY OF SMOOTH PIPE.

I desire to call attention to the fact that the use of a bag I desire to call attention to the fact that the use of a bag drawn ahead continuously after the pipe-laying has the effect of producing a continuous smooth pipe the entire length of the conduit, the small particles of cement mortar which are forced up into the chamber of the pipe in calking being smoothed over in the line of the flow of the water, and the joints entirely obliterated. Very careful measurements on a weir at the outlet of the Little Falls conduit showed, when conduit was running full head, a daily flow of 4 250 000 gallons although the calculated daily flow of 4,250,000 gallons, although the calculated capacity was 3,000,000 gallons.

VALVES IN LINE.

To prevent a pressure ever being put on conduit, under no circumstances must any valve be placed in the line, but it must be an open conduit from end to end; the water must be regulated at the head, or by the introduction of a branch pipe with valves on branch, which may then be located at any point at which it is desirable to draw the water off. On the Little Falls conduit I placed branches and blow-offs on each section of the iron pipe at their lewest points.

ECONOMIC FRATURES OF COST.

The most important item in the whole matter, however, is the relative cost as compared with cast-iron pipe. saving is well worth looking into wherever new works are being designed, or additional supplies added to existing systems, to see if it is applicable to the case in hand.

Taking the actual results of the cost of constructing the

Little Falls conduit, the comparative statement, excluding the cost of dam, inlet-chamber, etc., common to any plan, will be as follows: total cost of conduit, 8.72 miles long,

\$86,085.27; vitrified pipe portion, 5.63 miles long, \$45,544.43; cast-iron portion, 3.09 miles long, \$40,540.80.

If cast-iron pipe had been used exclusively in place of vitrified pipe, the sizes, owing to the contour of the ground, would still have been the same as were used in the line as

would still have been the same as were used in the line as actually constructed; the total cost of conduit at contract prices would have been \$147,409.29.

If it had been possible to follow on the hydraulic grade line the entire length of the conduit, using vitrified pipe exclusively, the total cost would have been \$57,206.64.

From the actual workings of the conduits at Amsterdam, Johnstown, and Little Falls, I am satisfied that, if proposity laid a salt glazed pipe conduit is as durable as any

erly laid, a salt-glazed pipe-conduit is as durable as any that can be laid, as well as being economical, as the above results of actual work show. There being no pressure, there can be no breaks to repair; maintenance is reduced to the minimum.

LIMITATION OF ITS USE.

Vet I think that I must state that the application of vitrified in place of cast-iron pipe must be limited to conduits of two feet to thirty inches in diameter, and to those localities where a line can be run to follow the hydraulic grade line, terminating at a distribution-reservoir adjacent to town, which will give sufficient head for the distribution system, or ending at a pump-well.

CONCLUSION.

I believe that the use of vitrified-pipe conduits will enable many localities to avail themselves of the better and

purer water-supplies that are, without its use, too far distant to be financially available. For example, the Little Falls water is brought at such a moderate cost as to enable Falls water is brought at such a moderate cost as to enable them to sell their surplus water at a profit at five cents per 1,000 gallons. It would have been too heavy a burden with cast-iron, or at least the taxpayers would have objected to the heavy expense. They probably would have resorted to pumping from the Mohawk River, which takes all the drainage of the cities above them. In the one case they have a pure mountain trout stream of three to four million gallons flow. In the other they would have had million gallons flow. In the other they would have had the sewage-contaminated Mohawk River, the constant daily expense of pumping, with no surplus of water to sell. DISCUSSION OF PAPER ON USE OF SALT-GLAZED VITRIFIED PIPE FOR WATER-WORKS CONDUITS.

In reply to various questions from members of the association and guests, Mr. Babcock said that the length of pipe sections at Little Falls was two feet.

The total fall of the pipe is 130 or 140 feet from surface of collecting reservoir to point of distribution. The two or three breaks reported in the cast-iron pipe had been due

By true hydraulic grade was meant a grade sufficient to discharge through a pipe of the given size the required amount of water.

No difficulty was experienced in laying the salt-glazed pipe through quicksand, which was frequently encountered and was along most of the line at Johnstown, where the and was along most of the line at Johnstown, where the old pipe had two summits and gave constant trouble, which was further increased by action of quicksand under the dam. A new masonry dam was constructed and from a concrete chamber above it the water was drawn into a stand-pipe provided with a regulating valve which admitted it to the salt-glazed pipe. Much of the trench was dug through quicksand saturated with water, which was made available to increase the supply in the pipes the joints available to increase the supply in the pipes, the joints were all left as wide open as possible and covered with ryestraw, then filled around with earth or sand as usual. No

water leaked out of the pipes, but much was brought in, Mr. Holme, Jr., admitted the durability of salt-glazed pipe, but wished to call attention to the greater economy and equal success of the wooden mains lately constructed in Denver. The line is laid irrespective of grade, is nearly seven miles long and sustains pressures as high as 40 pounds per square inch. Railroad ties of redwood, similar to that used in the pipe, have lasted for 40 years and it is expected the pipe will last at least 25 years, although it is so cheap that it could be renewed three or four times It is so the priod with more economy than to use iron pipe.

No leaks or breaks have yet occurred but could be remedied by the insertion of a new stave.

Mr. Holme described the details and construction of this pipe, which was illustrated in our issue of February

Secretary Decker mentioned the recent construction at Quincy, Ill., of 1,500 or 2,000 feet of hard pine pipe simtlar to the Denver pipe that is giving good satisfaction. It was briefly described in our issue of March 24.

Mr. T. N. Hooper described a six-inch bored redwood pipe that he saw in the Sanoba Valley, California, which had been buried 15 years and sustained a pressure of 80 rounds per square inch, and was in perfect condition when pounds per square inch, and was in perfect condition when he examined it.

President Fanning described a pipe that he had built of Georgia pine for a line 700 feet long, with 40 feet fall and an initial head of 10 feet. The pipe was 72 inches in diameter and made of staves planed from 4x4-inch timber. diameter and made of staves planed from 4x4-inch timber. The knives in an ordinary planing machine were set to give the proper angle to the abutting faces of the staves. The pipe was built up from the lower end, the staves breaking joints and a piece of hoop iron three-quarters of an inch wide and slightly longer than the width of the stave being set at each joint between the abutting ends of the staves in a saw-kerf made three-eighths of an inch the staves in a saw-kerf made three-eighths of an inch deep in the end of each stave and parallel to its outside face. This made a perfect joint between the four adjacent staves when they were tightened up. They were in 15-foot lengths and hooped with iron bands, from one-half inch thick at foot of the pipe to one-quarter inch thick at the head. At two deflections of the pipe butt-joints were made in the plane bisecting the angle and covered by a wrought-iron sleeve and tightly calked inside and outside.

Mr. Fanning also described the use, twenty years ago, of one and a half miles of 24-inch Scotch glazed pipe laid under an initial head of 14 feet with a fall of 12 inches per

under an initial head of 14 feet with a fall of 12 inches per mile from a storage-reservoir of 18 acres surface.

A stand-pipe was provided at the head of the pipe, and the joints were made with wrought-iron sleeves filled with cement. The pipe has given satisfaction up to the present

time.

Mr. Fanning stated that the durability of wooden pipe is due to its protection from air, and mentioned some timber he had recently removed from the mud near low-water mark, where it must have been buried nearly one water mark, where it must have been builted hearly one hundred years ago. It was a chestnut bridge sill, and a chip taken just beneath the sap wood was tough and fibrous and in perfect preservation.

Instances were related of pipes recently dug up in Connecticut that were in good preservation and still perfectly

serviceable after being buried eighty or ninety years. One was a bored wooden pipe 16 inches in diameter, with 2-inch hole and cup-joints. The other was a cement pipe 5 inches external and 1½ inches internal diameter, with

Mr. Y. Nakajima, Hon. Mem. W. W. A., being absent, his paper on the "Water-Supply of Tokyo, Japan," was

read by title only and ordered to be printed in full in the

PRACTICAL HINTS FOR DRAUGHTSMEN. By Charles William MacCord. A. M., Sc. D., Professor of Mechanica William MacCord, A. M., Sc. D., Professor of Mechanical Drawing in the Stevens Institute of Technology. New York: John Wiley & Sons. 1888. Cloth, 100 pp., 9/x11/4 in. \$2.50.

"The leading object of this treatise is to explain various modes of representation which are in many cases better than the precise ones of projection; for mechanical drawings often convey false impressions by too close adherence to the truth, and become obscure by being too

This quotation from the preface very accurately indicates the scope of the first part of this book, and its promise is well fulfilled.

Most draughtsmen of intelligence and experience will find that they have anticipated many of Professor Mac-Cord's conclusions, but that only proves their correctness. To the young draughtsman, and indeed to many old ones, the careful study of the first three chapters will be very profitable, and there are few employers of draughtsmen that would not find it a paying investment to place the

book in the drawing-room for reference.

To make drawings theoretically correct is comparatively To know when and how to make judicious variasimple. Thinks when and now to make judicious varies tions and labor-saving short cuts can only be learned from experience, either one's own or another's, and the latter is

here supplied.

The advice about drawing instruments and materials, although helpful in many respects, should be followed with some caution. The best size for compasses is given some-what differently in two different places, and the sometimes what differently in two different places, and the sometimes convenient lengthening bar is unsparingly condemned, as is also the drawing pen with hinged blade, although a hinged blade is shown on the compass pen. It is to be hoped that no one will spend money for such bow instruments as are shown on page 68. They are destitute of needle points and have the adjusting-nut on the wrong side. The objection that shouldered needle points prevent the making of very small circles is entirely overcome by filing a little off of one side of the shoulder, by which it is possible to make circles very much smaller than Professor MacCord's minimum of one-thirtieth of an inch. The little compass, with stationary spindle, much used by bridge draughtsmen for making rivet-holes and heads in large members, is not mentioned, and generally all tools bridge draughtsmen for making river-noies and neads in large members, is not mentioned, and generally all tools for special purposes are ignored or condemned. The pro-portional dividers is stigmatized as a "brazen impostor," which it usually is when made of brass, but a good German silver one is on some rare occasions a great convenience. The beam compass recommended requires too light a bar for convenient or reliable use with very long radii. A bar of T-section, to the rib of which the sockets may be clamped and from which they do not "drop off," with ordinary care is much more satisfactory, and if the top is made flat the compass can conveniently be laid on its back when out of hand without danger of inking the drawing

board.

The Professor's style is rather dogmatic and not infrequently "slangy," which, while it may seem to make the book more readable, somewhat detracts from its dignity. Such phrases as "back the bull off the bridge," "Calvanistic observance of the letter of the law," and "face the guns and carry the battery," however they may serve to enliven a class-room, seem out of place in a scientific work.

The book concludes with an appendix giving convenient tables of proportions of bolts, nuts, pipes, etc., and the whole is conveniently indexed.

REPORT OF THE NEW BEDFORD WATER-WORKS.

WE have received from Mr. R. C. P. Coggeshall, Superintendent, the eighteenth annual report of the Water Board of New Bedford, Mass., for the year 1887. This city contains an estimated population of 36,000, of which some 31,750 are adjacent to the mains, and about 30,080 were actually supplied with 1,112,302,789 gallons of water last year, being a daily consumption of 3,047,404 gallons, giving an average of 85 to each inhabitant and 101 to each secretary and 555 to each of the 5405 tags in use. to each inhabitant and 101 to each of the 5,495 taps in use. Of this water ¼ per cent. passes through 60 domestic meters and 17 per cent. through 42 manufacturing meters. It is supplied through 54 miles of pipes (three miles added last year), from 4 to 30 inches in diameter, whose repairs cost last year \$21 per mile. Nine miles of this pipe is cementlast year \$21 per fine. Nine fines of this pipe is cement-lined wrought-iron, whose ultimate replacement with cast iron is recommended. The pressure varies at the centre of the city from 29 pounds by day to 37 pounds at night. Twenty-eight motors and elevators are in use, 4 motors and 22 meters having been added during the year. The works were built during 1866-9 and belong to the city. The supply is drawn from a storage reservoir formed by a dam across the valley of the Acushnet River, from which the water flows by gravity seven miles to the city, where it is pumped to an elevated distributing reservoir. There are three pumping-engines: No. 1, a McAlpine; No. 2, a Worthington, and No. 3 a high-duty Worthington, which Worthington, and No. 3 a high-duty worthington, which have pumped during the year a number of gallons against an average dynamic head in feet and with an average duty in foot-pounds per 100 pounds of combustible as follows: No. 1, gallons, 220,337,172; head, 134; duty, 88,088,013; No. 2, gallons, 121,455,608; head, 126;

* This interesting paper was printed in our issue of March 17, in ignorance of Mr. Nakajima's intention to present it at this convention, information of his purpose having been received only on the day of publication.

duty, 57,407,881; No. 3, gallons, 754,340,094; head, 127; duty, 93,142,804. The coal used was anthracite egg, with price per gross ton delivered and percentage of ash as follows: Lindermann's Sugar Loaf Lehigh, \$5, 10.2 per cent.; Old Company's Lehigh, \$5,48, 11.9 per cent. The cost of pumping per million gallons figured on total pumping station expenses of \$9,436, of which \$4,210 was for fuel and \$3,868 for labor, was: for raising to reservoir \$861, and for raising one foot high 6.7 cents.

Mention is made of the valuable work done by the State Board of Health in making water analyses, of which a table is given. Mr. Desmond Fitzgerald, Superintendent of the Western Division of the Boston Water-Works, is quoted as saving that the evaporation during a year from

quoted as saying that the evaporation during a year from a water surface is about 35 inches, and may in summer reach six-tenths of an inch in one day, equal to 16.291

reach six-tenths of an inch in one day, equal to 16.291 gallons per acre.

A very fully detailed report is given of a 24-hour test made by Messrs. William Rotch, William R. Billings, and R. C. P. Coggeshall of two upright Corliss boilers, 64 inches diameter and 13 feet 7 inches long, with internal fire-boxes and 128 two-inch tubes. They developed 79 H. P. (on the basis of 30 pounds of water evaporated per H. P.), and evaporated 10.25 pounds of water at 212 for every pound of combustible, burning 7.92 pounds of coal per square foot of grate per hour.

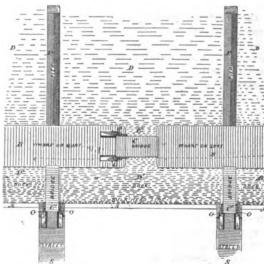

The monthly consumption of water and the height of the water in the storage reservoir are shown graphically and form an interesting diagram. It seems a pity that the curve of the rainfall could not have been added to make it complete, especially as the figures for it are given at the bottom of the same sheet. The monthly consumption varied from 72,272,875 gallons in April to 104,961,884 gallons in July, and the daily from 1,646,144 Sunday, April 24, to 4,238,221 on Thursday, July 21. No mention whatever is made of waste of water. The whole regallons in July, and the daily from 1,040,144 Sunday, April 24, to 4,238,221 on Thursday, July 21. No mention whatever is made of waste of water. The whole report of 124 pages is very carefully prepared and represents much work. Extended tables give the location of every pipe, hydrant and stop-gate with much minuteness. An index would have added to its convenience.

Novelties.

A DOCK SYSTEM.

THE arrangement of this system of docks is shown very clearly by the illustration, it being only necessary to add that the bridges are movable, of the balanced lifting or bascule type, though any other convenient draw-bridge may be used.

The illustration represents only a section of the system. which may be indefinitely extended. The piers are intended to accommodate long vessels like ocean steamers, while the smaller vessels can be accommodated in the inner

docks D' D', which they can enter through the opening E, so placed midway between the piers that it will not be obstructed by vessels lying at them. By lifting the bridges C' C', vessels can pass from one section to another of the inner dock D' D' without the hazard and delay incident to

passing around the pier heads.

The inventor is John M. Cornell, of the firm of J. B. & J. M. Cornell, 141 Centre Street, New York City, who proposes this as a plan for the relief of the water-front of

C. F. CASSLEMAN, of Chicago, Ill., has patented a system for canal-boat propulsion which consists essentially of an endless cable driven by machinery and running on suitable supports in opposite directions on either bank of the canal, to which the boats are attached as required.

NAT. W. PRATT, of Brooklyn, N. Y., has invented a pneumatic gun in which the projectile automatically shuts the door after it as it goes out.

STEPHEN E. RHODES, of Saratoga Springs, N. Y., has invented a radiator with a swivel joint at one end, to which the steam and return pipes are connected, and around which the radiator can be swung, if desired to change is position or to clean under it.

PLANT OF THE BOSTON HEATING COMPANY. No. V.

(Continued from page 353.)

THE CONVERTER.

THE water, as I have already shown, is merely the vehicle for the transportation of heat. And now having indicated the method by means of which we introduce it inside a customer's wall, the question arises, How can it be used?

Very broadly it may be stated that our service is perfectly adequate to afford a supply of heat for any purpose whatsoever requiring a temperature of 400° or less, whether it be for heating, power, cooking, chemical operations, or any branch of manufacturing. The various appliances, however, by means of which the heat contained in the water may be utilized are as varied as the different branches to which it may be applied.

For heating simply, two plans present themselves. Hot water can be introduced directly into a radiator which may occupy the same position that the furnace in the house does, and may warm a quantity of cold air supplied through the cold-air box, and send that air heated through the flues that are already in place, so as to warm the building in the same way that the furnace does at the present time, only substituting a hot-water coil for the glowing mass of incandescent coal.

Where the edifice is already piped for steam, or in case of a set of offices where a very varied supply is desired, steam heating in the usual manner may be resorted to by the introduction of a device called a "converter." This contrivance may be very briefly described as a steam dome, for in reality in our system it occupies the same place that a steam dome does in a boiler. If, in imagination, you will conceive an ordinary boiler to be stretched out so as to occupy two miles of space, you will have a very fair conception of our system as applied to the distribution of steam heat.

The end of the copper pipe, as it comes in from the street, is attached to a reducing-valve. This reducing-valve we make of rather peculiar construction, so as to specially adapt it to withstand the pressure to which it is subjected, and also to afford a regulator of unusual sensitiveness and durability. By means of the pressure-reducing valve most of the pressure on the water contained in the copper pipe is removed, and the water allowed to flow into a large iron receptacle which forms the steam dome proper. By the removal of the pressure a part of the water is thereby permitted to take up the superfluous heat and to expand into steam.

A small steam-gauge is attached to the converter, the purpose of which is to constantly record the pressure, and to enable the reducing-valve to be set so as to give a pressure of any desired amount. From the top of the converter a steam-pipe conveys the steam away as fast as it is formed, and carries it to any part of the building where its use may be desired. At the bottom of the converter a return main is connected to a float-trap placed on the inside of the converter. Another pipe is used to convey back to the converter the condensed water from all the radiators, so that there may be little or no loss in the system. As fast as this condensed water accumulates in the converter, the trap previously alluded to discharges the water into the return main and allows it to flow into the main in the street whence it is conducted to the station.

As a precautionary measure a safety-valve is attached to the converter, so that in case of any failure of the reducing-valve to act in a proper manner, which might possibly allow a greater pressure to come on the converter than is intended, this safety-valve will open and permit the contents of the converter to flow into the return main and relieve itself entirely.

For supplying steam to an engine we generally calculate that to preserve an adequate supply, it would be necessary to have the volume of the converter at least ten times that of the cylinder of the engine which it is desired to feed. So for a large engine we merely increase the size of the iron steam dome to such proportions as shall always pre-

serve the requisite amount. For cases where both heat and power are desired in the same building, as frequently occurs, we use a compound converter with two reducingvalves so arranged that the water first introduced from the street shall expand into one chamber, giving, for example, a pressure of sixty pounds of steam for the purpose of driving an engine. As soon as the water, under the pressure of sixty pounds, is discharged from this first chamber in the converter by means of the trap, it is received in a second one where by means of an additional reducing-valve. the pressure is again reduced and the remaining portion of heat contained in the water allowed to expand a part of it into steam which may be used for heating. By this means we are enabled to reduce the temperature of the water the greatest amount, thereby returning it to the station as cool as possible.

THE ASBESTOS COVERING.

In a system of this kind protection from radiation is an exceedingly important consideration. After a number of exhaustive experiments on nearly all of the non-conducting covering now in use, we decided to adopt a covering made of asbestos. The covering is simply a roll of pure asbestos-fibre 1½ inches thick. It is made by taking the asbestos from the mines, carding it in the same way that cotton-wool is carded, and winding it around a cylindrical roll. After the mixture is dry a saw is run along the side of the roll cutting the covering in two; then the roll is opened and taken off. On the outside of the asbestos is a solidly-woven cloth made of asbestos rendered water-proof by an admixture of plaster of Paris and held in place by a wire netting.

Returning for a moment to the section of conduit, Fig. 3, page 328, we have in the centre the pipe itself; outside of the pipe 1½ inches of asbestos, with a water-proof asbestos covering. An air-space of 4 inches separates the asbestos from the first brick arch; then a second air-space of 2 inches and a second brick arch. So we think the system is about as thoroughly protected from radiation as could be done. As to the insulating power of the asbestos this experiment may be interesting.

I had an air-bath made so arranged that it could be kept at a constant temperature of 500° Fah. A sheet of the asbestos covering was laid on top of the air-bath. In contact with the upper side of the asbestos a piece of 2-inch yellow pine plank was placed so as to cover the sheet entirely. Between the asbestos and the plank a second registering thermometer was introduced so that the temperature between the abestos and the plank could be accurately ascertained. The experiment was continued for several days, during which time the air-bath was constantly maintained at a temperature of 500°, and the highest temperature ascertained as occurring between the asbestos and the wood was 158°.

Postscript, February 10, 1888.—The main and station of the Boston Heating Company was completed and in

readiness to commence circulution about the middle of December. The pipe line, after being tested from the station round to the station again complete, was thoroughly washed out to remove all dirt and grease by pumping water through it for two days; the main was then connected with a battery of boilers of 200 horse-power, underneath which a slow wood fire was started so as to gradually heat the water contained in the boilers; a steady circulation was at the same time maintained through the whole of the main, so that as fast as the water was warmed in the boilers it might be sent out into the main, thus gradually heating the whole system.

About ten days was consumed in warming the main to about 380°; during this time the whole line was carefully watched to ascertain whether any leakage developed, and whether the expansion joints worked in a proper manner; and no trouble of any kind was experienced, the main under heat being found to be fully as tight as it was under cold-water pressure. All of the expansion joints operated as had been anticipated, taking up the expansion as the temperature increased in a perfectly satisfactory manner. After the temperature of 380° was attained, a solution of potash was pumped into the main and circulated for several days in order to remove all grease and red lead, so that the system would be full of clean water, After two or three days circulation of potash water, the mains were cleaned by allowing the hot potash water to escape and refilling it in the boiler with fresh warm water. This cleansing of the main was continued until the water showed no signs of potash or grease.

After this thorough cleansing had taken place, the various consumers, whose house-connections had been made, were, one after another, turned on to the line; and, at the present time, the company is heating about twenty-five large buildings, and supplying power to some engines. So far all the consumers on the line have expressed complete satisfaction with the service rendered to them.

Experiments on the losses by radiation show that in a circuit of nearly two miles the entire loss in the supply main does not exceed three per cent, even in the coldest weather. In all probability, as soon as the masonry of the conduit shall have had sufficient time to thoroughly dry out, even this small loss will be gradually reduced.

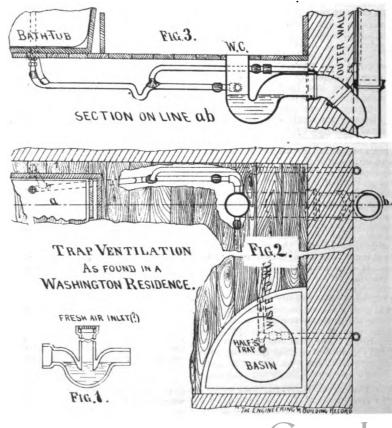

dry out, even this small loss will be gradually reduced.

Testimonials from parties using steam show that the steam furnished is exceptionally dry. One engine is run from an exposed pipe over 80 feet from the converter, and no trouble whatsoever is experienced with water in the cylinder, showing that even after the steam is exposed to this amount of radiation it is as dry as steam furnished by ordinary boilers.

A SPECIMEN OF BAD PLUMBING IN WASH-INGTON

WASHINGTON, D. C., May 5, 1888.

SIR: My attention was called a few days ago by Mr. James Lockhead, master plumber, of this city, to an interesting and curious specimen of ignorance and bad work-

Digitized by Google

manship recently discovered by him in a dwelling to which he had been called to find the cause and correct the evil of an offensive odor that had been noticed by the occupant for some time and which had grown to be well-nigh unbearable.

On taking up portions of the floor in the kitchen, near the wash-tubs and sink (where the smell was worst), the earth beneath was found to be covered with greasy filth. evidently from leaks in the drain-pipes. Removing these it was found that the 11/4-inch lead pipes from the fixtures were connected with branch terra-cotta pipes (2-inch) only by slipping the former into the latter, with scarcely a pretense of cementing the two together. The 2-inch terra cotta branch pipes entered a 3-inch of the same material, at right angles—the ends of the smaller pipes projecting into the larger about an inch, and but imperfectly cemented.

This 3-inch pipe was in an area beside the house, and received no other branch before being enlarged to 4-inch, and taking a rain-leader (trapped), soil-pipe (continued to above roof) and two area drains (with bell-traps).

On looking down into what was evidently intended for a fresh-air inlet it was at first supposed that there was an obstruction in the trap, for water was visible seemingly in the air-inlet. By digging down to the trap, however, it was discovered to be of a form in which the cleaning hole was located on the upper side of the lowest part of the trap, and the plumber (presumably in ignorance of the object of the fresh-air inlet) had extended this to the surface and placed a grating over it. (See Fig. 1.)

After correcting this it was found that there was still no air-current through the soil-pipe. This led to further excavation, which revealed another earthenware trap of the same sort on the main drain, a short distance below the foot of the soil-pipe—the cleaning hole being made this time to serve for the admission of area-water through a bell-trap at the surface. Thus all channels for the direct escape of air from the space between the kitchen branches and the main trap being closed, the drain became "airbound" when large volumes of water were emptied from the wash-tubs, backing up the water, forcing it through the open joints, and forming deposits in the pipes—the space between the entrance of the wash-tub branch and the sink branch (about ten feet) being nearly full of the pulpy substance peculiar to laundry drain-pipes

In the bath-room in the second story was found an interesting method of trap ventilation, illustrated by plan and sectional elevation in Fig. 2. The traps of bath and basin being ventilated in the usual way, the waste-pipe from each fixture is discharged into the water-closet trap above the water. The water-closet in use (removed before the sketch was made) was of the type known as "plunger," with no trap except the one shown—under the floor. The basin vent-pipe, after passing through the outer wall, rose vertically about eight feet, then ran about twenty-five feet nearly horizontally-descending, however, instead of rising, so that a trap containing a gallon of water was formedand, finally, rising again vertically some eight feet more. All of this outside vent-pipe is of 11/4-inch wrought iron, unprotected from corrosion. The soil-pipe (also unprotected) is run independently to above the roof, following the same general course as the vent-pipe.

This work was done three years ago.

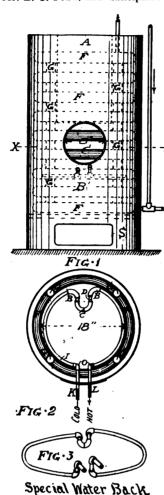

DANA C. BARBER.

SPECIAL WATER-BACK.

THE accompanying figures illustrate a puzzle that recently arose in the plumbing of a Cleveland residence and the solution effected by the fourth plumber that was called to do the job. Figure 1 is an elevation of the boiler for the hot water heating system for the house. In the cylindrical shell S are placed a series of horizontal circular pipes, F, F, etc., with communicating branches G, G, etc. Inside these rings are the coal reservoir A and the fire-box B. In the latter it was desired to place a circular pipe, I, to heat water for kitchen use. To avoid interference with the fuel, it was necessary that this ring should fit close to the inside of the boiler, thus requiring a diameter of 18 inches, and it could only be introduced through a door, C, inches in diameter.

Figure 2 is a cross-section through X X, and shows the water-back I in position and its construction. Two pieces of pipe, A A, were bent to required curve, and united by the street L's B B, the return C and the nipples D, and had elbows, O O, fitted to the outer ends. The pipe was then doubled up by folding on the joints at D, and readily inserted through the door, then opened out, as shown in

Fig. 3, and the hot and cold pipes K and L connected. Soon complaint was made that it heated too well, and that hot water came through the cold faucet. The plumber, Mr. E. C. Fraw, had anticipated this trouble,

and remedied it by placing a check-valve in the cold pipe to prevent return of hot water, and a self-closing cock on hot water branch at the sink, which, if subjected to much pressure, would automatically open and relieve it.

PROPOSED PLUMBING REGULATIONS FOR PITTSBURG.

WE learn that a committee of the Master Plumbers' Association of Pittsburg has been engaged for some days past in preparing plans for regulating plumbing-work in that city. At present there are no regulations whatever governing the Bureau of Plumbing, and the inspector asked the Plumbers' Association to prepare something which might aid him and Chief Brown in establishing rules. The inspector himself has been hard at work in the same line, corresponding with other cities, and getting all the light he can on the subject. With what information he gains in this way, his own practical knowledge, and the suggestions which will come from the master plumbers, a code of rules will be made, and ordinances passed by the City Councils giving power to enforce it. As it is now, it would make no difference what regulations the inspector might think were proper, he has no authority to compel persons to observe them.

The master plumbers are not only willing that there should be, but they are really anxious to have laws governing their trade and work. They tried to have a bill passed by the last Legislature compelling plumbers to be licensed, but it failed. The license system will prevent incompetent men from doing work, often apparently much cheaper than regular plumbers would do it for, but in reality much

This is the most useful and public-spirited work any master plumbers' association can engage in, and we wish them all success.

PHILADELPHIA TRADE SCHOOL.

OUR Philadelphia correspondent writes that a great deal of interest is being shown in the projected trade school of the Master Builders' Exchange of that city, and the men most interested in the scheme are congratulating them-

A committee of seven, representing different branches of the trade, have been appointed to secure the co-operation needed to make the movement a success.

Correspondence.

All correspondents should send us their names and addresses, not necessarily for publication, but as a guarantee of good faith and because it is often necessary to communicate with them for additional information before printing their communications. Anonymous letters will not be noticed.

ON PROPRIETY OF OMITTING TRAP FROM HOUSE-DRAIN CONNECTED WITH SMALL PIPE-SEWERS

CORNING WATER-WORKS, HEERMANS & LAWRENCE, Prop's. CORNING, N. Y., May 14, 1888.

SIR: We note your comments on our letter of inquiry SIR: We note your comments on our letter of inquiry in the issue of May 12 of your journal. To give you further details as to the construction of the "separate" system of sewers in Corning we state as follows: The main outlet sewer is 18-inch, about 2,300 feet, and other sizes are: 600 feet 15-inch; 2,200 feet 12-inch; 8,500 feet 10-inch; 9,500 feet 9-inch; 20,000 feet 8-inch; and 30,000 feet 6-inch. Manholes, with ventilated covers, are placed 250 feet apart on the entire system.

At the up-grade end of every line of sewers is placed a Van Vranken flush-tank, which discharges periodically. Four-fifths of the sewers have steep grades. A limited quantity of rain-water is admitted.

quantity of rain-water is admitted.

Now, as you seem to advocate in most cases a trap with fresh-air inlet, do you consider it proper to have this inlet open in the yard, as some authorities advise? What is the best practice?

Your answer to our first question as applicable to the Corning system will be appreciated by your readers here.
The question is, Should a trap be used on the main drain?
Very truly, HEERMANS & LAWRENCE.

[Under the circumstances stated, we are not prepared to advise that traps on the main drains should be insisted on. As we said in our former reply, which should be read in connection with this, this question depended largely on the condition and maintenance of the public sewers and house plumbing.]

THE DUTY OF NEW YORK PLUMBING INSPECTORS.

UTICA, N. Y., May 15, 1888.

SIR: Will you kindly tell me what are the duties of a plumbing inspector in New York City?

A. B. JOHNSON.

[The duty of an inspector is to see that all plumbing work is done in accordance with the plans filed with and approved by the Health Department for work done in his district and to report all violations.]

WANTED-A TELEPHONE PLANT.

RIDGEWAY, VA., May 17, 1888.

SIR: I have an interest in the construction of fourteen miles of the Roanoke and Southern Railroad, our miles of the Roanoke and Southern Railroad, our work extending from Martinsville, Va., to the North Carolina

Am anxious to establish telephone connections over the

fourteen miles.

Will you refer this to a good telephone company who
Will you refer this to a good telephone company who will you refer this to a good telephone company who will immediately quote me wire and instruments? Will buy or lease instruments for one year.

For prompt attention will oblige a subscriber to your valuable journal.

H. W. Newby,

Engineer and Contractor.

[The Southern Bell Telephone and Telegraph Co., 195 Broadway, New York, is the lincensee of the territory covering Ridgeway, Va.]

FORMULÆ FOR DYNAMITE AND ADDRESS OF PARTY SKILLED IN ITS MANUFACTURE.

RIDGEWAY, VA., May 21, 1888.

Digitized by

SIR: Owing to the refusal of dynamite shipments by certain railroad companies, I am considering the practicability of mixing on the spot. Can you furnish the formulæ in general use and give me instructions as to methods? Also the address of some one skilled in the manufacture of Respectfully, H. W. NEWBY.

[From inquiries concerning this matter we find that rack-a-rock, a high explosive, claimed to be equivalent to dynamite that is 75 per cent. nitro-glycerine, can be shipped to any point in its separate parts and mixed as needed for use without danger or requiring skilled attendance. All railroads handle it willingly as shipped from the factory and charge the freight rates usual for chemicals. It is manufactured by the Rend-Rock Powder Company, of New York, whose card appears in our advertising columns.

The manufacture of dynamite in the field depends largely on the magnitude of the undertaking and probably would not be desirable for small quantities. The risk would naturally be greater than at established factories with experienced hands, and the initial outlay would be consid-

The difficulty lies in the manufacture of the nitro glycerine, which is the active component of dynamite, and probably would not be transported by any railroad. Its manufacture on the spot requires, besides the chemical and mechanical appliances, very thorough and extensive refrigerative apparatus, as it explodes if permitted to rise above a certain low temperature. Dynamite is prepared by simply mixing nitro-glycerine with pulp, charcoal, or earth, or any similar base that will absorb it and act as a vehicle.

Mr. Michael Brady, Rahway, N. J., would probably furnish a nitro-glycerine plant at moderate cost, and very likely send a man with it to take charge. An interesting account of some new European high explosives is given in our issue of April 28.]

STRENGTH OF CEMENT MORTAR.

BROOKLYN, May 11, 1888.

SIR. The article by Professor Baker in the issue of your paper for May 5 seems to contain some inexplicable errors in the percentages given in the second and third tables. In the second table the ultimate strength of piers ranges from 1,411 to 2,375 pounds per square inch; the brick are stated to have an average strength of 1,500 pounds per square inch; and yet the strength of piers is given in column 8 as only from 9 to 17 per cent. of the strength of the brick.

Similarly in the third table the strength of the brick ranges from 1,195 to 5,390 pounds per square inch, and the ultimate strength of the brick-work with the different mortars from 53 to 341 pounds only per square inch, vet the strength of the brick-work is said to be from 44 to 63 per cent. of that of the brick. It would seem in this latter table as if there were one too few figures in the amounts given for strength of brick-work. J. F. FLAGG.

THE NOMENCLATURE OF RAILROAD CURVES.

NEW YORK, May 3, 1888.

SIR: Please explain what is meant by a curve of 60° etc., and by a curve of 60° radius, — feet long as applied to railroad curves? Is a 60° curve one deflecting 60°? DRAFTSMAN.

The degree of curvature in railroads is designated by the length of the arc in degrees that is subtended by a chord of 100 feet. For instance, a "3° curve" is one in which 3° of arc is subtended by a 100-foot chord, or in which the radii to the extremities of a 100-foot chord make a central angle of 3°. The expression refers solely to the degree of curvature and has nothing to do with the length of the curve; thus, a "3" curve" may deflect 1" or 90", corresponding to a length of 33 feet or 3,000 feet respectively. The greatest curvature that can be thus designated is that of a "180° curve," whose radius would be 50 feet.

For ordinary curves, in which the arc of the 100-foot chord which subtends it are practically of the same length, the length of the radius is in exact inverse proportion to the degree of the curve. Thus, the radius of a "ro curve" is 5,730 feet; of a 2°, 2,865 feet; 3°, 1,910 feet; 5°, 1,146 feet, etc. Curves sharper than 1,000 feet radius, or say 6°, are avoided where possible on important roads. The limit of curvature on the West Shore Road as originally laid out was 4°, but in some places on the New York Elevated Roads curves of 90 feet radius are successfully used. They are "671/2" curves."

To answer your specific questions, we would say that "a curve of 60°" deflects 60°, no matter what its radius; what a "curve of 60° radius" may be we cannot conjecture, and certainly never heard of it as applied to railroad or any other curves. A "60° curve," as before stated, may deflect any amount, but for reasons above given it will always have a radius of 100 feet.]

AMERICAN SOCIETY OF CIVIL ENGINEERS.

THE date of the convention of 1888 at Milwaukee, Wis., will be the last week in June. Arrangements as to transportation are in progress with the passenger associations and committees, whereby it is expected that a rate of one and one-third full fare will be made for the round trip from all points on the lines of the roads represented by

Papers or discussions on papers already published are invited. A concise abstract of any paper to be presented should be sent to the secretary not later than May 31. This will make discussion more probable, as a copy of the abstract will be sent to members who may be expected to contribute discussion.

WESTERN SOCIETY OF ENGINEERS.

THE 247th meeting was held April 9 in Chicago, President A. Gottlieb in the chair, L. E. Cooley, Secretary. The memorial to Congress was amended to read as

"Whereas, The system under which our National Pub-lic Works is conducted is subject to severe and just criticism, being without a well-considered policy or a consistent pose," etc. 11. Beckler and John Herron resigned to join the

Montana Society of Civil Engineers

A communication was received from Mr. T. I. Nicholl. Vice-President and General Manager Natchez, Jackson and Columbus Railroad, accompanied by a letter from the Pennsylvania Steel Company, advocating the use of rails 33½ feet long, as standard, as cars are now 34 feet.

33½ feet long, as standard, as cars are now 34 reet.
The Committee on Highway Bridges, consisting of C. L.
Strobel, A. Gottlieb, and E. C. Carter, made the following

recommendations:

"We think that improvement in the character of highway bridges can be brought about by the following means:

"The Governor of each State to appoint an engineer, whose duty it shall be to examine and report on existing bridges, with authority to condemn unsafe structures, and to act as expert adviser to the Legislature on all questions and measures pertaining to the construction of new work.

"Cities and counties should be encouraged to employ engineers who are bridge specialists to prepare specifications and complete detail plans for bridges, and tenders from contractors should be received on the basis of these specifications and plans. In order to facilitate the adoption of this method, we think it highly desirable that engineers agree upon a scale of minimum rates for doing such work on a similar plan as in vogue among archite. ts.

"Inasmuch as we think it desirable that any action taken shall be, as far as possible, the joint action of all organizations similar to our own, we recommend, as a step preliminary to such joint action, that the Secretary be instructed to place himself in communication with other local engineering societies, and request from them an expression of opinion on the subject under consideration."

The report was referred back to the committee, with

The report was referred back to the committee, with instructions to correspond with other societies, with a view to an expression of opinion and ultimate co-operation.

ENGINEERS' CLUB OF PHILADELPHIA.

THE regular meeting of the club was held May 5, President Joseph M. Wilson in the chair, Howard Murphy, Secretary; thirty-four members present.

The secretary presented an illustrated description of a

rolling bridge for docks by Mr. Oscar Sanne, who says:
"During my stay with the Union Bridge Company I

was called upon to make a design for a rolling bridge to be used at the Government's Dock at Quebec, which was estimated to weigh 239,444 pounds,

"The bridge has to be moved back the full width of the channel, which is 69 feet 5 inches. The machinery is designed to open it in 2 minutes 54 seconds.

"All shapes are of steel, eye-bars and rods of iron

"This structure is to be built this spring and I hope

Mr. Robert A. Cummings presented, for the Reference Book, a table of equality of curves at different scales, by which a set of curve patterns cut for a certain scale can be

used for other scales.

Mr. M. R. Muckle, Jr., described a general and detail

arrangement for a system of underground conduits for electrical conductors, with numerous illustrations.

Mr. Henry G. Morris presented a number of specimens of Mitis metal castings, and an illustrated description of the furnace used in their manufacture.

ENGINEERS' CLUB OF ST. LOUIS.

THE club met May 16, twenty-eight members and nine visitors present. The president being absent, Secretary William H. Bryan announced the resignation of George E. Otis, and the election of Colonel E. D. Meier as Vice-President, who then took the chair. William T. Gould was elected a member. Mr. Charles F. White read a paper on "The Failure of a Firmenich Boiler," which occurred at the Plant Flour Mills St. Louis. The construction of at the Plant Flour Mills, St. Louis. The construction of at the Plant Flour Mills, St. Louis. The construction of the boiler and the arrangement of the plant, together with the method of operation, were described. The material used was C. H. No. I iron of 45,000 pounds tensile strength. Test specimens had shown a tensile strength of from 50,100 to 58,900 pounds. The boiler had 3.375 square feet of heating surface and was rated at 225 horsesquare feet of heating surface and was rated at 225 norse-power. In the opinion of the speaker the failure was due to faulty design, which permitted great differences of tem-perature and consequent differences of expansion of ad-ioining tubes, as well as danger from scale. Messrs. joining tubes, as well as danger from scale. Messrs. Meier, Wheeler, Russell, Blaisdell, Nipher and Johnson

Meier, Wheeler, Russell, Blaisdell, Nipher and Johnson took part in the discussion.

The second paper was read by Mr. Louis Stockett on "A Well-Ventilated Mine." The proper ventilation of mines was such a simple matter that it was a cause for surprise that it was not better done. Mr. Stockett described in detail the arrangement at Mine No. 6, Staunton, Ill., illustrating his remarks with drawings. The difficulties met with and their remedies were with and difficulties met with and their remedies were since the state of

difficulties met with and their remedies were pointed out.

A report was then read from the committee to which was referred the matter of proposed legislation on National Public Works. They were of the opinion that the proposed legislation as laid down in the Cullom-Breckinridge bill is a step in the right direction, and recommended the appointment of one committee to raise funds as requested by the Executive Board by private subscription from members of the club and others, and another committee to correspond with similar committees from other clubs and with any persons who may be able to aid in bringing the merits of the proposed legislation to the attention of members of Congress. They were also of the opinion that promotion from the grade of Division Engineer to Depart-

ment Engineer should be subject to the recommendation of an examining board, and recommended that the club pass a resolution to this effect.

After discussion the report was adopted and the action required by its recommendations was made the special order for the next meeting, May 30, which will be the last of the spring session.

NEW ENGLAND WATER-WORKS ASSOCIA-TION.

THE seventh annual convention of this association will

be held at Providence, R. I., June 13, 14 and 15.

The following papers will be read and discussed: "Soils be held at Providence, R. I., June 13, 14 and 15.

The following papers will be read and discussed: "Soils from which supplies of water may be obtained by filter-galleries or driven wells," Phineas Ball, C. E., Worcester, Mass.; "Description of apparatus for notifying when high-water level is reached in reservoirs and water-tanks," W. P. Whittemore, Supt., North Attleboro, Mass.; "Microscopical sketches of some vegetable growths in reservoirs." F. F. Forbes, Supt., Brookline, Mass.; "The aeration of water-supplies by natural canals and low dams," S. E. Babcock, Chief Engineer, Little Falls, N. Y.; "Can tests by tubular wells be relied upon to show the amount of water that may be obtained for a public water-supply." W. C. Boyce, C. E., Worcester, Mass.; "The use of relief or safety-valves in distributing systems," S. E. Babcock, Chief Engineer, Little Falls, N. Y.; "Covered reservoirs," Charles H. Swan, C. E., Boston, Mass.; "Testing water-meters and some things learned thereby," L. Fred Rice, C. E., Boston, Mass.

Also the following topics will be discussed: What is the best way to limit the use and weight of special castings? What is the best method of locating gates and specials? What is the best method of locating gates and specials? What is the true value of pressure and recording gauges? Office routine—method of keeping accounts. What is the percentage of difference between the yield of driven wells at extreme seasons of the year?

Professor J. E. Denton, of the Stevens Institute of Technology, will illustrate with the stereopticon the

Professor J. E. Denton, of the Stevens Institute of Technology, will illustrate with the stereopticon the hydraulic problems involved in the construction of the new Croton Aqueduct and the methods of construction

Members of water boards and all others interested in questions pertaining to water-supply are always welcomed to the meetings of this association, and all persons eligible for membership are cordially invited to join it.

Edwin Darling, President, Pawtucket, R. I.; R. C. P. Coggeshall, Secretary, New Bedford, Mass.

CINCINNATI CIVIL ENGINEERS' SOCIAL CLUB.

THE civil and mechanical engineers of Cincinnati have organized an Engineers' Club, at the preliminary meeting thirty-two gentlemen being present. The officers for the current year are: Colonel William E. Merrill, U. S. Engineer Corps, President; Gustav Bouscaren, Vice-President; Russell Hindman, Secretary. The directors are G. B. Nicholson, A. L. Anderson, and J. Forster Crowell. The object of the club is to create social intercourse and friendly relations among the members. The meetings will be derelations among the members. The meetings will be devoted to discussions of matters pertaining to the science of engineering and reading papers on modern improvement and development.

AT a meeting of the Milwaukee members of the American Society of Civil Engineers in Milwaukee, the following committees were appointed to get ready for the annual convention of the American Society of Civil Engineers, which will be held in that city June 26, 27, 28 and 29: Finances—D. J. Whittemore, E. P. Allis, C. L. Colby, A. Conro, F. R. Finney, H. J. Hilbert. Arrangements—G. H. Benzenberg, S. A. Harrison, F. W. Kimball, O. Bates, E. J. Pœtsch.

W. C. KUTTER.

MR. W. C. KUTTER died suddenly of apoplexy at Berne' Switzerland, on the 6th inst. Mr. Kutter was the author who gave to the profession a formula for the flow of water in open channels which bears his name, and which is now very largely used by engineers. He was employed in the City Engineer's office at Berne, his position being that of principal assistant.

PERSONAL.

CIVIL ENGINEER ASSERSON, who has been in charge of the Yards and Docks Department and whose term of service at the Brooklyn Navy Yard expired on the 25th instant, has been detached, and Civil Engineer T. C. McCollum appointed in his place. Engineer Asserson will remain in charge of the construction of the Simpson

CONTRACTING NEWS DEPARTMENT.

A WEEKLY RECORD

OF SPECIAL INTEREST TO CONTRACTORS, BUILDERS AND MANUFACTURERS OF ENGINEERING AND BUILDING SUPPLIES.

ARCHITECTURAL COMPETITIONS.

WILMINGTON, N. C.—Church.—Plans are wanted for a church, to cost from \$12,000 to \$15,000. No date specified. Address John W. Primrose as above.

RAWLINS, Wyo.—Penitentiary.—Plans are wanted here until June 5 for a Territorial Penitentiary to be erected here. Total cost of building to be \$100,000. For circular of instructions address James P. Wallace, Secretary Territorial Penitentiary Building Commission, as above.

WYOMING, O.—Sanitarium.—Plans are wanted here for a sanitarium to be erected on Findlay Heights, at Findlay, O. Address R. B. Latta as above.

FINDLAY, O.—Tabernacle.—Plaus are wanted here y the Good Templars for a tabernacle, to cost \$5,000. or details address Charles Williams, Assistant Cashier, armer's National Bank, as above.

Toledo, O.—Library Building—Plans are wanted here for a \$40,000 public library building. For details address C. A. Dresser, Chairman Building Committee, as above.

BUFFALO, N. Y.—Church.—Plans are wanted here for a church edifice to cost \$100,000, to replace 5t. Paul's Cathedral, recently destroyed by fire. For circular of instructions, etc., aderess Albert J. Barnard, of the Building Committee.

For works for which proposals are requested see also the "Proposal Column," pages i-vii-viii-368

Persons who make any use of the information they find in these columns we trust will not omit to mention THE ENGINEERING & BUILDING RECORD as the source.

Our readers will oblige us by notes, clippings, or any information which will put us in the way of obtaining early and reliable news for our "Contracting Intelligence." Information of importance sent to us exclusively, and not elsewhere published, will be liberally paid for.

WATER, SEWERAGE, ETC.

LA SALLE, O.—Water.—The officials of this city advertise for a quantity of assorted pipe, also hydrants and other material. For complete details see our Proposal Columns

PASADENA, CAL.—Water.—It is said that the water companies of this place will substitute a 22-inch steel pipe line for the cement ditch now in use, which conveys the water to the consumers from the reservoir.

BRAUMONT, TEX.—Water.—Thomas & Gorman, water-works contractors, at this place, write as follows: "This city has just completed a system of water-works, which they have leased to a company, in concection with which this company intend erecting at once an electric light plant, 15 ton ice machine, refrigerator, steam laundry, telephone and fire alarm system, and desire machinery for the several plants. Information can be secured from Thomas & Gorman."

ABILENE, TEx.—Water.—Our correspondent writes as follows: "No steps have been taken to improve our water-works system."

BARRINGTON, R. I.—Water.—William Lawler, of the Drownville Water Co., at this place, writes as follows: "Our 'works' consist simply of a tank of 54,000 gallons capacity, on an elevation (105 feet), supplied by two iron turbine wind-mills from a large well some 2,600 feet away. We laid about 8,000 feet 4-inch Wyckoff pipe, and are to supply about forty dwellings, etc. Total cost, \$6,800. Estimated capacity, 10,000 gallons per day. David A. Waldron is president of he company.

he company.

TARENTUM, PA.—Water.—Concerning the improvements to be made to the water-works at this place, H.

M. Brackenridge, of Natrona, Pa., writes us as follows: "We will build a reservoir, 80 feet in diameter, 15 feet deep, to feet excavations, and 5 foot fill, besides doing other work and laying the following pipe: 11,800 feet 8-inch, weight, 48½ lbs.; 6,800 feet 6-inch, weight, 6½/2 lbs.; 4,280 feet 4-inch, weight, 10½ lbs.

Address all communications to me, at Natrona, Pa."

JEFFERSON CITY, Mo.—Water.—The officials of this city have granted a franchise to F. H. Binder for the construction of a system of water-works. For further details see our Proposal Columns.

SALT LAKE CITY, UTAH.—Water.—It is probable that the movement to establish a sewerage system for this city will give way for a while to a water-works project, which, the city officials think, should be settled first. The question of engaging an engineer to make investigations, etc., concerning the water supply, is now being discussed by them, and a meeting is to be held in a few days to take conclusive steps in the meeter.

WAKENBURG, Col..—Water.—It is reported that a system of water-works is to be constructed here and that details can be had by addressing Dr. T. F. Martin.

Bellevile, Kan.—The question of water-works is to be settled here at early day. Offers from numerous parties to purchase the franchise and erect a plant have already been made. So far, no definite steps have been taken.

LIGONIER, IND.—Water.—It is reported that the people of this place have voted in favor of establishing a system of water-works.

PLYMOUTH, IND.—Water.—It is reported that the people of this place have decided in favor of establishing a system of water-works.

HELENA, ARK.—Water.—It is probable that con-clusive steps will soon be taken towards the construc-tion of a water-works system here. Address the Town Clerk for details.

HEMPSTEAD, L. I.—Water.—The Auverne Water Company has been organized here with a capital of \$60,000. For details address C. E. Hoffman, as above.

SUTTON, NEB.—Water.—It is probable that a system of water-works will be creeted here soon. Complete details can be had by addressing Major Mattison of the City Council.

Ennis, Tex.—Water.—The water-works question is being agitated here.

WEATHERFORD, TEX.—Water.—It is reported that he erection of a water-works system at this place is to

HERINGTON, KAN.—Water.—An election is to be held here this month to settle the question of erecting a \$15,000 system of water-works.

GUTHRIE, Ky.-ls is reported that the Louisville and Nashville R. R. Co. will establish a water-works system here.

TROY, ALA.--Water.—A franchise for the construc-tion of a system of water-works here has been awarded to J. Walker Bates. It is reported that the supply will be obtained from attesian wells.

Youngstown, O.—Water.—The water-works trustees of this place have decided to extend the service by laying an additional trunk main, besides laying service pipes in several streets. Work is to begin at once. Details will be furnished by the clerk of the board as above.

OBERLIN, KAN. - Water. - Our correspondent writes: This place is to have water-works, to cost \$25,000.

A. A. Richardson, Engineer of Lincoln, Neb., is making the plans and specifications."

WATER-WORKS.—See our Proposal Column for information concerning water-works and water-works supplies at the following places: Welland, Ont.; La Salle, Ill.; Jefferson City, Mo.; Des Moines, Ia.; New York City; Cincinnati, O.; Atlanta, Ga

BRIDGES.

DES MOINES, IOWA.—It is reported that there is a project towards the erection of several bridges at this place, and that Charles Weitz can furnish details.

JACKSONVILLE, FLA.—Ammett F. Cook, of this city, can be addressed for details of a bridge scheme at Oxford, Fla.

PITTSBURG, PA.—It is reported that County Engineer Charles Davis can furnish details of 20 bridges to be erected in his county at a total cost of \$90,000.

RIVERTON, VA.—An iron bridge is to be erected over the Shenandoah at this place by the Shenandoah Val-ley Railroad Co. The company's office is at Roanoke, Va.

McKinney, Tex.—The county commissioners of Collin County, will, it is reported, rebuild the fourteen bridges recently destroyed by floods.

AKRON, N. Y .- It is reported that an iron bridge is to be erected here.

DUNLAP, TEX.—Two bridges are to be erected here the county commissioners, who can furnish details.

GAS AND ELECTRIC-LIGHTING.

WILMINGTON, N. C.—The Wilmington Gas Light Company has decided to increase its plant.

Annapolis, Mp.—The Annapolis Electric Light Co. expect to purchase the necessary material, etc., at once, to proceed with establishing a plant here.

BUFFALO, Wyo.—An electric light plant is to be established here.

HARRISONBURG, VA.—It is is probable that an electric light plant will be established here. For details, address Mr. Pace, at Washington, D. C.

MERIDIAN, MISS.—It is probable that an electric-light plant will soon be established here.

EAST PORTLAND, ORR.—The East Portland Lighting C mpany has been organized here with C. B. Bellinger at its head. Capital, \$130,000.

PATERSON, N. I.—An electric-lighting plant is to be rected here by the Paterson Electric Light Co. Dealls can be had of John Noonan.

DELAWARE, O.—The Delaware Edison Illuminating Co. has been incorporated here with a capital of \$50,500. B. W. Brown, and others, incorporators.

PROVINCETOWN, MASS.—A gas plant is to be established at this place.

Note.—The item published in this column last week stating that the city of Jacksonville, Fla., advertised for bids for electric lighting was erroneous in so far as the name of the city was concerned. Jackson, Miss, was the place intended. See our Proposal Column on page 368 for corrected proposal.

FLUSHING, L. I.—The Equitable Gas Light Company has been incorporated here with a capital of \$50,000. The directors have applied to the village trustees for permission to lay mains, establish a plant, and furnish has to consumers, but as yet the permission has not been granted. For details address Frank Keeler, of the Board of Trustees, as above.

RAILROADS, CANALS, ETC.

CLINTON, MO.—A franchise has just been granted to the Clinton Street R. R. Co., to build a street line here.

ERIE, PA.—A street railroad is to be constructed here as soon as details can be settled.

Modesta, Col.-A street roailroad is to be con-

structed here this season.

ST.CATHERINES,ONT.—Messis. James A. McMahon, W. M. Shea and George A. Begy, of this place, have been awarded 17 miles of Grand Trunk double-track work from Coteau to Lancaster, near Montreal. The amount of the work is about \$150,000.

New York City.—The scheme to build an elevated railroad on Broadway, this city, has had a setback in the reversal by the General Term of Judge Donahue's order appointing commissioners to appraise value or right of way. It is proposed to carry the matter to the Court of Appeals.

BIDS OPENED.

right of way. It is proposed to carry the matter to the Court of Appeals.

BIDS OPENED.

CLARKSBURG, W. VA.—Water-works.—The following proposals for the construction of a system of water-works at this place were opened May 15 by John W. Hill, Cincinnatt, O., Consulting Engineer:

Water-Pipe and Special Castings.—Donaldson Iron Co., Emaus, Pa., \$17,307.51; New Philadelphia Pipe Works, \$18.058.50; R. D. Wood & Co., \$18,181.20; J. H. Harlow & Cc., \$18,242.10; James J. Dwyer, \$18,272.20; Mellert Foundry Co., \$18,145.00; Addyston Fipe and Steel Co., \$18,445; Lake Shore Foundry Co., \$18.670.45; John Fox, \$18,455.32; Hugh H. Davis, \$18,561; National Foundry and Pipe Works, \$18,860.10; Chattanoga Pipe Works, \$18,621; Detroit Pipe Co., \$19,449.35; Gloucester Iron Works, \$20,271.34; Dennis Long & Co., \$20,449.20; H. B. Leach, specials only, \$576; J. S. Cassin & Co., specials only, \$576; J. S. Cassin & Co., specials only, \$576; J. S. Cassin & Co., \$464.50; James J. Dwyer, \$456; Eddy Valve Co., \$464.50; James J. Dwyer, \$456; Eddy Valve Co., \$474.95; Bourbon Copper and Brass Works, \$477.50; W. S. Payne & Co., \$480.45; Ludlow Valve Co., \$468.64; Chapman Valve Co., \$517.48; Mellert Foundry and Machine Co., \$520; R. D. Wood & Co., \$221.05; James H. Harlow & Co., \$567; Jonson Foundry Co., \$614.50; Gloucester Iron Works, \$655. Contract awarded to Eddy Valve Co.

Fire Hydrants.—James J. Dwyer, \$1,598.50, \$1,431; Bourbon Copper and Brass Works, \$1,472.50, \$1,482, \$1,513; H. B. Leach, \$1,482; Chapman Valve Co., \$1,507.30; J. H. Harlow & Co., \$1,677.80; Gloucester Iron Works, \$1,790.50; Eddy Valve Co., \$1,507.20; J. H. Harlow & Co., \$1,677.80; Gloucester Iron Works, \$1,790.50; Eddy Valve Co., \$1,507.20; J. Dwyer, \$1,500.50; J. H. Harlow & Co., \$1,677.80; Gloucester Iron Works, \$1,770; Deane Steam Pump Co., \$4,360; A. C. Osborn, Worthington pump, \$4,720, Deane Pump, \$4,770; Deane Steam Pump Co., \$4,360; A. C. Osborn, Worthington pump, \$4,720; Deane Pump, \$4,770; Deane Steam Pump Co., \$6,250; National Iron Works, \$6,500; H. H. Leach,

Morrison.

Louisville, Ky.—Water-Works Materials.—The following bids for the erection of a new pumping station for the Louisville Water-Works Company were opened by the Board of Directors of the Company May 15: Mr. McDonald, caisson, \$114,000; masconry, \$16,40 per cubic yard; brick, \$13 per thousand; sills, \$1.40 per foot; croping, \$1.40 per foot; granite, \$4.75 per foot; setting irons, \$4 per ton; pointing, 6 cents per ton, and new crib, \$16,800. Sooy, Smith & Co., caisson, \$112,000; masonry, \$16.50 per yard; brick, \$14.50 per thousand; sills, \$1.50 per foot; coping, \$1.30 per foot; granite, \$5 per foot; pointing, to cents per ton, and crib, \$17,400. Shanshan, O'Connor & Co., caisson, \$125,000; masonry, \$12 per yard; brick, \$16 per thousaud; sills, \$1.50 per foot; coping, \$1.50 per foot; granite, \$4.50 per foot; setting irons, \$5 per ton; pointing, 5 cents per ton, and crib, \$18,000. The bids were all considered too high, and the Board decided to have the work done under the management of the company.

NEW BRUNSWICK, N. J.—Building Dam.—The following proposals for building a water-works dam at this place were opened May 21 by C. H. Cramer, water-works superintendent. The estimated quantities were as follows: Foundations, 325 cubic yards; dam and abutments, 644 cubic vards; coping, 800 square feet. Bidders: P. H. Rehill, Jeisey Citv, \$14,100; B. J. Bailey, New York, \$13,075; J. E. Brooks, New York, \$10,062.50; John Cox, Brooklyn, N. Y., \$14,813.75; F. W. Sullivan, Newark, N. J., \$0,595; B. M. & J. F. Shanley, Jersey City, \$8,716.25; John Meyer, New Brunswick, N. J., \$12,600; Bell & Dunham, \$10,000. Contract swarded to Shanley.

Dunham, \$10,000. Contract swarded to Shanley.

MINNEAPOLIS, MINN.—Pumping station.—The following bids have been submitted to the City Council for the North Minneapolis pumping station: M. H. Chittenden, slate roofing, per square, \$10.50; steel roofing, \$5.75; ion, tin, etc., \$12.90. Grygla & Seldon, slate roofing, per square, \$10.25; steel roofing, \$5.50; iron, tin, etc., \$15.50. Robert Wishart, slate roofing, per square, \$10.25; steel, \$5.50; iron, tin. etc., \$12.50. The contract was awarded to Robert Wishart.

ROSTON MASS —Works for Chamical Treatment of

contract was awarded to Robert Wishart.

BOSTON, MASS.—Works for Chemical Treatment of Sewage.—The following proposals for erecting works for the chemical treatment of sewage at Winchester, Mass., were opened May 19, by the Boston Water Board. The quantities, etc., were as follows: Four

precipitation tanks, engine-house, auxiliary building, precipitation tanks, engine-house, auxiliary building, 850 cubic yards excavation, 75 cubic yards brick masoniy, 73 cubic yards concrete. The following were the bidders with the amounts in their respective order: Joseph Ross, Ipswich, Mass., \$3,252, \$1,266, \$577. \$722.50, \$1,200, \$78; total, \$7,095.50; John McLaren, Boston, Mass., \$3,760, \$4,360, \$845, \$637.50, \$1,200, \$0,7.50; total, \$7,000; \$5. Sanborn, Boston, Mass., \$2,900, \$2,125, \$1 025, \$1,062.50, \$1,087.50, \$65; total, \$0,165; W. H. Keyes & Co., Boston, Mass., \$4,149.50, \$2,345, \$1,124.75, \$680, \$1,125, \$84,50; total, \$9,508.75. The contract was awarded to Joseph Ross.

\$9,165; W. H. Keyes & Co., Boston, Mass., \$4,149.50, \$2,345, \$1,124.75, \$680, \$1,125, \$84.50; total, \$0,508.75. The contract was awarded to Joseph Ross.

ST PAUL, MINN.—Reformatory Building.—The following proposals for the erection of the Minnesota State Reformatory were opened May 15 by J. W. Stevens, architect:

Stone and Masonry and Excavation—William O'N rel and C. O'Brien, Faribault, \$21,675; Carlisle & Sons, Minneapolis, \$42,087; J. L. Bjorkquist, Moorhead, \$44,500; M. Breen, St. Paul, \$46,669.85; Walter Arnold & Co., St. Cloud, sandstone, \$48,150, grante, \$40,275; R. E. Patterson, Agt., St. Paul, carpenter work, \$54,000; Oscar Ludlum, Minneapolis, \$55,650; Hennessee Bros., Agnew & Cox, St. Paul, \$55,750. Contract awarded to Carlisle & Sons.

Carpenter Work—G. W. Smith, Minneapolis, \$55,750. Carlisle & Sons, Minneapolis, \$7,300; William Letteau, St. Paul, \$9,696. Contract awarded to G. W. Smith. Iron Work—Haugh, Ketcham & Co., Indianapolis, \$23,437; St. Paul Foundry Co., St. Paul, \$24,193. Clark, Raffen & Co., Chicago, \$24,600. Contract awarded to Haugh, Ketcham & Co.

Plumbing.—A. J. Kinslow, Brainerd, \$3,885; J. P. Adamson, St. Paul, \$4,480; W. W. Sykes & Co., Minneapolis, \$4,600; I. T. Holmes, St. Paul, \$3,300; E. P. Adamson, St. Paul, \$3,295,44; Thomas Davis, St. Paul, \$3,300; Allen Black & Co., St. Paul, \$3,300; E. F. Osbora & Co., St. Paul, \$3,295,44; Thomas Davis, St. Paul, \$3,300; Allen Black & Co., St. Paul, \$3,300; E. F. Osbora & Co., St. Paul, \$3,295,44; Thomas Davis, St. Paul, \$3,300; Allen Black & Co., St. Paul, \$3,300; C. F. Paul, \$3,300; Allen Black & Co., St. Paul, \$3,300; C. F. Paul, \$3,300; Allen Black & Co., St. Paul, \$3,300; C. F. Paul, \$3,300; St. Paul, \$3,300; St. Paul, \$3,300; St. Paul, \$3,300; St. Paul, \$3,300; C. Contract awarded to George Winding, Milwaukee, \$1,710. Contract awarded to George Winding, Milwaukee, \$1,710. Contract awarded to George Winding, Milwaukee, \$1,710. Contract awarded to George Winding, Milwaukee, \$1,710. Contract awarded to St. Paul, \$5,745; C. Contract aw

**JSO. \$15.000, \$200, \$4.000, \$500, \$1.200, \$7.200, \$7.200, \$1.200, \$2.000, \$1.200, \$7

tract was awarded to Houbens & Shelton.

ST. CLOUD, MINN.—New bids for constructing the reformatory, at this place, have been opened. The successful bidders were as follows:

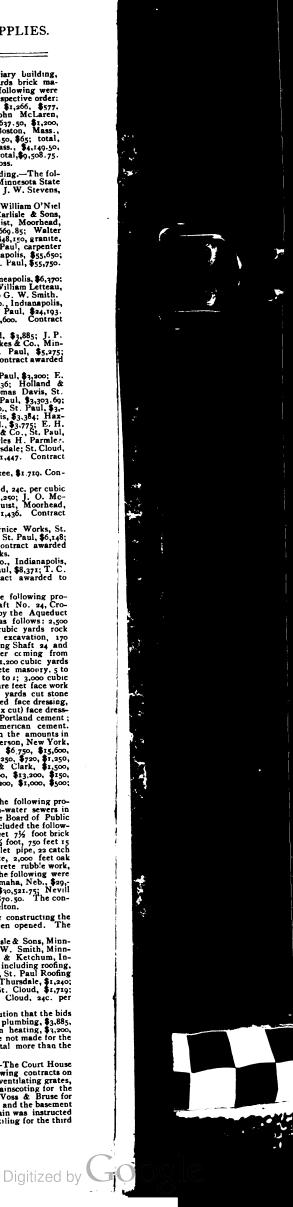

Brick and stone-work, James Carlisle & Sons, Minneapolis, \$42,087; carpenter work, G. W. Smith, Minneapolis, \$6,270; iron cell work, Hall & Ketchum, Indianapolis, \$7,074; other iron work, including roofing, same parties, \$23,437; slate roofing, St. Paul Roofing Works, \$5,194; painting, Hussey & Thursdale, \$1,240; asphalt flooring, George Windig, St. Cloud, \$1,739; excavating, N. Anderson, East St. Cloud, 24c. per yard.

yard.

The managers have passed a resolution that the bids of H. A. Kingston, Brainerd, for plumbing, \$3,885, and C. H. Parmlee, St. Paul, steam heating, \$1,200, were the lowest, but the awards were not made for the reason that they would make the total more than the appropriation available this year.

appropriation available this year.

St. Paul, Minn.—Court House.—The Court House Commission has awarded the following contracts on the new court house building: For ventilating grates, to J. T. Tostevin & Son; marble wainscoting for the first and second stories, to Grant, Voss & Bruse for \$47,358. All bids for the third story and the basement were rejected. County Auditor Kain was instructed to advertise for bids for encaustic tiling for the third story and basement.

GOVERNMENT WORK.

OWENSBOROUGH, KY.—Post Office.—The following proposals for the erection of a post office at this place were opened May 18 by the Supervising Architect of the Treasury Department:

John O'Connor, \$39,970; John Mitchell, \$46,310; Dumesneil Bros., \$31,042; McCarthy & Baldwin, \$37,818; G. W. Corbett, \$35,000; James H. Costen, \$42,222; Thomas & Driscoll, \$47,500.
